Nestorians refer to Christians who follow Nestorius, a leader of an early Eastern Christian tradition. Persecution for heresy forced the Nestorians toward Central and East Asia, including China. As the first generation of Christians coming to China, they arrived in the Tang court in the early seventh century, and remained in the country for two hundred years.

Christianity was introduced to China during the Tang dynasty (618–907 CE) and became widely known as “Jingjiao” (Luminous Teaching) during the Tianqi period (1625–1627) of the Ming dynasty (1368–1644) after the discovery of a luminous stele (a carved or inscribed stone slab or pillar used for commemorative purposes). Modern scholars identify this form of Christianity as Nestorianism, one of the churches of the East led by Nestorius (386–451 CE).

Persecution for heresy had forced the Nestorians toward Central and East Asia, including China. Although Nestorianism is mentioned in traditional Chinese sources, the most important historical sources have been the Nestorian Stele, discovered in Chang’an (modern Xi’an in Shaanxi Province) in the seventeenth century, five Nestorian manuscripts written in Chinese and recovered from Dunhuang (Gansu Province), and numerous tomb inscriptions found in Inner Mongolia and Quanzhou in the modern period. According to these sources, Nestorianism was introduced to China by Alopen in 635. At that time, acting under an imperial edict from the Emperor Taizong, the Nestorians first translated their scriptures into Chinese and established a Nestorian church in Chang’an. After that many Nestorians came to China either by land from Central Asia or by sea from Persia (Iran). The Nestorian Stele was erected in 781, a time of relative prosperity for Chinese Nestorianism. It is said to have been inscribed by a Nestorian priest named “Adam” (“Jingjing” in Chinese) with the sponsorship of a larger congregation. The stele offers a brief but thorough history of Nestorianism in Tang China. According to manuscript sources, the Nestorian leader Adam translated about thirty-five scriptures into Chinese. Several of these translations survived as the manuscripts from Dunhuang; one of them is identified as Gloria in excelsis Deo in Syriac texts. However, after 845 the Nestorians virtually disappeared in Chinese sources, having suffered political persecution under the reign of the Emperor Wuzong. They fled from central China and settled in peripheral regions, especially Samarqand and Turfan. Tomb inscriptions show that Nestorianism experienced a modest revival in several regions during the Yuan dynasty (1279–1368), especially in Inner Mongolia and a few coastal cities in southeast China such as Zhenjiang and Quanzhou. But after the fourteenth century Nestorianism vanished from in China again, this time for good.

**Doctrine, Ethnicity, and Languages**

Nestorius was banished by the Council of Ephesus in 431 for his heretical views regarding Jesus as both a man and a divine son. A doctrine with similar views was introduced...
to China. Other Nestorian doctrines preserved in Chinese translations concern the Trinity of Father, Son, and Holy Spirit; God the creator; Jesus the savior; and the concept of original sin. Although the Nestorians left many sources written in Chinese, it is doubtful if any of these Nestorians were ethnic Chinese themselves. It is clear that the majority of Nestorians in China were Iranian-speaking people. During the Tang dynasty most Nestorians seem to have lived in large cities, such as Dunhuang, Chang’an, Luoyang, and perhaps Cheng’du, which naturally attracted foreign merchants. According to the Nestorian Stele from Chang’an and a Nestorian scriptural

pillar from Luoyang, all the Nestorians named in Chinese sources were clearly either Sogdians or Persians. A tomb epitaph found in Xi’an belongs to a Nestorian family from Persia, even though the family received a Chinese surname identical to the emperor’s and many of the family members served in the Tang imperial government. But no Chinese sources provide any evidence of the views that Chinese intellectuals and common people may have held regarding Nestorianism.

Psalms written in Syriac have been uncovered from Dunhuang and elsewhere. Numerous Nestorian manuscripts were found in an abandoned monastery in Bulayiq, Turfan, all of which were written in either Syriac or other central Asian languages, especially Sogdian and Turkic-Uygur. None was written in Chinese. These manuscripts date from the ninth to the thirteenth century, when the Chinese empire had no sovereignty over this area. The discovery of these Syriac manuscripts indicates that Nestorians in China kept Syriac as their church language. Yet, Nestorians of different ethnicities also used their own languages during their religious activities. All tomb inscriptions from the Yuan dynasty are written in bilingual form, either Turkic-Uygur and Chinese or Syriac and Turkic-Uygur.

Nestorianism and Other Religions in China

When Nestorianism came to China, Confucianism, Buddhism, and Daoism dominated the religious life of the Chinese people. Nestorians borrowed a lot of loanwords (words taken from another language and at least partly naturalized) from the texts of these three religions. Buddhism had a particularly close connection with Nestorianism. The Nestorian leader Adam tried a collaborative translation project with Buddhist monks, but the Tang emperor suspended this project. Adam’s translations borrowed a lot of terms, phrases, and usages from Buddhist texts, although he adapted their meanings considerably.

Daoism was the official ideology in the Tang dynasty, and it seems that the Nestorian Stele also borrowed many Daoist terms. At one time the Tang government confused Nestorianism with Zoroastrianism. The Nestorian church was ordered by the government to change its name from “Persian Church” (bosi si) to “Byzantine Church” (daqin si) in 745 when the Tang government realized that Nestorianism was originally from the eastern Roman area. In Chinese sources Nestorianism, Manichaeism, and Zoroastrianism were often referred to as the “three foreign religions” (or “barbarian religions,” yijiao or hujiao), in contrast to the three domestic religions, Confucianism, Buddhism, and Daoism. In 845 all foreign-origin religions, including Buddhism and Nestorianism, suffered...
political persecution. This persecution was partly because of the increased isolationism that began to develop in the Tang government after the An Lushan Rebellion (755–763) nearly a century before. In sum, Nestorianism embarked on its journey to China when the Tang empire was open to all religions but suffered when the Tang empire began to decline.

Further Reading
During the early twentieth century, many classically educated Chinese intellectuals, disillusioned with a weak and inefficient government, advocated for a new Chinese culture based not on Confucian values, but instead on Western-style ideals and thought. The resulting New Culture Movement inspired revolutionary leaders—radical and conservative—to reform China’s intellectual, political, and social traditions, thus shaping modern China.

The term “New Culture Movement” refers to a short span of time in the early twentieth century when Chinese intellectuals, influenced by knowledge and events from abroad, hastily and passionately set new directions in intellectual, social, political, and cultural trends. It is often used synonymously with the “May Fourth Movement.” Historians tend to use the years 1915 and 1923 to delineate the beginning and ending of this event, but they disagree about what constitutes its most salient aspects. Some see the movement primarily as a watershed in revolutionizing literary and intellectual consciousness, as a form of Chinese Renaissance or Enlightenment (Hu Shi, Benjamin Schwartz, and Vera Schwarcz, to name just a few); others see it as a political awakening that enabled the rise of Chinese Communism (Mao Zedong and mainland Chinese Marxist historians); still others view it as a two-tiered process by which cultural iconoclasm eventually led to political radicalism (Chow Tse-tsung, Joseph Chen, and others); and others consider it to be neither cultural Renaissance nor Enlightenment, but a multidimensional and multidirectional movement of both radical and conservative ideas (Yu Yingshi and others).

But all authorities concur that a defining moment in this process was the May Fourth demonstration of 1919, when over three thousand students marched on Beijing’s Tiananmen Square to protest the negative outcome of the Treaty of Versailles. The stipulations of the treaty, negotiated in Paris from January to June 1919, led the Allies to turn over German-controlled territory in Shandong Province to Japan instead of China, whose hope had been buoyed by Woodrow Wilson’s call for national self-determination. This incident signaled a new chapter in Chinese political and intellectual history because the demonstrators were young students who came of age after the elimination of the civil-service exams in 1905, a system that had reinforced Confucian values and provided a path toward official success for many centuries. Informed by Western political ideologies introduced mainly from Japan, they railed against the government for selling out to the same Japanese and Western imperialist powers. Most importantly, they were joined by merchants, laborers, and other hitherto apolitical segments of the Chinese population.

The New Culture Movement, therefore, not only signified a time when intellectuals reexamined all aspects of society, including its literary, intellectual, and philosophical underpinnings, in an attempt to save the country, but it also inaugurated a period in which new social groups experimented with disparate political ideologies, foreshadowing the eventual showdown between the Nationalists and the Communists in the ensuing decades.
Decline of Imperial China

The year 1915 is often considered the start of the New Culture Movement, not only because it marked the founding of the most influential magazine of the period, Youth (Qingnian), later renamed New Youth (Xin Qingnian), but also because it was the year that President Yuan Shikai (1859–1916) of the Republic of China was issued the infamous Twenty-One Demands by Japan. On 18 January the Japanese minister to China secretly presented Yuan with a list of conditions that would give Japan effective control of the whole country. The effete Chinese government, under the threat of war, leaked the terms of this onerous document in the national and foreign press, and won a great deal of moral support both at home and abroad. After Japan presented an ultimatum on 7 May, China acquiesced to most of the terms on 9 May. Public indignation was roused to an unprecedented height, and these two dates were marked as National Humiliation Days.

Japan could confront China with such brazen aggressiveness because by the early twentieth century, the political and socioeconomic conditions in China had deteriorated to a point of no return. Beginning with the First Opium War (1839–1842), China endured a series of disastrous military defeats at the hands of the West and Japan, and with each loss the Chinese ceded more territorial control and millions of ounces of silver in indemnity payments. China’s humiliating defeat in the First Sino-Japanese War of 1894–1895 cost the dynasty 200 million taels of silver and the island of Taiwan, among other indignities. The debacle of the Boxer Rebellion of 1900 resulted in an indemnity payment of 450 million taels to eight foreign nations, a sum more than four times the annual income of the state. Internally, a series of rebellions that began in the 1850s and 1860s brought more hardship on the people, and weakened the control of the central government. The Taiping Rebellion (1850–1864) occasioned the loss of approximately 20 million lives and nearly toppled the Qing dynasty (1644–1912). Several serious famines and floods in the second half of the nineteenth century led to further social unrest, and the situation was aggravated by a corrupt bureaucracy that could not relieve the sufferings of the people. Opium addiction and unemployment contributed to the demoralization and turmoil of society. Beset by internal disorder and external encroachments, the dynasty was teetering on the verge of extinction at the turn of the twentieth century.

The New Republic

As anti-Manchu revolutionary societies began to appear across China, Sun Yat-sen’s Revolutionary Alliance, formed in 1905 in Japan, became the most popular and well-organized group. Composed of intellectuals and secret-society members, these revolutionary societies staged uprisings in various parts of the country, and succeeded in overthrowing the Qing in October of 1911 (the emperor abdicated in February 1912). Sun Yat-sen (1866–1925) assumed the office of the provisional president of the
Republic of China on 1 January 1912, but soon yielded the office to Yuan Shikai (1859–1916), who had superior military power. In an effort to stem Yuan’s increasing political ambition, the Revolutionary Alliance absorbed four other political parties and was renamed the Nationalist Party (Guomindang) under Song Jiaoren in 1912. Song’s assassination in 1913 was widely believed to have been ordered by Yuan. In an effort to halt Yuan’s growing dictatorial ambitions, the revolutionaries in the Nationalist Party launched a second revolution. It collapsed in a short few months, whereupon Yuan became unstoppable. At the onset of World War I in Europe, Yuan was preparing for his role as emperor. He died of illness in 1916, after which the country endured a decade of warlordism. By 1918 the country was roughly divided into the northern government, controlled by warlords of the Beiyang faction under Duan Qirui, and the southern government of Sun Yat-sen, backed by Chen Jiongming and other southern warlords.

China’s decision to join World War I by sending laborers to Europe for the Allies was made in the hope that an Allied victory would gain the return of the Jiaozhou Peninsula, which was ceded to Germany in 1898. Woodrow Wilson’s advocacy of national self-determination had raised the hopes of the Chinese people. It was therefore a devastating blow to learn that Britain, France, and Italy had signed secret treaties with Japan in 1917 backing its claims to Germany’s rights in China. Their disappointment turned to fury when the Japanese diplomats in Paris further disclosed that Duan Qirui’s government had negotiated a secret loan in 1918 for the construction of railroads in Shandong, and not only had pledged the property and the income of the two railroads to Japan, but also agreed to a seven-point Japanese proposal with regard to management and policing of the railroads.

When news of this development reached the Chinese public on 3 May 1919, the students of Beijing University, with the support of Chancellor Cai Yuanpei (1868–1940), decided to move up the date of a planned demonstration on 7 May to mark National Humiliation Day. On 4 May, over three thousand students from thirteen colleges and universities in Beijing gathered at Tiananmen Square, protesting the treachery of their own government and the aggression of the foreign powers and urging the Chinese delegates in Paris not to sign the treaty. The demonstration began peacefully but turned violent as the marchers arrived in front of the residence of the pro-Japanese minister of communications, Cao Rulin, and were forced back by the police. Angry students set fire to Cao’s residence, and a few were arrested by the police. After an initial period of confusion, the government adopted a hard-line approach by arresting thousands of students. This act only increased the indignation of the public. As a result, sympathy strikes by students spread to more than twenty cities within a month. In Shanghai, the Federation of All Organizations of China was formed on 5 June, linking merchant and labor groups, the press, and the student union. On 16 June a Student Union of the Republic of China was established with representatives from several cities and provinces. The public uproar finally forced the resignation of the three pro-Japanese officials who were targets of the May Fourth demonstration. Duan resigned in the following year, as the struggle for power continued throughout the country.

The political and cultural iconoclasm that characterized the New Culture Movement grew out of changes in the late Qing period. As the dynastic center spun out of control, a breathing space was provided for opponents of the political and cultural status quo to voice their discontent without recrimination. Deeply concerned with the breakdown of the Qing state, Chinese intellectuals initiated a soul-searching examination of all aspects of their world—from religion, philosophy, politics, literature, and epistemology to the nature and direction of China’s modernization. Most significantly, they questioned the viability of Confucianism as doctrinal canon for a new China. The revisionist and reformist writings of individuals such as Kang Youwei (1858–1927) and Tan Sitong (1865–1898), as well as Yan Fu’s (1854–1921) translations of Herbert Spencer, Montesquieu, and numerous Western philosophers and thinkers forged a link between evolutionary change and social and political progress in the minds of their readers. While Yan Fu focused on the material learning of the West, Liang Qichao (1873–1929), Kang’s most famous disciple, believed that China needed to overhaul its legal, educational, and bureaucratic systems in order to create a new citizen, “one whose character would be based on “civic activism, respect for human rights and a spirit of adventure” (Chang Hao 1971, 216). Yan and Liang were also among the first intellectuals to discuss social Darwinism, suggesting that the concept of
"great harmony" (datong) was compatible with the concept of socialism, thus providing a "scientific" alternative for the May Fourth generation to counter the hegemony of Confucianism. In doing so, they severed the link between the Confucian spiritual order and the sociopolitical system, freeing the May Fourth intellectuals to embrace a scientific world view and to entertain the concepts of democracy, socialism, anarchism, and communism as possibilities for China.

Reforms and New Youth

Even as the late Qing reformers were adopting Western political ideas and denouncing aspects of their own cultural heritage, a concern for the future of the country was uppermost in their minds. Nationalism, in the sense of a patriotic concern with China’s future, was arguably the dominant theme in the writings of most Chinese intellectuals from the 1890s onward. In October 1905, Sun Yat-sen laid out a program to save the nation in his revolutionary paper People’s Journal, articulating the “Three People’s Principles”: nationalism (minzuzhuyi), democracy (minquanzhuyi), and socialism (minshengzhuyi). Sun’s journal was instrumental in broadening the discourse on socialism in the first decade of the twentieth century. Two of the editors of the People’s Journal, Liu Shipei (1884–1919) and Zhang Binglin (1868–1936), espoused anarchist principles in the paper. Liu founded an anarchist group in Tokyo in 1907. Calling for the overthrow of the state and of all ideas and institutions that inhibit freedom, such as the Confucian ideology and the family, the anarchists envisioned a universal brotherhood based on mutual assistance, grounded on the principle of “from each according to his ability, to each according to his need” (Gasster 1969, 164). They drew inspiration variously from Laozi and the Daoist thesis of nonstriving (wuwei), or the theory that one does only what comes naturally, as well as from strands of Mahayana Buddhism and Kropotkin’s concept of mutual aid. While anarchism was one voice among a plethora of socialist doctrines in the early decades of twentieth-century China, historians have long recognized the important role of anarchists in paving the way for the Chinese acceptance of communism. They credit anarchists with radicalizing the discourse on change, for bringing together laborers and intellectuals in work-study programs, for elevating the importance of labor, and for hailing the Russian Revolution as a universal social revolution.

Many of the intellectual debates of the New Culture Movement took place within the pages of the New Youth magazine, particularly before its transformation into an organ of the Chinese Communist Party in 1923. Founded in Shanghai in 1915 by Chen Duxiu (1879–1942), who went on to establish the first Chinese Communist cell in 1920 and the party itself in 1921, the magazine targeted high school and university students, and reached a monthly circulation of over 10,000 copies at its height. In 1917, when Chancellor Cai Yuanpei invited Chen to become the Dean of the School of Letters at Beijing University, Chen added many faculty members to the editorial board of the magazine. His opening salvo—“To Youth”—summarizes his already-radical views. In this article Chen Duxiu called on the new generation to become independent, progressive, aggressive, cosmopolitan, utilitarian, and scientific in order to save the country. By addressing the young generation, Chen encouraged their direct political and social involvement in society. He followed this essay with a discussion on French civilization and credited France for contributing three gifts to mankind: democracy, evolutionism, and socialism. “Science” and “democracy” became the rallying cry of the generation who came of age with the New Youth magazine, and “tradition” became the common enemy. As Chen stated in defending his magazine from detractors: “In order to advocate Mr. Democracy, we are obliged to oppose Confucianism, the codes of rituals, chastity of women, traditional ethics, and old-fashioned politics; in order to advocate Mr. Science, we have to oppose traditional arts and traditional religion” (Chen Duxiu 1926, 10–11).

One of the most important achievements of the New Culture Movement was the vernacularization of the written language. In 1917 Hu Shi (1891–1962) published his “Some Tentative Suggestions for the Reform of Chinese Literature” in New Youth, in which he called for a new literature that did not imitate the ancients, one that emphasized substance over form, one that was devoid of clichés, and one that embraced the language of popular literature. Hu declared that the classical written Chinese was a dead language, and that only the spoken, or vernacular
Chinese, was a living language and therefore it was the only appropriate medium for the creation of a living Chinese literature. Chen Duxiu responded enthusiastically, and together they denounced the fundamental assumption of Chinese literary theory, which was the idea that literature must convey the Way (dao), or the moral principles of the Confucian teaching. Chen proposed instead that Chinese literature adopt the style of realism found in European literature, in order to reflect life’s contemporary problems. Like most of his contemporaries, Chen possessed a somewhat simplistic understanding of European literature as progressing in a linear fashion from classicism, romanticism, and realism to naturalism.

Ironically, in order to earn the respect of their fellow intellectuals, the contributors to New Youth at first felt compelled to display their erudition by making frequent allusions to classical texts and by composing “new” poetry in a classical form. Eventually New Youth launched a campaign in 1918 for editors and readers to create poetry, plays, and translations purely in the vernacular style. In the process they created a new genre, the short essay, which became a powerful vehicle for social commentary. As Hu Shi issued a call for “a literature in the national language, and a literary national language,” (Hu Shi 1918) readers set up hundreds of literary societies in response. Along with Lu Xun (1881–1936), one of the greatest writers in Chinese literature, Hu Shi and his colleagues—including not only Chen Duxiu, Qian Xuantong, Shen Yinmo, Li Dazhao, and Zhou Zuoren, but also their students, Fu Sinian, Luo Jialun, Zhu Zhiqing, and Ye Shaojun—spearheaded the new literary movement. By March of 1920 the Ministry of Education in Beijing decreed that school textbooks should be written in the vernacular language, and within a year the vernacular language was officially recognized as the national language.

A dominant theme in the new literature of the New Culture Movement was the desire on the part of the Chinese writers to save their nation. Lu Xun’s short story “Iron House” poignantly captured the despair of someone who could not awaken a nation because its people were in deep slumber and oblivious to their imminent demise. The intense subjectivism of the literature of the period was manifested in an intense preoccupation with the self, and with a celebration of individualism. Stories revolving around the theme of love replaced that of propriety, as love became symbolic of freedom and the new morality. Women’s issues became prominent in the writings of the New Culture Movement, touching on topics such as women’s education, the concept of chastity, and the practice of forced marriage. Eight or more new women’s publications appeared during this period. Ibsen’s Nora became an emblem of the May Fourth generation, symbolizing women’s increasing self-assertion and individualism. But women’s suffrage was not yet granted, and Lu Xun’s pointed question of what happens after Nora leaves home was met with silence. In Miss Sophie’s Dairy, the respected female author Ding Ling (1904–1986), blazed a new literary trail by creating a female protagonist who reveals her sexual desires for two men, shocking her audience. In 1921 the manifesto of the Association for Literary Societies proclaimed for the first time that writers were a professional group dedicated to the practice of literature as an independent vocation. The emancipation of the literary form and language during the New Culture Movement led to the development of a rich body of short stories, novels, and the founding of literary societies such as the Crescent Moon Society, the Creation Society, and the Association for Literary Societies in the 1920s.

Another major feature of the New Culture Movement was the use of scientific methodology in reexamining China’s past. At first Chinese intellectuals understood Western science simply as the use of Baconian inductionism, which emphasized observation and the accrual of data; they were relatively unconcerned with the speculative element in the collection of these facts. Hu Shi, Gu Jiegang, and Fu Sinian embarked on projects to “reorganize the national heritage,” and produced new histories of philosophy, folk literature, and philological treatise using “scientific” methodology. The study of archaeology became an important “scientific” tool to determine the veracity of claims to Chinese antiquity. Ding Wenjiang, a geologist and one of the few trained scientists among the New Culture intellectuals, even advocated eugenics and a scientific bureaucracy to transform society. Chen used the concept of “science” to attack the stultifying and superstitious customs of Chinese society, from arranged marriage to foot binding, while others called for a “scientific” way of living, complete with pointers on personal hygiene.

The impulse to employ scientific perspectives in evaluating all phenomena had a significant impact in the
realm of politics. Influenced by social Darwinism, the May Fourth intellectuals perceived that socialism represented the most advanced state of political evolution. The success of the Bolshevik Revolution in 1917 further enhanced the prestige of socialism and communism. As a high school student in Hunan, Mao Zedong (1893–1976) formed the New People’s Study Society, and some of its members eventually became leaders of the Chinese Communist Party. By the end of 1919, a Society for the Study of Socialism was established at Beijing University under the protection of Chancellor Cai Yuanpei; it soon split into different organizations studying guild socialism, anarchism, and syndicalism. In 1920, under Li Dazhao’s (1888–1927) leadership, some of its members regrouped to create the Society for the Study of Marxist Theory. Other societies involved a mixture of educators, journalists, writers, and students. The most notable of these was the Young China Association, whose members initially devoted themselves to the study of economic and social problems both at home and abroad.

The search for solutions for a better society led the faculty and students of the Beijing higher institutions to experiment with living arrangements. Zhou Zuoren (1885–1967), Lu Xun’s younger brother, was enamored of the Japanese utopian social movement, in particular the atarashiki mura (new village) concept introduced by Mushakoji Saneatsu, which he and Lu Xun discussed extensively both in New Youth and in New Tide, a magazine formed by students of Beijing University in 1918 and supported by the faculty. Inspired by the new village and work-study concepts, these students organized the Work-and-Learning Mutual Assistance Corps in several big cities in China in 1919. This was a short-lived attempt to adopt a new style of living with the ultimate aim of creating a utopian society. In the same year, students from Beijing Higher Normal College founded the Work-and-Study Society, also attempting to build a society modeled on the work-and-study units. Inspired by their teachers, students formed organizations and study groups enthusiastically to do their part to save the country. Student demonstrations proliferated after the May Fourth incident, totaling more than 125 significant protests in 1922 alone.

By the early 1920s, disillusionment with the republican system of government at home and with the tragedy of World War I led many to reexamine the limitations of Western-inspired notions of science and democracy. Opposing this torrential trend to tear down China’s cultural heritage was a group of scholars associated with the 1922 journal Critical Review, based in the National Southeastern University in Nanjing. Led by Mei Guangdi (1890–1945) and Wu Mi (1894–1978), two scholars educated under Irving Babbit (1865–1933) at Harvard University, they argued that the transcendental moral order and the moral value of literature in Confucianism could be re-fashioned to fit the new age. They aimed to propagate Babbit’s interpretation of New Humanism in China by forging their own understanding of Confucianism. Similarly Feng Youlan used Western philosophical methods to reevaluate Zhu Xi’s once-orthodox interpretation of Confucianism. Because they wrote in classical Chinese and vehemently opposed the literary revolution, they have been branded “conservatives” in the conventional literature on the New Culture Movement. But recent scholarship suggests that their complete rejection of all previous interpretations of Confucianism was arguably an act as revolutionary and radical as those who endorsed the vernacular movement.

**Political Implications of the New Culture Movement**

Perhaps more than at any other time in the last two thousand years of Chinese history, the New Culture Movement became a crucible for the transformation of the political conviction of Chinese intellectuals. From this period onward, intellectuals could be generally classified into four groups: the liberals, the radicals, the members of the Nationalist Party, and the members of the Progressive Party. The liberals were an ill-defined group who generally advocated democracy but tended to stay out of practical politics. The early radicals were anarchists or socialists, but not yet converted to Marxism. Hu Shi, China’s most famous liberal, wrote an article titled “More Study of Problems, Less Talk of ‘isms’” in July 1919, suggesting that focusing on practical studies of specific problems, and not on high-sounding theoretical doctrines, was the only way to solve China’s problems. Li Dazhao, by then committed to Marxism, countered that “isms” were crucial in formulating a structural framework to elucidate
the problems. Hu Shi replied that civilization was created incrementally, and that the solution to societal problems must also proceed “by inches and by drops.” Li, however, argued that society needed a complete transformation in economic structure in order to progress.

During this time, John Dewey, Bertrand Russell, the mystic and poet Rabindranath Tagore, and Russian Comintern agents all visited China, adding the weight of Western political authority, and sometimes their own practical knowledge and experience. In the early 1920s, while members of the Progressive Party, associated with Liang Qichao, espoused a form of guild socialism inspired by Bertrand Russell and Henri Bergson, the Nationalist Party found itself divided between a southern revolutionary faction under Sun Yat-sen, and a northern parliamentarian faction struggling with the warlord-dominated government in Beijing. Committed to a socialist vision for China, Sun Yat-sen aligned with the leftists in endorsing Leninist party organization and welcoming Russian advisers into his fold. Meanwhile, Chen Duxiu, also contacted by Comintern agents, formed the first Shanghai Communist cell in 1920, which formally became the Chinese Communist Party in the following year. From the early 1920s until this day, Chinese history has been profoundly shaped by the struggle between the two major parties inspired by the ideas and politics of the New Culture Movement.

In February 1934, a time when tensions between the Nationalist and Communist parties were high—and the Japanese threat loomed—Chiang Kai-shek launched the New Life Movement. Chiang believed that outward changes in behavior would strengthen and toughen the inner spirits of the people, and hence strengthen the country. Controversy surrounds the impetus of the New Life Movement, questioning whether it stems from Confucian, Christian, or fascist thought.

On 19 February 1934 Nationalist Party (Guomindang) leader Chiang Kai-shek (1887–1975) launched the New Life Movement (Xin shēnghuó yǔndòng) during a speech in Nanchang, Jiangxi Province. The New Life Movement was designed to revitalize the spirit of the people through a series of campaigns orchestrated to improve their customs and social habits. The movement attempted to utilize traditional ethics and behavior modification to achieve a revolution in living. Changes in hygiene and behavior, it was believed, would lead to China’s moral revitalization and thus the strengthening of the nation-state. In Chinese history nothing similar to the size, organization, and methods of the New Life Movement had ever been attempted. Eleanor Roosevelt and Soong May-ling, wife of Chiang Kai-shek. Madame Chiang was one of the most public proponents of the New Life Movement, which was designed by Chiang to improve the customs and social habits of the dispirited Chinese people. As the threat of Japanese invasion loomed in 1936, and the movement was in decline, Chiang turned over the day-to-day activities to Madame Chiang and the U.S. missionary reformer George Shepherd.
Movement had been seen, making it one of the most intriguing events of the Republican era (1912–1949).

**Historical Background**

The New Life Movement was set in motion alongside the fifth Bandit Extermination Campaign in 1934 to remove the Communists from their base in Jiangxi, but its origins can be traced back to the late 1920s. In the first of three stages of the national revolution of party leader Sun Yat-sen (1866–1925), the Nationalist Party embarked on the Northern Expedition in 1926 to unify the country militarily. As the expedition swept north defeating the warlord armies who had held a stranglehold on China since 1916, a split occurred between the Nationalists and Communists who were conducting the Northern Expedition jointly as part of their United Front strategy. As the split widened the Nationalists began a policy designed to eliminate all Communists from Chinese politics; the effort included the 12 April 1927 White Terror in which thousands of alleged Communists were executed. To survive, the remaining Communists fled to Jiangxi, where they established a rural base area. From 1930 to 1934 Chiang and the Nationalists initiated a series of so-called Bandit Extermination Campaigns to wipe out the surviving Communists. During the fifth and final extermination campaign the Nationalists drove the Communists from their base area and onto the Long March, a military retreat lasting more than a year and covering roughly 6,000 miles. To recover the former base area and reeducate those people “poisoned” with Communist ideology, Chiang set the New Life Movement in motion. Quickly dissatisfied with the limited scope of the movement, he gave a series of four more speeches in which he outlined a national movement for a new life.

**Theory of the New Life**

Chiang Kai-shek’s five speeches constitute the ideological basis of the New Life Movement. The lives of Chinese, he claimed, were notable for their filthiness, hedonism, laziness, and decrepitude—in sum, Chinese were living lives that were barbaric and unreasonable. To resolve these problems Chiang called for the revival of what he termed the four virtues: propriety or disciplined behavior; righteousness or proper behavior; integrity or clear discernment; and shame or earnest conscientiousness. Although the four virtues harkened back to traditional ethics, they were reinterpreted to suit modern circumstances. Along with these four cardinal virtues were the eight qualities of orderliness, cleanliness, simplicity, frugality, promptness, exactness, harmoniousness, and dignity. The four cardinal virtues and eight qualities were to be applied to the basics of life—clothing, food, residence, and behavior—and Chiang spelled out in ninety-six prescriptions for how to do it. The prescriptions for the people were so detailed that they governed the minutiae of everyday life, an example of which can be seen in the following: People should wear simple, utilitarian clothing, dress neatly, avoid nakedness, remove their hats indoors, wash their bedding, and purchase national products; people should eat only clean food, use washed utensils, consume local produce, keep regular meal hours, avoid noise when eating, sit correctly, follow proper table manners, and avoid smoking; people should keep their homes clean, use simple furniture, air out their houses, properly dispose of garbage, eliminate rats, flies, and mosquitoes, and display the national flag on holidays; people would be orderly in public, walk on the left side of the street, not spit, urinate, or sneeze in public, avoid crowding and pushing, stand at attention for the national anthem, and avoid gambling, prostitution, and the use of opium.

According to Chiang’s theory, respect for the four virtues and application of the eight qualities to food, clothing, residence, and behavior would allow the Chinese people to create a new life of public morality that would, if each person correctly followed this path, jointly revitalize the spirit of the people and the country. The revitilization of the country would produce a more rational environment in which the people’s lives would become beneficially more artistic, more productive, and more militarized. Focusing on the arts would eliminate the vulgar social habits and customs of the people; productivity would increase the people’s material well-being and create self-reliance; and militarization would discipline the people and teach them to defend themselves.

**Implementation of the New Life Movement**

To ensure the success of the movement the work was to be carried out as a threefold process: investigation of current conditions and difficult obstacles, detailed planning of
the various steps to be taken, and the actual implementation of the plans. In all things the slogans of “From the Simple to the Complex” and “From the Self to Others” were to be followed.

The first step was for the workers of the movement to instruct the people in the purpose and aims of the new life. After a campaign was under way inspectors would be sent out to check the results and make necessary recommendations for further improvement. After a campaign was successful—no campaigns were ever fully successful—a new campaign could be launched. Throughout this process strict rules were to be applied: (1) Only superiors had the right to interfere in the daily life of others, and friends could only encourage each other; (2) the movement could be carried out only during leisure hours or vacation time; (3) and all movement funds were to be raised and dispensed by movement members or local government but never from the general public.

Although purportedly driven by popular participation the New Life Movement was entirely planned and carried out by the Nationalist Party through the New Life Movement Promotion Associations.

New Life Movement Promotion Associations

In the weeks after Chiang’s speeches numerous New Life Movement Promotion Associations were established around the country to guide the mass rallies at which New Life Movement ideology was disseminated to the people. The associations consisted of provincial organizations, municipal associations that were in large cities independent of provincial oversight, railroad associations overlapping multiple provinces, county associations, and overseas associations for Chinese living abroad.

The New Life Movement Promotion Associations were staffed by at least one member of the following bodies: the provincial government, the provincial Nationalist Party organization, the Bureau of Civil Affairs, the Bureau of Education, the Bureau of Public Safety, local military authorities, and leaders of local civic groups. The director of the railroad, chief of the railroad police, and the railroad Nationalist Party organization led the railroad associations. Overseas associations consisted of members of the local Chinese consulate, the local Nationalist Party branch, local Chinese schools, merchant’s guilds, and various Chinese organizations. As this list makes clear, Nationalist Party members controlled all promotion associations.

The first actual association was founded at Nanchang on 21 February, and it immediately planned and carried out the first public meeting at the Nanchang Athletic Grounds on 11 March; activities such as street sweeping were emphasized. During March and April nine provinces and three municipalities established New Life Movement Promotion Associations. By the end of the first year fifteen provinces, three municipalities, and nine railway centers had New Life associations. The movement continued to grow through 1937, by which time there were nineteen provincial, five municipal, twelve railroad, thirteen hundred county, and ten overseas associations (two in Japan, two in Korea, two in Southeast Asia, as well as one each in Macao, Timor, Mexico City, and Lima, Peru).

New Life Movement Voluntary Service Groups

The New Life Movement Promotion Associations were largely advisory bodies, while the actual work of the movement fell to a series of more permanent institutions, including the military police, the regular police, and the Boy Scouts. To assist these organizations the promotion associations created a number of voluntary service groups such as the Jiangxi Youth Vacation Service Corps, the Merchants Members, and the Women Civil Service Corps. These voluntary service corps carried out the actual work of the movement by leading movements such as the antirat and anti-mosquito campaigns. On a national basis the Women’s New Life Movement Voluntary Service Corps, led by Chiang Kai-shek’s wife Song Meiling (1897–2003), was established in thirteen provinces and focused on leading women into the New Life Movement by emphasizing activities such as cooking, sewing, and child care. but also educational activities such as literacy training.

Christians in the New Life Movement

By 1936 the movement began to lose its momentum as more immediate problems such as the encroachment of...
Japan into Manchuria took the focus off the New Life Movement. During this decline Chiang and the more prominent members of the movement turned over the day-to-day activities to Madame Chiang and the U.S. missionary reformer George Shepherd, who was placed in direct charge of the movement in early 1936. In this second, less-promoted phase the emphasis moved from mass meetings and national campaigns to more focus on intensive training of promotion association members and more emphasis on inspecting various problems throughout the country.

Both foreign and Chinese Christians, especially Protestants, supported the New Life Movement as an attempt to modernize China’s ancient teachings—propriety, righteousness, integrity, and shame. They also felt that the stress on changing “un-Christian” habits such as public spitting or urinating would help civilize the Chinese. The Christians did object to some of the more anti-female emphasis of the movement and wanted more freedom for women, but overall they found the New Life doctrines entirely compatible with Christian teachings and thus supported them. The New Life Movement emphasis on social service and cleanliness especially commended itself to Christians. Chiang Kai-shek himself was a Christian, leading some early commentators to go so far as to claim that the entire New Life Movement was based on the fundamentals of Christianity. Despite new measures and the involvement of service-oriented Christians, however, the Japanese invasion of China on 7 July 1937 began to quiet the movement. Although it survived in government propaganda manuals throughout World War II, the New Life Movement slowly faded from the national spotlight in 1937.

Despite the poor results of the New Life Movement, it was one of the largest and most unique government-led “popular” movements in Chinese history. Its methods were unusual and its goals sometimes obscure, but it remains one of the most misunderstood and historically interesting episodes in modern Chinese history.

Further Reading

The New Rural Reconstruction Movement refers to mainly non-governmental efforts in the 1990s and early 2000s to improve the governance and conditions of China’s countryside. The movement has been greatly influenced by the work of public intellectuals such as agricultural scholar Wen Tiejun, who argued against a reliance on neo-liberal economic strategies.

The New Rural Reconstruction Movement 新农村建设运动 grew from a loose alliance among intellectuals, activists, officials, and members of the public in the 1990s and early 2000s that called attention to the plight of the countryside, whose problems they blamed on globalization and neo-liberal policies which relied on market incentives. Although leaders were inspired by international counterparts (especially those in Kerela, South India, an agrarian area with an extremely high literacy rate), used a range of cosmopolitan theory, and saw China’s rural problem in global terms, in their choice of a name they evoked China’s own Rural Reconstruction Movement of the 1920s and the 1930s. Rather than joining opposition to the government, NRRM encouraged and supported official reform efforts and prodded China’s leaders to address the problems.

In their analysis, they determined that China’s rural problem grew out of economic reform programs in the late 1970s and early 1980s which gradually dissolved the commune system in order to allow small-scale family farmers to enter the market. At first, farm family income grew rapidly, but growth leveled off by the mid 1980s. While government planners turned their attention to promoting export growth and as urban families enjoyed rapid rises in their standard of living, individual farm families now were expected to pay for schooling, health care, and social welfare, responsibilities which originally had been the commune’s. In addition, farmers faced price fluctuations; pollution from chemical fertilizers, pesticides, and local small-scale industry, much of which was owned by outside investors; insecurity of land tenure; lack of accountability among local officials; growing corruption; and inequalities between the areas which had access to the sources of growth (such as large cities and coastal provinces) and rural areas, especially inland ones.

Starting in the early 1990s, farmers protested more often and about a wider range of issues. In 1994, there were 10,000 protests, according to China’s Public Security Ministry, in 2003 there were some 58,000, and in 2005 there were 87,000 incidents of protest involving an estimated 3.76 million people. In eastern China, where urban expansion made land more valuable, protests no longer focused only on traditional complaints such as taxation and corruption, but on the seizure of farmland by local officials for roads, power plants, dams, factories, waste dumps, and housing projects for city-dwellers.

As these protests gained strength, a generation came of age that had gained practical experience during the Cultural Revolution (1966–1976) and had trained in the intellectually cosmopolitan period of reform. As these government administrators, members of Party think tanks, and academics expanded their knowledge
of western political theory and increased their contacts abroad, their thinking went beyond (but did not totally reject) Maoism, especially its concerns with social equity. They observed that rural problems were not unique to China but also occurred in other developing countries, leading them to conclude that Mao’s leftist policies and the Cultural Revolution were not the cause. In fact, a New Left group suggested that China’s rural problems had grown after the rejection of Maoism and the adoption of pure reliance on the success of the market, that is, not from the failure of open trade policies such as those suggested by the World Bank, but from their very success in creating wealth among limited groups. Accordingly, in the years leading up to China’s entering the World Trade Organization (WTO) in 2001, there was growing concern among activists that to enter the WTO would be unfavorable to China’s farmers.

According to Wen Tiejun, NRR’s leading theorist and organizer, the Maoist policy of economic independence from the world capitalist system had been necessary, and the government had successfully fostered industrialization, but these policies left villages in a weak position. The breakup of the commune produced individual plots too small to use technology efficiently and farmers were once again at the mercy of economic planners who favored exports, heavy industry, and the cities over the countryside. To solve these contradictions, further market reforms were not the right strategy. Rural life had to be reconstructed. Wen, born in Beijing in 1951, spent eleven years in the countryside during the Cultural Revolution before becoming a field worker and researcher for the Ministry of Agriculture. In 1987 he became dean of the School of Agricultural Economics and Rural Development at People’s University in Beijing, where he founded the Center for Rural Reconstruction. Wen coined the term sannong wenti (“three rural problems”), which includes nongmin (“farmers” or “peasants”), nongcun (“villages” or “rural society”), and nongye (“agriculture”). He and his associates did not want to be called part of China’s New Left, especially in the aftermath of the 1989 anti-government democracy protests. Still, many NRRM members shared New Left doubts about World Bank neo-liberal policies and the pure reliance on market strategies.

At the turn of the twenty-first century, a loose grouping of university faculty, researchers in government research institutes, officials, and independent journalists created an urgent awareness of village problems. Li Changping, a township party secretary, created a furor with his letter to Premier Zhu Rongji explaining the plight of peasants burdened with taxes and local officials. Li told his story in a bestselling book, but he left his village in frustration to look for work in Shenzhen, the Special Economic Zone which epitomized globalized market capitalism. Cao Jingping, a professor of sociology at East China University of Science and Technology in Shanghai, spent years conducting field research and interviews in Henan Province.

The loose alliance of intellectuals, activists, officials, and members of the public that make up the New Rural Reconstruction Movement blame the plight of the countryside in the twenty-first century on globalization and neo-liberal policies. PHOTO BY JOAN LEBOLD COHEN.
His 2005 book *Huanghe bian di Zhongguo* advocated organization from the top down, waiting until the peasants had been uplifted to eventually give them power. Yu Jianrong, a rural development scholar, focused on the areas of Hunan Province which Mao had studied in the 1920s. Like Mao, Yu declared that farmers were not passive or ignorant but canny in their organization of protests and knowledgeable of laws and regulations. Li Yuanxing, a professor of sociology at Anhui University, echoed the arguments developed by Liang Shuming, Fei Xiaotong, and others in the 1930s, concluding that China, unlike the west, could not rely on urbanization to take rural workers out of the village to work in factories. The widest impact was made by two independent journalists, Chen Guidi and Wu Chuntao, whose indignation roused the public. Their series of dramatic reports in the respected journal *Dushi* exposed petty village despots who tortured and even murdered farm leaders for challenging their illegal acts. In one month the public bought 100,000 copies of their book, *Zhongguo Nongmindiaocha* (Beijing: Renminwenxue, 2004) translated as *Will the Boat Sink the Water? The Life of China’s Peasants* (New York: Public Affairs, 2006).

Anti-globalization protesters in other developing countries argued that the rural crisis was not local or temporary or superficial, nor could it be addressed by further economic development or urbanization. NRR called for a turn away from reliance on economic strategies, especially capitalist economic strategies, in favor of cultural and social reconstruction. In 2002, NRR activists visited the People’s Science Movement in Kerala, India. The Kerala movement included Maoists and took inspiration from Gandhi and from Mao, but Kerala had achieved social revolution without the violence of China’s Cultural Revolution. Kerala’s high literacy rates, successful health system, and economic progress were the result of large numbers of trained organizers working from the bottom up and organizing on a community level.

Wen Tiejun disagreed with rural economists who argued that private land ownership rights, specialization, and increased marketization would leave the farm community better off. Wen and his colleagues concluded that only through cooperative economics could farmers overcome their structural handicaps of small scale and inefficient technology. Although they were inspired by these foreign examples, they chose as their model the wide range of domestic cultural, economic, and political reforms that Y.C. James Yen had developed in the 1930s. In 2003 Wen and his colleagues took the opportunity to put their theories into practice by establishing the James Yen Institute of Rural Reconstruction headquartered in Zhaicheng Village, in Ding County, Hebei Province, where James Yen’s headquarters were during the Republican period (1912–1949). The James Yen Institute was among a number of NGOs which recruited college graduates and local activists to organize rural schools, clinics, and cooperatives in order to develop new community institutions and foster community consciousness. The reform groups also conducted clinics to introduce organic farming and appropriate technology to compensate for dangerous overuse of pesticides.
and chemicals. However, the most important change was the development of rural consciousness. Despite these reforms, it became clear that effective reform was possible on a small scale and could not be spread on a national scale, nor could private groups deal with the problems of labor surplus and migration, corruption, inefficient technology, reform of land rights, and discrimination.

When Wen Jiabao's national administration came into office in 2004, public intellectuals and party elites agreed that a rural crisis existed but there was no consensus on what to do about it. Premier Wen declared to the National People's Congress in March 2004 that “constructing a New Socialist Countryside” (jianshe shehui zhuyi xin non-gu) was the “most important of all important issues.” (Renmin ribao; People's Daily Overseas edition, March 5, 2004, quoted in Thogersen, p. 230). His discussion revolved around “three rural problems,” those described by Wen Tiejun. Wen Tiejun was widely consulted both in China and abroad as he deepened his critique of Western style development. In 2008 the party announced plans to allow farmers to buy and sell land rights, but it remained to be seen whether individual ownership and increased marketization could address the concerns raised by Wen and others without a substantial government commitment to local community organizing and social investment.

New Year (Spring Festival)
Nónglì Nián (Chūnjié) 农历年（春节）

Spring Festival, or Chinese Lunar New Year, is as important to the Chinese in China and around the world as Christmas is to the West. It has a legendary origin and a rich tradition of celebrations including ancestor worship, fireworks, feasting, shopping, gift-giving, and, most important, reuniting with family. Lasting fifteen days, the Spring Festival season ends with a Lantern Festival.

The Spring Festival, or Chinese Lunar New Year (Nongli Nian), is the most important seasonal festival in China. It marks the end of the old year and the beginning of the new. Unlike the Western New Year, the Lunar New Year is not fixed to a particular date but instead is determined by the phase of the moon. The new year traditionally begins on the first new moon of the first lunar month of the year, usually in late January or early February. The festival, however, extends from the sixteenth day of the twelfth month to the fifteen day of the first month. It is the longest festival in China’s calendar of festivals and affects every aspect of life.

An Ancient Celebration
The Chinese character for the word nian (year) sheds some light on the festival’s origins. Its oracle-bone glyph indicates a person carrying a bundle of grain. Records show that more than 3,000 years ago the Chinese already had begun celebrating their harvests and offering sacrifices to their ancestors at the beginning of the new year. A legend, however, tells a different story. Nian was a long-horned monster preying on humans every New Year’s Eve. A god taught them to survive this attack by decorating their houses in red, keeping all their lights on, and burning bamboo to create loud crackling noises. Because “to survive Nian,” or guonian, sounds like “to celebrate the year,” the festival tradition came into being.

The traditional (pre-twentieth century) Chinese calendar followed the movement of the moon in determining the yearly cycles. Each month begins with the new moon on the first day, reaches its midpoint (or full moon) on the fifteenth, and ends the month with the descending moon on the twenty-ninth or thirtieth day. This yearly cycle contains twelve months, numerically named (the first month, the second month, and so forth), each having between twenty-eight and thirty days, for a total of 354 days. In general, traditional Chinese used this lunar calendar (yinli) as the reference point to record or plan personal events, such as a birth date, wedding, and funeral (in feng shui calculations) and seasonal festivals. Following this system, the Lunar New Year’s Eve falls on the evening of the thirtieth day of the twelfth month.

Calendar Reckoning
In spite of its importance in predicting the rhythm of the moon, especially the appearance of the full moon, the lunar calendar is incompatible with the rotation of
the sun, which dictates that the yearly cycle should be 365.24 days. To accommodate the discrepancy between the sun and the moon in determining the length of the yearly cycle, a solar calculation system was inserted in ancient China around 104 BCE. This solar calendar divides the yearly cycle into twenty-four solar “nodes” (jie or jieqi) spaced approximately fifteen or sixteen days apart to reach the total of 365 days. The primary nodes are the spring equinox 春分, summer solstice 夏至, autumn equinox 秋分, and winter solstice 冬至.

The juxtaposition of these two calendar systems, however, puts the Chinese New Year, which is based on the period between successive new moons, at odds with the solar calendar of the year. Throughout much of Chinese dynastic history, from the Zhou dynasty (1045–256 BCE) to the early twentieth century, the reconciliation of the two incompatible reckoning systems had become one of the major official responsibilities through the issuing of the imperial calendar (huangli) by the court each year. The imperial calendar uses the lunar cycle to calculate major annual events but affixes the solar nodes alongside to indicate major seasonal changes and the time for proper agricultural activities.

The Nationalist Revolution in 1911–1912 and the Communist Revolution in 1949 not only brought about fundamental changes in political institutions but also removed the lunar calendar as the official reckoning system of the year in an attempt to “modernize” China. The Gregorian calendar was adopted as the official calendar, and New Year’s Day was moved to 1 January of each year. At the same time, the Lunar New Year was renamed the Spring Festival.

The adoption of the Gregorian calendar, however, has not dampened popular enthusiasm for the Lunar New Year, nor has it resolved the difficulty in timing the exact day of the holiday. Even today the date of the Spring Festival still fluctuates between 21 January and 20 February and is determined year by year. To accommodate the time needed for celebrating the Spring Festival—invariably called Spring Vacation in China, Hong Kong, and Taiwan—all yearly plans of major activities, both public and private, must be individually shaped.
A Family Celebration

Weeks before New Year’s Day, the Chinese go on a shopping spree as Westerners do before Christmas. They shop for food, presents, decorations, and clothing. Presents vary in different regions. Southerners prefer flowers while northerners like pastry and wines. Today, more and more Chinese emphasize the significance of gifts regardless of its monetary values.

Businesses large and small celebrate this festival season with a year-end banquet, generally around mid- to late January. Bonuses of cash in red envelopes are given to employees so that they can travel home for the holiday. In China, Taiwan, Hong Kong, and Singapore, the year-end banquet also signals the beginning of the Lunar New Year holiday season. Most businesses close or curtail operations throughout the holiday season.

The twenty-fourth day of the twelfth lunar month (somewhere between late January and early February) marks the second major ritual that involves individual families. This is the day when each family sends its residential kitchen god back to heaven to report to the Jade Emperor, the ruler of heaven. It is customary for each family to prepare sweet foods, like *tángguā* (a kind of malt-sugar candy) or foods made from glutinous rice as sacrifices to the kitchen god. The belief is that with his mouth full of sticky and sweet rice, the kitchen god can mumble only a few sweet words when he makes the yearly report about the family to the Jade Emperor.

On New Year’s Eve, all family members gather for the evening meal. By lighting incense before the meal, the head of the family symbolically invites the departed ancestors and deities to join the occasion. The food served at the evening meal varies from region to region. Generally, these houses in southern China are decorated for the New Year. Small paintings and calligraphy honor the Kitchen God and other auspicious guardians who will keep the evil spirits away from the door. PHOTO BY JOAN LEBOLD COHEN.

northerners eat jiaozi (dumplings) as the entree while southerners eat niangao (rice cakes), both supplemented with plenty of meat and vegetable dishes. There are several explanations for the significance of jiaozi. One is that the first character of the word jiao 饺 is homophonic with 交, which means “intersect,” and the second character zi 子 means zishi or “the time of zi,” which refers to the three hours across the midnight. Jiaozi 饺子 thus means the time that connects the past and the new year and jiaozi 饺子 becomes the food for New Year celebration. The word niangao is a pun for “life improved year after year.” Almost all Chinese eat fish 魚 as part of the feast because it is homonymous with the Chinese word for “abundance” 余; the character is a combination of clothing and food.

After the meal, children pay respects to their parents by bowing (in China) or kowtowing (in Taiwan and Hong Kong) to them. In return parents give their children money in red envelopes. At midnight children and their parents light fireworks, as Americans do on the evening of Independence Day, but they all do it at the same time and in a much larger scale, so much so that the entire sky is lit up. Families stay awake through the night, leaving on all the lights in the house, a tradition known as shousui (watching the year in).

Worshipping ancestors is the first ritual on the morning of New Year’s Day. Traditionally, the Chinese then put on new clothes and visit their kin, friends, and neighbors. In the past people wandered out to greet anyone who crossed their path, but today text-message greetings...
have increasingly replaced physical visits. In traditional neighborhoods people attend public dragon dancing performances put on by teams of young men who practice martial arts and dancing throughout the year to prepare for the festivities.

The celebrations generally last three to five days while businesses are closed. On the fifth day, businesses start to operate after a ceremony of welcoming the god of wealth, and people begin to go back to work and their routines. Many taboos enforced during the first few days of the New Year season are lifted. For instance, people can dump their trash without fear of casting out their family fortune in the process. The fifth day, known as powu (breaking out of the fifth), is thus celebrated with the eating of jiaozi. Despite this winding down of celebration, the New Year season lingers till the fifteenth day of the month when it reaches its climax.

This day is the Lantern Festival, also known as the Yuanxiao Festival (yuanxiao means “the night of the first yuan,” one of three divisions in the year in ancient China). There are several legends about its otherwise unknown origins. It is believed that a god told humans to light their communities with lanterns to cheat the Emperor of Heaven, who was about to destroy them by the fire of his wrath. Others argue that because deng (lantern) is close to the word ding (population), lantern display is a way of wishing for fertility.

The traditional food of the Lantern Festival, originally called fuyuanzi (floating balls), later adopted the name of yuanxiao in the north and tangyuan (soup balls) in the south. Shaped like meatballs of different sizes, yuanxiao is made of glutinous rice with a candied or meaty stuffing and served with the soup in which it is boiled. Its round shape resembles the full moon that appears that night and symbolizes family unity and harmony.
People pour into the streets to celebrate. During the day people are entertained by shehuo, shows put on mostly by amateurs. The performances include various kinds of folk dances, such as the dragon dance, lion dance, yangge dance (rural folk dance), hanchuan (folk dance with model boat, donkey, and other props), gaoqiao (stilts), and a variety of drum dances. The evening is brightly lit by a fabulous display of lanterns of all sizes, shapes, and materials. Especially catchy among the lanterns are those in the shapes of assorted real and imaginary animals and popular figures appearing in Chinese classics and legends. Clusters of lanterns can be stacked in the shape of a large tortoise, known as aoshan, and can be built into a gate tower called xiulou. Lanterns are everywhere: hung in the air, placed on the ground, and floating on the water. The night concludes with a magnificent display of fireworks.

Like the other traditions of the Chinese New Year, those of the Lantern Festival also vary from place to place. People on the Pescadores archipelago of Taiwan, for instance, observe the custom of qigui (begging for turtles) in addition to the display of lanterns. Temples exhibit turtle-shaped lucky symbols made of all kinds of rice and allow worshipers to take them home. Dubbed pingangui (turtle of peace and security), a rice turtle taken home is believed to bring good luck to the family that houses it.

A Worldwide Party

Though a festival of the Han Chinese, the Spring Festival is also celebrated by twenty-nine of the fifty-five ethnic minorities in China. As a result of cultural diffusion, it is also part of traditions in Korea, Indonesia, Malaysia, Singapore, and Vietnam. Chinese immigrants have also brought Spring Festival celebrations to their adoptive countries throughout the world.

Newspaper Development

Newspapers have existed in China for more than a thousand years. Always changing and evolving with Chinese history, they have served a variety of purposes, from informing readers about government activities and current affairs to keeping ordinary people up-to-date on the lives of celebrities. Today’s state-run newspapers face the challenge of operating in dual roles: as ideological instruments and players in a competitive media industry.

Chronologically, the development of Chinese newspapers can be divided roughly into three phases. First, before the nineteenth century, China’s newspapers were mostly government gazettes that served to facilitate communication between the central court and local officials. The second phase is from the nineteenth century to 1949. Modern newspapers emerged in this period. The earliest ones were initiated by Western missionaries. Later, when Chinese started to set up their own newsrooms, they mostly published civilian papers, although party-sponsored papers also appeared in this period. The mainstream trend for newspapers of the time was to serve as a forum for intellectuals to voice their political voices. The third phase started after the People’s Republic of China was established in 1949, and it can be further divided into two stages: from 1949 to 1976, when most newspapers were strictly operated and regulated by the Chinese Communist Party (CCP); and from the end of the Cultural Revolution in 1976 to the present. China’s newspapers at this period are characterized by large variety, diverse content, and the modern “newspaper group” model.

Government Gazettes in Ancient China

Somewhere between 776 and 835, in the middle of the Tang dynasty (618–907 CE), local authorities from different locations stationed agencies in the national capital (Chang’ān, or today’s Xi’an city in Shaanxi Province) to collect information and intelligence. The officers of these agencies would sporadically send back either documents published by the imperial court or intelligence they had gathered to affiliated local lords so the lords could keep abreast of occurrences in the central government. These bulletins later evolved into official gazettes, whose sources were controlled by the central government. The contents of these publications included the emperor’s orders, appointments of officials, and ministers’ reports to the emperor, as well as information about the royal family. The content and function of these gazettes, which were copied by various local agents, remained unchanged even though methods of circulation and modes of regulation varied from reign to reign. The gazettes remained an instrument to facilitate communication across local governments in the realm of the throne, but they had no unifying title and were all named differently. Because the earliest agencies sent to the national capital by local governments were called Di, starting from the Song Dynasty (960–1279) the gazettes they published were gradually named Di Bao. During the Song
Newspapers in China have evolved from government gazettes that fostered communication between the central imperial court and local officials to the cosmopolitan newspapers of today. Modern, appealing, reader friendly—and available early in the day—they feature not only the news but coverage of sports, entertainment, and fashion trends. Photo by Joan Lebold Cohen.

dynasty the general public was allowed to copy and spread the Di Bao. In the Ming dynasty (1368–1644), civilian-operated agencies that copied the gazettes appeared, and agencies printing and selling government gazettes surfaced in the Qing dynasty (1644–1912). These developments helped the public access information to some extent. Starting with the Song dynasty, gazettes emerged that were not published by the government. But they were banned by the dynastic governments and doomed to extinction.

From the Late Qing Dynasty to 1949

China’s modern newspapers were started by foreigners in the nineteenth century. Missionaries were the pioneers, followed by businessmen and politicians. The Chinese began to run their own newspapers in the 1870s. At the end of the 1890s, civilian newspapers reached their peak in number. From August 1896 to September 1898 alone, more than seventy newspapers were launched in China, double the total number of newspapers established by Chinese in the previous twenty years (Ding, 1998, 87). Confronted with the booming civilian newspapers and backed up by the central government, some local authorities in the Qing dynasty started to launch their own official newspapers in 1901 in an attempt to influence public opinion and check the effects of civilian papers. Since these official papers mainly carried news of laws that had been passed, administrative directives, and government documents—and most of them were distributed free to different government agencies and schools—their impact
on public opinion was minimal. They were no rival to the prosperous civilian newspapers.

At the threshold of the twentieth century civilian newspapers thrived. After the imperial dictatorship was toppled and a new republic was set up, the development of civilian newspapers picked up pace. Meanwhile, due to frequent and fierce conflicts between parties and military tycoons, civilian newspapers were diversified to become organs of different political interests, and often integrity fell victim to the fluctuations of party conflicts.

After the Chinese Communist Party (CCP) was established in 1921, the party newspaper systems for the CCP and the Nationalist Party (Guomindang, GMD) gradually took shape and matured. The ruling GMD established national news-regulation institutions. After about a decade, the CCP build its own party newspaper system and its basic paradigms, which would exert profound influence on China's newspaper industry after 1949. Though some other party newspapers survived, most merely scraped by and their influence was limited, at best.

But private newspapers were never extinct. Some of them emphasized business operation and expansion, and the prototype of the modern newspaper group can be detected among them. Some cherished the ideal of free expression and neutrality to win professional prestige and become leaders in shaping national public opinion. Some popular tabloids focused on women and the personal lives of celebrities.

The pattern for the literati to comment on politics was still an integral part of China's newspaper industry at that time. Taking advantage of newspapers, intellectuals promulgated modern science, voiced political opinions and criticism, and motivated the masses. Hence, among the large variety of newspapers, the majority were still devoted to political opinion. This trend for intellectuals to voice political opinions via newspapers was a result, in part, of the political movement to rescue the country from the despair and decline in the late-Qing period and of the tradition for intellectuals to serve their country. Yet as the fight between the CCP and the GMD escalated at the end of the 1940s, the world that tolerated diversified politics and opinions was no longer viable, and intellectuals had to identify with one party or the other. After the GMD met its Waterloo, so to speak, in 1949, the model for intellectuals to run newspapers vanished.

Newspapers in the People’s Republic of China

When the People’s Republic of China was established in 1949, the CCP immediately built its own newspaper system. Apart from the People’s Daily, the official newspaper for the CCP’s central committee, the main emphasis was to establish party newspapers at the provincial level. Gradually, these efforts were extended to the local cities and counties, so that a party newspaper framework featuring the four levels of central committee, province, local cities, and counties was set up. Moreover, non-CCP parties, professional associations, and social groups also started or revived their newspapers, and some private civilian newspapers also survived.

But after 1953, private newspapers were nonexistent and public newspapers centering on CCP information became the dominant players. Over the years the number of newspapers fluctuated according to the domestic economy and the political situation. Yet as these fluctuations mainly affected specialized industry papers, county-level papers, or newspapers run by enterprises, their impact on the overall structure was minimal. In 1965, China had a total of 413 newspapers. When the ten-year Cultural Revolution started in 1966, newspapers were either closed or seized and their numbers dwindled drastically. In 1970, only forty-two newspapers had survived nationwide (Wu 2008, 483).

In 1976, the Cultural Revolution ended, and China’s newspaper industry caught its breath again. By 1978, there were 186 papers in China; at the end of 1995, this number had skyrocketed to 2,089. The quantitative boost invariably triggered major restructuring of the newspaper industry. Before 1978, the newspaper industry was very primitive, featuring only the different levels of party papers and a very small number of industry, enterprise-based, and evening newspapers. At the end of the twentieth century, although party papers were still the mainstream, an industry characterized by variety, diversity, and multiple levels had taken shape. Correspondingly, the function of newspapers went beyond publicity and political mobilization.

In 1979, the government permitted China’s newspapers to be “a public cause in nature but business in
practice,” (Li, 2003, 104–105), a designation that confirmed the newspapers’ roles as party organs as well as their independence as business entities. Newspapers had to practice business policies independently and be self-supporting. In 1993, the newspaper industry became the third largest in China, and it was acknowledged officially that newspapers had ideological functions as well as fiscal responsibilities. The political and theoretical preconditions for marketing newspapers were satisfied. Pushed by these notions and policies, in the thirty years since 1978, China’s newspaper industry reformed itself completely and rapidly to adapt to the development of a market economy. The reform of China’s newspaper industry could be divided into the following stages.

**EXPANSION AND POPULARIZATION**

In the 1980s, the increase in the amount of information was the focus of newspaper expansions. Numerous papers emerged during this period to carry news, especially economic reports. Meanwhile, other newspapers enlarged their pages to contain more information.

Changes took place at the operational level, too, with advertising playing a significant role for the first time and many newspaper companies beginning to do their own distribution.

In the 1990s, China’s newspapers embarked on its popularization process. At the beginning of the decade, magazine-like weekend newspapers featuring society news, crime stories, and human interest stories became the rage. They depended on sales for profit. In the mid-1990s, evening newspapers took the place of the weekend newspapers, which were criticized for their vulgarity. Propelled by large subscriptions and advertising income, the number of evening newspapers grew from 48 to 180 during the decade. The evening newspapers focused on local news, and their content was relevant to the daily concerns of ordinary households.

But at the end of the 1990s, cosmopolitan newspapers featuring a wide-ranging array of information useful in daily life, with coverage of sports, entertainment, and fashion, became the trend. Compared with evening newspapers, cosmopolitan newspapers were modern, good looking, and reader friendly, and they were available earlier in the day. They were welcomed by city residents, especially the younger generation. Ever since the first cosmopolitan newspaper hit the market in 1995, the format has won out over that of the evening newspapers, catching the fancy of the entire nation. Pressured by cosmopolitan newspapers, 70 percent of evening newspapers at the time were forced to print earlier than scheduled to vie for readers. Yet that wasn’t enough to give them a competitive edge, and China’s popular newspapers gradually became the main players of the market.

**NEWSPAPER GROUPS**

From the end of the 1990s to the early twenty-first century, many party-controlled newspapers merged into groups. The growth of newspapers was quantitatively remarkable, but overlaps in market positioning and the small scale of operations made for vicious competition. More seriously, these problems weakened government regulation of public opinion and undermined the influence of the party newspapers. In 1994 the process of establishing newspaper groups began, and in 1996 the first “merger,” Guangzhou Daily Newspaper Group, was officially launched. Over the next five years, forty newspaper groups were approved by the state. Most of these groups were based on existing party newspapers, which usually became the flagships for six to twelve newspapers, magazines, websites, and other businesses. The establishment of newspaper groups symbolized the adjustment and variation of China’s state-run newspapers under new circumstances. A different mode of operation was put into effect.

After reforms over three decades, China had 1,926 newspapers at the end of 2007, and advertisement revenue reached RMB¥312.6 billion (about US$44.7 billion) in 2006 (Li, 2008, 4, 7)

**General Characteristics and Problems**

Today’s newspaper industry in China has several characteristics. First, it functions both as an ideological instrument and as a part of the information industry. Second, it has multiple identities: As an ideological institution, newspapers must serve as government and party organs; as content providers, they must satisfy the needs of consumers and provide services; as public-service providers,
they must prioritize public interest and promote civility and social progress; and as businesses, they must survive and make profits. In terms of overseeing content and circulation, newspaper groups are divided by administrative districts, and each group covers only one district.

Presently, China’s newspapers are facing multiple challenges. The dual identities of newspaper groups endow them with the nominal independence of legal entities. Yet, the appointment of newsroom leadership, the major operational decisions, the distribution of vital resources, and the editorial policy decisions all reside in different levels of party organizations. Operationally, these groups also have to be self-supporting. Content production and business operations are separated, in that contents are planned and controlled by party organs and governments of different levels while marketing decisions have to cater to the fluctuating reader tastes. Multiple roles conflict sometimes. The political obligations on newspapers are compulsory, yet survival hangs on independent business procedures. Caught in such conflicting demands, neither the social responsibility of the press nor professional ethics of practitioners can be guaranteed. Also, the division of newspaper groups by administrative districts fosters regional monopoly and weakened market competition. The call for a cross-regional, cross-industry and cross-media newspaper group becomes an empty slogan if the scale and competitiveness of newspaper groups can’t be effectively boosted.

The 92 Consensus is a face-saving agreement reached in 1992 between China and Taiwan—technically still at war—in which both entities acknowledged the “one China” principle, but with different interpretations of how that principle would be defined. The consensus is the foundation for all negotiations between the two governments.

The 92 Consensus is an agreement that addresses the principle by which the People's Republic of China and the Republic of China (Taiwan) believe that only one China exists: Mainland China and the Republic of China on Taiwan agree that both belong to the same China but agree to disagree on the definition of that one China. The 92 Consensus allows the two countries to negotiate even though they are technically still at war as a legacy of the Chinese Civil War (1945–1949) that followed the 1945 surrender of Japan, which ended World War II.

The agreement’s name refers to a 1992 meeting in Hong Kong between unofficial representatives of both governments during which both sides came to their “one China” consensus. Although this debate may seem purely semantic, the 92 Consensus remains the foundation for all relations between China and Taiwan, and when its premise was questioned during the presidency of Chen Shui-bian of Taiwan, China refused to negotiate with representatives of the Taiwanese government.

The groundwork for the 92 Consensus began after Taiwan and China established respective semiofficial organizations to negotiate with each other in 1991. Taiwan organized the Strait Exchange Foundation (SEF), and China organized the Association for Relations across the Taiwan Straits (ARATS). Immediately thereafter the two sides began to negotiate technical matters, such as extradition policies for criminals, registration of professional and business licenses, and recognition of college degrees. However, talks stalled because China insisted that Taiwan accept the “one China” principle as a precondition for further negotiations, and Taiwan refused. Finally a compromise was reached at a meeting in Hong Kong on 30 October 1991.

Under this compromise both sides agreed that there is but “one China” while acknowledging that two political entities exist under the “one China” principle. This oral agreement was to be submitted to their respective governments in Beijing and Taipei for final approval.

On 3 November 1991 China’s ARATS sent a cable to Taiwan’s SEF stating that ARATS would “respect and accept” the Hong Kong oral agreement with the provision that certain points could be renegotiated in the future. This cable was published by Xinhua, China’s official news agency.

In response Taiwan’s SEF in 1992 published its own reply in a press release disseminated by media outlets in Taiwan: “We (the SEF) will express the concrete content of the oral statement (on one China) in line with the ‘Guidelines for National Unification’ and the resolution on ‘one China’ adopted by the National Unification Council [under the President’s office] on August 1 of this year (1992)” (Su Chi and Cheng An-kuo 2002, 92). All Taiwanese media publicized this reply as the “92 Consensus.”
Of course, Taiwan considers the “one China” as its Republic of China on Taiwan, whereas Beijing regards the “one China” as its People’s Republic of China. However, based on this agreement to disagree, the chairmen of ARATS (Wang Daohan) and SEF (C. F. Koo) held their first meeting in Singapore in April 1993 and negotiated several binding agreements. Thus they were able to lay the foundation for future cultural, economic, and other peaceful exchanges between the two sides for a number of years until Taiwan President Chen Shui-bian openly repudiated the 92 Consensus. As a result the PRC immediately canceled all meetings between ARATS and SEF.

However, after winning the election in 2008 Taiwan president Ma Ying-jeou accepted the 92 Consensus, and both sides resumed negotiations, resulting in the establishment of offices of ARATS and SEF in each other’s capital to conduct official business more efficiently.

Although the 92 Consensus may seem convoluted from a Western point of view, it allows the two governments effectively to “save face” so that they can negotiate peacefully in spite of the fact that they are technically still at war.

Wù jí bì fǎn
Ningxia Hui Autonomous Region

Níngxià Huízú Zìzhìqū 宁夏回族自治区

6.1 million est. 2007 pop. 66,000 square km

Ningxia Hui Autonomous Region is one of the smallest regions in terms of both population and size in China. It is home to the five largest ethnic groups in the country: Han Chinese (China’s majority ethnicity), Mongolians, Manchus, Tibetans (Zang) and Muslim Huis, for whom the region is named. Islam is the dominant religion; Ningxia has an estimated three thousand mosques.

Livestock raising and agriculture are the major economic activities. Herbs and berries, such as the wolfberry (goji) are harvested for medical use; sheepskins and precious stones are among the region’s other natural resources.

Because of its altitude and cold weather, Ningxia’s natural conditions are relatively adverse. The central part of the region is dry land and desert. The Wulin plain, where most of the region’s agriculture is to be found, lies to the north, with the Huang (Yellow) River passing through it. The percentage of forest-covered land is only 4.85 percent and soil erosion is common. Several irrigation canals built during the Qin (221–206 BCE) and Han (206 BCE–220 CE) dynasties, taking advantage of the Huang’s waters, are still in use.

Indeed, water shortage is a big problem for Ningxia. It is one of the poorest regions of China; its precipitation is low, and water from rainfall evaporates quickly year around. To improve this situation, the central government has helped the Ningxia Autonomous Region build irrigation projects, which are expected to improve the ecosystem and natural environment of the dryland areas of Ningxia.

Ningxia’s population distribution is uneven geographically, and so is its economic development level. In the better-irrigated areas in the north, the land is relatively...
densely populated, whereas in the dryland areas and high altitude areas of the south, population is sparse and the living standard is lower.

Yinchuan, with an estimated 2006 population of 1.42 million, is the capital and the political and economic center. Its history of more than 1,300 years and more than sixty historical sites, including mosques, pagodas, pavilions, temples, and imperial tombs, make it a popular tourist destination. The Hui people make up an estimated one-quarter of the city's population.

Varying factors have brought non-governmental organizations (NGOs) into the limelight in the late twentieth century, and China’s NGOs are no exception. Although “civil society” is a still-developing and often contested concept in China, the growing presence of NGOs has remained strong. But the impact of global recession—whether it peaks the Chinese sense of social justice or patriotic duty—will no doubt affect the future of China’s NGOs.
International Context and Discourse

Various factors brought NGOs and the broader concept of “civil society” into global currency during the closing decades of the twentieth century. The collapse of communism in the Soviet Union and Eastern Europe drew the attention of political scientists to citizen movements such as Solidarity in Poland and Charter 77 in Czechoslovakia. In Western countries (where civil rights movements already had a rich history) environmental pressure groups played a prominent role in highlighting ecological concerns and in debates around the notion of “sustainable development.” The end of apartheid in South Africa also gave a boost to transnational pressure-group advocacy, which made a significant contribution to that momentous change.

At much the same time, some international development NGOs based in Western countries and a growing caucus of citizen organizations in, especially, Latin America, South Asia, and the Philippines, were calling for more “participatory” approaches to development in contrast to what they saw as inequitable “trickle-down” growth models promoted by international financial institutions such as the World Bank and International Monetary Fund. These institutions were encouraging developing-country governments to cede economic control to market forces and, in the name of fiscal prudence, to limit their ambitions in social provision. But while their economic orthodoxy remained firmly pro-market, the international financial institutions (and developed-country government aid agencies) also came to see NGOs as performing a useful function in “correcting market failures,” in meeting some of the service delivery functions from which many states were retreating, and in improving “governance” through, for example, citizen pressure for greater government accountability and respect for human rights.

Thus, from various perspectives, the late twentieth century saw growing global enthusiasm for NGOs. To a certain extent an international discourse of human rights began to eclipse the ideologies of “right” and “left” and there was, arguably, some shift in political initiative and opinion making from mainstream parties to “civil society” groups and media. According to one American scholar the era was seeing a “global associational revolution” marked by “a striking upsurge . . . in organized voluntary activity and the creation of private, nonprofit or nongovernmental organizations” (Salamon, 1994). Certainly, by the 1990s, NGOs were visible global actors and there was widespread agreement on the desirability of a (non-government, non-business) “third sector” or “civil society.” This led many international observers to look for, and some to encourage, its emergence in China.

Chinese Context and Discourse

Despite reform and opening, China seemed to buck, or at least to resist, nearly all of the trends described above. In the late 1980s a “Democracy Wall” movement, led mainly by students and intellectuals, sought political reforms to match economic reform. This was comparable to citizen movements in Eastern Europe but, far from causing the political régime to crumble, it was forcibly suppressed during the summer of 1989—notably through the violent dispersal of a mass gathering in Tiananmen Square causing hundreds (or, according to some estimates, thousands) of deaths. “Reform and opening” did mean that the state was relinquishing its virtual monopoly on economic activity; but this was a gradual retreat, not the “big bang” or “shock therapy” liberalization prescribed by the Washington Consensus of neo-liberal economics. In social provision, the Chinese Communist Party and government were by the late 1980s actively calling on social forces (shehui liliang) to subsidize and fill gaps in state services. Government agencies were at the time establishing public fundraising foundations to advance state-directed philanthropy and creating professional, trade, and industry associations in order both to promote exchange with international bodies and to pass some of the functions of contracting economic ministries to intermediary organizations.

All of this was firmly couched in a rhetoric of state leadership to which social forces were subordinate. At the same time, although the preamble to many Chinese laws stated that their purpose was to protect the rights and interests of specific constituencies, and although the government signed various international rights conventions, there was little official interest in the generic idea of human rights. The Communist leadership was adamant that
China’s development was sui generis, emphasizing that development processes must have “Chinese characteristics” and asserting the collective “right to development” against the political rights of the individual.

Formal Associational Sphere and State-Sponsored Philanthropy

From China’s 1949 “liberation” until Mao Zedong’s death in 1976, all associational activity was mediated through state and Communist Party channels. Alongside the Party, People’s Governments, rural communes, and urban neighborhood committees, a number of “mass organizations” ensured dissemination of the Party line to diverse social constituencies. Prominent examples were the All-China Confederation of Trade Unions (established in 1925), All-China Women’s Federation (1949), and All-China Youth Federation (1949). Replicating state administrative tiers, these typically had provincial, county, urban district, and in some cases rural township branches. The Women’s Federation generally had one or two cadres in every village. A handful of other official bodies, such as the China Association for Friendship with Foreign Countries (1954), coordinated international exchange and promotional efforts.

The 1980s saw significant growth of what became known internationally as China’s “Government-Organized NGO” (GONGO) sector. Groups such as the China Association for International Understanding (1981) and China Education Association for International Exchange (1981) were formed to promote international linkages. Others, such as the China Family Planning Association (1981), were established to support the work of line ministries (in this case, the State Family Planning Commission). The Women’s Federation created a China Children and Teenagers Fund (1981) and a China Women’s Development Foundation (1988). A China Disabled Persons Federation (1988) was established under the personal leadership of Deng Pufang (a son of the then-prominent leader, Deng Xiaoping), who had been paralyzed during the political violence of the Great Proletarian Cultural Revolution (1966–1976). The Youth Federation created a Youth Development Foundation (1989) whose flagship Project Hope was notably successful. During its first ten years it raised, from individual and corporate donors, US$200 million to build rural primary schools and sponsor school drop-outs from poor families to resume their education. Several line ministries also established their own national foundations. Few enjoyed Project Hope’s fundraising success, but the Ministry of Civil Affairs’ China Charities Federation (1994) managed to create a national network of foundations, mainly supporting Civil Affairs work in the localities. Their efficacy was, however, limited by their being required to absorb government staff during successive rounds of bureaucratic streamlining.

Also during the 1980s and 1990s the All-China Federation of Industry and Commerce (1953), originally established as a mass organization to rally the few remaining private entrepreneurs behind the Party line, was revived as the parent body of a growing number of industry-specific trade and manufacturers’ associations. (These are generally regarded as having been broadly successful in facilitating government-industry communication, resolving disputes and facilitating industry growth [Wexler, Ying, & Young, 2007]). The All-China Association of Science and Technology (1958), the mass organization designed to capture scientists and technicians, similarly became an umbrella organization for professional associations in specific sectors and for farmers technical associations.

As the mass organizations sought new roles appropriate to the reform and opening era, some Women’s Federation cadres showed interest in moving towards a more independent, NGO identity. (Others, however, did not; it must be emphasized that the attitudes, approaches and work of these national organizations varies considerably from locality to locality.) Debate around these issues was stimulated when, in 1995, the Federation hosted in Beijing a UN World Conference on Women. This also encouraged some women to create more independent groups, in many cases enjoying the institutional shelter of the Federation.

Quasi-independent legal existence became possible for social organizations (shehui tuanti). These are membership organizations that can, in theory, be started by private citizens; but in practice the regulations for their registration and management (introduced in 1989, in the wake of the Tiananmen suppression, and revised slightly in 1998) are highly restrictive. In order to register, an
organization must have at least fifty members, start-up capital, and office premises. Further, it must obtain the agreement of a government or Communist Party agency to act as its “leading and management unit” (zhuguan danwei), implicitly accountable for any trouble the group might cause: only then can it apply to register with the Civil Affairs authorities. This need for government patronage is a clear constraint on independence and it is hard for private citizens to achieve registration unless they have good connections with local officials and/or are proposing activities that enjoy explicit government backing. Furthermore, social organizations are not allowed to engage in public fundraising, which is a right reserved to GONGOs.

Nevertheless by the mid-1990s some 180,000 social organizations were registered in different localities across the country. Very many of these were leisure or recreational groups such as literary circles or calligraphy clubs, but some embraced charitable or public-interest ends.

In 1998, parallel regulations (with identical supervision and management requirements) were introduced for ‘people-run non-enterprise units’ (minban feiqiye danwei). This was a new category apparently designed to capture and formalize the status of numerous social service facilities—from private kindergartens to tearooms for senior citizens—that had been established by government agencies, neighborhood committees or private citizens. Registrations in this new category were initially slow but by the early twenty-first century numbered tens of thousands.

“Corporatism” or Managed Transition?

Scholarly studies in the mid-1990s highlighted the limitations of civil society in China (White, Howell, and Xiaoyuan, 1996). Some scholars perceived a model of state “corporatism” whereby the state sought to co-opt and control newly arising social forces and to crush those that it could not control (Chan and Unger, 1995). (Examples of the latter include, as well as Democracy Wall, the quasi-Buddhist Falun Gong movement, which was once registered as a social organization but was proscribed in the late 1990s.) Other writers argued that the GONGO sector was spreading social initiative to institutions bound less tightly to the Communist Party and might be a half-way house to a more autonomous sphere—as seemed to be borne out by the willingness of some GONGOs to sponsor some citizen-initiated groups (Young, 2001). Yet others argued that closeness to government offered distinct advantages over autonomy. One scholar noted in 2000: “New social organizations … can have considerable impact on the policy-making process by retaining strong linkages to the party and state, far more than if they were to try to create an organization with complete operational autonomy” (Saich, 2000). The point was arguably illustrated by the achievements of a national campaign against domestic violence jointly undertaken in the early 2000s by the Women’s Federation and a cluster of more independent women’s groups. Unlike some earlier Federation activities this seemed to be chosen not by senior leaders but by women activists. Because of the Federation’s involvement, the campaign was able to draw other state actors, including the police and legislators, into a range of practical and legislative interventions (Young, 2004).

The Independent Sector and “Grass Roots”

Despite the advantages of state linkages there were, by the mid-1990s, signs of a more autonomous NGO community emerging, comprising new organizations that soon began to identify themselves as “grassroots (caogeng) NGOs.” Some managed to register as social organizations; some as “people-run, non-enterprise work units.” Others were unable to do so, but registered instead as businesses in order to have at least some legal status. Some did not bother to register at all.

An independent pioneer was the Amity Foundation, established in 1985 by the Protestant church in Jiangsu Province. By 2000 this had an annual budget of around US$6 million (derived almost exclusively from overseas church groups) devoted to social welfare, education, and rural development projects broadly similar to those implemented by international NGOs. The YMCA of China, established in the early twentieth century but dormant throughout the Maoist years, was also resurfacing by the early 1990s, and active in urban community projects, especially in Shanghai. By 2000, Catholic, Islamic, and Buddhist service organizations were also operating.
Other initiatives came from determined individuals. An early example was a woman named Meng Weina who set up Guangzhou Zhiling (1985), a nonprofit school for intellectually impaired children. This at first met fierce resistance from local authorities who ordered the school to close, but it has since flourished to the extent that Meng’s renamed Huiling NGO now has branches in several cities. Dozens of other NGOs, often started by parents of disabled children and young people, now offer disability care and support services and, in some fields (such as autism) are moving towards informal federation.

Pioneering women’s groups included the Maple Women’s Psychological Counseling Centre (1988), and Rural Women (1993), a magazine that went on to offer skills training and support services to migrant women workers.

Several centers, generally attached to law schools, offered pro-bono advice and advocacy in the broader sense of trying, through legal representation in high-profile cases where rights had been grossly abused, to broaden public rights awareness and discussion. The pioneer in this field, based in Hubei Province, was the Center for the Protection of the Rights of Disadvantaged Citizens (1992). Some later adopters of the template focused on specific sectors: notably, the Center for Women’s Law Studies and Legal Services (1995) and the Center for Legal Assistance to Pollution Victims (1998), both based in Beijing.

Some NGOs grew out of academic research and were geared towards policy influence and advocacy. Examples include the Center for Biodiversity and Indigenous Knowledge (1995), established in Yunnan Province by researchers from the Kunming Botany Institute, and the Pesticides Eco-Alternatives Center (2001) created by entomologists, also in Yunnan.

The environment was a fertile area for grassroots activism. Liang Congjie, the grandson of a reform-minded Qing court official, started Friends of Nature (1994) and a TV journalist, Liao Xiaoyi created Global Village of Beijing (1996). Initially these groups limited their activities to environmental education, but this soon attracted copious media coverage (from media thirsty for a new kind of story) that helped unleash a proliferation of similar groups across the country. There are now at least one hundred environmental NGOs formed independently by private citizens in China and some of these explicitly seek a “public supervision” (gonggong jiandu) watchdog role.

Grassroots groups also tackled the highly sensitive issues of HIV/AIDS (Aizhixing, 1994) and labor rights (Migrant Workers Document Handling Centre, 1998).

The great majority of these NGOs were urban initiatives, but some more rural (and ethnic minority) “bamboo shoots” (the epithet comes from the proliferation of such organizations “like bamboo shoots after rain”) also appeared in the late 1990s. One example was the Sanchuan Development Association (1997) in Qinghai Province. Others have followed.

All of the groups named above were profiled in a 2001 China Development Brief report, “250 Chinese NGOs: Civil Society in the Making” and remain active, although most have found it hard to grow and scale up their activities. The following years were marked by rapid but chaotic growth of the independent sector. Some established groups split. Some new ones lasted only a few months, but many more managed to weather the difficulties of fundraising constraints, an uncertain policy environment and lack of NGO management experience. There are now almost certainly thousands of independent organizations in China that—although they may desire and seek government linkages—think of and describe themselves not according to any Chinese taxonomy but as NGOs. This is still small compared to China’s vastness. Other sources suggest much higher figures. The official English language China Daily claims, rather breathlessly, that “there are 3 million NGOs in China” (which would make one per 400 citizens) while the World Bank quotes estimates of over 1 million (Working to build trust, 2007).

**Government-NGO Relations**

Government attitudes to independent NGOs remain ambivalent. Many local governments are still suspicious, but others have welcomed service provider groups and even some, such as Community Action/Shining Stone (2002) that work on issues of local governance. In central government, the Ministry of Civil Affairs, under whose jurisdiction NGOs fall, seems to have gradually moved from regarding this as an administrative burden to seeing the sector as an asset, and has launched a series of initiatives to promote philanthropy. (Revised regulations on foundations, introduced in 2004, at last made possible the creation of fully private foundations; the Ministry is keen
to channel some of China’s new, private wealth to “social welfare.”) The Ministry of Environmental Protection has been receptive to public participation in monitoring and protection. The State Council’s Leading Group for Poverty Reduction has also considered NGOs as a potential means for more effective targeting and delivery of poverty reduction programs. In the early 2000s, this all appeared consistent with a broader picture of a developing civil society whose other elements included an increasingly adventurous media, more independent scholarship and an emerging legal profession some of whose members took rights and “rule of law” seriously. China’s culture of government seemed gradually to be embracing a notion of public participation that was still technocratic, falling short of democratic accountability, but that went well beyond “mass mobilization.” The Communist Party appeared to be shifting towards a more consultative kind of authoritarianism.

But social stability is a perennial concern of Chinese authorities, and some continued to see NGOs as a threat. Various reasons for this can be adduced. Firstly, international advocacy groups like the International Campaign for Tibet, Human Rights Watch, Sweatshop Watch and numerous environmental groups almost certainly struck China’s political leaders as implacable critics—even wanting to “pull up the ladder” and stop China from developing. The Communist leadership had no wish to see this kind of activism spread to China and conservatives tended to suspect Chinese NGOs of harboring unpatriotic or “un-Chinese” elements (in much the same way that American conservatives feared “un-American” citizens during the Cold War). Secondly, despite government efforts to control its impact, the Internet (and other communication technologies) had clear potential to empower domestic activists. Thirdly, the turn of the century saw a rising tide of rural unrest as social and economic inequalities sharpened against a background of unchecked government corruption. Protests, some of which concerned intolerable pollution, were generally spontaneous and had nothing to do with NGOs—the grassroots groups, who overwhelmingly saw themselves as contributing to the “harmonious society” that was the stated objective of Hu Jintao and Wen Jiabao’s administration, avoided confrontational approaches and wanted closer and more cooperative relationships with government agencies. But some NGOs were becoming more self-confident and assertive in advocacy efforts and messages and at least some individuals and informal groups (often styling themselves “rights defenders”) were adopting overtly dissident positions.

Government concerns were heightened by “color revolutions” in Georgia (2003), Ukraine (2004), and Kyrgyzstan (2005), and the role in fomenting them allegedly played by U.S. public and private funding agencies. This prompted a two-year investigation of international organizations working in China and local NGOs receiving funding from overseas. (Given the legal constraints on local fund-raising, many grassroots NGOs rely heavily on international funding.) As a result of this investigation a few groups and publications were closed down in the run-up to the 2008 Olympics, and the chilly atmosphere of heightened security served as a warning to others.

This, however, seemed less a general crack down than an effort to tidy up and manage the sector. The Ministry of Civil Affairs has repeatedly promised new regulations to this effect—but, given the extreme difficulty of framing laws that facilitate the “right” sort of NGO and prohibit the “wrong” sort, and given the long delays in previous legislative ruminations, no one should hold their breath. Another, more evident management pattern is the growing use of GONGOs to serve not in a state monopoly but in a filtering and supervisory position. One GONGO, the Chinese Association of STD and AIDS Prevention and Control (1993) was in 2007 lined up as a retailer, to grassroots organizations, of wholesale funds emanating from the Global Fund to Fight AIDS, Tuberculosis, and Malaria. Another GONGO, the China Legal Aid Foundation (1997) has for several years been making grants to grassroots legal aid organizations. More recently—and partly in response to the 2008 Sichuan earthquake, where many grassroots groups joined relief efforts—grants to the grassroots have been awarded by the China Red Cross Society (1904; but since 1949 firmly under the Ministry of Public Health administrative control). Furthermore, a new GONGO, the China NGO Network for International Exchanges, was set up at the end of 2005—color-revolution scare year—in an apparent bid to shepherd the many grassroots NGO representatives who were heading out of China to international conferences, and to guide the many international NGOs representatives landing in Beijing to look for local partners. Recent policy thus appears to fall somewhere between the “corporatist” and
“transitional” strategies mentioned above: control, but relatively loose control with some room for independent experimentation.

Impossible to tell at this juncture are the impacts of global recession on China’s NGOs. As millions of unemployed migrant workers troop back to their villages of origin—no longer required in the export processing zones and less affordable to urban elites accustomed to having their dishes, clothes, and streets cleaned by peasants—some grassroots NGOs may be fired by stronger feelings of social injustice. Or (as happened to a large extent in the 2003 SARS crisis), they may be infused with a sense of patriotic duty to keep the nation on track to glory. Or they may be torn in two directions at once. About all that can be said with some certainty is that public space and associational freedoms in China will, in the foreseeable future, remain contested.

China changes constantly, and the Encyclopedia of China will change and grow, too. Berkshire’s authors and editors welcome questions, comments, and corrections: china.updates@berkshirepublishing.com.
Once nicknamed China’s industrial heartland, the northeast region has been in economic decline. In an attempt to develop this region on a par with the country’s economic success, a plan was proposed in 2003 to revitalize and reform the region’s economic structure and upgrade its technology. While challenges such as reallocation of laid-off workers remain, the region has reported an increase in foreign investment.

In 2003 Wen Jiabao, premier of China’s State Council, announced a plan to revitalize the three northeastern provinces of Heilongjiang, Jilin, and Liaoning. Wen Jiabao confirmed that the central government would support the three provinces in their efforts to reform their economic structure and to upgrade technology. China aims to convert the northeast region into a national and even a world-class industrial base for equipment manufacturing and the extraction and processing of raw materials.

Since establishment of the People’s Republic of China in 1949, the manufacturing structure of the northeast region has been based on heavy industry: the production of steel, machine tools, locomotives, and airplanes. But over time the economic efficiency of many companies in the area has deteriorated, since most of them are state-owned enterprises (SOEs). As these companies have become less competitive, the Chinese economy has been growing rapidly and opening more and more to overseas investment.

The recent economic success of China is associated with Chinese Communist Party leader Deng Xiaoping’s reforms that started in 1978–1979. The reforms encouraged entrepreneurship, introduced market elements into economic relations, triggered modern industrialization, and opened the door to foreign direct investment (FDI).

Northeast China faces many challenges: injection of new investment, restructuring of state-owned enterprises, improvement of the social security network, reform of the financial system, improvement of the investment environment, and strengthening of the infrastructure. Once China’s industrial heartland, the northeast region has declined into a “rust belt.” The northeast revitalization plan is the second such plan launched by the Chinese government in recent years, following the Develop the West project that started in 2000. The goal of these plans is to minimize economic discrepancies across the regions of China. The plan to revive the northeast was inspired by the economic success of China’s coastal areas such as the Yangzi (Chang) River delta and the Pearl River delta.

A key challenge to the northeast revitalization plan is the reallocation of laid-off workers. The region suffered massive layoffs of state-owned enterprise employees—nearly 10 million workers. The unemployed are engaged in constant protesting, which creates an element of political instability. The unemployment rate in the northeast is 10–15 percent. Russia, China’s neighbor in the north, has consistently expressed concerns about illegal cross-border immigration.

In the early 1990s the United Nations Development Programme (UNDP) created a plan to revitalize northeast China and to promote regional cooperation in northeast
Asia. The Tumen River plan was intended to receive $30 billion for infrastructure development to create an international transport, trade, and industry hub on the Tumen River, which separates China, North Korea, and Russia, but due to lack of financial input from those three governments the UNDP project was not successful. Since the Chinese government announced its determination to prioritize the northeastern region in 2003, the UNDP is considering reviving its project.

Since 2003 the provinces in the northeast have reported an increase in foreign investment. The process of revival is supervised by a special branch of the central government, the Office for Revitalizing the Old Industrial Base in Northeast China under the State Council. Goals include rejuvenating the region, subjecting it to structural adjustments, and improving its investment environment.

Jilin Province is home to China’s first automobile maker, the First Automobile Works (FAW), which has a longstanding joint venture with Volkswagen. The province attracted more than $1.19 billion in contractual foreign investment in 2004. In Jilin Province foreign investors are encouraged to buy into state-owned firms. Wang Min, acting governor of Jilin, announced that his province intends to revitalize through the development of new industries and a focus on education, science, and environmental improvement. However, Jilin Province is still struggling as the worst-performing and poorest province in the northeast. The province lacks a coastline, oil reserves, and a developed private sector. In Changchun, Jilin Province, nearly 80 percent of economic output is generated by just one giant state-owned enterprise: the First Automobile Works.

Shenyang, capital of Liaoning Province, brought in more than $1.47 billion in foreign investment in 2004—52.9 percent more than in the previous year, according to the city government statistical bureau. To draw more foreign investment, Heilongjiang and Liaoning provinces named 2004 the “Year of Improving Investment Environment” and the “Year of Investment and Construction.” Zhang Wenyue, governor of Liaoning, announced that his province aims to maintain sustainable economic growth and to strive for a per capita gross domestic product (GDP) of $3,000 by 2010.

The inflow of foreign investment to the three northeastern provinces totaled a record high of $3.4 billion in the first half of 2004. Foreign investment goes to such sectors as equipment manufacturing, raw materials, chemicals, electromechanical products, modern agriculture, high tech, and automobiles.

China hopes to make the northeast region part of the country’s economic success story. Although the government talks about creating jobs in the private sector, state officials continue to focus on rescuing northeastern state-owned, capital-intensive, heavy industries from bankruptcy. Critics of the current government efforts argue that what the northeast needs is diversification of its industrial base and creation of labor-intensive jobs in the private sector. But since 2003 the region has attracted a large volume of foreign direct investment.

The desire for a return to the past, to a golden age, has often driven change in Chinese life, including the arts and letters. Such longing for the past was sometimes a response to current societal ills, as was the case with The Old Prose Movement in the Tang dynasty (618–907 CE).

Literary innovation or even literary reform in the Chinese context has often meant the restoration of antiquity, the return to styles and modes of the past, where purity of expression was thought to be found. This is in keeping with the Confucian ideal of the past as the location of perfection and the present as a falling away from that golden epoch. The Old Prose Movement, or Classical Prose Movement (guwen yundong), which emerged during the middle years of the Tang dynasty (618–907), was part of this call to return to the past. Leaders of the movement, including the scholar-poet Han Yu (768–825), favored imitating the literary prose styles of the Qin (221–206 BCE) and Han (206 BCE–220 CE) dynasties. To Han Yu and his fellow intellectuals, the literary fashion practiced during the period of the Tang was unsatisfactory.

Causes of Change

The Old Prose Movement, however, should not be seen as literary nostalgia. It is often thought that this movement sought to return moral gravity to literature, which had been abandoned for flashy style. This view does not accurately describe the reasons why such a movement came to the forefront. The causes of change are found in the political and cultural instability that followed the An Lushan rebellion (755) that brought chaos to northern China, in the form of decentralization of power, and dire economic and cultural consequences.

One aspect of this disorder was a sense of insecurity that the intellectual classes felt. The culture they had come to believe in, as worthy and stable, had suddenly been destroyed by the rebellion. These men looked for reasons for the disaster and concluded that they themselves were to blame because they, and the men of their class, had over time forsaken the morality of old that had provided not only structure to society but also a sense of continuity. The problem, therefore, was a moral one. Moral corruption had brought about political and cultural turmoil.

Private Experience

The Old Prose Movement used the past to critique the present, and it did so by broadening the reach of literary activity. In the past the concern of the writer had been to grapple with the larger forces that affected society and the individual. Literary concern centered upon social, political, and intellectual questions. Han added a fourth aspect: private and interior life. This new concern has been attributed
The Old Prose Movement was a belief among Tang dynasty scholars that a return to the writings styles of the past was necessary to combat the moral corruption that had brought about political and cultural turmoil during their time. This Chinese study offers a tranquil environment for reading and writing. Photo by Yixuan Shuke.

to the volatility in society after the An Lushan rebellion, where the only surety was the self and its protection, as well as private experience. Han favored a direct, personalized style and the use of colloquial expressions over formal ones. He also sought to record the individual’s reaction to external forces. This reaction becomes a guide for constructing a personal morality through which the individual may make sense of a fragmented social structure. Further, Han felt that the disintegration of morality was linked to the general weakening of Confucianism. He attributed this weakening to an external force, Buddhism, which he denounced as dangerous to the Chinese way of life.

Han’s concerns were shared by his friend the scholar-official Liu Zongyuan (773–819), who also regarded the utilitarian aspect of literary culture the most vital. His famous dictum, “Literature is to illuminate the [Confucian] Way,” was a motto of the Old Prose Movement. Confucian morality could be made known only by doing what the ancient sages had done. He advocated elucidating Confucianism for the people of his time by way of the tradition. Thus literary skill without moral content was useless; writing that was beautiful and attractive could also be morally wrong. He also gave a very specific definition to the Way. It was a morally correct attitude to life that could be learned by entering into a dialog with the sages of the past through intensive study of the Five Classics and the various texts of the One Hundred Schools, the many books of history and literature that addressed political and cultural attitudes and were so popular with the Confucians.

The desire to enter into a dialog with the sages was a way to acquire a clear and precise style of writing, which for Liu was important because it was a way to engage in life through the written word. Literary activity was not entertainment, nor was it merely intellectual activity; rather, it was a way to life itself. Therefore, the prose that he valued was one that contained depth, clarity, restraint, fullness and range, simplicity, precision, and gravity.

The Old Prose Movement initiated by Han Yu and developed by Liu Zongyuan was more than a style. It began with an affirmation that the past contains moral value that must be continually recouped by way of literary and intellectual engagement with life. More forcefully, this movement sought to find and reestablish a unified culture, after the fragmentation brought about the An Lushan rebellion, by recognizing that content must determine form, that writing is the search for a moral center, and that literacy culture is not merely cultural production; it is wisdom about life.
Legacy

The Old Prose Movement did not last beyond its two main proponents, perhaps because the influence of Buddhism, as well as Daoism, was gaining ground in China, so that engagement with life was tempered by a desire to understand the ways of the soul and the cosmos. However, during the Song period (960–1279), the movement enjoyed a brief revival with the works of Ouyang Xiu (1007–1072) and Su Shi (1037–1101). Thereafter, the movement retained very little popularity.

It was a unique aspect of Chinese literary culture in that it sought perfection in the past; perhaps for this reason its influence was limited and it has had little effect on later Chinese literary production.

The 2008 Summer Olympics in Beijing was China’s first chance to host the world’s biggest sporting extravaganza. It provided an opportunity for China to showcase both ancient heritage and modern aspirations. Substantial investments in necessary infrastructure and sponsorship accelerated China’s integration with the global economy.

When Beijing hosted the 2008 Summer Olympics, the event was saturated with cultural meaning, economic expectations, and political significance. The world’s biggest sports extravaganza, hosted for the first time by China and for only the third time by an Asian country, represented a chance for China to showcase both ancient heritage and modern aspirations. It also provided a catalyst for substantial investments in infrastructure and accelerated China’s integration with the global economy—while signaling pride and acceptance on the world stage and a boost to China’s international stature.

Some 200 nations participated in the Beijing games, bringing 10,500 athletes and 20,000 sports officials to town, along with nearly 22,000 accredited media representatives, more than 10,000 unaccredited journalists, and half a million spectators and tourists. The activities unfolded 8–24 August at thirty-one venues in Beijing and six venues in other locales, including Hong Kong, followed by the Paralympics 6–17 September.

Chinese endeavors to earn international acceptance and respect through athletic performance go back to the late nineteenth century and the importation of modern forms of competitive sports, largely in conjunction with Western missionary activities. But decades passed before...
China began to make a mark on the Olympic movement, and half a century more passed before China began to emerge as an Olympic powerhouse.

The earliest Chinese representation at the games consisted of an official observer at Amsterdam in 1928; the first Chinese athletes entered the games in Los Angeles in 1932. In 1958 the People’s Republic of China (PRC) severed ties with the International Olympic Committee (IOC) over the IOC’s inclusion of Taiwan as the Republic of China; not until 1979, coinciding with China’s redirection of development strategy and reopening to the outside world, did the PRC come back into the Olympic fold, with Taiwan taking part as the Chinese Taipei team.

China won fifteen gold medals in the 1984 Los Angeles Olympics, sixteen at the 1992 Barcelona games, and sixteen in Atlanta in 1996. Intensified training of elite athletes in a broader array of Olympic sports brought the count up to twenty-eight gold medals and a total of fifty-nine medals at Sydney in 2000 and thirty-two gold medals and a total of sixty-three medals at Athens in 2004; China now ranks third in the medals total after the United States and Russia. By contrast, China’s Winter Games achievements are much more modest: a cumulative harvest of three gold, fourteen silver, and fourteen bronze medals over the period 1980–2006.

China’s strengths have been in precision sports such as diving, shooting, table tennis, and badminton, with consistent excellence in weightlifting as well. National icons emerging from the Summer Games range from marksman Xu Haifeng, 1984 winner of China’s first Olympic gold, to Liu Xiang, whose 2004 victory in the 110-meter hurdles made him the first Chinese man to win an Olympic track event. Woman diver Fu Mingxia won two gold medals in Atlanta and four in Sydney; the men’s gymnastics team brought home a gold from Sydney; and Chinese partners won the women’s tennis doubles in Athens.

Firing the Imagination: The Olympic Torch

The 2008 Olympic torch relay took place from 25 March to 8 August 2008, prior to the Olympic Games. It lasted 130 days and carried the torch 137,000 kilometers—the longest distance of any Olympic torch relay. After being lit in Olympia, Greece, the torch traveled to the Panathinaiko Stadium in Athens and then went to Beijing. From there, the torch followed a route passing through six continents. The torch specifically visited cities on the Silk Roads, symbolizing ancient links between China and the rest of the world. The relay also included a successful attempt to carry the flame to the top of Mount Everest, which it attained May 8, 2008.

The torch traveled to twenty countries around the world, including the United Kingdom, France, the United States, Australia, India, and Japan, and then made its way through Taiwan, Hong Kong, and Macao before visiting 113 cities in China. It arrived at its final destination in Beijing on 8 August 2008.

The relay itself will probably be remembered for its political significance, as its widely-publicized route became one of the most regularly covered subjects in the media all over the globe, and because it took place during a period of significant publicity regarding China’s internal turmoil in the Tibet region. Because of this widespread coverage, it then became a prime target for people who wished to protest the central Chinese governing body, on Tibet and other issues. At several locations, including Islamabad, Delhi, and in Indonesia, the torch’s route was cut short, due to security concerns. In other places, only enhanced security was necessary. Nevertheless, the torch arrived safely in Beijing exactly on time. The relay and the Olympics events themselves went on smoothly, despite whorls of debate on the periphery.
Along with the intensified spotlight on athletic prowess, China’s hospitality, organizational abilities, people-moving facilities, command of security, air, weather, and much else came under scrutiny leading up to the geopolitical crucible of the 2008 games. Beijing initially had sought to host the 2000 Olympics, losing out to Sydney in 1993 by a mere two votes at a time when international disapproval of China’s military suppression of the 1989 Tiananmen Square demonstrations remained strong. The city’s second bid culminated on 13 July 2001, with joyous celebrations in that same plaza greeting the news that the IOC had selected Beijing for 2008.

The selection was buoyed by public opinion at home; an IOC poll had found 96 percent support for the bid among Chinese urban residents. Beijing pledged to mount a “green,” “high-tech,” and “humanistic” Olympics, with an estimated $400 million going into construction and preparations; about a third of the budget was earmarked for an ambitious environmental protection program that included relocation of entire industrial centers. Relentless road building and subway expansion changed the city map constantly. A recruitment campaign to enlist 100,000 volunteers drew more than four times that number of applicants.

When Beijing made its Olympic bid in 2001, typical Western headlines read, “China Doesn’t Deserve the Olympics” and “Unwelcome Bid from Beijing.” During the bid process, multiple petitions were sent to Chinese leaders, the IOC, a number of national governments, and human rights groups. The U.S. Congress debated a resolution in opposition to the bid.

The Beijing Organizing Committee for the Games of the XXIX Olympiad (known by the acronym BOCOG), in coordination with the municipal government and to the cheerleading of mass media, orchestrated a prolonged buildup to the games, marking occasions 2 years, 500 days, 1 year, 100 days, and finally 50 days before the opening ceremonies. The unveiling of slogans, mascots, and a uniquely designed Beijing National Stadium, known as the “Bird’s Nest,” hosted the track and field events at the 2008 Olympics. The stadium is pictured here under construction. Photo by Tom Christensen.
songs, and other trappings provided cause for additional press conferences and celebrations. Meanwhile the city launched drives to replace poorly translated signage and improve public sanitation and local civility.

Echoes of ancient culture were captured in the games’ official emblem, a figure in the form of a traditional artistic seal; its postmodern face arose in the imposing steel-wrapped National Stadium, also known as the “Bird’s Nest,” and the National Aquatics Center, or “Water Cube.” The mascots, five cute characters modeled on animals and introduced as the “Friendlies,” later changed to “Fuwas,” translated well to official Olympics merchandise ranging from T-shirts, hats, and key chains to stuffed animals. The games’ official slogan was “One world, one dream.”

China’s athletic hopes for 2008 were particularly high; an Olympic host country typically experiences a boost in medal count due to athletes’ familiarity with venues and home crowd support. In addition, as host, China automatically gained entrance to some sports in which otherwise it would have had to compete for inclusion, including baseball, softball, and soccer; while China’s women were strong contenders in soccer and softball, the men would have been unlikely to qualify in soccer and baseball.

Given the important role of corporate sponsorships in the Olympics, against the backdrop of China’s galloping economic growth and the promise of future expansion in productivity markets, the Beijing games were seen as a boon for business, both domestic and transnational. Concern for possible “losers” of the games, including residents displaced by construction, along with recognition of the value of historic preservation in promoting tourism, ultimately strengthened policies and programs to save what was left of the old city—but not before new construction, most unrelated to the Olympics, had replaced much of Old Beijing. Meanwhile calls by various organizations abroad, including Reporters Without Borders and the Save Darfur campaign, to boycott the Beijing games on human rights grounds appeared to have little traction; many observers still saw the games as a force for social and political improvement.

The Beijing Games will probably be remembered by history as a significant milestone for the PRC, but it has yet to be seen whether or not it will be considered a turning point, as some have hoped. Athletically, many records were broken, including significant achievements by Chinese athletes in both traditionally strong and traditionally weak events. Potential rivalry between the United States and China was muffled by the fact that by using different standards both sides were able to claim victory.
in the medal count: the Americans counted overall medals, including silver and bronze, and the Chinese counted only gold medals. There were also some unfortunate incidents, including the sad injuries of the Chinese track superstar, Liu Xiang, and the tragic death of a family member of the U.S. men’s volleyball team. Despite these setbacks, the 2008 Olympics will most likely be remembered for its lavish opening ceremonies, its careful and firm planning and security, and the emergence of a China with a strong national identity and desire to express itself as an equal in the modern world.

平时多流汗，战时少流血

Pingshí duō liú hàn, zhàn shí shǎo liúxuè
Although a Chinese educator introduced the idea and ideals of the Olympic Games to his country in 1908, China’s participation in the Olympics didn’t begin until 1932—and was then interrupted because of World War II and the “two-China” conflict. After re-entering the competition in 1984, China quickly moved up the medals rank, eventually hosting the Games in Beijing in 2008.

In August 1908, the fourth modern Olympic Games took place in London, and it was there—in the city that will host the 2012 Games—that the first steps were taken to set China on the path to Olympic glory. Even though China was not yet a member of the International Olympic Committee and Chinese athletes did not compete, an influential Chinese educator, Zhang Boling 张伯苓, the principal of Nankai University 南开大学, was in London, on his way to visit several schools and universities in Britain. He was impressed by the principle of the Olympics—fair play 公平竞争. He returned to China in October and introduced the idea—and ideals—of the Olympic Games to his students in Tianjin 天津.

After Zhang’s introduction, students of Nankai University held a seminar that would become famous for asking the “Three Questions about the Olympics.” These questions were: When would China send its first athlete to participate in the Olympic Games? When would Chinese athletes win their first gold medal at the Olympic Games? When would the Olympic Games be held in China?

It took the Chinese twenty-four years to answer the first question. In 1932 China sent Liu Changchun 刘长春, a sprinter, to participate in the Olympics in Los Angeles. He was eliminated in the earliest of the preliminary heats. It was another seventy-six years before the second question was answered. On 29 July 1984, Xu Haifeng 许海峰 won China’s first gold medal, in another Los Angeles Olympics. And it took a full century to provide an answer to the final question—“When would the Olympic Games be held in China?”—as the Games at last came to China in August 2008.

On 13 July 2001, Juan Antonio Samaranch, then president of the International Olympic Committee, announced in Moscow that Beijing would host the twenty-ninth Olympic Games in 2008. Hosting these Games proved controversial in many ways, but it also came to be a symbol of China’s “linking up with international standards” —the biggest event in China since the Communist revolution of 1949. Acclaimed Chinese filmmaker Zhang Yimou 张艺谋— the director of the lavish opening and closing ceremonies at the 2008 Beijing Olympics—spoke for the nation when he said: “It is not just an opening ceremony for the Olympics—it is a way of showing China to the world and what is happening today.”

China’s Olympic Dream

Examining China’s role in history, especially over the last two centuries, helps to explain why the Olympics mean so much to the Chinese. China, the world’s oldest civilization, cherishes the memory of its long
supremacy at the center of the world and the knowledge that China has contributed greatly to global scholarship, philosophy, and scientific innovation. As a consequence, the Chinese people feel abiding pain and deep chagrin over what can only be described as repeated humiliations at the hands of the Western and Eastern imperialist powers in the late nineteenth century and early twentieth century.

Modern Chinese history is one of struggle and striving to restore national pride. The Olympic Games, the largest sport event and one of the biggest social and corporate enterprises in the world, became a stage upon which China could achieve some of its political, social, and economic objectives. Since the establishment of the People’s Republic of China in 1949, sport has been a powerful tool, and in the Maoist era between 1949 and 1978 sport was for China, as well as for other nations, right at the center of politics and diplomacy—a way to demonstrate the superiority of socialism over capitalism.

Since the 1980s China’s sporting success has been regarded not only as evidence of ideological superiority and economic prosperity, but also a powerful symbol of national revival. The government and most of the Chinese people believed that Chinese athletes’ excellent performance in the Olympic Games was a powerful demonstration of China’s rising power and influence on the global stage.

### Changing Perceptions of Chinese Athleticism

Why has hosting the Olympic Games been so important to China for the last hundred years? The answer to this question begins with label “sick man of East Asia” (dongya bingfu). This label seems to have had its roots in the port city of Tianjin, where the North American YMCA was particularly active. YMCA educators seem to have held a stereotype of sickly, effeminate, overly intellectual Chinese men. A popular story circulated among Western physical educators about a British consul in Tianjin who invited a high Chinese official—the Daotai—to dinner and afterward personally demonstrated for him the game of tennis. When he asked the Daotai what he thought, the Daotai responded that the consul was covered in sweat, and it would be better to hire someone to play in his place.

This story made its way from the Western educators to their Chinese pupils and is still widely cited in China today as an example of the corruption of the “old society.” Also bolstering the stereotype of the sickly Chinese was the publication in 1911 of The Changing Chinese by Edward Ross, a prominent U.S. sociologist. In that book Ross complained that young men imitated the stooped shoulders of the scholar and wore broad-rimmed glasses even when they didn’t need them, so they could look like scholars. He decried what he perceived as a lack of admiration for martial virtues. And perhaps most damning of all, he said that the young men played tennis like girls.

Of course the notion of the effeminate, intellectual Chinese is strongly contradicted by the martial arts tradition. Indeed, one can argue that kung fu films, more than anything else, have erased the perception of the effeminate Chinese among young Westerners, who admire Bruce Lee, Jackie Chan, and Jet Li. Although the stereotype was not accurate, from early on it was taken to heart by Chinese nationalists dismayed at China’s weakness, and it was written into the narrative of national humiliation that has become the standard in China’s history. Chairman Mao was one of the reformers who took steps to make sure the stereotype would not apply to the country as a whole. In his first published article, “A Study of Physical Culture” (1917), he complained, “Exercise is important for physical education, but today most scholars are not interested in sports.” Throughout his political career, Mao held to the belief that yundong (“activity” or “movement”) was the remedy for the passivity and weakness that ailed China. Yundong is also one of the words that can be translated as “sport,” and it was the word used to label the endless political “campaigns” of the Maoist period.

Susan BROWNELL

performances on the Olympic stage would be the best proof of China’s great achievements in economic reform and modernization. Brilliant victories achieved by Chinese athletes at the Olympics would not only show China’s ability to stand proudly and independently among the other nations of the world, but would also strengthen the national spirit and confident vision of its citizens. Most Chinese people believed they could witness the glory of China, feel proud of being Chinese, and experience unity as a great nation by participating in, and eventually hosting, the Olympic Games.

China’s Influence on the Olympics

The slogan of the 2008 Olympics was “One World, One Dream” and the Beijing Games were also characterized as “humanistic Olympics,” “green Olympics,” “high-tech Olympics.” These core concepts derive from shared international principles, but have also been influenced by Chinese cultural understandings about social interaction, environmental protection, and modernization.

The perception of some Western people and the Western media of what the Games would bring about was often different from what the majority of ordinary Chinese people might have hoped for. For the Chinese, especially the 94 percent of Beijing citizens who voted to support the Games, the Olympics provided the best opportunity to show the world the unique identity of the Chinese culture and its people. The Games provided the opportunity to invest in programs to control air and water pollution, which raised awareness of environmental issues. They provided job opportunities for many people, and thus contributed to raising living standards. At the same time, neighborhood streets became cleaner and public transportation improved. New construction and upgrades to the city’s infrastructure helped to ensure that Beijing will remain a first class world city after the Games.

Olympic Participation

The history of China’s participation in the Olympic Games can be divided into three periods: the latter part of the Qing dynasty (1644–1912), the Republic (1912–1949), and the People’s Republic (1949–present).

Long before the Olympic Movement spread to China, a few Western sports existed there. Some were military exercises imported from Europe and the United States, which were in accord with the Chinese martial spirit and could be used to support the traditional Chinese ideal of a unified regime known as the “Middle Kingdom” Zhongguo 中国. This regime, the Qing dynasty, had been deteriorating gradually in authority since the end of the eighteenth century, but still dominated the nation culturally as well as militarily. In addition, a number of Western sports that are now contested at the Olympics came to China in the nineteenth century, usually due to educators at missionary schools and universities, or under the auspices of the Young Men’s Christian Association (YMCA). The British brought modern soccer to Shanghai in 1856. Basketball, which originated in 1891 at the YMCA in Springfield, Massachusetts, arrived in China only four years later.

The first modern Olympic Games were held in 1896, thanks to the work of Pierre de Coubertin. Coubertin had traveled widely in England and the United States to learn about sport and physical education in private and public schools as well as in colleges and universities; he then convened a conference in Paris to discuss the revival of the ancient Olympic Games. The first modern Games were a huge success, with over sixty thousand people attending in the restored grand marble stadium at Olympia, Greece. Coubertin told the world that he had revived the Games with these goals:

1. as a cornerstone for health and cultural progress;
2. for education and character building;
3. for international understanding and peace;
4. for equal opportunity;
5. for fair and equal competition;
6. for cultural expression;
7. for beauty and excellence; and
8. for independence of sport as an instrument of social reform, rather than government legislation.

It is generally agreed that when the French envoy forwarded an invitation to the Chinese government to
participate in the first modern Olympic Games, officials showed no interest in taking part. In 1904, when the Third Olympic Games took place in St. Louis, the Chinese media began to report it. In 1907, before the Fourth Olympics took place in London, a few Chinese educators suggested that China should participate in the games. But there was no response from the Qing government and without it no other impetus sufficient to take China into international sporting competition. Nevertheless, the notion of such an event clearly intrigued some outward-looking Chinese educators.

The Qing dynasty, which had ruled China since 1644, was overthrown in the Republican revolution of 1911 (although the emperor refused to abdicate until 1912). In 1911 the YMCAs of the Philippines, China, and Japan proposed that an Asian Olympic Games among Asian countries be held every two years. In 1913 the first Asian Olympic Games took place in Manila, Philippines. It was an imitation of the Olympic Games including all the regulations, rules, ceremonies, and even the use of the English language. It was called the Far Eastern Olympiad. The International Olympic Committee (IOC) welcomed the games but suggested that the word Olympiad should not be used in the future. Therefore, in 1915 when the games took place in Shanghai, the name was changed to "Far Eastern Championship Games" (FECG). The IOC sent a telegram of congratulations to the games.

**China Enters the Olympics**

In 1928, when the Ninth Olympic Games took place in Amsterdam, China sent one observer, Song Ruhai. Then in 1932 China participated in the Tenth Olympics in Los Angeles by sending a single athlete, Liu Changchun 刘长春, a sprinter and national champion, and his coach to the games. After twenty-five days at sea, when Liu finally arrived in Los Angeles, he was too exhausted to perform well and was eliminated in the heats. Four years later, China sent its first substantial contingent: 141 Chinese athletes traveled to Berlin to compete in the Eleventh Olympic Games. They did not win a medal, but after World War II, when the Games resumed in London in 1948, China sent forty athletes. There was still no medal to take home in this Games, the last one before the establishment of the People’s Republic of China. In 1949 the Chinese Communist Party, under the leadership of Mao Zedong 毛泽东, defeated the Nationalists led by Chiang Kai-shek 蒋介石, took over China, and established the People’s Republic of China (PRC). The Nationalists fled to Taiwan. Both Communists and Nationalists claimed that they were the legitimate government of China. Thus began the era of the “two Chinas” in political and sports history.

The Communists lost no time in recognizing the
importance of the Olympic Games as an international stage on which China’s identity could be asserted. In 1952, when the Fifteenth Olympic Games took place in Helsinki, the IOC invited both Beijing and Taiwan to participate. Taiwan claimed that it could not “compete with Communist bandits on the same sports field” and withdrew from the games in protest.

China is said to have received the invitation from the IOC just one day before the opening ceremony. They managed, nonetheless, to send a delegation of forty to Helsinki one week later to raise the national flag at the Olympic Village and watch the last few events.

Beijing prepared to participate in the Melbourne Olympics in 1956. However, when it was informed that Taiwan would attend, Beijing withdrew, despite the fact that the qualifying events had taken place and more than fourteen hundred Chinese athletes from twenty-seven provinces, cities, and autonomous regions had attended the preparatory competitions in China, and ninety-two athletes had been selected for the PRC sports delegation and were waiting to go to the Olympics. Instead, Taiwan participated.

Two years later, in August 1958, disappointed with the IOC’s ambiguous attitude toward the “two Chinas,” the PRC withdrew its membership from the IOC. Therefore, between 1958 and 1980, Taiwan represented China at six Olympic Games.

The situation started to change in the 1970s. In 1972 Lord Killanin became the new president of the IOC, a position he would hold until 1980. He felt that the IOC should not continue to ignore the PRC and exclude one-fourth of the world’s population from the Olympic Movement and the games. He visited Beijing in 1977. The famous “Olympic formula” was produced in 1979 and China renewed its membership in the IOC. Taiwan, according to the Olympic formula, would change the name of its Olympic committee from the “Chinese Olympic Committee” to “Chinese Taipei Olympic Committee” and change the name of its team from the “Chinese Olympic Team” to “China Taipei.” In this way both Beijing and Taiwan would be able to participate in the Olympics.

### PRC Reemerges at the Los Angeles Games

In 1984 at Los Angeles, the PRC reemerged at the Olympics after an absence of thirty-two years, and would strengthen its performance for the next twenty-four years. (See table 1.)

The PRC won fifteen gold medals and finished fourth in the gold medal tally in the 1984 Los Angeles Games. Although the good showing was partly attributed to the absence of the Soviet Union and the Democratic Republic of Germany, it excited the Chinese—from government officials to ordinary citizens. “Develop elite sport and make China a superpower in the world” became both a slogan and dream for the Chinese.

But the 1988 Olympics in Seoul, South Korea, were a nightmare for the Chinese. When two sport superpowers, the Soviet Union and the Democratic Republic of Germany, returned to the Olympics, China’s gold medal tally shrunk to five. China had slipped from fourth to eleventh in gold medals.

In 1992 China fought back at the Barcelona Olympics. Although the Soviet Union had broken up into several

countries, it still took part in the Games as a unit under the name “Commonwealth of Independent States” (CIS). The two Germanys had reunited, and the country was even more powerful than before. Nevertheless, China won sixteen gold medals and returned to fourth place in the gold medal count.

In Atlanta in 1996, the Chinese again won sixteen gold medals and remained fourth on the gold medal count. But in Sydney in 2000, China achieved a historical breakthrough. It increased its gold medal count to twenty-eight and finished third.

In Athens in 2004, the Chinese competed in 203 events and won thirty-two gold, seventeen silver, and fourteen bronze medals. Among thirty-two gold medals, four were won in events traditionally dominated by Western athletes: track and field, swimming, rowing, and canoeing. With sixty-three medals in total, China finished third in the medal rankings after the United States and Russia. With thirty-two gold medals China beat the Russians and finished second to the United States. Furthermore, Chinese athletes established six world records, and they broke Olympic records twenty-one times.

After their triumph in Athens, the Cable News Network (CNN) commented: “In the six Olympic Games they have competed in, China has moved up the medal tally in world record time.” China had become one of the three superpowers, with the United States and Russia, in the Summer Olympics.

In the Beijing Olympics of 2008, China finally surpassed the United States in the number of champion athletes it brought home from the games. The games traditionally try to ignore the competition of nations between one another in overall medal counts, but in this case both China and the United States claimed victory, China according to the number of gold medals (51 as opposed to 36 for the U.S. athletes), and the United States according to overall medal counts (110, as opposed to China’s 100). The U.S. method would seem to imply that a country whose range of medals was more equally distributed (36 gold, 38 silver, and 36 bronze medals) had more athletic prowess than a country scoring 51 gold. But there is no doubt that China currently stands at the top of the world athletically until the 2012 Olympics in London.

Conceiving a Green Olympics

China faces serious pollution problems, but its position as host of the 2008 Olympics provided a strong impetus for ecological reform while simultaneously creating opportunities for critics to say that the country is not doing enough, or doing it fast enough.

Originally, the environmental organization Greenpeace drafted the concept of a green Olympics for the 2000 Olympic Summer Games in Sydney. The International Olympic Committee subsequently mandated that all summer Olympic Games be green Olympics. In 2005, the United Nations Environment Programme and the Beijing Organizing Committee for the Olympic Games agreed to try to make the summer Olympics of 2008 environmentally friendly. The Beijing Organizing Committee promised to make environmental protection a priority, not only in designing and construction of Olympic venues, but also through afforestation campaigns, beautification of urban and rural areas, increased public awareness, and promotion of green consumption.

One-Child Policy

As China’s political and economic systems have evolved, so has its approach to population control. Although the one-child-per-family policy remains firmly in place, it has changed as China has changed.

China’s current population control program has been both praised and criticized. It has been praised because it advocates—and, to a large degree, has achieved—adherence to a limit of one child per family, although the government has not entirely eliminated two-child or multichild families. The one-child policy is credited for helping to hasten China’s development by holding population numbers at a level lower than they otherwise would have been, thus reducing the consumption of resources and the demand for public goods. It has been criticized because its very institution was an assertion that the state could and should plan human reproduction in the same way it planned for the production of grain or steel. The act of human reproduction was put in service of economic production, and babies became subject to the same local quotas as other products were. Grain production had to go up; baby production had to go down.

Since its implementation in 1979, the one-child policy has produced a new generation of couples of childbearing age who take it for granted that they will have only one child, two at most. Where the number of children one wants declines, voluntary compliance increases, and the blunt, widespread use of coercion diminishes. It is important that the origins and evolution of the policy be understood, however, as any assessment of the demographic benefits that it has produced must take into consideration human and social costs.

The Early Years

From the creation of the People’s Republic in 1949, population pressures received the attention of Chinese Communist Party (CCP) leaders. During the first two decades of the Maoist era, however, the proper approach to demographic issues was hotly debated. Initially, Mao advocated population growth. He rejected the argument that China was overpopulated. Like Marx, he believed that the exploitative class systems of feudalism and imperialism, not overpopulation, were the causes of poverty, disease, and unemployment, and that those evils would disappear as capitalism was replaced by socialism.

In 1949 China’s population already numbered about a half billion, a staggering figure that many outside of China believed would prove an unbearable drag on the country’s attempts to develop. It was two decades before China began to make population control a state priority, but top officials in the CCP had already begun to worry about the dimensions of the problem and the pressures created by a large and rapidly growing population. When the results of China’s first national census were tallied in 1954, some began to speak in more practical ways about the burden of population growth and to recommend that China amend its population policy to provide more support for family-planning education and to allow the import of contraceptives.
Before these first steps could yield any meaningful results, the radicalization of domestic politics interrupted the campaign, and advocates of family planning were branded as Rightists, or enemies of the revolution. It was only in the wake of the famine resulting from the devastating economic and agricultural policies of the Great Leap Forward (1958–1960) that it became possible once again to speak openly of population growth and family planning. The Great Famine, as it is sometimes called, claimed some 30 million to 40 million excess deaths. The setbacks to agriculture and grain production were so grave that it took several years just to raise production to levels that had been achieved in the mid-1950s. On a per capita basis, grain production was not keeping up, and worried leaders decided to reintroduce the birth control campaign in the early and mid-1960s.

In 1965 Premier Zhou Enlai proposed the first national population control target: reducing the annual rate of population growth to 1 percent by the end of the century. But the political upheaval of the early years of the Cultural Revolution (1966–1976) prevented any progress in population control.

**Developments in the 1970s**

By the early 1970s, Mao began to accept the idea of promoting birth control. Zhou became a strong advocate of explicit population planning and population control. China’s first nationwide targets were set in 1972. Zhou authorized the creation of an extensive family-planning bureaucracy to oversee implementation of the new policies; provide free access to contraceptives, abortions, and sterilizations; and monitor the enforcement of local birth targets.

Annual and five-year economic plans began to include national targets for population size and growth, targets that were then broken down to the provincial and local levels. Local officials who were responsible for meeting grain and steel production quotas now began to receive quotas for babies. In the early and mid-1970s, the campaign slogan was “later, longer, fewer,” promoting later marriage, longer spacing between births (three to five years), and fewer births (a two-child ideal and a three-child limit). By the middle 1970s, the goals had changed. The new slogan was “one is not too few, two is enough, three is too many.” In large cities young couples began to feel pressure to have only one child.

Looking back, China’s leaders and demographers have argued that the two-decade delay after 1949 was a fateful mistake. By the time the state began encouraging fertility control, a vast new generation of young people had already been born and was approaching childbearing age. As a result, even with declining fertility levels, demographic momentum meant continued growth of the total population. In 1979 China’s population hit the one billion mark.

**Instituting the One-Child Policy**

By 1979 China’s leaders were so concerned about the likely impact of population growth on their development plans that they took the extreme step of launching a one-child-per-couple policy—the most extensive and aggressive attempt ever made to subject childbearing to direct state control and regulation. China’s top demographers and scientists announced that if China were to achieve its economic goals by the year 2000, population had to be contained within 1.2 billion. The one-child-per-couple rule (which had some exceptions for special circumstances) was put in place to meet that goal.

To have a child, all couples of childbearing age, urban and rural, had to receive official birth permits from the state. Provinces drafted regulations that offered economic incentives to encourage policy compliance and imposed stiff punishment for policy violators. In China’s cities and towns, growing acceptance of the small-family norm, reinforced by the late-marriage policy and tight administrative control in workplaces and neighborhoods, brought the urban total fertility rate down from 3.3 in 1970 to about 1.5 by 1978, a remarkably low level for a developing country. With a large population of women about to enter their peak childbearing years, however, the state deemed even this low level inadequate.

To further suppress fertility and prevent more second births, state monitoring intensified in workplaces and neighborhoods. Monthly gynecological examinations for women of childbearing age, plus a system of marriage and birth permits provided by the work unit (danwei, the state system encompassing economic and social services, from
employment and housing to healthcare and retirement benefits), ensured that anyone attempting to have a second child was caught in a tight surveillance net.

**Challenges in Rural Areas**

Rural China, on the other hand, posed a far more difficult challenge. As in rural areas in other countries and times, life in rural China encouraged high levels of fertility. Agricultural work requires household labor, and unlike their urban counterparts, even very young children could be put to work in service of family income. Moreover, while urban couples had the promise of a state pension for retirement support, rural families had no such welfare safety net. Children were the only guarantee of old-age support, and the most destitute villagers were inevitably those who were alone and childless. Only a son could ensure that a couple would be spared such a fate. In addition to these practical considerations, the traditional emphasis on bearing sons to carry on the ancestral line remained very strong in the countryside. As a result, although rural fertility levels were cut in half between 1971 and 1979 (declining from approximately 6 to 3), much of rural China remained hostile to a two-child or one-child limit, including the rural cadres who would have to enforce the policy.

**Fang-shou Campaign Cycle**

During the Maoist era, mass campaigns were a basic method of policy implementation. As campaigns grew more radical, resistance began to build, unintended consequences and difficulties were revealed, and the pressure to retrench would mount. The campaign tide would begin to recede, and steps would be taken to repair the damage that had been done. This pattern of “intensification followed by relaxation,” the so-called *fang-shou* cycle, unfolded repeatedly in the 1980s and 1990s as attempts were made to meet ambitious and unrealistic targets for birth limits. In 1983, for example, the Deng regime responded to evidence of stagnant birth rates by deciding to launch a major sterilization campaign. The result was a fourfold increase in the number of tubal ligations performed in 1983, as compared with the previous year.

As the campaign began to play itself out and elite politics took a more liberal turn, a decision was made to modify the one-child policy to allow for more exceptions. Fearful of a breakdown of authority in the countryside and widespread anger over the one-child limit and the often brutal tactics used to enforce it, leaders in Beijing decided to simply concede the need for a son in the countryside. The rural policy became a one-son or two-child policy. This concession was made in the hopes of pacifying restless villagers and improving enforcement, but over a period of several years, the effect was to encourage local governments to relax their enforcement efforts. This policy slippage weakened central control over the levers of enforcement and provided support for experts and birth planning officials who argued that the policy should be more flexible. These officials believed that the same benefits could be achieved with less effort and more
compliance by altering the policy to respond to the nuances of family need. This more differentiated policy was put into place in the latter half of the 1980s, only to be upset by the events of May–June 1989, which ended in a military crackdown on protesters in Tiananmen Square and their supporters in Beijing and other cities around the country.

The martial atmosphere that returned to Chinese politics for the next few years made it possible to once again tighten local enforcement and to carry out another campaign, which was justified by the failure to meet the population targets for the five-year plan that ended in 1990.

**Developments in the 1990s**

As the political mood in Beijing began to moderate, debate over the merits of a campaign approach to population management renewed. More people began to argue that development was the key to achieving low fertility levels. While the language of population targets and birth quotas was still in use, one began to hear more about women’s reproductive health and local enforcement flexibility. And instead of relying on the punitive approach of harsh fines and penalties, new experiments in client-centered service were undertaken. Three factors contributed to weaken the conviction that a one-child policy was necessary.

First, the obsession with grain production levels and self-sufficiency began to subside as the economy continued to grow.

Second, China’s post-Deng leadership, though still extremely cautious regarding formal policy change, was more open to the increasingly sophisticated and nuanced analysis being provided by a new, highly trained group of demographers and policy specialists who pointed to two disturbing trends in China’s demographic structure: rapid population aging and a seriously imbalanced sex ratio at birth.

Third, in the decade after 1992, China began to participate more actively in international organizations and institutions and played host or sent delegations to a growing number of international conferences. This shift coincided with a period of heightened United Nations focus on the interrelated problems of environmental protection, population growth, and the rights and status of women; it was further encouraged by the global discourse on these subjects that ensued. When China implemented its one-child policy in 1979, the dominant theory was that population growth was a primary impediment to economic growth. In the 1980s, however, liberal critics argued that population growth was not necessarily an impediment to development. While conceding that population growth could hinder development under certain circumstances, liberals argued that it could sometimes be an asset. Similarly, the feminist critique argued that population control programs objectified women by treating them as mere targets of a birth control agenda, rather than as human beings whose maternal, health, and reproductive needs should be met. These two critiques eventually merged in the form of a new international agenda that emphasized reproductive health and rights and explicitly rejected the use of compulsion to achieve population goals.

China’s Outline Plan for Family Planning Work in
1995–2000 showed the influence of that new outlook. It stressed the impact of the socialist market economy on population control and the necessity of linking population control to economic development. The plan placed special emphasis on improving women’s educational levels to promote lower fertility, and it stressed the importance of protecting the legitimate rights and interests of the people. Similar language appeared in a white paper on family planning issued in 1995, though that paper also stressed the virtues of the one-child policy and the duty of China’s citizens to adopt birth control and limit childbirth.

**One-Child Policy in the Twenty-First Century**

Despite liberalization, China’s one-child policy remains firmly in place. China continues to set national five- and ten-year goals for population growth, and isolated cases of brutal campaigns to enforce local targets continue to appear. Beijing has consistently declined to make any significant change to the policy or to abandon the one-child family goal. As long as the leadership measures its overall economic success in per capita terms, as long as local officials have targets to meet and suffer penalties if they fail, birth planning will remain a fixture in China’s reform policies.

**Further Reading**

The Open Door policy highlighted the contradictory attitude of the United States toward China, which combined high-minded ideals with blatant avarice and dreams of a special relationship in the pursuit of imperialist privilege. Diplomatic initiatives by the United States in 1899 and 1900 marked the clear articulation of this policy, which shaped Sino-U.S. relations for decades.

Commerce formed the basis for the first Sino-U.S. contact in the late 1700s. The Chinese, then under the Qing dynasty (1644-1912), had little interest in international trade and viewed the United States as similar to, but weaker than, the “barbarians” of Europe. After defeating China in the First Opium War, the British began the “unequal treaty” era with the 1842 Treaty of Nanjing. The United States was not far behind. In July 1844 the Qing government signed the Treaty of Wangxia with U.S. representatives, an agreement modeled on the Nanjing treaty. The Treaty of Wangxia was the first of many unequal treaties that the United States would sign with a declining Qing government.

Humanitarian interests entered into the relationship as many people in the United States were eager to change China through Christianity, education, and charity. U.S. citizens presented themselves as friends of China, often by contrasting themselves to Europeans. Neither side, however, was satisfied with the other. Chinese were disappointed to discover that U.S. claims of benevolence were not translated into changes to the unequal treaties. People of the United States went through cycles of unrealistic expectations followed by disillusionment as large-scale trade never materialized, missionaries were largely unsuccessful, and the Chinese had little interest in imitating U.S. political, economic, or social models. In particular, U.S. interests in China were always driven more by a potential market than by the reality of a poor country harboring deep, and often quite justified, suspicion of foreigners. Nevertheless, economic instability in the United States during the 1890s made the China market seem even more important.

The possibility of China’s collapse or its division in spheres of influence by the European powers and Japan spurred U.S. diplomats to act more assertively. Japan’s victory in the first Sino-Japanese War in 1895 raised concerns over Tokyo’s influence. In 1898 imperialist competition for China transformed as Europeans and Japanese moved from simply seeking privileges through unequal treaties to demanding more exclusive spheres of influence—often called “carving of the melon.” The Germans used the excuse of Chinese attacks on missionaries to occupy Qingdao, an important city on the southern coast of the Shandong Peninsula, while the British took Weihaiwei on Shandong’s northern coast. The French focused their attention on areas bordering French Indochina, including Yunnan and Guangxi provinces. The Russians increased their forces in Manchuria and in the port city of Lushun. The Japanese wished to spread their influence into Korea and from Taiwan into China. These spheres not only further undermined Qing sovereignty but also
threatened to exclude the United States from commercial opportunities.

Over the next two years the United States crafted a policy designed to seek a consensus among the Great Powers (Great Britain, France, Germany, Japan, Russia, and Italy) to guarantee equal access to China’s market and resources and to preserve its territorial integrity. The United States advocated the Open Door policy because it provided a framework for business people, missionaries, educators, and diplomats to cooperate. Although such a policy offered an opportunity for the United States to highlight its ideals, the Open Door Notes were ultimately designed to preserve the advantages obtained in the unequal treaties. The notes also reflected limited U.S. interests and capabilities. U.S. leaders were not willing to risk military conflict in order to pursue limited trade with China but instead relied on persuasion.

In fact, the United States could not escape Old World diplomacy, and the United States was as much the transmitter as the originator of the first note. It was a British official in China who suggested to William W. Rockhill, the U.S. Department of State’s China expert, that a note be circulated to European powers to clarify the U.S. position. Alfred Hippisley, an official in the Chinese Imperial Maritime Customs Service, had a vested interest in ensuring that he could collect the tariff on imports in a uniform manner throughout China. The service was a product of the unequal treaty system and was designed to ensure that the tariff was collected to pay indemnities owed to European powers. The tariff became one of the most important sources of income for the Qing government. Although the British were seeking a sphere of influence, they preferred to preserve the ideal of free trade throughout all of China. Rockhill modified the British draft and passed it along for the approval of U.S. Secretary of State John Hay.

The first Open Door Note, sent by Hay to the major European powers and Japan in September 1899, did not demand an end to spheres of influence. The United States requested that spheres protect the principle of equal access to the China market by ensuring that all nations’ merchants pay the same tariff and harbor fees. Further, the Chinese Imperial Maritime Customs Service was to continue to collect all revenue on behalf of the Qing government. Most recipients acknowledged the note without making a clear commitment to accept its contents. Regardless of U.S. hopes, because of heated imperial competition elsewhere and concerns about maintaining the balance of power in Europe, the recipients had little interest in a conflict over access to China.

The Boxer Rebellion set the stage for the second note. The rebellion took place in north China, primarily in Shandong Province. Young and poor Chinese men attacked foreigners, such as businessmen or missionaries, and anyone connected to the West, particularly Chinese Christian converts. This violence enjoyed brief support from some officials, and the Qing court briefly championed the Boxers when it appeared that they might force the foreigners out of China. In the summer of 1900 the United States, along with most European nations and Japan, sent troops to crush the uprising and force the Qing government to sign yet another humiliating treaty. U.S. president William McKinley and Hay feared that other nations’ troops, especially the Japanese and the Russians, would never leave and would further erode Chinese sovereignty. In July 1900 Hay sent another note that called for the same economic access that the first note had detailed

“Looking south over the Russian trenches and magazine from the central fortifications ofNaNshan Hill, Manchuria.” Russian trenches in Manchuria, 1904. For the United States the Russian presence in China meant a threat to trade. STEREOSCOPIC PRINT, 1904, UNDERWOOD & UNDERWOOD.
but then added a request for all nations to respect the territorial integrity of China. The second note summarized U.S. goals clearly:

[T]he policy of the Government of the United States is to seek a solution [to the Boxer Rebellion] which may bring about permanent safety and peace to China, preserve Chinese territorial and administrative entity, protect all rights guaranteed to friendly powers by treaty and international law, and safeguard for the world the principle of equal and impartial trade with all parts of the Chinese Empire. (U.S. Department of State 1900)

Hay neither made threats nor offered incentives but simply stated U.S. expectations. The Europeans and Japanese replied politely. Great Britain was most supportive as London wished to focus on a commercial competition that it was well prepared to win rather than formal empire building in China.

Following the occupation of Beijing by an international military expedition that included the United States, the resulting treaty, the Boxer Protocol, required a huge indemnity from China. The United States, eager to differentiate itself from other nations, remitted its portion of the funds, using the money to fund education in China and to bring Chinese scholars to the United States.

The United States portrayed the Open Door Notes and the Boxer Protocol indemnity as proof of benevolence and a “special relationship.” Although Chinese hoped that the United States could provide the Western education that some felt necessary to modernize China and leverage against other powers, they also confronted the reality of continuing U.S. treaty privileges. In the late 1800s and early 1900s tensions increased due to discrimination against Chinese in the United States. All this occurred in the larger context of rising Chinese nationalism and anti-imperialism. In fact, the Open Door policy would loom much larger in the memory of U.S. citizens than in the memory of most Chinese.

U.S. president Theodore Roosevelt largely followed McKinley’s China policy. His successor, William Howard Taft, created what became known as “Dollar Diplomacy” by attempting to use loans to help China modernize and limit the power of other imperialists. This practice added the unrestricted movement of capital to the Open Door policy ideal of free trade and equal access. Nevertheless, the United States continued to disappoint many Chinese. Following the 1911 revolution the United States supported Qing general turned president Yuan Shikai rather than the revolutionaries led by Sun Yat-sen.

People of the United States found themselves torn between sympathy for China and recognition of Japan’s military and economic power. Without vital interests to protect, the United States was willing to make compromises to the Open Door principle. The 1905 agreement between the then secretary of war William Howard Taft and Japanese prime minister Katsura Taro acknowledged the growing colonial empire of each nation. The agreement between Secretary of State Elihu Root and Japanese ambassador to the United States Takahira Kogoro implicitly recognized Japanese dominance of Manchuria in 1908. In the Lansing-Ishii Agreement of November 1917 Secretary of State Robert Lansing acknowledged to Viscount Ishii Kikujiro Japan’s “special interests in China,” an act that appeared to contradict the Open Door policy.

The Eight Power Treaty, signed in Washington in 1922, highlighted U.S. interests in reinvigorating the Open Door ideal, particularly as concerns over Japanese intentions and capabilities increased. The signatories—the United States, Great Britain, Belgium, France, Italy, Japan, the Netherlands, and Portugal—agreed to respect the “sovereignty, the independence, and the territorial and administrative integrity of China” and to protect the “principle of equal opportunity for the commerce and industry of all nations throughout the territory of China” (Treaty 1922, 278). The Open Door principle became a key part of what the scholar Akira Iriye calls the “Washington Treaty System,” a series of agreements designed to preserve the status quo in eastern Asia.

Japan’s invasion of Manchuria in 1931 and then China proper in 1937 marked the open repudiation of the Open Door policy. But U.S. limited interests and the focus on events in Europe meant that Washington did little to ensure commercial access or the territorial integrity of China. Only as a result of the Japanese attack on Pearl Harbor in 1941 did the United States act. In his message to Congress in December of 1941, President Franklin Roosevelt noted that:

At that time [the late 1800s] there was going on in China what has been called the “scramble for concessions.” There was even talk about a possible partitioning of China. It was then that the principle of
the “open door” in China was laid down…. Ever since that day, we have consistently and unfailingly advocated the principles of the open door policy throughout the Far East. (Roosevelt 1941)

In this context the Open Door policy was less a driver of U.S. policy than a rhetorical justification for it. Roosevelt’s statement also illustrated a shift in emphasis in the Open Door policy as the unequal treaty era drew to a close. Discussions of commercial access, which meant the protection of unequal treaty rights, faded from the U.S. consciousness, and the Open Door policy increasingly highlighted protection of territorial integrity.

Since World War II the United States and China have been more skeptical of the Open Door policy. For example, influential scholars such as William Appleman Williams placed the policy squarely in the context of imperialism. Certainly the Chinese Communists offered a biting critique of U.S. intentions. In August 1949 Communist Party leader Mao Zedong stated that the Open Door principle was the basis for “U.S. imperialism over the past 109 years (since 1840 when the United States collaborated with Britain in the Opium War)” (Mao 1949). It was the arch-realist, U.S. president Richard Nixon, who openly confronted the complex legacy of the Open Door policy. On the eve of his historic trip to Beijing in February 1972, his annual foreign policy report acknowledged that the “open door’ doctrine of equal treatment for all foreigners carried ambiguity in Chinese eyes” (Nixon 1972).

China’s growing power and wealth made the Open Door policy unnecessary. Today U.S. pressure for market access is directed at the protectionist practices of the Beijing government rather than at European or Japanese imperialists, and discussions of territorial integrity immediately lead to the sensitive issue of Taiwan’s reunification with the mainland rather than China’s possible partitioning. But the ideals behind the Open Door policy—that the United States was, and is, a good friend to China and that this amity is entirely compatible with commercial interests—remain important to the relationship.

In a conversation on 23 February 1972, President Richard Nixon, Prime Minister Zhou Enlai, and Secretary of State Henry Kissinger discussed the 1962 Indo-Chinese war, Sino-American normalization, and Sino-Soviet tensions, among other issues.

Jingju (Beijing Opera) is characterized by simple and spare stage sets, highly stylized gestures and movement, and elaborate costumes and headgear replicating those worn in the Ming-dynasty; it is historically renowned for the skill with which women’s roles were once portrayed by female impersonators.

Jingju (Beijing Opera or Peking Opera) is the style of regional opera that originated in Beijing late in the eighteenth century. Jingju is sometimes regarded as a national Chinese theater. It belongs to the Pihuang system of regional operas, which combines the two musical styles: xipi, which is vigorous and bright, and Erhuang, more lyrical and dark.

Origins and Development to 1900

The xipi and Erhuang styles first occurred together in Beijing in 1790 when actors of the Sanqing (Three Celebrations) Company came from Anhui Province. In time three others—Chuntai (Spring Stage), Sixi (Four Joys), and Hechun (Harmonious Spring)—joined the Sanqing to form the “four great Anhui companies” (sida Huiban). These dominated nineteenth-century Jingju, the Chuntai lasting until the Boxer Uprising led to the destruction of Beijing’s theater district in 1900.

Initially the most famous Jingju actors were female impersonators (nandan, literally “male female characters”). A system of indenture developed by which entrepreneurs bought little boys in Jiangsu and Anhui provinces under contract and took them to Beijing, teaching them the Jingju arts. The Taiping Rebellion (1851–1866) stopped the practice of bringing boys from the south, but acting talent ran in families, and boys could be found in Beijing to carry on the tradition.

By the 1830s the nandan were joined by the great laosheng (old male) actors. The most famous was Cheng Changgeng (1811–1880) from Anhui, who led the Sanqing company from about 1845 until his death and developed the laosheng arts to such a degree that many still call him “the father” of Jingju. Many plays were considered the property of particular actors, but the playwrights are rarely known.

Despite a tradition of female warriors, male characters dominate the “military” (wū) plays, whereas in the “civilian” (wén) plays, which deal with family matters and romance, the female characters are just as important. Content is based on old dramas or novels. A major source of military plays was the novel Sanguo yanyi (Romance of the Three Kingdoms), which deals with the civil wars of the third century CE and includes incidents showing heroism, treachery, and skillful strategy. The military plays feature battle scenes, characterized by thrilling gymnastics displays.

From 1900 to 1949

The twentieth century featured profound change in society, culture and politics in China, a lot of which was inspired by the West. In fact, the term colonial modernity was coined to describe many of the processes of change. The most important actor—and the most famous China has ever produced—was Mei Lanfang (1894–1961), who brought the art of Chinese female impersonation to its highest level. He also introduced several major reforms. For instance, he took on female disciples and performed in plays with social content. One of them was the long Niehai bolan (Waves of the Sea of Sin, 1914) about prostitution, which featured a strong social message, realistic acting, and contemporary costumes. Like actors of previous times, Mei had a repertoire of plays that was special to him, but in contrast to tradition, Mei collaborated with a particular playwright, the scholar-theorist Qi Rushan (1877–1962), himself the author of many works of Jingju.

One group of thorough-going reformers was the Chinese Communist Party (CCP). In May 1942 CCP leader Mao Zedong (1893–1976) declared that all art represents class interests and demanded that the CCP’s art should be propaganda for the revolution. This demand did not mean eliminating traditional opera, but it did mean reforming old plays to suit revolutionary purposes or writing new ones that showed rebels against the feudal system as positive and the old ruling classes as evil. In January 1944 Mao even wrote a letter of praise concerning the revolutionary Jingju called Bishang Liangshan (Forced Up Mt. Liang), which premiered the previous month in the CCP’s headquarters at Yan’an. Based on the traditional novel Shuihu zhuan (Water Margin) about the rebels of Mount Liang, the opera concerns how ruling-class oppression forces protagonist Lin Chong to throw in his lot with rebellion.

Performance

The traditional Jingju stage is square and bare, with simple properties, a carpet on the floor, and a curtain at the back but not the front. The basic role types are sheng (male), dan (female), jing (painted face), and chou (clown), the last usually a negative character and noted for the white patch on his nose. Jingju has many subtypes of sheng and dan indicating character, age, and other qualities. In contrast to stage simplicity, costumes and headgear are complex and colorful, matching status, gender, personality, and calling. Costumes copy the clothes of the Ming dynasty (1368–1644), no matter when the play is set. Movements and gestures are highly stylized, with mime central to many of the civil (wén) plays.

Musically, Erhuang tends to be sedate, slow, and low, appropriate to serious contexts, whereas xipi is vivacious and higher, suited to more light-hearted circumstances. Both have two or four beats to the bar, but xipi also has quick free rhythms. The orchestra is small, with the two-stringed fiddle jinghu usually the dominating instrument, but the clapper (ban), drum, and cymbal are also important. Other instruments include the yueqin (moon guitar), the three-stringed sanxian, and the double-reeded suona.

People’s Republic

The CCP’s initial policy was to support Jingju but to reform content along the lines of Mao’s 1942 proposals. Many traditional Jingju were simply banned or never performed. The CCP tried to raise the social status of actors. For instance, Mei Lanfang was lionized and appointed to the National People’s Congress. Although the old nandan were supported, new female-role trainees were girls.

During the Cultural Revolution (1966–1976) reform was taken to extremes. Operas with traditional content were banned and replaced by some fifteen model revolutionary operas (yangban xi), most of them Jingju. Apart from the heavy propaganda and class content of these models, the old costumes and role types were eliminated and the music greatly changed, for example, with Western instruments added for heroic effect.

The reform period since the 1980s has included the revival of traditions and newly written Jingju plays. At the beginning of the twenty-first century about two hundred...
traditional plays are considered outstanding. Women play almost all female roles; the nandan having almost disappeared.

On the whole Jingju has not done well under reform. The number of troupes fell from 248 in 1978 to only 93 in 2006, and many of the audience are tourists. However, regular festivals are held, and Jingju retains a following not only in Beijing but also in other cities such as Shanghai and Wuhan.

About 330 types of regional opera in five broad categories exist in China, the great majority of which are popular or folk theater; many have religious aspects as well. The government has supported regional operas as an art form that can reach the masses, but many Chinese, especially urban youth, have come to prefer more modern forms of entertainment.

Regional operas in China (difang xi 地方戏) consist of 330 or so traditional drama (xiqu 戏曲) types. Ranging from small-scale folk theaters, with casts of only two or three, to large-scale complex art forms, at the pinnacle of which are the Beijing Opera (Jingju) and Kunqu, almost all of the regional opera types take their names from their place of origin. Although a few stories are specifically local, the dramatized tales do not vary much from region to region, many being based on the ancient arts of storytellers, novels, and old dramas. While regional variations exist in such aspects as gesture, costumes, and makeup, the main differences among regional xiqu types lie in the music, including melodies and instrumentation, and the dialect of the lyrics and dialogue.

Origins and Development
Musical traces from the thirteenth century exist in such surviving xiqu types as the Liyuan xi (Pear Garden Drama) of southern Fujian Province. Already in existence at that time was the musical pattern called “joined-song structure” (lianquti), which means in essence that dramatists add words to existing and named tunes. By the Ming dynasty’s (1368–1644) later years another pattern called “beat-tune structure” (banqiangti) came into use, in which metrical and tune patterns are developed appropriate to the desired dramatic effect. Xiqu types originating in the south tended to follow the liantuqi pattern, those in the north the banqiangti. Beginning in the fifteenth century regional theater proliferated in China, gathering momentum and yielding a large array of drama types in which originally northern and southern xiqu types mingled.

Five Categories
The five broad categories of China’s regional operas are (1) The Yiyang qiang system, (2) Kunqu, (3) clapper operas (bangziqiang), (4) the Pihuang system, and (5) all others.

Yiyang qiang songs and music arose in Yiyang, Jiangxi Province, probably in the fourteenth century. Beginning in the sixteenth century this opera spread to southern China and even to Beijing, becoming an integral part of many regional xiqu types under the name “Gaoqiang,” including Sichuan Opera (Chuanju). Its main features, according to the drama historian William Dolby (1976, 91), are that “It [uses] drums and cymbals for the rhythm, [has] bangqiang [helping tunes] choral backing in the final lines of the songs, and [is] brisk, vigorous and loud in delivery”. Its music follows the joined-song structure.
Kunqu, one of the oldest and most literary forms of traditional drama, combines music, poetry, dance, and highly stylized hand gestures that correspond to the music and percussion, and draws as well on mime, farce, and acrobatics, elements of ancient Chinese theater. It’s name comes from a type of music characteristic to the form, and dating to the fourteenth century, that originated in the district of Kunshan, in modern Jiangsu Province. The cast members include male characters (sheng), female characters (dan), clown characters (chou), and the strong male character with the painted face (jing). Although performance of Kunqu declined dramatically after reaching its peak in the eighteenth century, it regained popularity after the opening of China, and today some 700 troupes, many veterans of Beijing Opera, perform all over China.

Clapper operas are named for the hard wooden clapper (bangzi) that sets the rhythm. The earliest of the systems to follow the beat-tune structure, clapper operas also have string accompaniment, mainly from the yueqin (moon guitar). Arising in the Shaanxi area of north China in the sixteenth century, they quickly spread over the north and, by the seventeenth century, even to Hunan and Hubei provinces. This type of opera makes strong use of local folk songs.

The Pihuang system, which also follows the beat-tune structure, is actually the combination of two xiqu types: the xipi (literally “western skin” but meaning “song from Shaanxi Province” in the west) and Erhuang, a xiqu type probably developing in Yihu, Jiangxi Province, in the late Ming dynasty. Xipi music is vigorous and bright, whereas Erhuang is more lyrical and darker in texture. Pihuang xiqu types share musical accompaniment by the two-stringed fiddle huqin as well as the ban (clapper), two loosely connected pieces of hardwood, one striking the other to beat out the rhythm. By the eighteenth century xipi and Erhuang flourished together as Pihuang in south China, forming a major part of such important regional xiqu types as Sichuan Opera, Anhui Opera (Huiju), and Guangdong Opera (Yueju)—(this Yueju is not to be confused with Shaoxing Opera, which also goes by the name...
Yueju; even though the sound is identical, the characters for “Yue” are different). Most important, the Beijing Opera belongs to the Pihuang system.

The fifth category covers those regional opera xiqu types that do not belong to any of the systems, among them being many small-scale village folk theaters, most with small casts, and ethnic minority theaters. Other than Yueju, those attracting particular attention include the following:

1 Huangmei Opera (Huangmei xi) is based on local tea-picking songs in Huangmei, Hubei Province, and nearby Anhui. By the nineteenth century it began to perform full stories and in the twentieth was introduced to the city of Anqing, Anhui Province.

2 Nuo ritualistic dramas of minority areas in Guizhou and Hunan Provinces and Guangxi Zhuang Autonomous Region share the use of masks. Diverse in color, shape, and pattern, these make symbolic use of such factors as character, status, age, and gender.

3 Tibetan Opera (ache lhamo) is the only ethnic minority drama in China to develop independently of the Han. Of fifteenth-century origin, it also makes much use of masks. Singing is high-pitched and flows smoothly, and accompaniment is limited to drum and cymbals.

Authorities regarded these popular performances with great suspicion, and both central and local governments adopted many rules against them. Authorities saw such performances as an occasion for sexual misconduct and demanded the separation of the sexes, often forbidding women even to attend at all. Authorities also saw regional operas as an occasion for social disobedience, for rebels to incite the people against legitimate authority. Authorities were particularly suspicious of operas based on the novel Shuihu zhuan (Water Margin), which concerns rebels and tends to characterize them positively. On the other hand, Confucian thinkers tried to use drama to spread their own thinking by emphasizing filial piety and loyalty in characterization.

During the Ming dynasty single-sex acting troupes became all but universal and remained so until the twentieth century. The great majority of troupes were all-male, which meant that cross-dressing of males impersonating females became a major artistic and social feature of Chinese theater. Boys began learning acting skills at a young age; their training was conducted within the acting

Social Setting

A major reason for the proliferation of regional operas was their close association with society. Becoming familiar with these popular dramas was part of everybody’s childhood socialization. Most xiqu types originated in the countryside, many then becoming more complex and moving into the cities.

Occasions for regional operas were many. Three of particular importance were popular festivals, religion, and fairs. These three were often interconnected, since festivals usually had religious connotations and fairs often took place at temples. Of all the festivals, the most important throughout almost all of China was the Spring Festival or Chinese New Year. This was generally the occasion for people to go out and celebrate, with an opera performance being part of the festivities.
The troupe itself, so pedophilia and homosexuality were common. Although folk troupes existed in the villages, many urban-based performers spent much of their time strolling around the countryside, especially during the peasants' idle seasons. As wanderers with socially despised morals, actors not surprisingly held a low status. In addition, they were subject to discriminatory laws and enjoyed no government protection.

**Stages for Regional Operas**

Although records indicate the existence of public indoor theaters in China's capital cities under the Song dynasty (960–1279), they had disappeared by the Ming dynasty. Until the rise of teahouse-theaters in Beijing, public performances of regional operas took place not in theaters but rather on outdoor square or rectangular stages or in other available spaces.

Many temples had a stage near or at the exit, popular regional operas being frequently part of religious ritual. The stage might be erected opposite the statue of the deity to whom the temple was dedicated. The performance was then offered to the deity, even if its content was secular. Dramas could also be performed outside the entrance of the temple.

Temporary stages also were used. They were erected for just a few days during the drama season or the temple fair and then dismantled. Sometimes such temporary stages were erected near each other, with a range of performances taking place simultaneously.

Although the stages were covered, audiences were not. They usually stood around and did not necessarily stay for the whole play. In dramas performed to honor a particular god, the human audience members were theoretically no more than incidental onlookers. Men outnumbered and stood or sat separately from women. Audiences were not required to be silent during a performance.

Tibetan drama performances took place in the monasteries in specially designed tents or in open spaces. If a performance took place in a tent, the actors stood in the center, entering or exiting through a narrow corridor, while the audience could stand or sit around on the floor, as appropriate. High-ranking guests had special seats.

**People's Republic**

The government of the People's Republic of China (founded in 1949) reformed the regional operas in several ways. It took over existing troupes and gave members formal salaries, attempting not only to improve actors' quality of life but also to raise their social status. The Chinese Communist Party (CCP) recognized regional operas as positive art forms ideologically because they were attended by such large groups. At the same time theater workers reformed the operas' content, eliminating material they regarded as antisocialist and promoting what could be used for propaganda purposes. During the Cultural Revolution (1966–1976), during which CCP leader Mao Zedong (1893–1976) had his wife Jiang Qing (1913–1991) carry out a class-obsessed "revolution" in the Beijing Opera, the regional operas mostly disappeared from the stage or simply copied the stereotyped patterns of the model revolutionary operas in which traditional themes were totally excluded. After the reform period began in the late 1970s the regional operas returned like a pent-up flood. Early in 1978 the main architect of the reform policies, CCP leader Deng Xiaoping (1904–1997), explicitly encouraged actors in his native Sichuan Province to restore traditional themes in his beloved Chuanju. Since that time many traditions have revived in the regional operas, both in terms of content and social context. Some good regional opera works have been created, but in most xiqu styles output has tended to dwindle since the high point of the 1980s.

The modern public proscenium stage—darkened during performance and with the audience seated in front of it in rows and tiers, possibly at a significant distance from the performance—was introduced to China in Shanghai in 1908. Although they were not initially intended for performance of regional operas, theaters built since 1949 follow modern patterns, whatever kind of drama takes place within them.

Amateur folk troupes still perform, especially at festival times, but young people are tending to become more interested in modern art forms. The number of state-run troupes throughout the country (excluding the Beijing Opera) was 1,450 in 1998 but only 1,412 in 2006. The number of performances that these troupes gave held fairly steady during the same time, being 195,000 in the countryside and 60,000 in the cities in 2006, but the total
The number of audience members fell from 323 million in 1998 to 275 million in 2006.

Although regional operas survive, especially in the countryside, competition from more popular modern forms of entertainment are exercising a harmful influence on them.

Yue Opera, which originated in Zhejiang Province, is unique among Chinese regional operas. Its actors are primarily female, and its stories and actions center on love and romance. Among China’s regional opera forms, its music is unusually lyrical and sweet.

Yue Opera (Yueju), whose name reflects the ancient designation of the Zhejiang region, is the main regional opera style of Zhejiang Province and Shanghai. It is among the best known and loved of Chinese regional opera styles, second only to Beijing Opera. Two main features differentiate Yueju from other Chinese local styles: its actors are mostly or entirely female, and its stories, costumes, and actions emphasize love and romance to the virtual exclusion of war and fighting.

Music and Style

The first stage performance of a yue opera, which took place in a village of Sheng County, Shaoxing, Zhejiang Province, in 1906, was very simple. The music was based on local folk songs, and the costuming and props were rudimentary. The style proved successful enough for a 1910 introduction to the provincial capital Hangzhou, and in 1916 Wang Jinshui led a troupe to Shanghai. Reform followed over the next few years, and instruments like the two-string fiddle erhu and the three-string sanxian were added to the accompaniment. With the advent of women actors in the 1930s, the music became more lyrical and melodious, with smoother vocal lines, to suit the range of the female voice.

In October 1942, the famous actress Yuan Xuefen adopted the slogan “new Yueju,” leading further reforms, some influenced by Western theatre and film, others by Chinese romantic traditions. They included lighting and elaborate décor, colorful makeup, and costumes copying pictures of beauties of ancient times, with soft colors replacing bright ones and soft materials like crepes and georgette. The more feminine texture of yue opera is reflected in its lack of fighting and acrobatic scenes, distinguishing it from other regional styles.

Story Lines

Favored story lines emphasize romance and women, rather than the military dramas so popular in other regional styles. Many new operas were written during the reform period after 1949, including some that were directly political. Perhaps the most famous Yueju is Liang Shanbo and Zhu Yingtai. This new version of Chinese culture’s most famous love story premiered in 1952. The young beauty Zhu Yingtai dresses as a man in order to engage in study. Fellow student Liang Shanbo falls in love with her, but her parents force her to marry somebody else. Liang dies of a broken heart, and the mournful Zhu dies jumping into his tomb. The couple change into butterflies, hence the name “the butterfly lovers” often given the story. The 1952 version emphasizes the cruelty of arranged marriages, but there are many implications in the
story about cross-dressing, sexuality and gender relations. Other performances in the repertoire include *Dream of the Red Chamber*, based on one of China’s most famous classical novels. The opera highlights the love-story between Jia Baoyu and Lin Daiyu. Although Baoyu is destined to marry Xue Baochai, he falls in love with another cousin, Lin Daiyu.

**Actors**

All performers were male in the first Yuefu stage performance in 1906. In 1923, Wang Jinshui began training girls for a women’s company. Within a few years the women’s companies were competing with the men’s companies, displacing them by the mid-1930s.

Men actors tended to appear again in limited numbers beginning in 1952. Traditions have returned, though, and since the 1980s almost all young stars have been female. Li (2003, 191) draws attention to a “bifurcated development in cross-dressing” in contemporary China: the once-dominant playing of female characters by male actors is dying out, while the converse performing of male characters by females is still flourishing, especially in *yue* opera. In this sense *Yueju* holds a special place in the Chinese theatre.

With its unique emphasis on female characters and stories of romance and love, the regional Yueju is holding its audiences very well in the twenty-first century.

**Further Reading**

Before the seventeenth century opium was used in China primarily for medicinal purposes. As the practice of smoking opium prevailed in China from the 1820s onward to the 1870s and the turn of the twentieth century—a time fraught by increasingly contentious issues regarding opium trade—opium’s addictive properties became more apparent. China was faced with a dilemma: whether to benefit from the revenue of opium trade or outlaw its use.

China’s opium trade is said to have been started by Arabian merchants in the seventh century during the Tang dynasty (618–907 CE). But the research of the Japanese scholar Yano Jin’ichi indicates that what China began to use during the Tang period was an opium-containing medicine, and that Chinese people did not know of or, as some opium historians have said, produce opium itself—the raw substance that’s derived from collecting the milky juice found in the unripe seed capsules of the opium poppy (*Papaver somniferum*), which becomes a brownish sticky gum when exposed to the air—until the sixteenth century.

Since the Tang period and into the Song dynasty (907–1279) a medicine produced by grinding, frying, and boiling opium poppy seeds and their dried cases had been used to treat bone ailments, kidney stones, stomach diseases, and respiratory ailments. Neither poppy seeds nor their dried cases are considered to be “real” opium. Moreover, the medicine made after grinding, frying, and boiling them was ingested, not smoked.

Opium (in its raw form) for medicinal purposes came to China around 1500, either from Thailand and Vietnam in Southeast Asia as tribute (payment of respect to China) or from central Asia by Arab traders. As some Chinese doctors said in the sixteenth and seventeenth centuries, opium had a curative effect for colds, diarrhea, anal prolapse, weak pulse, infected sores, and dysentery, among other supposed uses.

**Opium Imports Intensify**

From the seventeenth century to the early eighteenth century the Portuguese were the most habitual importers of the opium from India. In 1757 English merchants began to sell Indian opium to China. In 1773 the British East India Company, reaping further the benefits of India’s colonization, exerted influence on the trade, levying a tax on merchants. Overseas Chinese in Southeast Asia played important roles in forwarding Indian opium to China’s various coastal harbors other than Canton (Guangzhou), which was the only port the British merchants could enter.

From the evidence available Chinese did not begin to use opium for smoking until 1710, when opium was first smoked by mixing it with tobacco, and after the 1770s pure opium was smoked using a pipe. Opium smoking was at first limited to Fujian and Guangdong, and it did not spread nationwide until around 1820.
After the practice of opium smoking expanded in China during the eighteenth century, opium imports gradually increased. According to the British East India Company’s records, in 1767 imports were more than 1,000 chests (a chest is a little heavier than 1 picul, which is 133.33 pounds), in 1790 more than 4,000 chests, in 1824 more than 10,000 chests, in 1832 more than 20,000 chests, in 1835 more than 30,000 chests, and in 1838 more than 40,000 chests. Because opium imports suddenly increased markedly during the 1830s, and the Chinese government could not thoroughly implement its opium prohibition policy, the First Opium War, which was the first military defeat of China by Western powers in the modern period, broke out in September 1839.

The war did not end until July 1842; China was defeated. Opium imports, considered illegal, flourished nevertheless in plain sight of the Qing court. In the twenty years after the First Opium War opium imports increased from their level of 40,000 piculs prior to the war to 75,000 piculs by 1859, according to Chinese maritime custom data. By that time the Second Opium War (1856–1860) was underway in China, with France, as well as Britain, in the fray. When the war ended, again with China in defeat, opium imports were legalized.

In the thirty-six years from 1858 to 1894, except for six years during which opium imports exceeded 75,000 piculs, imports fluctuated between 55,000 piculs and 75,000 piculs. During the few years when imports exceeded 75,000 piculs, they were at most 83,000 piculs. In the eleven years from 1895 to 1906—except for 1899 and 1903, when imports were 59,000 piculs and 58,000 piculs, respectively—opium imports always remained less than 55,000 piculs. The lowest was 49,000 piculs in 1909, and in 1906 imports were 54,000 piculs. Because of the decrease in foreign opium imports since 1895, Britain’s profits from the opium trade were slim, and in 1907 the Sino-British Opium Prohibition Regulations were signed, which decreased British opium imports 5,100 chests each year until imports were eliminated in 1918.

Opium Production in China

China did not possess knowledge of how to produce opium until around 1500, approximately three thousand years after opium’s first appearance in western Asia. Although there are records of opium production in Yunnan and Gansu in western China during the eighteenth century, no evidence exists that it was much produced or used for smoking. Not until 1820 did records show that the production of opium for smoking gradually began to increase. To this day historians cite Commissioner Lin Zexu’s 1838 warning that opium use would deprive China of soldiers strong enough to resist a hostile army. Nonetheless, in 1833 Lin was the first Chinese official to suggest that the production of native opium be considered to ease
the drain of silver from China—a deficit in the international balance of payment—caused by China’s spending more on opium imports that it brought in by selling silk and tea.

Although China increased opium production in the 1820s, not until late 1870 did surpass foreign opium imports. The production of native opium increased fivefold between the late 1870s and 1906, when total production of native opium was nine times greater than imports. The main opium-producing areas continued to be in peripheral China. Provinces in the southwest, including Sichuan, Yunnan, and Guizhou, produced about 60 percent of the total opium output. Provinces in the northwest, including Shanxi, Shaanxi, and Gansu, produced about 20 percent of the total opium output. The peripheral regions of the littoral provinces (located on a shore, especially of the sea) produced the remaining 20 percent. Before 1869 Yunnan was the most important opium-producing province. Thereafter Sichuan took its place.

In addition to native opium’s geographic and climatic suitability (and the fact that little land and labor were needed in peripheral China to produce it), the high price of native opium, caused in part by the Indian opium monopoly, was sufficient to cover the transportation costs between the inland and the coastal provinces. The import of Indian cotton made southern China rely less on cotton of northern China and southwest China, which resulted in increased opium production in these areas. Some evidence shows that half of all native opium was produced for the long-distance domestic trade and that the value of this opium constituted as much as one-sixth of the value of all of China’s interregional trade.

Opium Distribution

Although it had been long thought that foreign opium had not been sold beyond the Yangzi River before the First Opium War, the scholars H. B. Morse and John K. Fairbank, by “reconstructing” (from Qing palace archives) the pre-1839 distribution route of imported opium, determined that imported opium was distributed all over China. Soldiers, officials, large merchants, and small peddlers brought it inland.

After the Opium Wars China’s main entrepot (an intermediary center of trade and transshipment) for distributing foreign opium shifted from Guangzhou to Shanghai. When native opium swiftly increased in the 1870s, the sphere of distribution for foreign opium was more and more reduced to the coastal area between Jiangsu and Guangdong. Like the market of imported opium before the 1870s, that of native opium after the 1870s was all over China.

Records of the International Opium Commission of 1908 and of opium use of other countries in the late nineteenth century indicate that the 630,000 piculs of opium used by China in 1908 represented 95 percent of the total amount of opium used in the world that year. The per-capita amount of opium used in China was fifteen times that of England, twenty times that of the United States, and fifty times that of India. Southeast Asia, in total, used 20,000 piculs of opium at most. Except for the small island of Singapore, the figures for per-capita opium consumption in most of the countries in this area were lower than that of China. Out of the total population, 1.64 percent of opium users were American and 4.5 percent were from China. Among opium-producing countries, the percentage of domestic users was 25 percent for Persia (modern-day Iran), 8 percent for India, 1 percent for Turkey, and 99 percent for China.

Health Issues vs. Policies

Even though Chinese doctors had warned against opium overdose since the seventeenth century, they did not have much influence on Chinese policymakers. The Chinese view of opium as an addictive drug has actually been greatly affected by new medical views of opium in the West. Prohibitive views spread in Britain, especially after 1874, but Britain officially prohibited opium use only in 1916. The view of opium in other Western countries followed a roughly similar pattern.

In contrast to earlier Chinese discourse about native opium production between 1833 and 1874, which did not pay much attention to opium’s effects on health, the post-1874 Qing discourse by both proponents and opponents of native opium conveyed a deep concern for “national health.” Paradoxically, from 1874 to 1905, when opium was blamed for degrading social morale and when Chinese nationalism was rising, opponents of native opium lost the upper hand. “To seek final prohibition through
commanding the supply” was the Qing government’s rationale. Intellectuals such as Zheng Guanying, Wang Tao, and Sun Yat-sen all favored domestic cultivation. The worsening of the economy and a shortage of state revenues somewhat explain this paradox.

Furthermore, in contrast to Christian physicians who introduced the dangers of opium addiction to China around 1874, China-based Western doctors working for the Chinese maritime customs were slow to reflect this disapproval of opium. Not until the end of the nineteenth century did their view evolve from opium as a curative to opium as a “poison.” The Imperial Maritime Customs publications were another Western media that influenced late Qing thinking.

Opium Prohibition—Ramifications

By 1905, in addition to the victory of non-opium-smoking Japan over Russia and the prevalence of the view of opium as a poison in the Western world, many changes had taken place. Native opium was out-competing foreign opium. Opium imports had ceased to be profitable. Importation of foreign goods other than opium was increasing; foreign businesses gradually found other sources of profit. These conditions spread prohibition attitudes across the country and paved the way for the successful prohibition movement from 1906 to 1916.

However, the opium-abolition movement was relaxed in 1916 as China entered the Republican period (1912–1949). During the entire Republican period tensions over the production, sale, and use of opium were even keener than they had been during the nineteenth century. On the one hand, economic considerations encouraged some permissiveness toward opium growing and trading. On the other hand, concern was increasing that opium use harmed national health. Particularly during the Republican period, opium use was somewhat different from that during Qing times. In many villages in north China opium had been taken by pills or by injection. While opium-suppression bureaus of various political regimes in Republican China continued to function, the fiscal benefits of supplying opium was hard to ignore: The Japanese empire sold opium from Mongolia, Taiwan, Korea, and Osaka to coastal China and Manchukuo during the Sino-Japanese War.

The data for the sources of opium supply during the Republican period were scanty. The highest estimate of annual production was 400,000 piculs—less than the 580,000 piculs of 1906 when the Qing dynasty reached its climax. According to John Lossing Buck’s survey of thirteen areas of fifteen provinces, opium poppy fields were 14 percent of total agricultural land in 1904–1909, 3 percent in 1914–1919, 11 percent in 1924–1929, and 20 percent in 1929–1933. Although the survey did not represent the entire country or the entire period, it reveals more fluctuation in opium production during the Republican period than the steady increase during the late Qing period.
In Taiwan under Japanese colonial rule, a policy of gradual abolition was adopted. This policy was adopted by China between 1906 and 1916. From 1896 onward the Japanese colonial government had set up factories to refine opium purchased from India and Persia into opium paste to sell to licensed smokers. The amount of opium used in 1899 was 229,864 kilograms and was gradually reduced to 3,667 kilograms in 1944. The number of licensed smokers was 52,063 in 1919 and 2,778 in 1942. In contrast, on the Chinese mainland, the People’s Republic of China resorted to drastic measures from 1949 to 1952 to eliminate the opium business by condemning it through mass propaganda as counterrevolutionary and subject to severe punishment.

While the use of other illegal substances has increased to some extent in both Taiwan and China in recent years, from the scale of its use and its effects is far less that of opium in the past.

*Canton Harbor*, oil painting by an anonymous Chinese painter, nineteenth century. This scene, painted in 1840, shows a British side-wheeler arriving in Guangzhou (Canton). Prior to the First Opium War (1839–1842), merchants from the West were not permitted to trade outside of the city.
Opium War, First

Di-Yì Cí Yāpiàn Zhànzhēng
第一次鸦片战争

The First Opium War (1839–1842) between Britain and China was triggered by disputes regarding the trade of opium, but contentious Sino-British relations had already been in existence for nearly a century. China’s clear defeat in the war began another century-long era in which China was subject to active foreign aggression.

Chinese attempts to prohibit British importation of opium in the 1830s, and the First Opium War (1839–1842) that resulted from them, were clear defeats for the Qing dynasty (1644–1912). After the war, while opium trade in China continued, China lost Hong Kong to Britain and was then forced to open “treaty ports” to foreign trade and to accept unequal treaties that limited China’s control over its foreign affairs.

Opium imports became a serious concern for the Qing dynasty in the 1820s as the court worried about the effects of smoking opium on officials and soldiers and the supposed drain of silver out of the country. In the 1830s people debated whether these problems were best dealt with by legalizing and regulating opium or by prohibiting it. Prohibition won, and Commissioner Lin Zexu was sent to Guangzhou (Canton) in March 1839 to bring about the end of the trade.

The British had for years been unhappy that the Chinese government forbade them to trade in ports other than Guangzhou—and while in Guangzhou they were forced to trade with a group of monopoly merchants (the Cohong). By forbidding the trade of opium, the Chinese now forced the British to smuggle it or relinquish the enormous profits it brought. (Two earlier British attempts to win the British full access to Chinese markets and European-style diplomatic relations with China, the Macartney mission of 1792–1794 and the Amherst mission of 1816, had also failed.) British merchants were also unhappy at being subjected to Chinese law, which they regarded as barbaric.

When Lin Zexu seized and destroyed the British opium at Guangzhou he demanded that foreign merchants pledge not to import opium again. The British deemed these actions to be justification for war and sent a naval and military force from India; skirmishes ensued throughout 1839. Formal fighting began in June 1840 when a large British expeditionary force was dispatched from Singapore. The British strategy was to seize the island of Zhoushan, near the mouth of the Yangzi (Chang) River, and then sail north to Tianjin, demand payment for the seized opium, and completely renegotiate relations between the two countries. The British easily defeated all the Chinese naval and land forces they faced. The Qing court was eventually forced to agree to the Treaty of Nanjing. The Second Opium War of 1856–1858, also called the “Arrow War” (because an of incident on the ship Arrow involving Chinese marines) resulted in the 1858 Treaty of Tianjin, which further opened China to foreign penetration. These treaties were the foundation of the system of unequal treaties that would govern China’s
relations with the imperialist powers until World War II. The opium trade continued and grew, and the political and economic dislocations caused by the war and the treaty were key causes of the Taiping Rebellion, which lasted from 1851 to 1864.

Further Reading
The Second Opium War (1856–1860) is less well known outside China than the first, but its impact was no less profound. The First Opium War (1839–1842) marked the beginning of the end for imperial China, but only because of the second conflict were opium imports legalized, foreigner governments granted the privilege of establishing embassies in China, and missionaries permitted to live and work in China’s interior.

Historians have as many names for the clash between the British, French, and Chinese from 1856 to 1860 as they have interpretations of that clash. It is sometimes called the “Anglo-French War” and perceived as yet another military engagement with aggressive imperialist powers. It is also called the “Arrow War,” after the ship whose allegedly illegal boarding by Chinese marines became the catalyst for war. Finally, the clash is most often referred to as the “Second Opium War” because in many ways the conflict was an extension of the tensions that caused the First Opium War (1839–1842).

As with the First Opium War, the opium trade was a crucial component of the tensions surrounding the Second Opium War, but it was by no means the only or even the most important bone of contention between the Chinese and the British. Most British at that time had an unshakable belief in not only the inevitability but also the righteousness of free trade, and Qing dynasty (1644–1912) restrictions on commerce seemed unreasonable and even provocative. The First Opium War demolished the Canton (Guangzhou) system of restrictive trade, but only five Chinese ports were open for foreign commerce. The clandestine opium trade flourished but remained illegal, much of the city of Guangzhou seethed with antiforeign sentiment, and most Chinese still viewed the foreigners as barbarians. The British and the French quickly grew dissatisfied with the terms of the Treaty of Nanjing (1842), as well as what they saw as China’s unwillingness to live up to the promises contained in that treaty. The British were particularly angry that their merchants were still unable to live and work inside the city of Guangzhou, a measure that Chinese officials insisted would be dangerous for the merchants. By 1856 no one was satisfied with the status quo, and tensions were high.

The incident that began the war involved the Arrow, a lorca—a three-masted ship with a European-style hull and rigging characteristic of a Chinese junk—that Chinese authorities suspected of piracy. The Chinese crew was arrested and taken to shore. Initially, outraged British officials claimed that the Arrow was a British vessel and that the Chinese hauled down the Union Jack flying on its mast, but both accusations were false. In fact, the British registration had expired, and the flag was not flying when the ship was boarded. Sir Harry Parkes (1828–1885), British consul to Guangzhou, angrily called for military retaliation. Most scholars now accept that the Arrow incident was simply a British pretext intended to provoke open hostilities and wrest further concessions from a weakened Qing government. The French had their own excuse for joining the conflict—the beheading of
a Catholic missionary working in Guangxi Province in violation of Chinese restrictions on foreign movement. The two incidents were related because Guangdong and Guangxi provinces were administered as a single unit by the same governor-general, Ye Mingchen, a staunch opponent of foreign imperialism who resided in Guangzhou, the provincial capital of Guangdong.

Concessions of War

The British and French attacked Guangzhou in 1857 after some delays related to the outbreak of the Indian Mutiny, seizing the city and capturing Ye. They then sailed north to Tianjin, just southeast of the Qing capital of Beijing, which the British threatened to attack. Negotiations resulted in the Treaties of Tianjin (1858), which, among other concessions, allowed foreign ambassadors to reside in Beijing, opened ten new ports for trade, permitted foreign ships to travel the Yangzi (Chang) River (where four of the new treaty ports were located), and allowed foreigners—missionaries included—to travel freely in the Chinese interior. The Chinese were to pay Great Britain and France large indemnities and to cap transit tariffs on foreign goods inside China. In addition, a fixed tariff was to be paid on all imported opium, thus legalizing foreign opium imports. Russia and the United States quickly claimed many of the privileges accorded the British and French in their own treaties. The agreements were to be ratified within a year, when all parties would gather again for a formal signing.

Although none of the concessions was welcome, the Xianfeng emperor (reigned 1850–1861) was said to have been particularly incensed at the notion of ambassadors from these aggressor nations living in Beijing and other foreigners traveling freely about the Qing empire. When it came time for the Chinese to ratify the treaties in 1859, Qing authorities unexpectedly changed their minds, blocked foreign troops and dignitaries intending to sail up the Beihe River toward Beijing, and bombarded them from Dagu Forts at the mouth of the river. Outraged, the British and their French allies—led by James Bruce, the eighth earl of Elgin (1811–1863), on the British side and by Baron Gros on the French—landed a combined army of nearly twenty thousand soldiers and marched on Beijing. Discouraged by the Russian ambassador from burning the Forbidden City, the complex in which the royal family resided, the troops instead looted the Yuan Ming Yuan, the summer palace just outside the city favored by the Qing royal family, and then burned the complex to the ground. Faced with the overwhelming military strength and advanced military technology of the Anglo-French forces, the Qing government backed down, and the Conventions of Beijing

During the 1856 war, Chinese set fire to foreign factories. The British retaliated by burning Chinese houses. Burning of Canton Harbor, oil painting, by an anonymous Chinese artist, nineteenth century.
were finally signed in October 1860, but only after China paid a much larger indemnity, adding Tianjin to the list of ports open to trade, conceding the Kowloon Peninsula across from Hong Kong to the British, and agreeing to a French demand that missionaries be permitted to purchase property inside China.

**Far-Reaching Ramifications**

The conflict had profound political and socioeconomic consequences. The Qing dynasty was forced to allow greater foreign penetration of Chinese territory and to consent to the further erosion of its sovereignty. At the same time the humiliating settlement generated a strong desire for reform among a number of top Chinese officials. The Self-Strengthening Movement, spearheaded by Zeng Guofan (1811–1872) and Li Hongzhang (1823–1901), sought to learn from the West in order to modernize China’s technology and strengthen its military. The treaties signed at the conclusion of the Second Opium War also contributed to the decision on the part of foreign powers to support the Qing dynasty against the Taiping rebels, whose catastrophic rebellion (1850–1864) overlapped the war and had the potential to topple the dynasty and invalidate those treaties. Last but not least, after opium imports were legalized in 1860, the opium trade with India surged dramatically, with imports peaking in the late 1870s and diminishing only because of growing competition from the Chinese poppy crop.

The Second Opium War is less well known outside of China than the first, but its impact was no less profound. Although the First Opium War is often cited as marking the beginning of the end for imperial China, the lesser-known Second Opium War left more visible scars of the destructive power of Western imperialism. The summer palace has never been rebuilt; its ruins remain to educate subsequent generations.

Initially used by ritual practitioners in prehistoric times as tools of divination, the bones of animals, as well as turtle shells, were inscribed with an ancient form of the language the Han use today. More than two hundred thousand of these “oracle bones,” covered with details of daily living, form the foundation of the world’s earliest written historical record.

A sophisticated system of divination called jiaguwen, or oracle bones, was practiced by royalty in the Shang (1766–1045 BCE) and Western Zhou (1045–771 BCE) dynasties. These survive as inscriptions, mainly on animal scapulae and turtle shells, whose function was to predict the future of national affairs, and they were written in an ancient form of the Han language that is used by the majority of Chinese today. The oracle-bone inscriptions of the Shang from Anyang, in Henan Province, were discovered at the end of the nineteenth century, and they form the most complete historical record of that period. Their various writing styles are artistic and are appreciated as calligraphy. About 210,000 pieces of Shang oracle bones have been collected. About 80 percent of about forty-five hundred characters used in the oracle bone inscriptions are recognizable, and many are still in use in modern Chinese. In Anyang, nearly twenty-five thousand inscribed pieces were excavated between 1928 and 1937; they include more than twenty-two thousand turtle shells and some twenty-two hundred bones. The excavation of Anyang has been resumed since 1950 and continues now; the largest excavation of inscriptions totaled more than five thousand pieces.

Some three hundred different inscriptions from the Zhou dynasty (1045–256 BCE) have been excavated from several places since 1979: the Zhou’s royal center, Zhouyuan, in Shaanxi province; Xingtai in Hebei province; and Fangshan Liulihe in Beijing. The Zhou inscriptions have smaller-sized characters and different representations than the Shang’s, and their nature has not yet been interpreted with certainty; some believe that these Zhou artifacts should be attributed to the Shang peoples. Nevertheless, the knowledge we have now comes mostly from the Shang oracle bones.

Belief System and Astronomy

The materials selected for use as oracle bones were animal scapular bones and turtle shells. Some of the turtle shells came from as far away as the South China Sea. Ritual practitioners, or wu, would heat the dried bones during a ceremony and ask questions of ancestors or the gods. By examining the cracking patterns and listening to the sound of cracks, the wu were supposedly able to hear the divine answer. These questions, answers, and results, as well as the date and the wu’s name were inscribed on the bones and/or shells. The wu of the Shang dynasty were experts in specialized fields such as the medical science, agriculture, and war. It seems that female wu were in charge of reporting forecasts and other changes. Written
language was only accessible to some elites and the wu; the latter were thought capable of communicating with the gods.

The Shang believed that ancestors could protect them but they could also bring disaster. Royal ancestors were worshiped along with gods. The highest god was Di, who led a group of gods of nature, such as wind, rain, storms, individual mountains and rivers, and planets and stars. Royal ancestors could also influence the gods, so a king could perform a ritual wherein he married one of his dead consorts to a god. The king, also named "King Di," acted as a medium between the divine and the human worlds, and some had even learned the wu’s profession.

From the written records on the oracle bones, much has been learned about the lives of the ancient Shang. The Shang established a mature ritual calendar and had a concept of past and future. Such a calendar is based on the knowledge of the regularity of the sun and moon, which can be reconstructed according to the inscriptions. The inscriptions show the discovery of new stars, comets, the different stages and changes of the sun and the moon, and they also contain the earliest record of an eclipse in history. Big months of 30 days, small months of 29 days, and a year of 353–354 days were recorded. The Shang had also set up a double month and double year to resolve the extra time accumulated, which is unique in the world calendar. The Shang used a decimal system in which 10 days equaled one xun. For each xun one ancestor was worshiped, and 36–37 individual xun were offered reverence, creating a one-year cycle.

### Economy and Technology

Both the Shang and the Zhou were agricultural societies, so the weather was extremely important; the subject of many inscriptions is weather—begging for rain or for the rain to stop. Food, liquor, and blood, along with music and dance, served as offerings to the gods for their favors. Sometimes animal and human sacrifices were necessary. These records show that four-hundred humans were once sacrificed at one time.

The oracle-bone inscriptions of the Shang explain group farming methods and the different instruments used in agriculture along with fertilizers and equipment for storing the harvest. The main produce was grain and millet, and the Shang produced a large amount of liquor; the Zhou, on the other hand, forbade drinking. Some bones record that sweet wine and aromatic liquor were offered in rituals—often together in hundreds of pots.

The Shang used sophisticated techniques for the domestication of animals. Cows, sheep, horses, pigs, and dogs were domesticated. Horses and dogs were also used in battle and for hunting. The oracle-bone inscriptions contain categories of terms that describe certain animals according to type, shape, color, character, and sex.

Bronze ritual vessels are the most important artifacts of the Shang and the Western Zhou people; they were considered to serve as mediums to the supernatural world and symbolized royal power. Techniques for casting bronze were kept secret. The oracle-bone inscriptions record that the Shang made blood sacrifices when casting bronze vessels.

More than two hundred characters used on the bones relate to silk production, weaving, silk cloths, and nets, revealing that the Shang had mastered extensive textile
technologies. Sixteen kinds of medical conditions ranging from pregnancy to urinary diseases, children’s diseases, infectious diseases, and facial and teeth problems, including some diseases that are known today, were inscribed on oracle bones. Techniques and medicines used in surgery were recorded, as well as the activities of specialists who took care of royalty. Some of the medicines and medical instruments described are still used in traditional Chinese medicine.

Government and Social Systems

The oracle bones reveal much about the structure of the government and social system of the ancient Shang dynasty. The Shang had established a sophisticated legal system and government, all under the king’s dominant control. A group of titled, high-ranking elites with many consorts lived in the royal court. Both male and female elites had feudal lands, and both genders participated in ritual practice and war. Commoners and slaves were on the lower rungs of this social ladder.

The government included specialized departments that dealt with matters ranging from hunting to war, from salt to ritual calendars. The Shang had established a postal system, and they used shells as currency. The Shang had a well-equipped and well-trained army of about thirty thousand people during peacetime that included foot soldiers, chariots, and cavalry.

The inscriptions on the oracle bones act as a royal journal; they form a three-thousand-year-old window into the daily lives of the Shang people and their rulers.

Overseas Chinese

Throughout the past two centuries, Chinese have migrated to different places for different reasons. The terms for these groups have varied as well, and their profile in economic markets has changed from unskilled to highly skilled. Although descendents of older generations of Chinese migrants might have fewer emotional ties to China, they share a common bond of interest in their heritage.

The migration of Chinese from different regions in China to different parts of the world is a phenomenal process in globalization that has demographic, socioeconomic, and political implications both worldwide and in China. Numbering between 30 million (lowest estimate) and 40 million (highest estimate) worldwide, not including Chinese living in Taiwan, Hong Kong, and Macao, the overseas Chinese are minorities in some countries, making up as little as 3 or 4 percent of the population, but form significant percentages of the population in others (78 percent of Singapore’s population, for instance, and 28 percent of Malaysia’s). Although the highest concentration of overseas Chinese is in Southeast Asia, the United States has the largest absolute population with 2.5 million, a number expanding due to the continuous flow of Chinese migrants into the country from China and other parts of the world.

Today most overseas Chinese are visibly urban, and many are engaged in the business, professional, and service sectors. There are also many Chinatowns around the world, whether remnants of historical niches of Chinese communities or new creations for attracting tourists.

Distinctive Names

The term *overseas Chinese* loosely refers to all Chinese who reside outside China, including both citizens of China and citizens of other nations. The Chinese term for Chinese migrants who settle outside China is *huaqiao* or “Chinese sojourners” and is generally interchangeable with the English term *overseas Chinese*. When these Chinese and their descendents identify themselves by their local nationality as, for instance, Malaysians or Americans, they prefer to use the more neutral term *huaren*, literally Hua people, which refers to the Chinese ethnically without any implication of nationality. The term *huaren* is today commonly used by Chinese of different regions and nationalities, including those in Hong Kong, Macao, and Taiwan, instead of the term *zhongguoren*, which also means Chinese but is derived from the root word *zhongguo*, which refers to the country of China (literally as the Middle Kingdom). In fact even in China, when politicians and other individuals wish to emphasize Chinese worldwide, *huaren* rather than *zhongguoren* may be used, although often they are collectively referred to as *huaqiao/huaren*. In China today, *huaqiao* refers only to citizens of China living abroad, and so it is technically incorrect to refer to Chinese of other nationalities as *huaqiao*.

Such distinctions are not addressed by the English
label *overseas Chinese*. Because of this, many scholars who study them prefer to use the terms *Chinese overseas* or *Chinese of different nationalities* (CDN) to refer to Chinese who are citizens of other countries worldwide. These terms are more comparable to the Chinese term *haiwai huaren*, meaning, simply, the Chinese outside China, and they are commonly used by Chinese scholars in China. Although overseas Chinese are also described as Chinese diaspora, especially by scholars in the West, some Chinese scholars take issue, perhaps with “forced exile” implicated in the term diaspora as it was originally used, since overseas Chinese departures from China have been voluntary. But for simplicity in this discussion in English, the term *overseas Chinese* refers to all Chinese living outside China, without any disrespect to those who wish to stress their new national identities. Regardless of the labels they are given, these populations have their Chinese origins in common, even if their regional backgrounds are diverse.

Since there is no consensus on a label that can cover all Chinese in different parts of the world, it is worth pointing out one aspect of a Chinese term about which Chinese scholars agree: *huaren*, or Hua people, or more specifically *haiwai huaren* excludes Chinese living in Taiwan, Hong Kong, and Macao. Scholars and politicians in China refer to these Chinese as *jingwai huaren*, or Chinese in the territories outside mainland China, in contrast to huaqiao and CDN. Also worth noting is that overseas Chinese are often assumed to be Han Chinese, although in the term *overseas zhongguoren*, non-Han Chinese, such as the Uighur in Turkey, who originally migrated from Xinjiang should also be included. There are Koreans, Russians, Mongolians, Huis, and other non-Han *zhongguoren* (Chinese) who live overseas. The Huis, for example, either form a distinct population of Chinese Muslims or merge with the local dominant Muslim population.

**Migration and Distribution**

Southeast Asia, known to the Chinese in the past as the South Seas, had long been visited by Chinese traders and pilgrims. But when Admiral Zheng He made various expeditions to Southeast Asia (and further west) in the first part of the fifteenth century, there were few Chinese in the region; it was not until the end of the eighteenth century that there were significant Chinese settlements in different Southeast Asian ports. These earliest Chinese settlers were traders.

In the nineteenth century, many Chinese migrated to Southeast Asia and the Americas. Most of them were recruited as coolies or indentured laborers. This was the time of the Taiping Rebellion (1850–1864) in China, which had brought about much suffering in South China; many peasants from the region were willing to migrate overseas to secure a better livelihood, while a number of colonial economies welcomed Chinese labor. In the Americas, slave trade had just ended after a civil war, and coolies were needed to replace slaves. In places like Cuba, British Guiana, and Peru, coolies were in fact treated like slaves to work in sugarcane and other agricultural plantations, build railroads, and even dig guano. In North America, Chinese coolies were recruited for railroad construction in the United States during the 1860s and in Canada during the 1880s. The earliest Chinese migrants in Panama were indentured laborers recruited to build the Panama Railroad in the 1850s.

The migration of Chinese in the nineteenth century to North America, as well as to Australia and South Africa, was also linked to the gold rush. For example, Chinese migration to Canada began with the Fraser River gold rush in 1858. The early Chinese immigrants to North America, however, suffered from white racism and opposition from local organized labor. The United States introduced the Chinese Exclusion Act in 1882 to restrict and discriminate against Chinese immigration. Not until 1965 did the New Immigrant Act abolished quotas of immigrants based on national origins. And the introduction in 1967 of Canada’s universal points system—in which immigration officers assigned points for certain criteria such as education level, the availability of suitable employment, age, and fluency in English or French—helped to prevent racial discrimination against immigrants entering Canada.

Compared to the migration to North America, there were relatively less Chinese who migrated to Europe in the nineteenth century. Nevertheless, the Allied Forces in World War I recruited more than 100,000 laborers from Shandong, Shanghai, and Zhejiang to serve on the war front in such roles as cooks and trench diggers. In Russia, Chinese laborers were recruited also during World War I to build railways. The more affluent European countries attracted Chinese migrants from their former
colonies. The United Kingdom attracted Chinese from Malaysia, Singapore, and Hong Kong, both students and professionals. Many of the migrants from Hong Kong established and worked in Chinese restaurants. Chinese from Indonesia and Suriname were attracted to the Netherlands, where they are still very visible in the twenty-first century. After the defeat of the Americans in Vietnam in 1975, many Chinese from Indochina migrated to France.

The 1920s and 1930s saw another surge in Chinese migration overseas, especially from Fujian and Guangdong, as young men sought to escape kidnapping by bandits or recruitment by soldiers to fight in the civil war between the Nationalists and the Communists. Migration from China subsided after World War II, however, as the independent new states in Southeast Asia restricted Chinese immigration. There was a further surge before the founding of the People’s Republic of China (PRC) in 1949; after which migration became extremely difficult. With the opening of China in 1979, Chinese were again freer to migrate, especially to the richer industrial West. There were also Chinese who “re-migrated” from the poorer south to the richer north, such as from the Caribbean to Canada. The years preceding the British handover of Hong Kong to Communist China saw the migration of many Chinese from Hong Kong to the United States, Canada, Europe (especially the United Kingdom), Australia, and New Zealand.

Today overseas Chinese of similar regional origins in China often settle near each other outside of China (such as the Hokkiens, Hakka, Cantonese, and Teochiu in Southeast Asia, the Taishan Chinese in America, or the Hakka in Calcutta and Jamaica). Although they might assimilate the diverse cultures of their new locales (by learning to speak Tagalog or Malay or Spanish, for instance) many of them, bonded by their national origin, still share a common interest in various aspects of Chinese symbolism and civilization. While most overseas Chinese originated from the southern provinces of Fujian and Guangdong, today many of the migrants in Europe are from Zhejiang, especially Wenzhou. There has been overland migration from Yunnan to mainland Southeast Asia, especially Myanmar (Burma) and Thailand, where there is a significant population of Yunnanese Chinese. There are small numbers of Chinese who migrated from elsewhere in China; for instance, there is a small community of Chinese in Sabah, Malaysia, whose forebears migrated from Hebei and Shandong.

**Overseas Chinese and China**

Chinese migrants have always maintained some ties with qiaoxiang, their native region in China. This included returning to China to visit relatives or to marry. The early migrants were generally men, while women were left behind in China. There was thus a large number of “living widows,” wives who were visited by their husbands once every few years and who were dependent on them for remittances. The unlucky ones never saw their husbands after some years passed, as the men married local women in the lands where they settled. By the end of the nineteenth century, more and more women emigrated from China, resulting in overseas Chinese communities with a more balanced ratio of men to women, especially after World War II. While the women also suffered from patriarchal restriction in the early period of migration, most eventually were able to receive a modern education, and many contributed significantly to running family businesses. But the lack of women in the early period of migration resulted in many men marrying local non-Chinese women, giving rise to some racially mixed populations, such as the Chinese Mestizos in the Philippines and the Creoles in the Caribbean. Although originally racially mixed, the Chinese Peranakan in insular Southeast Asia eventually married intensively among themselves and with Chinese migrants, and they have remained Chinese, albeit with a localized identity, such as the Babas in Malaysia and Singapore.

There always had been transnational networks between overseas Chinese and their relatives in China. With the opening of China since 1979, the advance in transportation and Internet technologies, and the expansion of global capitalism, today’s transnational networks are even more intense and frequent. Overseas Chinese have contributed significantly to investments in China, although the bulk of the investors are usually the Chinese in Hong Kong and Taiwan. The Chinese, because they speak Mandarin or a relevant Chinese language and have contacts through the wider Chinese networks, may be in an advantageous position to establish the guanxi

© 2009 by Berkshire Publishing Group LLC
(personal relations) so necessary in business ventures. At the same time the overseas Chinese are able to play a part in attracting investment from China to their respective countries.

The migration of Chinese today also takes the form of overseas Chinese re-migrating to China, since the expanding economy and the presence of international investments offer many business and professional opportunities. These returnees, called haigui, are different from the returning overseas Chinese called guiqiao, who were mostly Chinese from Southeast Asia who went back to China to study either before or soon after the establishment of the PRC, as well as those who left Indonesia because of anti-Chinese policies. Many of the latter returnees were sent to overseas Chinese farms (huaqiao nongchang); many of these returnees later migrated to Hong Kong in the 1970s, some even earlier.

Unlike the early migrants, now it is common to find these entrepreneurial Chinese leaving their families outside China while the men (usually) return to work in China or in both China and their newly adopted countries. This so-called astronaut family strategy came to prominence after many Chinese from Hong Kong migrated prior to 1997, when the British relinquished the territory to China, although the men later returned to work or do business in Hong Kong after finding that Hong Kong had remained relatively unchanged and stable. Worth noting are the many new migrants who left China after 1978, both legal and illegal: Among these are the illegal migrants brought by the snakeheads (smugglers) to Europe and North America. Most current migrants, in contrast to migrants of the past, are students and professionals. Many of them continue to identify strongly with both China and their new country, negotiating their identities as both, for instance, Australians and Chinese. So significant in number are they that the Chinese government has attempted to gain their support for nationalistic Chinese causes, especially by

influencing new migrants’ associations. Indeed, with its emergence as a big power and an economic giant, China is also seeking to have political and cultural influence among overseas Chinese and the local societies. The establishment of Confucian institutes (kongzi xueyuan) worldwide is an example, and so are the roles played by the Chinese embassies and the overseas Chinese organizations in keeping close contact with leaders of Chinese associations inside China. While the descendants of older migrants may not have the same emotional attachment to qiaoxiang or China in general, the curiosity about their ancestors’ homeland and the religious links with the lineages and temples in China continue to preserve their cultural ties with China. After all, China is the land of Chinese civilization, and it is always culturally relevant to the Chinese, whether in China or overseas.

Painting as an art form came into its own in the Han dynasty, and would later join poetry and calligraphy as one of the “three perfections” of the scholar-gentleman (wenren). Styles of post-imperial painting were affected by political turmoil, repression, and ensuing reforms; twenty-first century painters now have the freedom to challenge viewers with controversial subject matter.

Painting—along with poetry and calligraphy—is one of the “three perfections” of the scholar-gentleman (wenren) in Chinese culture. Painting and calligraphy, the latter being the means by which poetry was traditionally recorded, use essentially the same materials—brush, ink, and silk or paper—and depend on line for expression. The brush is of greatest importance in controlling the quality of the line. The thickness, flexibility, and readiness of the brush to absorb ink allow for the variety of strokes that an artist can achieve.

As early as the Neolithic period (8000–5500 BCE) evidence of painting in China can be found in the swirling abstract patterns on Yangshao painted pottery. Bronze décor of the Shang (1766–1045 BCE) and Zhou (1045–256 BCE) dynasties shows further development of pictorial art. These patterns and images were symbolic and were believed to possess special powers. At this time artists also produced wall paintings. The archaeological remains are fragmentary and few, but early texts confirm that surfaces were covered in painted designs. Painting was found in other media, too: During the Warring States period (475–221 BCE) painted silks and lacquers, especially those of tombs from the state of Chu, reflect the development of regional artistic styles.

Achievements of the Han Dynasty

Painting in China came into its own during the Han dynasty (206 BCE–220 CE), which inherited the tradition of painting murals from its predecessors during the Warring States period and the Qin dynasty (221–206 BCE). The subjects of Han painting, because of the increasing influence of Confucian thought, included models of proper social and moral behavior. But much of what is known about painting of that time is found only in written records, with only stone reliefs, pictorial clay tiles, tomb murals, painted lacquer, and a few silk paintings still in existence to provide visual evidence. The paintings from the tombs at Mawangdui in Changsha, Hunan Province, are among the most important examples.

Although they are different from paintings on paper or silk, clay and stone tile reliefs give a more complete sense of the use of pictorial space during the Han dynasty. The stamped, incised, or molded tomb decorations indicate interest in the afterlife, Confucian themes, and human activity. These relics, with fragmentary paintings found on tomb walls, show the Han artists’ ability to depict receding space and their interest in observing nature.
Earliest Masters

The earliest known Chinese painting masters lived after the Han dynasty collapsed. The first treatises on painting and calligraphy also date from that time. Xie He’s (c. 500–c. 535) *Six Canons of Painting*, which outlines early painting theory, is the earliest and most influential example. Although little painting exists from this time (largely because it was destroyed during periods of social and political upheaval), the copies and fragments of works tell us of a considerable interest in Confucian subjects. One work, attributed to Gu Kaizhi (c. 344–c. 406), is *Admonitions of the Instructress to the Ladies of the Palace*. Rendered in ink and color on silk, this handscroll uses text and image to outline wifely virtues and rules for proper behavior. Other important pictorial expressions of Confucian values are not paintings at all, and yet indicate the development of certain painting conventions. An engraved stone sarcophagus, illustrating tales of filial piety and dating to the sixth century, details the Confucian theme of having respect for elders and shows as well the beginning of landscape elements in art and an increasing confidence in depicting space. The sarcophagus is now in the Nelson-Atkins Museum of Art in Kansas City, Missouri.

Buddhism was introduced to China during the Han dynasty and began to flourish during the North and South dynasties (220–589 CE). The Buddhist cave-temple site of Dunhuang, on the eastern edge of the Gobi Desert, has the greatest collection of wall paintings. Artists began painting at Dunhuang in the fourth century and continued for several hundred years. The paintings there, combining Chinese and central Asian elements, are characterized by a vitality unsurpassed in early Chinese art, and they continue to provide inspiration for artists in the twenty-first century.

Painting at Its Pinnacle

After centuries of disunion China was reunited under the Sui dynasty (581–618 CE). The dynasty lasted only thirty-seven years, but it set the stage for the Tang dynasty (618–907 CE), China’s most cosmopolitan and glorious period. During the Tang dynasty painting achieved great heights. For example, the first imperial painting academy was established at the court and attracted many notable artists, such as Wu Daozi (flourished 720–760), the master of the monochromatic technique; Yan Lide (d. 656) and his brother, Yan Liben (d. 673); Li Sixun (651–716) and his son Li Zhaodao (c. 675–741), famous for their landscapes in the blue-and-green style; and the horse painter Han Gan (flourished 742–756). Although few paintings that survive can be firmly attributed to these artists, enough examples exist to give a sense of the character of their work. Those of Yan Lide and Yan Liben epitomize early Tang figure painting. The figures were first outlined in black, and then the colors were filled in, using some shading. Wu Daozi developed *baimiao*, or “white line,” a monochromatic technique that focused on calligraphic line. This simple method would influence later landscape artists, and it contrasted sharply with the more complex and strongly colored landscape paintings of Li Sixun and Li Zhaodao. Scholars associate the painter and poet Wang Wei (699–759) with the development of true monochrome landscape painting, where the focus was on nature rather than on narrative.

Song Dynasty Landscapes

The Song dynasty (960–1279) was a period of political decline and yet one of intellectual and artistic achievement. The growing number of patrons and the abundance of leisure time, combined with the rise of neo-Confucianism, contributed to a flourishing intellectual and artistic environment in which landscape painting reached its pinnacle. Song dynasty paintings would inspire artists into the Qing dynasty (1644–1912).

The monumental landscape characterizes painting of the Northern Song period (960–1126). In this style artists broke free from Tang influence and created a style that was purely Song. The early masters of the style were Fan Kuan (flourished c. 990–1030) and Li Cheng (919?–967?). Their works exhibit the rationalism and realism characteristic of the period. Artists conveyed the sense of distance and depth with towering mountains surrounded by clouds and mist, detailed foregrounds of rocks, and weathered, aged trees. Under Li Cheng’s student Guo Xi (c. 1020–c. 1090), this style reached a climax. His greatest work, *Early Spring*, is one of the most important works in the history of Chinese painting.

The monumental landscapes were scaled down to small scenic views near the end of the Northern Song
dynasty. These paintings, their subjects often viewed from bird’s-eye perspectives and through veils of mist, were more poetic and softer in feeling, as exemplified in the work of Mi Fu (1051–1107) and his son Mi Youren (1072–1151).

China’s first important painting academy began during the Northern Song dynasty, formed in the twelfth century under the Huizong emperor (1082–1135). At this academy teachers encouraged artists to paint in a more literal style, going beyond mere technical performance to capture the subject, usually flowers and birds. The Huizong emperor himself was a talented calligrapher and painter as well as a collector and connoisseur, and several of his works survive. His talent, however, did not extend to military matters; the invading Jin armies captured him in 1126, and he died in prison. The newly founded Southern Song dynasty (1126–1279), however, continued Huizong’s so-called Academy style in the new capital of Hangzhou.

Artists of the early years of the Southern Song academy featured some who had worked in the north, including landscapists as well as bird-and-flower painters. The landscape painters Ma Yuan (flourished c. 1190–c. 1225) and Xia Gui (c. 1180–1230) created the Ma-Xia style, in which the artist focused on a specific view of the natural world and used empty space by eliminating some detail and highlighting the extremes of distance and foreground.

Chan (the school of thought known in Japan as “Zen”) Buddhist painter-priests were also working at this time. They used more spontaneity with their brush and ink in capturing the essence of subjects, as exemplified in the work of Muqi (c. early thirteenth century–after 1279).

**Scholar-Painters of the Yuan Dynasty**

In the fourteenth century the Mongol conquests of the Southern Song empire devastated the Chinese. Although the Mongols employed some Chinese scholars at their court, most scholars refused to serve these “barbarian” rulers and dedicated themselves instead to painting, poetry, and calligraphy. Because of this dedication, the brief Yuan dynasty (1279–1368) included a great development in the arts and produced some of China’s greatest masters.
Zhao Mengfu (1254–1322) was one artist who was criticized for serving the Mongols. Zhao, a descendant of the Song imperial line, took a job in the Yuan bureaucracy and distinguished himself as a painter. His handscroll, *Autumn Colors on the Qiao and Hua Mountains*, with its varied, interwoven, and textured brush strokes, remains one of the great paintings of this period.

As the Yuan dynasty came to a close artist studios became gathering places for *wenren*. The scholar-gentlemen painted not as a means of livelihood, as did professional painters, but rather for personal expression and enjoyment. The best-known of these literati painters were the “Four Great Masters”: Wu Zhen (1280–1354), Ni Zan (1301–1374), Huang Gongwang (1269–1354), and Wang Meng (1308–1385). They refused to serve the Mongol bureaucracy and stressed an attitude of art for art’s sake, preferring landscapes to other subjects and working with ink on paper. The sharpness and purity of these media highlighted their meticulous, almost calligraphic, brushwork. Their theories of painting would influence later artists.

**Restoration under the Ming Dynasty**

The Mongols were driven out by the mid-fourteenth century, and China was again ruled by the Chinese under the Ming dynasty (1368–1644). With this new rule came the desire to return to Chinese traditions and to purge any memory of barbarian rule.

Because artists looked to the past and were influenced by the masters of the Tang and the Song dynasties, painting during the Ming period tended to be conservative. Distinctions between amateur and professional painters continued in the two principal schools. The conservative Zhe school—so named because one of its most prominent members, Dai Jin (1388–1462), came from the southeastern province of Zhejiang—consisted of professional and court painters who looked to Xia Gui and Ma Yuan of the Song dynasty for their inspiration. Zhe painters, in turn, had a strong influence on later artists. The Wu school, named after the Wu district near Suzhou where many scholar-painters lived and pursued art for pleasure, looked to the Four Great Masters of the Yuan dynasty—and the spirited sense of freedom from foreign court service that informed their painting. Wen Zhengming (1470–1559)
and Shen Zhou (1427–1509) were the leading masters of the Wu school.

It is not always easy to distinguish between the professional painters who worked in the styles of the Song dynasty and the amateurs who based their work on the Yuan dynasty artists. Three mid-Ming masters emerged, perhaps influenced to a lesser or greater extent by both schools: Tang Yin (1470–1523), Zhou Chen (d. c. 1536), and Qiu Ying (flourished c. 1522–1552).

The theorist and painter Dong Qichang (1555–1636) provided new impetus in the arts by the late sixteenth century. Dong, in studying the division between northern and southern schools of Chan Buddhism that began during the Tang dynasty (the “northern” and “southern” labels referred to their opposing views, not to their geographic positions), felt that painting similarly could be divided into two schools. The northern school of professional, often decorative painting with a focus on technical expertise, was characterized by the colored landscape style of Li Zhaodao and others who worked in the manner of Song artists Xia Gui and Ma Yuan. The southern school of painting, which favored poetic expression, ink over color, and free brushwork over meticulous detail, was characterized by the works of Wang Wei and other literati painters who followed the Four Great Masters of the Yuan. Dong ultimately favored the southern literati school, and his theory was especially influential when literati painting became the conventional (orthodox) style for artists of the early Qing dynasty.

The orthodox style is represented by the works of the Four Wangs: Wang Shimin (1592–1680), Wang Jian (1598–1677), Wang Hui (1632–1717), and Wang Yuanqi (1642–1715). The most traditional of the four was Wang Shimin, who assimilated Song and Yuan styles. The most original was Wang Yuanqi, who was closer to the individualist painters than the other three.

Some individualist painters, like their Yuan-dynasty predecessors, did not want to serve under foreign rulers and thus retired from official life to write poetry and to paint privately. Zhu Da (also called “Bada Shanren,” 1626–1705) had an abbreviated style, capturing his subjects with a minimum of brush strokes. The monk-painter Kuncan (also called “Shiqi,” 1642–1707) used bold washes, much deeper color, elegant detail, and in later life adopted an almost abstract treatment of landscape. Gong Xian (c. 1619–1689) was one of the most forceful of the individualists. His style features velvety ink and somber landscapes. In contrast, Hongren (1610–1664), the monk-painter from south China, painted spare landscapes composed of refined and simple brush strokes first seen in the work of Ni Zan of the Yuan dynasty.

Painting at the Qing court was influenced by the presence of European artists in the eighteenth century. The Italian Jesuit Giuseppe Castiglione (Lang Shining, 1688–1766) spent years in Beijing and combined Western realism with Chinese conventions. But his paintings, although admired by the Qing rulers, were little appreciated by Chinese literati.

Qing Dynasty and the Classical Tradition

The high point of the classical/traditional form of painting occurred under the Manchu-ruled Qing dynasty (1644–1912). During this time two basic approaches to painting existed: (1) the orthodox literati style, based on studying masters of the Song and Yuan, and encouraged by the writings of Dong Qichang, and (2) the individualist style, favored by many Ming loyalists who cultivated highly original styles, often to express frustration over another foreign rule.

The orthodox style is represented by the works of the Four Wangs: Wang Shimin (1592–1680), Wang Jian (1598–1677), Wang Hui (1632–1717), and Wang Yuanqi (1642–1715). The most traditional of the four was Wang Shimin, who assimilated Song and Yuan styles. The most original was Wang Yuanqi, who was closer to the individualist painters than the other three.

Some individualist painters, like their Yuan-dynasty predecessors, did not want to serve under foreign rulers and thus retired from official life to write poetry and to paint privately. Zhu Da (also called “Bada Shanren,” 1626–1705) had an abbreviated style, capturing his subjects with a minimum of brush strokes. The monk-painter Kuncan (also called “Shiqi,” 1642–1707) produced more complex paintings than Zhu Da and made effective use of color. Yuanji (also called “Shitao” and “Daoji,” 1642–1707) used bold washes, much deeper color, elegant detail, and in later life adopted an almost abstract treatment of landscape. Gong Xian (c. 1619–1689) was one of the most forceful of the individualists. His style features velvety ink and somber landscapes. In contrast, Hongren (1610–1664), the monk-painter from south China, painted spare landscapes composed of refined and simple brush strokes first seen in the work of Ni Zan of the Yuan dynasty.

Painting at the Qing court was influenced by the presence of European artists in the eighteenth century. The Italian Jesuit Giuseppe Castiglione (Lang Shining, 1688–1766) spent years in Beijing and combined Western realism with Chinese conventions. But his paintings, although admired by the Qing rulers, were little appreciated by Chinese literati.

The Twentieth Century to Today

Chinese art was redefined by the political turmoil of the twentieth century—led by the fall of the Qing dynasty in 1912 and followed by the May Fourth Movement of 1919, the War of Resistance against Japan (known outside China as the Second Sino-Japanese War, 1937–1945), the founding of the People’s Republic of China (1949), and the Cultural Revolution (1966–1976). Traditional literati painting faced opposition as artists began to look outside China for inspiration. Chen Shuren (1883–1949) and the brothers Gao Jianfu (1879–1951) and Gao Qifeng (1889–1933) were among artists who advocated the reform of traditional painting in the early part of the
twentieth century. They were members of the Lingnan School in Guangzhou (Canton). Gao Jianfu had substantial influence on young Xu Beihong (1895–1953), the best-known artist to blend French academic and Chinese styles. In contrast, Lin Fengmian (1900–1991), another modern master, was influenced by the fauvists and post-Impressionists.

With the founding of the People’s Republic of China art became a tool for the ideology of the Chinese Communist Party and reflected Marxist views on class, as outlined in Chinese Communist Party leader Mao Zedong’s “Talks at the Yan’an Forum on Art and Literature” of 1942. Art, according to Mao, should serve the masses and further the revolutionary cause. His Cultural Revolution created further upheaval as artists were persecuted, and many were sent to the countryside to be “reeeducated” and to learn from the peasants. Art was symbolic of party policy and was rendered on a grand scale for wide distribution, as seen in the two- and three-dimensional portraits of Mao that appeared throughout China.

**Art After Mao**

Mao’s death in 1976 ended the Cultural Revolution. There followed a gradual relaxation of government control in the arts and an openness to Western modernism. China’s young artists embraced this openness. Scar Painting was one of the first movements to emerge, seeking to address the deep societal “wounds” left by the Cultural Revolution. Avant-garde artists in the 1980s used previously banned Western-painting styles to create works that urged social reforms and called on the Chinese to break free from the past. The government attacked such art by launching its Anti-Spiritual Pollution Campaign of 1982. This campaign resulted in a stronger and more widespread avant-garde movement in 1985 (known as the “’85 Movement”), which produced such artists as Xu Bing (b. 1955), whose work, *Book from the Sky* (1987), was made of four thousand printed characters that, although they closely resembled classical Chinese, were in fact meaningless. Another noted artist was Cai Guo-Qiang (b. 1957), who came to international prominence by detonating gunpowder on paper or canvas. In 1989 the events of Tiananmen Square brought a return to conservatism.

Two new forms of avant-garde art emerged in the early 1990s: Political Pop and Cynical Realism. Political Pop mixes Marxist ideology and capitalism with American Pop art. Cynical Realism addresses serious ideological issues with irony, humor, and cynicism. Political Pop’s commentary about the intersection of consumerism and ideological propaganda is evident in Wang Guangyi’s
poster-style painting, Great Castigation Series: Coca-Cola (1993), in which three Cultural Revolution–era workers are juxtaposed next to a large Coca-Cola logo. Major artists of Cynical Realism include Zeng Fanzhi (b. 1964) and Yue Minjun (b. 1962). Zeng’s Mask Series 1996 No. 6 (1996), depicting eight masked figures dressed as Red Guards, set a record price for Asian contemporary art when it sold at auction in 2008. An example of the Chinese avant-garde and its brush with political controversy is Yue’s Execution (1995). Inspired by the Tiananmen Square crackdown, the painting depicts men pointing mock guns at grinning men standing in their underwear in front of a red wall that resembles the red wall of the Tiananmen Rostrum.

Although Chinese painters continue to be influenced by Western styles, these artists also look to their long artistic tradition to create works that are a synthesis of China’s culture and current international styles.

胸有成竹
Xióng yǒu chéng zhú
Imperial courts throughout China’s long dynastic history employed professional painters—as well as architects, artisans, ceramists, and gardeners—whose endeavors shaped the aesthetic experience of palace life. Courts were indeed the arbiters of artistic taste through the ages. The status of painters rose dramatically over the years, with the most prolific and renowned working from the Five Dynasties period to the Southern Song.

Professional court-employed artists served the aesthetic needs and desires of imperial dynasties throughout much of China’s history. Artists of the same period would often painted similar subjects using fine, meticulous techniques. Court painters became prominent during the Sui dynasty (581–618 CE) and the Tang dynasty (618–907 CE), but the roots of palace painting go back to Gu Kaizhi, a court official of the Eastern Jin period (317–420 CE). Gu’s famous painting, *Admonitions of the Court Instructress to Palace Ladies* (handscroll, ink and color on silk), contained strong Confucian moralistic messages about ways in which ladies should conduct themselves.

An detail of an scroll from the Jurchen-Jin dynasty titled *Admonitions of the Instructress to the Palace Ladies* by Gu Kaizhi (c. 344–406). In this scene royal children are groomed by their nannies as their parents look on indulgently. COLLECTION OF THE BRITISH MUSEUM.
During the Tang dynasty both Chinese and foreign artists were attracted to the court. The most celebrated were Yan Liben (600–673) and Wu Daozi (680–959). Yan Liben's *The Imperial Sedan Chair* (handscroll, ink and color on silk, Palace Museum, Beijing) records an important meeting between the Tang emperor Taizong (reigned 712–756) and the Tibetan ambassador in 641. In this painting Taizong is dressed in a scholar-official manner and surrounded by female attendants. He is one and one-half times the size of his subjects, indicating his importance. Similarly, the red-robed Tibetan ambassador is larger than his companions and is placed in a forward position. The emperor looks benign and appears to govern his vast empire by reason and persuasion rather than by force. The Tibetan ambassador is submissive to Taizong in his facial expression and hand gesture. This painting thus advocates the authority and virtue of the Tang emperor.

Tang court painters also developed independent genres in which they depicted female figures, birds and flowers, and horses. The two most famous figure painters were Zhang Xuan and Zhou Fang of the eighth century. A copy of Zhang Xuan's *Court Ladies Preparing Newly Woven Silk* portrays four ladies on the right side of the scroll holding pestles and smashing silk. To their left one lady sews while the other spins the silk. In the third scene one is ironing the silk, and three more are holding the silk straight and tight. The fifth lady is the youngest; she playfully lowers her head under the silk banner. Although these ladies are working together, none is interacting or communicating with any other. This expression of their isolation, together with their exquisite gestures, elegant dress, and calm demeanor, conveys a mood of tranquility and a profound sense of separation and loneliness.

**Cherished Masterpieces**

During the Five Dynasties period (907–960 CE), the Northern Song dynasty (960–1126), and the Southern Song dynasty (1127–1279) palace painting developed significantly. Works by such masters as Li Cheng, Fan Kuan, Dong Yuan, Ju Ran, and Guo Xi...
have been cherished ever since. Li Cheng’s *A Solitary Temple amid Clearing Peaks* (hanging scroll, ink on silk, c. 960, Nelson-Atkins Museum of Art, Kansas City), for instance, has a Buddhist temple sitting atop a small mountain in the center middle ground. Mist separates the temple from the monumental mountains directly behind it. The balance between the heroic rising mountains and the mist and the water flowing down the mountain recalls the interactive forces of the yin and yang. The centrality, order, and stability of the composition could symbolize the authority and power of the central court. Another politically charged palace painting expresses their isolation and, together with their exquisite gestures, elegant dress, and calm demeanor, conveys a mood of tranquility and a profound sense of separation and loneliness.

*Zhang Xuan’s Court Ladies Preparing Newly Woven Silk.* Although the women are working together, none is interacting or communicating with any other. This scroll painting expresses their isolation and, together with their exquisite gestures, elegant dress, and calm demeanor, conveys a mood of tranquility and a profound sense of separation and loneliness.
painting is *Peace Reigns over the River* (Zhang Zeduan, ink and color on silk, dated to the eleventh or twelfth century, Palace Museum, Beijing). This long handscroll provides a panoramic view of life in the Northern Song capital at Bianliang (modern Kaifeng, Henan Province); most art historians concur that the scene depicts the city on the day of the Spring (Qingming) Festival. Zhang Zeduan painted the city with remarkable realism: Hawkers, camel trains, pedestrians, vehicles, restaurants, city gate, hotels, pawnshops were all depicted with painstaking detail. The most intense moment happens in the middle of the painting, when the crewmen of a boat hastily lower their mast before it almost hits the rainbow-shaped bridge. On the bridge onlookers are caught in this drama. We can imagine that the emperor must have taken enormous pride viewing the prosperous urban life under his own wise rule.

Particularly under the rule of Emperor Huizong (1082–1135) were court painters organized as a systematic and well-ordered group. Huizong reformed and structured the imperial Painting Academy and promoted painting to the same status as calligraphy and poetry. Great masters of figure painting, landscape, and birds and flowers were appointed. During the Southern Song dynasty the works of Ma Yuan and Xia Gui of the twelfth and thirteenth centuries typified the achievements of the Southern Song academy. Both preferred the ax-cut technique to depict the texture of rocks and used off-centered composition. Mist and water define most of the painting space. A lyrical, mystic, and serene mood permeates Ma Yuan’s and Xia Gui’s paintings.

In the Yuan (1279–1368) and Ming dynasties (1368–1644) artists were enthusiastically enlisted to serve the court but were not organized in an independent painting academy. The leading Yuan figure was Wang Zhengpeng, who specialized in drawing architectural settings in fine details. The Ming palace figure paintings were predominately political scenes in which emperors were

**Detail of the painting The Imperial Sedan Chair, handscroll, ink and color on silk by Yan Liben. The painting records an important meeting between the Tang emperor Taizong (r. 712–756) and the Tibetan ambassador in 641. Emperor Taizong is surrounded by female attendants.**
portrayed as benevolent and wise. Virtuous rulers and ministers of the past were also depicted to serve educational purposes. Other masters, such as Bian Jingzhao (active 1426–1435), Lin Liang (active 1488–1505), and Lu Ji (active 1500), depicted birds and flowers. One example is Bian Jingzhao’s *Bamboo and Cranes* (hanging scroll, ink and color on silk, fifteenth century, Palace Museum, Beijing), which depicts two proud cranes underneath bamboo, Chinese traditional symbols of longevity, purity and perseverance.

### Cultural Diversity

During the Qing dynasty (1644–1912) palace painting flourished during the reigns of emperors Kangxi, Yongzheng, and Qianlong. The arrival of Jesuit missionaries and other Europeans from Spain, Portugal, The Netherlands, Italy, England, and France in the Qing court, including Giuseppe Castiglione (1688–1768), made possible interaction among Chinese and European painters. Chinese painters learned from their Western counterparts in the application of light, shade, scale, perspective, and copperplate etching techniques, while European painters adopted traditional Chinese painting subjects. The most popular palace paintings recorded contemporary events. Many of such paintings are handscrolls that bear bright colors of red and blue against grayish-yellow background.

Isometric perspectives were used to indicate depth and visual recession, and great architectural detail, clearly differentiated official ranks and clothing, and freshly portrayed trees, street, and clouds were included.

Flower and bird painting is a traditional Chinese painting genre that focuses on depicting plants and animals. It is much appreciated for the evocation of nature’s changing seasons and the painter’s lyrical emotions. In technique flower and bird painting uses either meticulously detailed and highly refined brushstrokes and colors or spontaneous lines, contours, and compositions for symbolic self-expression.

The earliest extant flower and bird painting, a scene with two crows perched on the branches of a tree, appears as part of the decorative embellishments painted on the exterior walls of an Eastern Han dynasty (25–220 CE) earthenware house (a tomb model, part of Han funerary tradition), an artifact now at the Nelson-Atkins Museum of Art in Kansas City, Missouri. The first known painter to specialize in flower and bird paintings, however, was the fourth-century painter Liu Yinzu, according to the Classified Record of Ancient Paintings (Gu hua pin lu) by Xie He, an art critic and painter of the sixth century.

Flowers and Birds through the Dynasties

During the Five Dynasties period (907–960 CE) flower and bird painting developed into an independent genre. During this time Huang Quan, Huang Jucai, and Xu Xi established a solid flower and bird painting tradition that profoundly influenced painters of the Song dynasty (960–1279) and later generations. On Huang Quan’s Sketches of Birds and Insects (handscroll, ink and color on silk, Palace Museum, Beijing), birds, turtles, bees, cicadas, locusts, and other small creatures are naturalistically rendered and colored in great detail. The variation of size, color, light and shade, gestures, perspectives, and composition in this picture represents a rhythmic and balanced view of the beauty of nature.

Birds in Autumn by Lin Fengmian (1900–1991). Lin often evokes a feeling of loneliness and isolation in his flower and bird paintings.
During the Northern Song dynasty (960–1126) painters made significant advancements over previous traditions of flowers and birds. A leading figure was the court painter Cui Bai (flourished eleventh century). His *Magpies and Hare* (hanging scroll, ink and color on silk, 1061, National Palace Museum, Taipei, Taiwan) captures the surprised reaction of a hare turning its head 180 degrees back toward a pair of tweeting magpies. The round contour of the hare parallels the gently slanting hill. Broad, loose brushstrokes depict the hill, which is counterbalanced by the diagonal, jagged tree. Grasses, branches, and leaves sway in the autumn wind.

Toward the end of the Northern Song dynasty the patronage of Emperor Huizong (1082–1135, reigned 1100–1125) ensured the popularity of flower and bird paintings. Indeed, Huizong himself was an accomplished painter. He emphasized the visual representation of poetic ideas that were rooted in classical beauty and realistic observation. In his *Finches and Bamboo* (handscroll, ink and color on silk, Metropolitan Museum of Art, New York) two birds are perching on bamboo branches on a bright spring morning. The bamboo leaves are colored in turquoise green. The contrast between void and solid spaces, black and white ink tones, and the formations of the rocks and the organic growth of the bamboo branches represents the emperor’s refined taste for poetic ideals. It is a vision of a sequestered ruler in a harmonious and quiescent world.

During the Yuan dynasty (1279–1368) flower and bird subjects were painted by both conservative court painters and literati scholar amateurs. The court painters followed the Song tradition in the naturalistic portrayal of grass carps, minnows, shrimps, lotus flowers, water birds, and so forth, whereas the literati painters, including Zhao Mengfu (1254–1322), Wu Zhen (1280–1354), and Wang Mian (1287–1359), were particularly in favor of bamboos and plum blossoms because bamboos and plums, together with the pine tree, were considered three friends of the cold, wintry season and stood for perseverance, purity, courage, and regeneration of a virtuous gentleman.

During the Ming dynasty (1368–1644) monochrome ink paintings developed in the works of Lin Liang (1416–1468), Shen Zhou (1427–1509), Tang Yin (1470–1524), Chen Chun (1483–1544), and Xu Wei (1521–1593). Among them Xu Wei used calligraphic and spontaneous brushstrokes in a highly expressive mode. In his *Grapes* (hanging scroll, ink on paper, Palace Museum, Beijing) a grape bough bears sprays of branches and transparent grapes. Flower and bird paintings remained a major genre...
during the subsequent Qing dynasty (1644–1912). When western Europeans came to the Qing court, Chinese painters learned oil painting techniques and applied perspective, light, shade, and the illusion of three dimensionality to their painting. Zhang Weibang’s *The Glory of the New Year* (hanging scroll, ink and color on silk, Palace Museum, Beijing) is such an example and recalls the still-life painting in the Netherlands in the seventeenth and eighteenth centuries. Other accomplished painters included Shen Quan (1682–1763), Ren Bonian (1840–1895), and Zhao Zhiqian (1829–1884). Ren Bonian’s *Pheasants and Dahlia* (hanging scroll, ink and color on paper, Palace Museum, Beijing) separates areas of color from ink. Thin ink wash defines the flower branches, while thick ink depicts the bird plumes. Intense red color is contrasted with the green leaves.

**Post-Imperial Tastes**

A leading artist of the flower and bird genre of the twentieth century was Qi Baishi (1864–1957), whose most common subjects were fish, shrimp, crabs, and frogs. In *Shrimp* (hanging scroll, ink on paper, 1949, China Fine Art Gallery, Beijing), Qi Baishi uses different shades of ink and adds water to the paper surface to express the transparency, liveliness, and playfulness of the water-dwelling creature. Another artist, Yu Feian (1889–1959), painted flower and bird subjects with meticulous detail in a style that follows the Song tradition. In his *Peonies* (hanging scroll, ink and color on paper, China Fine Art Gallery, Beijing) the heroic peonies in intense red and luminous yellow colors are supported by silver gray and turquoise green stalks and leaves.

After the establishment of the People’s Republic of China by the Chinese Communist Party in 1949, painting often served propagandistic purposes, and most artists were employed by the state prior to 1980. After the end of the repressive Cultural Revolution (1966–1976), artists

were able to express personal feeling and individuality. For instance, an important painter, Lin Fengmian (1900–1991), evokes a feeling of loneliness and isolation in his landscape and flower and bird paintings.

Chinese painters have used flowers, birds, and other creatures as an important genre since the Five Dynasties period. Throughout its development different techniques and traditions have been established, and flower and bird subjects have been used to represent different moods, personal feelings, or aesthetic tastes of the artists and the state.

**Huang Quan’s Sketches of Birds and Insects** (handscroll, ink and color on silk, Palace Museum, Beijing). Birds, turtles, bees, cicadas, locusts, and other small creatures are naturalistically rendered and colored in great detail. The variation of size, color, light and shade, gestures, perspectives, and composition in this picture represents a rhythmic and balanced view of the beauty of nature.
Folk painting in China focuses on subjects drawn from myth, drama, and fiction, as well as regional rituals, customs, and landscape. It includes forms such as woodblock prints commemorating the New Year or illustrating a popular drama or novel, and painted door gods to ward off demons and bad spirits. As a result of Mao’s ideology, it is an art not only by the people but for the people.

Folk painting in China is a traditional genre loosely defined as “art by the people” (mín jìnyìshù). It most often refers to art created by persons with no formal art training and, more specifically, to paintings by and for commoners—in contrast to work done by and for aristocrats and literati elite during dynastic eras. But the twentieth century brought to the genre the influence and the participation of professionally trained artists, as well as a starring role in the political agenda of Mao Zedong, who believed that art existed to serve the people as it championed his revolutionary cause.

Mainstream versus Folk Painting

Mainstream and folk paintings use many of the same pictorial subjects: birds and flowers, various religious deities (including Buddhist, Daoist, and folk belief) or literary and historical narratives. In general subjects such as folklore, festivals, traditional rituals and customs (such as funerals), and drama play a significant role in folk painting. But the scope of folk art, including painting, masks, silk embroidery, toys, kites, and architectural decorations, is less precise than that of mainstream art, and discussing its sources can be quite complex. This is because of the transformation and evolution of many areas that folk art draws on, such as ethnology, religious studies, anthropology, sociology, and other disciplines.

By including two-dimensional pictorial representations within the category of folk painting, the possibilities expand. New Year prints and genre painting occupy a significant portion of this cultural production. The historical period associated with these works focuses mainly on modern and contemporary times, from the seventeenth century to the present. It is important to recognize that such cultural works developed in response to particular audiences. They reflect differences in preferences and taste of subjects, choice of pictorial representations, and techniques according to the fashion admired by (and traditional to) particular regions and provinces.

Provincial Forms

The regions and provinces producing folk prints and paintings that have drawn the attention of scholars are predominantly along the coastal rim from Shandong to Fujian provinces. Beginning in the nineteenth century, the city of
Suzhou turned out a particularly flourishing and prosperous supply of woodblock prints, called Suzhou ben, representative of the south. Because of its convenient location near Shanghai and other vital cities, Suzhou folk artists gradually combined different regional styles in their prints. The “green willow” (yangliuqing) style from Tianjin, a city north of Beijing near the Korean border, is known for its characteristic color palette and elaboration of details. Initially, Tianjin’s yangliuqing prints drew on subjects similar to those focused on in other regions, such as festivals, the New Year, and stories from popular drama.

After the mid-nineteenth century, folk artists from Tianjian developed much more sophisticated prints. Some of these prints are associated with recognized artists, such as Qian Hui’an (1833–1911). Some landscape prints exhibit perspective that suggests an acquaintance with Chinese mainstream landscape painting and, perhaps, Japanese ukiyo-e (“pictures of the floating world”) prints by Katsushiko Hokusai (1760–1839) and Utagawa Hiroshige (1791–1858). By contrast, regions located more inland, such as Shaanxi province, have maintained their provincial and regional forms. This is likely due to their geographical distance from major cities and subsequent limited exposure to outside influences.

Other provinces are noted for prints of a particular style or focus. The work of folk artists from Huxian, near Xi’an, which is called Picture Land today, has maintained a traditional feel and subject matter—harvest and the abundance of life—while rejecting highly charged political implications. Typically these works have represented themes established in the Ming dynasty (1368–1644), but they’ve been accomplished with less sophisticated techniques.

New Year and Drama Prints

Because they are popular and in annual demand, New Year woodblock prints (nianhua) are the dominant media within the category of two-dimensional folk art. The primary subjects are portraits or images of Zhong Kui and other door deities. Zhong Kui, a historical figure of the Tang dynasty (618–907 CE), became a legendary demon queller after the Song dynasty (960–1279). His ugly and grotesque image posted on house gates is believed to have the supernatural power to expel bad spirits and demons. Production of his image for use at the New Year remains popular in China, Hong Kong, and Taiwan, as well as in

Lin Fengmian (1900–1991). Opera Story, Lotus Lantern. Along with Zhang Daqian and Wu Zuoren, two other artists influenced by the New Culture Movement, Lin studied painting in the West. PHOTO BY JOAN LEBOLD COHEN.
Chinese communities around the world. Various deities bearing auspicious metaphors and implications—such as the goddess and god of children (a symbol of fertility and wealth), the god of the earth (a symbol of longevity), the god of grains (a symbol of harvest and abundance), the deity of fortune, and the deity of promotion—are also common themes in New Year prints. Other festivals, such as the Dragon Boat Festival, originally commemorating poet Qu Yuan (343–277 BCE) for his loyalty and high principles, are celebrated in this medium. Historical heroes, such as Guan Yu, or Guan Yunchang, (c. third century), who was known for his loyalty and righteousness from the Romance of the Three Kingdoms (Sanguo Yanyi) composed in the fourteenth century, was adapted by folk beliefs and become one of the main deities in Daoism and folk belief practices. Both his single image and narratives of his stories from the novel are portrayed in the prints as well.

The popularity of xiqu (stage performances, the prototype of today’s Chinese operas) during the Mongol Yuan era (1279–1368) and narratives from novels can be measured by the number of their themes found in folk prints. This is particularly observable after the sixteenth century. Of note are subjects and characters taken from the Romance of the Three Kingdoms; the Water Margin, or Outlaws of the Marsh (Shuihu Chuan), composed in the fifteenth century; and the Romance of West Chamber (Xixiang Ji), written by Wang Shifu (c. 1260–1336). The main centers for drama prints are Suzhou, Beijing, and Linfen (Shanxi) because of the popularity of operas in these regions. In the north yangliuqing prints from Tianjin are more predominant. Over the course of time, characters adapted from Chinese operas, not only the early classical novels, are identifiable in these prints.

**Folk Painting since the Influence of Mao**

Folk painting has become more clearly defined since the twentieth century. The championing of folk painting increased under the advocacy of Mao Zedong, who famously celebrated farmers and workers to the detriment of the aristocracy of the imperial past in his historical and revolutionary speech “Yan’an Forum on Art and Literature” in 1942. Subsequently, artists were encouraged to produce paintings taking farmers, workers, and other noncultural elite classes as their subjects. Such works were the mainstay in the newly celebrated genre, folk painting.

The major center for the generation of ideas and production of the art suitable as art for the people was the Lu Xun Academy in Yan’an. Yan’an was the end point of the heroic Long March (16 October 1934 to 19 October 1935). It was during this retreat of the Red Army that Mao Zedong famously led the Eighth Route Army, culminating in a political landmark and turning point for the Communist Party in 1936. A few artists followed Mao, and later more artists joined the party in Yan’an and produced woodcut prints for the wartime effort and other political propaganda. Lu Xun Academy, which established this genre, was particularly influential from the 1930s to the late 1950s and during the Great Leap Forward (1958–1961).

Mao’s idea of art for the people did not stop with professionally trained artists. Consistent with his great revolutionary program, he also encouraged untrained artists, such as peasants, to depict their genuine views of the new society. The first works inspired by this effort appeared in Pixian, Jiangsu Province. Some 1,500 farmer artists produced about 183,000 art works in 1958. The media of this large quantity of art works ranged from individual paintings to murals, and subjects focused on farm products, mostly corn and pigs.

Other folk paintings—such as papercuts, New Year pictures, and the serial pictures (lianhuanhua)—either continued to be produced or were revived during this era. Papercut, a craft that goes back to the third century CE or earlier (and which often involves mounting the cut paper onto a window or door), drew on subjects such as flowers, mythical animals, and festival icons.

The serial pictures, which are cartoon strips or pages for children and teenagers, mainly relied on historical novels or drama, such as the Romance of Three Kingdoms and the Water Margin, but expanded from historical novels to contemporary historical events to take up themes such as the Long March and stories of revolutionary heroes after the 1950s. Serial pictures continued to be an important cultural form during the Cultural Revolution. Some of the best serial pictures were produced during the 1970s. The popularity of serial pictures and, later, picture books among the general public, along with demands from the market, surpassed that of other forms of folk painting. Several famous artists, including Chen Shifa (b. 1921), have participated in this production and
enhanced the qualities and styles of serial pictures and picture books.

While some artists produced characters from Chinese literature and romance, others illustrated exotic and foreign works ranging from *The Thousand and One Nights* to *Dante's Inferno* to *The Snow Goose* (Paul Gallico, 1897–1976). Because of their artistic training, artists of serial pictures sometimes incorporated Western themes and techniques, including Russian social realism and symbolism. These innovations brought the genre of serial pictures to its peak, adding depth to the category of folk painting in China in the 1980s.

The conventional subjects of the New Year prints, including door gods, shifted into various directions under Mao Zedong’s guidelines in 1949. New themes—such as the lives of the working classes, an image of the new China, and the overturn and liberation of feudal China—were encouraged. These politically charged themes greatly influenced the range of subjects and techniques and took folk painting into a new era. The results of this new energy were particularly reflected in folk paintings from the 1970s onward. Under Mao’s encouragement folk painting was no longer an exclusive genre for peasants; art professionals (artists and art educators) were encouraged to create folk painting. As a result, folk painting became more decorative, sophisticated, and realistic. The earliest examples of twentieth-century folk painting were created by peasants in Shaanxi province, and production of folk painting spread to other regions.

Since the 1970s, many regions have developed styles that reflect significant local features in their folk painting. For example, farmers from the Shanghai region are known for tranquil water scenes; Shandong folk painting often reflects bright colors under the influence of the local tradition of *yangliuqing* prints; and art from the Xinjiang region is enhanced with Muslim motifs and designs. The diversity to be found across regions and ethnic groups in China has expanded modern folk painting toward an unlimited horizon in terms of themes, styles, and imagination. This tradition is has been well preserved and sustained in the art schools since Mao’s death. It is also visible in the fact that there are no limits on gender, age, or social class of the artists who produce folk painting. The main feature that once distinguished folk painting—the categorization of particular artists producing the work as peasants without artistic training—is no longer relevant, as professional artists with complex Chinese and Western training in techniques and styles make contributions to the genre.

**Contemporary Outlook**

With the end of the Cultural Revolution, many varieties of folk painting in various forms and media continued to be produced since the 1980s. Contemporary folk painting may have suffered somewhat in recent times because of the popularity of TV, movies, and digital products. However, as Chinese economic strength and interest in Chinese tourism increases, the value of folk painting may well increase and will, perhaps, enjoy a revival.

**Further Reading**

Landscape painting—depicting mountains, trees, waterfalls, and rivers—developed as a genre during the Tang dynasty. After the end of imperial China, landscape painting continued to develop as artists expressed the new and engaged the old.

Although painting emerged in China prior to the Han dynasty (206 BCE – 220 CE), landscape as a formal category developed much later, sometime in the Tang dynasty (618–907 CE), and was fully established as a dominant category in the Northern Song dynasty (960–1126). Prior to the Song dynasty (960–1279) landscapes appeared in various formats, such as on scrolls, on murals, on musical instruments, screens, and the walls of tomb chambers, as well as on the walls of other architectural settings, including those serving decorative and religious purposes.

The theme of landscape painting (or shan shui, mountains and water) literally and pictorially refers to mountains, trees, waterfalls, and rivers. The simple display of outdoor scenery emerged much earlier than the Northern Song era. Some spare trees along with a stylized form of hills were represented in three-dimensional objects and are in evidence on the painted coffins from the Mawangdui tomb (Changsha, Hunan Provincial Museum), dated circa 165 BCE of the early Han era. This suggestion of outdoor scenery is considered the incipient and earliest surviving landscape subject in China. The Seven Worthies of the Bamboo Grove (Nanjing, Jiangsu Province) suggests a slightly more mature and sophisticated observation of trees in terms of types. A more complexly realized landscape representation is observed in the engraving of a stone sarcophagus dated to the early sixth century (Nelson-Atkins Museum of Art, Kansas City, Missouri). This piece is also one of the earliest examples in which the artist incorporated natural elements with figures and animals into the suggestion of a narration.

Artists who either specialized in landscapes or painted subjects in landscapes were first recognized and documented in the Tang dynasty by Zhang Yanyuan in Lidai Minghua ji (Record of Famous Painting of the Previous Dynasties, finished 847 CE) and by Zhu Jingxuan in Tangchao minghua lu (Record of Famous Painting of Tang Dynasty, compiled c. ninth century). The earliest surviving scroll landscape painting is dated to the sixth century. It has the title Spring Outing (handsroll, ink and colors on silk) and is attributed to Zhan Ziqian (Palace Museum, Beijing). It is particularly noted for employing the “level-distance” view.

Three-Distance Perspectives

The descriptions of three-distance perspectives were fully theorized by Guo Xi (c. 1001–c. 1090), one of the three masters of landscape, in his Lofty Ambition of Forests and Streams (Lin Quan Gao Zhi, c. 1080, with Guo Si, son of Guo Xi). Li Sixun (651–716 CE) and Li Zhaoda (dates unknown, flourished c. 730s, son of Li Sixun) were credited and known for their distinct “gold-and-green” or “blue-and-green” landscapes. One of the most famous
and exemplary pieces of this style is Emperor Minghuang’s *Journey into Shu* (hanging scroll, ink and colors on silk, National Palace Museum, Taipei), which is attributed to Li Zhaodao. Although it is considered a Song copy of a Tang work, this painting has many characteristics of Tang painting, which are echoed in the mural paintings at the Mogao caves of Dunhuang, Gansu Province. Another notable Tang landscape painter was Wang Wei (698–759 ce). Although Wang Wei’s paintings no longer survive, his reputation as the painter of such treasures as *Wangchuan Villa* is well documented, assuring his place in history.

Scholars have traditionally considered the Northern Song dynasty as the golden age of Chinese painting. This consideration extended to the painting of landscape, which became a formal category, although the term might have been applied in the Five Dynasties period (907–960 ce) by Jing Hao (flourished 907–923 ce) in his *Bifa ji* (A Note on the Brush). During the late Northern Song era Emperor Huizong (reigned 1101–1125) not only founded the Imperial Painting Academy but also sponsored compilations that documented the imperial art collections, which formulated into two influential records: *Xuanhe shupu* (Record of Calligraphy of the Xuanhe Era) and *Xuanhe huapu* (Record of Painting of the Xuanhe Era, preface dated 1120). The *Xuanhe huapu* is particularly significant for the history of landscape painting. In this compilation landscape painting not only was treated as an independent subject among thirteen categories but also significantly occupied four chapters (juan) out of twenty in total. Forty-one painters and 1,108 paintings were included and collected by the imperial treasure house. The Three Schools/Masters of Landscape—Li Cheng (919–967), Fan Kuan (flourished c. 1023–1031), and Guo Xi (mostly known for his *Early Spring*, dated in 1072)—and their paintings were listed with other important painters in this catalogue.

Because of the differences of geographical spheres, landscapes in the Northern and Southern (1127–1279) Song dynasties changed significantly in composition, arrangement of figures and space, additive inscriptions, and overall atmosphere of painting. The monumental scale of Northern Song landscapes, reflecting the grandeur scenery north of the Huang (Yellow) River, was gradually diminished and replaced by a misty and flat level of water and lake views of the Yangzi (Chang) River delta scenery in south China, and paintings by Ma Yuan (flourished 1189–1224) and Xia Kui (flourished 1195–1224) are exemplary of this era.

The Mongol Yuan dynasty (1279–1368) brought a revolutionary era for landscapes, theories, and other subjects. The notion of the Three Schools/Masters of Landscape was established during the Yuan dynasty by Tang Hou, an art collector and connoisseur of the late thirteenth century in Hangzhou. Tang Hou’s confirmation of Li Cheng, especially, set the foundation of the landscape tradition and theory later put forth by Dong Qichang, (1555–1636) whose canon divided northern and southern schools and the gave preference to literati painting. Although the “Returning to the Past” movement in both art and literature, focusing on the Tang and Five Dynasties periods, was advocated and executed by various Yuan painters, new ideas and approaches to landscape painting co-existed among the same painters. Zhao Mengfu’s (1254–1322) *Autumn Colors on the Qiao and Hua Mountains* not only synthesized the archaic elements and ideas of the past, and the movement to return to its style, but also deliberated from the tradition into a new era of Chinese painting—naturalistic-pictorial representation of actual geographic sites—a concept that was inspired by the Mongol court’s interests in science.

**Four Masters of the Yuan**

After the mid-fourteenth century the notion of Four Masters of the Yuan—Huang Gongwong (1269–1354), Wu Zhen (1280–1354), Ni Zan (1306–1374), and Wang Meng (1308–1385)—was formulated and adopted by the landscape painters and theorists of the Ming dynasty (1368–1644) and Qing dynasty (1644–1912). Dong Qichang and his Songjiang School painters (a regional circle) played an influential role in canonizing landscape tradition, followed by the Four Wangs—Wang Shimin (1592–1680), Wang Yuanqi (1642–1715), Wang Jian (1598–1677), and Wang Hui (1632–1717)—and formed the orthodoxy with their political advantages that remains today.

Landscape painting tradition did not end with imperial China but rather continued to develop as artists devised various methods to express the new and engage with the old. Particularly notable are divergent and
complex themes that have emerged as artists have explored new media, techniques, and ideas after the twentieth century in both China and overseas. Zhang Daqian (1899–1983), Wu Guanzhong (b. 1919), and Zao Wuo-ki (or Zhao Wuji, b. 1921) are a few of many contributors in the new era. Zhang Daqian developed “ink-splash” with a bright “blue-and-green” manner into a semiabstract pictorial representation of landscape with traditional media. Wu Guanzhong maintained stylized but identifiable landscapes with linear and calligraphic lines and Western media. Zao Wuo-ki transformed the emptiness in space of a cosmological (relating to a branch of metaphysics that deals with the nature of the universe) view of Chinese landscape into abstract and expressive oil painting. Contemporary Chinese landscape is still developing.

Diplomatic relations between Pakistan and China began in 1951, and relations between the two countries have been cooperative ever since, especially in the areas of defense, technology, and economics. China’s significant investment in Pakistan’s development, including monies for nuclear facilities, the port of Gwadar, and highways, helps China achieve access to natural resources and to extend its global sphere of influence.

The year 2006 marked the fifty-fifth anniversary of diplomatic relations between China and Pakistan. The bilateral relationship between the two countries has endured as a relatively uninterrupted, trust-bound and “all-weather relationship.” This tactical friendship has survived numerous geo-strategic changes: improved Sino-Indian relations from 1989 onward, the collapse of the Soviet Union, post-September 11 developments, especially Pakistan emerging as a frontline state in the war against terror, as well as the recent Indo-U.S. strategic convergence.

A Short History
Pakistan recognized the People’s Republic of China in 1950 and was the third non-Communist state and the first Muslim state to do so; afterward the two nations established formal diplomatic relations. Bilateral relations were further emphasized at the Bandung Conference in 1955, where talks between the two heads of state played an important role in promoting understanding and developing friendly relations and cooperation between the two countries. In 1961, Pakistan furthered diplomatic relations when it voted for a bill concerning the restoration of China’s legitimate rights in the United Nations.

Deterioration in Sino-Indian relations, which culminated in the 1962 war, provided further opportunities for Sino-Pakistani cooperation, and in 1963 both countries signed an agreement on border relations and the construction of a road linking China’s Xinjiang Uygur Autonomous Region with the northern areas of Pakistan. They signed their first trade agreement in 1963, and, in the years that followed, diplomatic exchanges increased significantly. Their strategic partnership was initially driven by the mutual need to counter the Soviet Union and India, and China supported Pakistan in its two wars against India in 1965 and 1971 with both military and economic assistance. The military alliance led further to the creation of a Joint Committee for Economy, Trade, and Technology in 1982, and in the late 1980s China began discussing the possible sales of M-11 missiles and related technologies to Pakistan.

In 1996, Chinese president Jiang Zemin paid a state visit to Pakistan during which the two countries decided to establish a comprehensive friendship. Relations since then have continued on the same steady path, especially as the United States, after the events of September 11, expressed a new strategic commitment to India. In
2005, China and Pakistan signed a landmark Treaty of Friendship and Cooperation, whereby each committed that neither would join an alliance that infringed upon the sovereignty or security of the other, and that neither would conclude similar treaties with a third party.

During the post–Cold War era, China emerged as Pakistan’s most important strategic guarantor vis-a-vis India. China was the source of initial design information for Pakistan’s nuclear weapons and assisted with the building of the latter’s nuclear technology complex. On the whole, China has been Pakistan’s most important source of modern conventional weaponry and a vital source of trade and investment. Moreover, given the American preoccupation with proliferation issues, China found in this military relationship with Pakistan to be a useful bargaining tool against Washington while discussing issues important to China like U.S. arms sales to Taiwan, for instance, and the deployment of the theater missile defense (TMD) system in East Asia. China’s close ties with Pakistan allowed the former a greater sphere of influence extending to South Asia, as well as a bridge between the Muslim world and Beijing. Within such a framework, the political scientist Kenneth Lieberthal posits, the driving factor for China was a hedge against India that also gave Pakistan access to civilian and military resources. The relationship, Lieberthal continues, is still of great strategic importance today, where, since the mid-1960s, the cornerstone of Pakistan’s foreign policy has been its military relationship with China, and “now that China is trying to build its global sphere of influence—for which it needs Pakistan—it doesn’t mind if Pakistan becomes a regional power in the meantime” (Pan 2006).

Nuclear Cooperation

Pakistan hoped that a civil nuclear deal would fructify between Washington and Islamabad, similar to agreements between the United States and India. Once it became clear that no such deal would be forthcoming from Washington, Pakistan turned to China because the Indo-U.S. nuclear deal suggested both strategic
instability and a security threat. China has been widely acknowledged as the source of Pakistan’s initial nuclear weapon strategy, a major partner in the development of Pakistan’s nuclear weapons complex, the major source of Pakistan’s short- and medium-range solid fuel missile technology, and the likely partner in the development of Pakistan’s Land Attack Cruise Missile. In 2006, China signed an agreement to cooperate in the peaceful application of nuclear power. Pakistan asserts that, having recorded one of the highest levels of economic growth in Asia during the first few years of the twenty-first century, it will need at least an eight-fold increase in its power requirements by 2013.

After President Zardari’s visit to China in October 2008, China agreed to provide Pakistan with two more nuclear power plants in addition to the Chinese-built nuclear reactor now at Chasma in Punjab and the one in progress. While Pakistan denies any such reports, the Indian press has frequently maintained that China has offered to upgrade Pakistan’s nuclear weapons capacity.

**Defense Cooperation**

Pakistan’s relationship with China has been the anchor of its defense and foreign policy since the 1960s. Defense cooperation is especially important for Pakistan as China serves the purpose of a high-value guarantor against India. China has proven to be a reliable supplier of conventional military equipment for Pakistan, selling F-7 fighters and a version of the T-96 main battle tank. The fighter aircraft JF-17 Thunder, a joint development of China and Pakistan, began production in 2008 at the Pakistan Aeronautical Complex in Kamra. It has been opined that this enhanced military cooperation could herald a shift in the center of gravity from Europe to Asia, with China at the forefront, followed by Pakistan.

In the spring of 2006 Pakistan clinched a $600 million defense deal with China, which included the construction of four F-22P frigates for the Pakistani Navy, the upgrading of the Karachi dockyard, and the transfer of technology for the indigenous production of a modern surface fleet. The first of these frigates was launched in Shanghai in April 2008. Two more frigates will be built in Shanghai and the fourth one at the Karachi dockyard.

**Trade and Energy Cooperation**

Pakistan is not merely expanding its defense cooperation, but is also improving its economic cooperation with China, thus attempting to reposition itself as an important trade route in South Asia. Both countries signed an agreement to promote bilateral trade and cooperation. From 2006 onward, the two countries will implement the first part of the free trade agreement. As tariffs drop to zero, the zone could emerge as a possible commercial hub of the region.

Both countries agreed to step up cooperation in the energy sector, promising to give China access to the gas and oil resources of Central and Western Asia. China supports oil and gas exploration in Pakistan, and promises to help Pakistan in developing its coal, lignite, and renewable energy resources. As the two countries explore joint ventures in the field of energy, there are already major infrastructure projects underway, namely the port at Gwadar, the Karakoram highway, and the coastal highway.

**Gwadar Port and Karakoram Highway**

China is projecting its might across the subcontinent through its strategic presence at the Gwadar Port project, located in Balochistan province on the Arabian Sea at the mouth of the Persian Gulf. Construction of the port began in March 2002 after the Chinese agreed to provide $198 million of the $248 million required for the first phase of the project. China has also invested in support infrastructure by financing a highway link from Gwadar to a central Balochistan town, connecting Karachi and Quetta. Just 420 kilometers from the strait of Hormuz, through which nearly 40 percent of the world’s oil supplies flow, the port is strategically located to serve as a key shipping point in the region. Its great strategic value augments Pakistan’s importance in the region while allowing China to diversify and secure its crude oil import routes and simultaneously gain access to the Persian Gulf.

China is also planning to build a 90-kilometer highway link connecting the Chinese side of the Karakoram highway to the Russian-built highway network that already connects all five Central Asian republics. This
regional highway network will directly link Gwadar to Xinjiang and to the landlocked Central Asian republics. The Karakoram highway and the coastal highway will both serve as vital trade routes.

Through the construction of the Gwadar port, Beijing also will gain considerable influence in the region, giving it a strategic entrance to the Arabian Sea and the Indian Ocean, while allowing it to closely monitor U.S. naval activity and U.S.-Indian maritime cooperation.

For Pakistan as well, the benefits are profound. Gwadar, designated as a “sensitive defense area,” would inhibit India’s ability to blockade Pakistan, and would permit China to supply Pakistan by land and sea during wartime. The construction of the port and the highway, by making Pakistan a regional trade hub for commercial traffic, would also boost domestic economic development, and would influence the geo-strategic environment of the region. The port will enable the transfer of Central Asia’s vast energy resources to world markets, earning Pakistan significant profits in transit fees, as well as attract considerable investment into Baluchistan. Although construction was beset by violence from Baluch nationals protesting against the federal government and the construction of the Gwadar port, it became fully operational in 2008. Additional phases will include additional terminals and docks.

Sino-Pakistani Relations: Assessments and Conclusions

The emphasis on trade and energy cooperation makes it appear that Pakistan is attempting to create a new strategic framework, outside military cooperation, through economic cooperation. If the expansion of Gwadar port facilities does fructify, Pakistan will be almost guaranteed a further “all weather relationship” with China for many years to come, with the extension of the Karakoram highway serving as a symbol of this calculated friendship. Pakistan could become a trading center for the region and receive substantial amounts of foreign direct investment to facilitate domestic development. For China, Pakistan could emerge as an energy hub as well as a low-end manufacturing center.

The 2005 Treaty of Friendship and Cooperation set the foundation for relations between China and Pakistan. Meetings between the two countries since then have reaffirmed the friendship and understanding between them. Demonstrations of this relationship include Pakistan’s support for China’s policies in Tibet; Pakistan, unlike other countries, welcomed the Beijing Olympic torch relay with no protests. The two countries have pledged to collaborate in economic development, especially expansion of free trade agreements, and in technology, such as the procurement by Pakistan of a Paksat-1R telecommunications satellite from a Chinese company. Other areas of collaboration include mineral development, environmental protection, cultural exchange, and scientific and agricultural research.

China’s Paleolithic era, also known as the foraging era, started about 2 million years ago and ended about 10,000 years ago. The large span of this era can be divided into the Lower, Middle, and Upper periods, each generally correlating with significant change in human evolution. As time went on, human-made tools became more sophisticated and human population also increased.

The Paleolithic, literally the “Old Stone Age” (also known as the foraging era), is a prehistoric era characterized by the use of percussion stone tools by humans. In geological terms this period falls within the Pleistocene period, which began some 3 to 2 million years ago. Archaeological materials suggest that China’s foraging era started some 2 million years ago and ended about 10,000 years ago. It was followed by the Neolithic era, or the New Stone Age.

Most of the foraging-era human fossils and cultural layers were found above ground. It is difficult, however, to determine whether stone objects from some early Pleistocene sites were human made or natural.

Model for Banpo, a Neolithic (or New Stone Age) village dating to about 4,000 BCE. The villagers of Banpo, despite their more advanced stage of civilization, still used many of the tools conceived during the Paleolithic era. PHOTO BY JOAN LEBOLD COHEN.
Dated to 2.4 to 2 million years ago, the Renzidong Cave in Anhui Province is the oldest foraging-era site found in China, if the stone objects from this site are indeed human-made tools. The site of the Xihoudu culture in Shanxi dates to about 1.8 million years ago, on a paleomagnetic analysis. Unfortunately, the Xihoudu relics suffered from severe erosion, which blurred possible traces of human processing of the stone objects. Another famous site, Shangnabang, Yuanmou, Yunnan, was initially dated as 1.7 million years old, according to paleomagnetic evidence. A few scholars have recently reexamined the paleomagnetic evidence and identified the age of two human incisors from Yuanmou to be 600,000–500,000 years old. During the lower foraging era, people either settled in certain areas for an extended amount of time or stayed temporarily in one place. A close examination of the animal bones illustrates their hunting and scavenging methods. Stone tools were used to cut animal meat; sometimes the broken animal limbs suggest that marrow was dipped out of these bones. Fire was probably used as well because the Shangnabang and Xihoudu sites yielded ashes, although natural, rather than human, fire could have left the ashes.

China’s lower foraging era can be further divided into at least three cultural zones. Zone 1 includes the Xihoudu and Qiahe cultures in Shanxi and the Lantian culture in Shaanxi. These cultures were distributed mainly throughout southern Shanxi, eastern Shaanxi, and western Henan. Although large, stone tools manufactured in Zone 1 are rather simple. Many of these tools are choppers. In particular a mandible (lower cheek bone) from a pithecanthropoid (a hypothetical species thought to be intermediate between humans and the anthropoid apes) found near the village of Chenjiawo in Lantian, Shaanxi, dates to about 650,000 years ago. In 1964 a human skull was discovered in Gongzhuling of the same county. Paleomagnetic analysis indicates that the Gongzhuling fossil is 1.15 to 1.1 million years old. Both fossils were probably remains of females.

Zone 2 covers northern Hebei, northern Shanxi, and southeastern Liaoning and is marked with cave sites. Many of the stone tools from Zone 2 are small. The main types are scrapers. In Zone 2, Zhoukoudian Locality 1 is the most renowned of all foraging-era sites in China. Its occupants were collectively called Peking Man. Located 48 kilometers southwest of modern-day Beijing, the site was first discovered in 1921. Excavation of the site began in 1927. Before 1941 five nearly complete crania were found at the Zhoukoudian cave site. Unfortunately, these fossils mysteriously disappeared in 1941. Since 1950, a few teeth, a skullcap, a mandible, and several long bones of human fossils have been discovered at Zhoukoudian. Taken together, the fossils from Locality 1 represent a population of more than forty Homo erecti. Clearly, Peking Man had used this site for a long time. More than 30 meters of cultural remains in thirteen different layers had accumulated on the site. Multiple dating methods, including paleomagnetic analysis and the uranium fission technique, place these layers at between 500,000 and 200,000 years old. Peking Man’s main food source was the meat of wild animals, among which 70 percent were deer with heavy horns. All together more than ninety kinds of mammal fossils have been found at the site, including remains of leopard, cave bear, Pachycrocuta sinensis (a kind of giant hyena), elephant, rhinoceros, water buffalo, and ostrich. Many pieces of charcoal, burned bone fragments, and hearths suggest that Peking Man had used fire and cooked meat, although there is no direct evidence to prove that he knew how to make fire. Peking Man made six kinds of stone tools: scrapers, points, chopper hammers, awls, engravers, and balls. Many are multipurpose objects. Zone 3, in southwestern China, is represented by the Guanyindong culture in Guizhou. The predecessors of the Guanyindong culture were probably related to the Yuanmou culture of Yunnan. Stone tools from this cultural zone differ to a great degree from the other zones, and there are quite a few different types. Most stone artifacts were skillfully fabricated.

The Middle Foraging Era

The middle foraging era was between 128,000 and 35,000 years ago. During this time the natural environment changed dramatically. In north China the climate became drier and cooler. As a result the saber-toothed tiger (Smilodon), the giant beaver (Trogontherium), and Pachycrocuta sinensis became extinct, while wild donkeys, horses, deer, Bos primigenius (a kind of cattle), and many other species gradually emerged.
In this period a deposit of wind-blown sand and clay, known as the Malan loess, transformed north China. By comparison changes in the tropical and subtropical natural environment in south China were less significant. Giant panda, oriental Stegodon (an elephant-like creature), the Asiatic elephant (*Elephas maximus*), rhesus monkey, sambar deer, and water buffalo were the typical animal species living there. The middle foraging-era cultures showed varying characteristics. For instance, the Xujiayao culture in Shaanxi and Hebei produced a number of types of small stone tools, most of which were small scrapers. By comparison the Dingcun culture from Shanxi used larger stone tools. The typical Dingcun tools were points with three ridges. The Xujiayao culture might have developed from the Zhoukoudian culture while the Dingcun may have come from the Qiahe culture.

Humans during this time lived in caves or camps above ground near to water. The middle foraging-era cave sites were used mainly for dwelling rather than for slaughtering animals. Many caves have hearths inside. No buildings from this time have been found to be constructed or modeled clearly by humans.

Lifestyles differed according to location. In the tropical and subtropical forest areas, food gathering was probably common. In the temperate zone grasslands, a combination of hunting and food gathering was more viable. Sometimes certain stone tools, including balls, characterize a specific site, suggesting that people were engaged in specialized hunting or food-gathering activities. Small, well-polished tools, such as engravers, were produced at this time. Such tools could be used to process other small-scale and more refined objects, which could be used for ornamental purposes. At this time in Europe and West Asia, graves emerged, but so far no tombs from this era have been found in Asia. The middle foraging era also saw an increase in human population.

### The Upper Foraging Era

The upper foraging era began about 35,000 years ago and ended approximately 10,000 years ago. This period witnessed the peak of the glacial period. Many parts of northwest China changed into frozen zones, deserts, or grasslands, while subtropical forests gave way to temperate-zone forest grassland or semiarid grassland north of the Nanling Mountains in south China. Following the peak of the glacial era, the weather gradually changed and warmed the land. From the end of the Pleistocene period, followed by the Holocene period, weather...
Among the 174 adult graves found at Banpo village, there were two graves that buried multiple bodies. In the upper foraging era humans were already showing an increasingly complex treatment of the deceased, including the placement of artifacts in tomb and a sense of the tomb itself as a resting place. Photo by Paul and Bernice Noll.

Patterns in China generally changed to become what they are today. Bone and horn artifacts became increasingly popular during this time, and humans evolved into *Homo sapiens sapiens*, or modern humans.

Upper foraging-era sites were found not only in northern and southwestern China, where foraging-era cultures were normally discovered, but also across Heilongjiang in the north; Jiangsu, Zhejiang, and Taiwan in the east; Yunnan, Guizhou, Guangdong, and Guangxi in the south; and the Tibetan Plateau in the west.

The development of upper foraging-era cultures was highlighted by the making and use of microlithic tools by humans. Other types of tools also emerged, including scrapers, points, engravers, awls, drills, and even arrowheads. Many of these artifacts are composite tools. The advancement of stone technology, the use of many new and efficient tools, and the specialization of tool types reflect a further development in the hunting and foraging lifestyle. The use of microlithic tools suggests a profound understanding of the physical qualities of stone and the ability of modern humans to modify the material into intended shapes. Composite tools also indicate a possible specialization among certain groups of people in stone making. Such specialization requires organization and coordination among the stone workers. At the same time, there appeared highly specialized hunters, including the horse hunters of the Zhiyu culture in Shanxi. Another notable achievement of upper foraging-era cultures was the manufacturing of bone and horn artifacts. Many such items have been excavated from the Upper Cave of Zhoukoudian of Beijing, Haicheng, and Zhejiang. Fish forks, spears, daggers, and shovels made of animal bone and horns were manufactured by applying sawing, cutting, scraping, surface polishing, and drilling methods. Large quantities of ornaments, of a variety of materials, were used, including many kinds of animal bones, animal teeth, stone, shell, and ostrich eggshells.

Another aspect of the upper foraging era was the multiplicity of lifestyles. People hunted wild animals, fished, or gathered plants and adapted to their changing environment. Society at this time was composed of small units. Often the existence of a hearth in a dwelling suggests a possible social unit, perhaps a family, while several units form some sort of clan or tribe. A remarkable development during the upper foraging era was the rapid expansion of the human population. Although the death rate of new babies remained high and the lifespan was seldom more than fifty to sixty years (with that of women less than forty years), in general this period saw more people growing old. Modern humans lived a healthier life than ever before.

In the upper foraging era, humans showed an increasingly complex treatment of the deceased. They not only...
buried their dead in specified locations, thus marking a kind of “resting” place for the deceased, but also placed artifacts in the tombs to accompany them. In the Upper Cave of the Zhoukoudian site, in addition to burial goods, hematite powder (iron oxide, often used a pigment in tomb murals) was also found spread around the bodies. Such treatment of the dead suggests that humans at this time had developed a concept of an afterlife, or another world to live in after one physically died. Primitive religious ideas might have arisen during this period, too.

The Legacy of the Foraging Era

In short, China's foraging era was characterized by regional differences and marked by different developmental phases. Changes in weather and the natural environment made a huge impact on people's lifestyles and migration routes. With the development of tools and the sophistication of the brain, people evolved into modern humans. Improved techniques in the fabrication of stone, bone, horn, and shell implements contributed to a higher quality of life and unprecedented prosperity among cultures. Toward the end of the foraging era, around 10,000 years ago, human beings in China began to cultivate plants, domesticate animals, make ceramic vessels for cooking, and generally settle down, thus ushering in the Neolithic era.

With only about 1,000 giant pandas left in the wild, this icon of Chinese nature is as rare as it is popular. The black-and-white animal’s natural habitat has receded to a minuscule mountain region in and near Sichuan, though it has become one of the most popular zoo attractions of modern times.

The panda, or giant panda (Ailuropoda melanoleuca), is a solitary bear-like animal native to the rainy bamboo forests in the isolated mountain uplands of Shaanxi, Gansu, and Sichuan between 1,200 and 3,400 meters above sea level. Their diet consists almost entirely of bamboo leaves, stems, and shoots; they occasionally eat other plants and even meat. Their Chinese name is da xiong mao (great bear cat 大熊貓). Pandas have a unique and distinct coloration: they have black fur on their ears, around their eyes and nose, on all of their legs, and across their shoulders; the rest of their bodies are white. Adults are typically 160–180 centimeters in length and 85–110 kilograms in weight. Their scientific classification, as either members of the bear or raccoon family, is still disputed. Pandas do not breed prolifically. They reach adulthood at age eight, and females are receptive to breeding only a few days per year. This, combined with habitat loss, are big factors in their declining numbers in the wild.

Pandas were mentioned in Chinese texts more than two thousand years ago, but they first became known to Western science only in 1869. Although historically pandas have been used as emissaries of good will and diplomacy for centuries, the People’s Republic notably employed “Panda Diplomacy” from the late 1950s to the early 1980s. The most well-known of these gestures was Mao Zedong’s gift of the famous panda pair Hsing Hsing and Ling Ling to U.S. president Richard Nixon after his historic diplomatic visit to China in 1972. The pair received over a million visitors in their first year in the U.S. National Zoo, making them arguably the most popular zoo attraction in history. But since the early 1990s, a series of international agreements have led to the “rental” of pandas to foreign countries for research purposes at a variable fee of around $1 million per year. The proceeds go to panda conservation and repopulation efforts in China.

Today there are an estimated six hundred to one thousand pandas in the wild, and they are highly endangered because of dwindling habitat caused by logging and forest clearance. In 2006 the Sichuan Giant Panda Sanctuaries, an aggregate of seven preserves in southwest Sichuan province, were added to the United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage Site list. Pandas, because of their rarity and distinctive appearance, have long been considered a Chinese cultural treasure and symbol.

Paper cutting (jianzhi) is one of many Chinese handicrafts emerging a few thousand years ago. Both the Han Chinese and their ethnic minority compatriots cut paper, though for different purposes. There are different schools of paper cutting today, each having its regional flavor. The themes of paper cuts are diversified, varying from animals and plants to people and scenery.

Paper cutting (jianzhi) belongs to the folk (minjian) tradition of the four-thousand-year-old art of Chinese handicrafts and has been influential in Chinese decoration since its inception. Whereas the other type of handicrafts, special handicrafts (tezhong), largely involve costly materials manufactured with sophisticated workmanship, as in the case of cloisonne enamel and lacquerware, folk handicrafts are mostly made by common people and possess distinct regional and ethnic flavors. Along with paper cutting, embroidery and wax printing (batik)—a method of dyeing a fabric by which the parts of the fabric not intended to be dyed are covered with removable wax—also belong to the folk category.

An excavation of a tomb from the Warring States period (475–221 BCE) in Henan Province revealed ornaments of silver foil with hollowed-out, flowery designs. These were the precursors of paper cuts. Before the mass production of paper in the Eastern Han dynasty (25–220 CE) expensive paper of bast and leaf fibers was already in use. A legend tells that Emperor Wu (156–87 BCE) of the Han ordered that a portrait of his deceased concubine be cut out of this type of paper to be used in a ritual to call her spirit back. Indeed,
early foil or paper cuts were mostly used for religious purposes.

Women of the Tang (618–907 CE) and Song (960–1279) dynasties used sheng (hollowed-out ornaments of paper, silk, and gold foil) to dress their hair. Designs came in the shape of squares (fangsheng), people (rensheng), and flowers (huasheng). Today, paper cuts are used primarily as house decorations to celebrate the Chinese New Year.

Besides the Han, ethnic minority Chinese, such as the Dai, Daur, Hezhen, Manchu, Mongol, Miao, Tibetan, Tu, Uygur, Xibe, and Yugur, also cut paper, though each group has a distinct style. The patterns of the Dai hint at Buddhism. Xibe and Uygur designs feature only flowers because their Islamic traditions prevent them from worshiping human or animal idols (Yuan 2006). Instead of decoration, they use paper cuts mostly as templates to create patterns on embroidery.

In the first decade of the twenty-first century, while some rural Chinese individuals are still fond of cutting paper to decorate their houses, paper cutting has become a profitable industry. Paper-cutting themes are diversified. Paper cuts can depict cultural symbols and characters representing good wishes, historical or legendary figures, flowers or animals, natural or life scenes, traditional or ethnic performances, and even images of the West such as Santa Claus. Styles of paper cutting also vary, falling into two major categories: positive and negative. With positive cutting, the product is usually made of monochrome paper so that the outlines of a design are kept and the lines within the outline must be connected. Negative cutting does the opposite, keeping only blocks of the cutout, which can be painted in multiple colors. Sometimes both techniques are applied to create a more vivid, or even a three-dimensional, effect.

The different schools of paper cutting are named after the locations of their origins. They include xiaogan, characterized by its vivid representations; guangling, recognized by its ink-and-wash effect, created with liquor; ansai, characterized by its bold and simple craftsmanship; Wei County, marked by a technique borrowed from the Yangliuqing New Year Paintings, a
600-year-old folk art of woodcut painting named after its place of origin Yangliuqing, a town on the outskirt of Tianjin, China; fengning, recognized by its Manchurian flavor; yangzhou, characterized by its exquisiteness, comparable to the region's famed embroidery; leqing, marked by its thin-lined patterns, which are often used to decorate lanterns of dragon boats; and guangdong, recognized by its integration of paper with glistening copper foils.

Paper can't wrap up a fire.

纸包不住火

Zhǐ bāo bù zhù huǒ
The Chinese inventions of papermaking and printing, though prompted by politics and religion, were the catalysts for major changes in ancient China, impacting culture, politics, and education. Papermaking and printing created separate communications revolutions in the premodern world, one in Asia and the other in Europe, by permitting the rapid and widespread transmission of information and ideas.

Chinese innovations from the third to eleventh centuries CE included the invention of paper and the development of stamps, rubbings, and woodblock printing. The mass production of text and images made possible by these inventions resulted in widespread dissemination of religious texts, the introduction of civil service examinations for government officials, the creation of storybooks for a mass audience, and an increase in public debate.

Invention of Paper

With the rise of the first Chinese empire (the Qin dynasty, 221–206 BCE) came an increase in imperial bureaucracy, and an increasingly urgent need for new writing materials and methods of keeping records. The earliest Chinese records from the sixteenth to eleventh centuries BCE were etched on tortoise shells and animal bones; these cumbersome materials were gradually replaced with wooden tablets and strips of bamboo. The imperial bureaucracy generated hundreds of pounds of records on these new, unrefined materials.

The invention of paper has long been attributed to a court official of the Han dynasty (206 BCE–220 CE). In 105 CE the eunuch Cai Lun (d. 121) presented the Han emperor with a new writing material, a composite paper perhaps made from plant fibers (such as hemp and bark), textile fibers (such as silk), and perhaps other ingredients as well. The exact formula was lost. But in 1957 Chinese archaeologists dated the earliest known sample of paper found in China to 49 BCE, over 150 years before Cai Lun’s presentation.

Early papermakers macerated old rope ends, rags, and fishing nets in water to free the component vegetable fibers, then sifted the solution through a screen to form a thin sheet of matted fibers. The wet sheets were left to dry on the screen or placed on another drying surface. What distinguishes paper produced this way from the papyrus of ancient Egypt is this process of separating and reforming vegetable fibers into a single sheet; papyrus, by comparison, is simply pithed and flattened to create a writing surface. Once dry, the fibers in paper form chemical bonds and create a strong but light writing surface.

By the fourth century paper was more readily available, and it replaced wood and bamboo strips as the writing material of choice; by the sixth century, Chinese papermakers had learned how to extract vegetable fiber from the bark of the mulberry tree, one of the best sources of paper fiber. Today mulberry bark is still favored by fine
papermakers in China, Korea, and Japan because of its strength and beauty.

Strong paper requires long-length fibers; as a result, much of the subsequent history of papermaking in Asia has depended on the development of techniques that preserved fiber length. To ensure the even distribution of the paper fibers, papermakers learned to add a starch solution to the pulp to suspend the fibers. This important development is thought to have occurred in the seventh century.

Stamps and Rubbings

Having created an inexpensive, light medium on which to write, the Chinese next searched for a way to mass-produce written text and visuals, primarily for religious reasons. In the eighth century, devout Buddhists sought to spread their religion by making thousands of copies of the Buddha’s word and image. One early technique used a stamp with an image carved in relief on its surface; once inked with a combination of black soot and oil, the stamp could be pressed onto a sheet of paper, sparing the patron the cost of reproducing the image by hand. This technique was suitable for relatively small images, but larger, more complex images and texts were much more difficult to reproduce.

Government artisans also frequently made rubbings from stone stele. Although this technique was not as fast as stamping, rubbings could be taken from large surfaces with complex engravings. To make a rubbing, the artisan needed to place a moist sheet of fine paper onto the surface of the text- or image-bearing stone stele or tablet. Once the paper adhered to the surface of the stele, the artisan carefully pressed some of the moist paper into the crevices of the stele or tablet with a pad. Then the artisan would take another pad, this time inked with water and black soot, and press the ink onto the surface paper. The pad would not touch the paper the artisan had pressed into the engraving. When the paper was dry, the artisan would peel the inked sheet off the stone, revealing a copy of the engraving in white on a black background. The rubbing technique is still valued today for its precision and aesthetic quality, and is still used to duplicate images of fine calligraphy for Chinese art collectors.

By the eighth century, all the prerequisites for printing were in place. Artisans knew how to take prints from both relief and engraved images with stamps and rubbings. Stamps could replicate small images quickly, and rubbings could reproduce large, detailed images, albeit slowly. But neither method could satisfy the increasing demand in Chinese society for more books: Buddhists, Daoists, and Confucians all sought to produce more copies of their canonical texts for an increasingly literate public. Some time in the eighth century, an artisan thought of combining the advantages of stamps and rubbings by making woodblock prints.

Woodblock Printing

Xylography, or woodblock printing, is both a simple and sophisticated technique for printing, unrivaled until the advent of mechanical printing presses in the nineteenth century. Three skilled artisans are needed to prepare a page of text for xylographic printing. First, using black ink, a calligrapher writes the text to be printed on a thin sheet of paper. Next, a woodcarver takes the sheet of paper and turns it over, pasting the right side of the sheet onto a foot-long block of fruitwood; once the sheet has dried onto the block, the carver can see the characters
in reverse through the back of the paper. The carver
then carefully cuts into the wood and removes the back-
ground, leaving the calligraphic characters raised in re-
lief. When the remaining paper is rubbed off, the block
is ready for printing. Finally, a printmaker inks the cut
woodblock with an ink pad, carefully inking only the
raised characters, and then lays a thin sheet of paper on
top. The printmaker presses the sheet of paper onto the
characters to take an impression. A skilled printmaker
can make two or three impressions a minute this way.
This technique was used to make the world’s earliest ex-
tant printed book, the Buddhist Diamond Sutra, which
is dated 868 ce.

The printing press was not invented in China be-
cause the xylographic process had no use for it. The
critical technical requirement for Chinese printing is
strong, thin paper, which had been perfected with the
development of strong mulberry papers in the sixth
century. By the twelfth century, Europeans learned to
make paper from the Arabs, who had captured some
Chinese papermakers in a battle near Samarqand (in
Uzbekistan) in 751 bce. European papers, however,
were much thicker than Chinese, especially papers
made from macerated cotton rags. European printmak-
ers needed a great deal more pressure to take a relief
impression with these thick papers and therefore re-
quired massive, heavy presses. Another important dif-
ference between European and Chinese printmaking is
the composition of the printing surface. In Asia, a single
woodblock was the preferred medium because the aes-
thetics and complexity of Chinese characters could be
captured easily by a skilled calligrapher. Some Chinese
printers experimented with movable type—tiny relief
blocks of each character—but the capital investment
required to produce and maintain the thousands of tiny
blocks of type was greater than the cost of a few skilled

LIBRARY OF CONGRESS.
calligraphers and woodblock engravers, who could set up shop anywhere and begin producing printed books on demand.

**First Print Culture**

The nature of the communications revolution brought on by the development of inexpensive book production is still debated. In China, wide access to a large number of texts costing less than one-tenth that of books printed a few centuries earlier reinforced the education and imperial examination system as a vehicle for recruiting civil service talent from a much wider portion of the population than had been previously possible. This correlation between printing and the examination system is supported by the fact that those areas in China that produced 84 percent of the successful examination candidates also produced 90 percent of China’s printed books.

While there was a dramatic reduction in the cost of books in China, there was also an explosion of printing for profit. By the eleventh century, xylographic printing was already a mature technology and had created the world’s first print culture in China. New literary genres emerged, such as storybooks, aimed at a popular as well as an elite audience. Popular *shanshu* (morality books) were also aimed at the newly created mass audience. The sheer volume and variety of publications for popular consumption prompted the Chinese government to attempt to censor, prohibit, or monopolize the printing of various materials, especially those works, like the dynastic histories, that could be a source of information to be used by rival governments if exported. But the fact that these prohibitions were repeatedly issued indicates that the government had very little real impact on the commercial trade. Printing technology was well established even among the seminomadic empires to the north, and the Chinese government tried to prohibit the import of books from these rival states as well.

The expansion of critical scholarship due to the easy circulation of the printed word is another important feature of print culture. Not only was the literacy rate increasing the eleventh century, but the social elites who were already literate were reading more books and comparing a greater diversity of ideas. We might expect the Chinese imperial library to have a very large collection, but by the twelfth century the government holdings were rivaled by private libraries sometimes containing more than a million volumes.

Easy access to books allowed writers and scholars to compare ideas and generate new ones with greater facility. When writing new books, Chinese writers could draw upon a wider variety of books and challenge old ideas. In his memoirs, the eleventh-century Song scholar-scientist Shen Guà made over 250 citations of a wide variety of works that were available to him, sometimes using those works to support his conclusions, at other times challenging his sources. When he finished his memoirs in the 1080s, they were printed and sold to his peers and other aspiring members of Song society. This highlights another
important aspect of print culture: Not only could people now read and question older ideas, their own ideas could be easily published and disseminated, adding to the scope and intensity of public debate and discussion. The creation of a larger and more critical reading public outside the auspices of government agencies was an important Chinese development of the eleventh century.

Developments after the Eleventh Century

The invention of woodblock color printing during the Ming dynasty (1368–1644) brought printing to a new level. A text called *Painting Manual of the Mustard-Seed Garden* appeared around 1640. This work was intended to provide instruction and inspiration for artists. The introduction of this work in Japan began the development of woodcut technique in that country. In the 1930s, lithography (an image is applied to a plate using a greasy medium that accepts ink) and intaglio (an image is etched onto a plate with ink filling the recessed areas) began to displace the woodcut as the primary printmaking technique in China. Screen printing, where ink is forced through a screen of silk or other fine mesh onto a surface, was developed in the second half of the twentieth century. “Hello to Autumn,” created by Guang Jun in 1980, is credited as China’s first screened print.

The existence of a large and discerning reading public in premodern China has diminished with political changes. The closing of schools and denunciation of teachers and intellectuals that characterized the Cultural Revolution (1966–1976) lowered the level of Chinese literacy. Despite a government campaign to eradicate illiteracy since that time, there are indications that the level of illiteracy in China has risen since 2000. Reasons include the increasing number of young workers who leave the classroom for migrant work in the cities. Nevertheless, the Chinese tradition of innovation in papermaking and printing spawned a world heritage of art and communication across three epochs.

Pawnshops
Diànhằng 典当行

Pawnshops in China, in existence since the fifth century, operate as small financial institutions. Their general function is to supply fast cash in exchange for goods held in collateral; interest rates, fees, and terms of repayment vary. Pawnshops were forbidden by law from the mid-1950s through the 1970s, but have revived in China since the late 1980s.

The concept of the pawnshop originated in China as early as 420 CE when Buddhist monasteries, having garnered an abundance of assets through donations and land rents, were able to make loans to those in need of financial aid.

A pawnshop was called zhi ku from the Tang (618–907 CE) through the Song dynasties (960–1279), jie ku or jie dian pu in the Yuan dynasty (1279–1368), and dian dang or dang pu in the Ming dynasty (1368–1644). In the Qing dynasty (1644–1912) pawnshops were divided into types according to their capital and business size: ya, ang, dang.

Ya was a smaller type of pawnshop that offered higher interest rates and required a lower value of the collateral. The period of redemption of a pawned item was between four months and one year. Ya pawnshops required little working capital and usually operated in rural or small-town areas. The pawnshop operator received clothes and jewelry from poor pawners as collateral for lending cash to them. Sometimes the pawnshop operator could repawn these items to large dang pu to generate profit or new capital to receive other collateral.

Ang was a midsized pawnshop that offered midrange interest rates and a longer period of redemption—between one and two years. Ang also could repawn their collateral to large dang pu for profit or currency liquidation.

Dang was the largest type of pawnshop. It offered lower interest rates and a longer redemption period—up to three years. Dang pawnshops could receive gold, jewelry, fine art, antiques, and even the deed to a house or land. Gold was the most welcome item because it could be resold in bulk to a smelter to be sold for scrap gold. These pawnshops had a large capital circulation, usually collected from rich Chinese businessmen, landlords, and high-ranking officials. These pawnshops existed in large cities and areas with promising economic prospects.

In the Ming and Qing dynasties large pawnshops were mostly in Anhui and Shanxi provinces. Therefore, they generated a specialized professional business. In 1685 China had 15,080 registered large pawnshops, and this number increased to 22,781 during the Qian Long period.

The pawner had to pay an interest rate as high as 3–10 percent per month to the pawnshop. Dang piao was a receipt of the collateral goods issued by the pawnshop operator. The receipt indicated the name of the collateral goods, how much they were worth, and the period of redemption. The amount of the pawn loan was much lower than the value of the collateral and carried a high interest.
rate. After a certain period the interest would be higher than the value of the collateral, so some pawners would rather lose than redeem the collateral. Then the pawnshop operator could sell or auction the collateral to the public or to other pawnshops.

Brisk Business

China’s pawnshops were very active in the early twentieth century. Local and central governments issued several pawn laws to regulate the business. The government even set up gong dian and gong dang (public pawnshops) under the supervision of local police departments. Several local pawning laws were passed in Jiangsu in 1927, in Anhui in 1929, in Beijing and Shanghai in 1930, in Zhejiang in 1931, and in Tianjin in 1932. The central government also began nationwide regulation of pawnshops (diandang guanli guizhe) in 1945.

Pawnshops were described as “bloodsuckers” after the founding of the People’s Republic of China in 1949 because they took items from poor people at extremely low prices and sold them to the rich at higher prices. Poor people were exploited by rich people, according to the theory of Marxism. Therefore, the pawn business was wiped out after the socialist transformation in 1956.

With China’s economic reform millions of private businesses have reemerged and demanded working capital and loans. Because state-owned banks and big commercial banks could not grant loans to small businesses, the old type of pawnshop was revived as an alternative financial institution. Since the pawnshop revival in Sichuan Chengdu in 1987, several thousand pawnshops have been founded.

Fast Cash

Pawnshops are convenient because a getting a loan from them requires no credit check and no guarantors, although the interest rate is high. The combination of fees and interest rate could range from 3.6 to 4.5 percent per month. A pawner can get cash immediately by pawning items such as jewelry, stocks, home appliances, houses, cars, cameras, and computers. Recent statistics show that about 90 percent of customers of pawnshops are small-business owners and low-income persons. With their simple procedures pawnshops are considered a type of microfinance institution.

The pawnshop revival in China has depended to a large degree on the pawnshop’s business culture over fifteen hundred years. Many Chinese choose pawning as an easy way of financing without having to go through a complex loan procedure in banks or having to lose face by borrowing money from friends. Consequently pawnshops will continue to be a unique alternative financial institution in China.

Peace Reigns over the River
The twelfth-century painted handscroll known as Qingming shanghe tu (Peace Reigns over the River; previously known as Qingming Festival on the River) is considered to be one of the best depictions of daily life in China.

Painted by Zhang Zeduan, Qingming shanghe tu (Peace Reigns over the River; previously known as Qingming Festival on the River) portrays the activities of a bustling city set along a busy river. This work is said to represent the Song-dynasty (960–1279) capital of Bianliang (modern-day Kaifeng) on the Bian River, a waterway that joined the Grand Canal and was used to ship commercial goods. Done in ink and slight color on silk, this painting measures just over five meters in length and slightly less than 25 centimeters in height. The painted scroll has been famous since the fourteenth century and inspired many forgeries and imitations, but the original disappeared from public for centuries. Its whereabouts were unknown until 1954, when it was returned to the Palace Museum in Beijing after having passed through many hands over the centuries; this painting is accepted as the earliest version known, predating the famous imperially commissioned scroll of 1736 in the National Palace Museum, Taipei.

A handscroll was originally meant for intimate, close-range, and occasional viewing. When not in use it would have been kept tightly rolled around a wooden pin, secured, perhaps, by a silken cord with a jade or
ivory toggle, then wrapped in silk and stored in a wooden case. When unfurled from right to left the handscroll would reveal shoulder-length sections of the painting at a time.

The intricate detail and astonishing realism of *Peace Reigns over the River* accurately depict the architecture, carts, boats, and bridges that would have been associated with a bustling commercial center in the Northern Song dynasty (960–1126). Moving from right to left, this painting takes the viewer on a journey through time and space: from early morning to early afternoon, and from the pastoral outskirts of town to the crowded urban center. The painting is composed of three sections. The first shows quiet farms shrouded by mist. A few figures quietly go

### Detail of *Peace Reigns over the River*. A train of camels passes through the city gate; an ornate tower guards the entrance. Willow trees planted along the river bank to hold the earth are beginning to turn green as the time for the Spring Festival nears.
about their duties among the trees. Activity increases as the scroll moves toward the city. The second section shows in exacting detail the area outside the city wall with its taverns, restaurants, and shops as well as barges moored along the river. Here excitement mounts at the Rainbow Bridge, where a crowd has gathered to watch one barge swing under the bridge. The third and final section is of the city itself, marked by a large gate in the city wall. It is now midday and people enjoy the activities that a large, prosperous city has to offer.

Although the painting is unsigned, the attached colophons (or written notes) attribute the work to Zhang Zeduan (dates unknown), a native of Dongwu (modern-day Zhucheng, in Shandong Province). Biographical details are few. The earliest colophon, datable to 1186 and written by Zhang Zhu, an official curator of the Jurchen Jin dynasty (1125–1234), states that Zhang Zeduan also went by the name of Zhang Zhengdao. He studied painting at the capital and excelled in a painting technique known as jiehua, or fine-line drawing, that he used for depicting such objects as boats, carts, markets, bridges, and moats. In Zhang Zhu’s opinion, the work is inspired and ought to be treasured.

It has been generally accepted that the painting depicts the city on the day of the Spring (or Qingming, literally “clear-bright”) Festival.
the city on the day of the Spring or Qingming (literally “clear-bright”) Festival that takes place one hundred days after the winter solstice when the graves of ancestors are swept, giving the painting its earlier and most familiar title, Qingming Festival on the River. Recently, however, scholars suggest that the size of the crowds and the relative lack of women allow another reading of the title. Qingming is also translated as “peaceful and orderly”; thus, with a title of Peace Reigns over the River, Zhang Zeduan has depicted an idealized city in which people from all classes mingle harmoniously at a time of economic and commercial prosperity characteristic of this period.

rén bù kě mào xiàng, hǎi shuǐ bù kě dòu liàng
During the Tang dynasty the progressive emperor Xuanzong endowed the Pear Garden in Chang’an (modern Xi’an) in 714 CE as a conservatory for the nascent performing arts. Secular music and dance developed and thrived there, especially Chinese opera; the roots of later classical and modern Chinese dramatic performance can be traced there as well.

In 714 CE Emperor Xuanzong (685–762) established a conservatory for the performing arts in the city of Chang’an (modern Xi’an), which he called Li-yuan, or the “pear garden.” During the Tang dynasty (618–907 CE), a period both of political stability and rich cultural expression, China encouraged, and sought out, interaction with the outside world. One of the results of this cultural and political milieu was the thorough advancement of the arts.

Although this period is renowned for its poetry, painting, and ceramics, it was also a time of steady progress in musical knowledge and theory. But it was during the reign of Emperor Xuanzong (685–762) that one aspect of Chinese music received his personal support: opera (xiqu). The initial purpose of the Pear Garden was to train actors, singers, and dancers for the personal delectation of the Emperor, but it was not long before the innovations that were developed there began to influence Chinese performing arts as a whole. Before 714, the performing arts were intimately linked with religious rites and rituals. Xuanzong, however, demanded personal entertainment that incorporated modes of performance that were traditionally sacred in origin, namely, singing and dancing. By removing the religious element, the performing arts began to develop along secular lines.

One style of presentation especially favored by the Emperor was choral song, which became further refined as art-song (xiaoling), a form that related tales in a dramatic fashion. Such songs were often concerned with courtly activity as well as the trials and tribulations of lovers beset by hardship and even political intrigue. Given their narrative emphasis of these songs, it was not long before another venue of dramatic recitation was engaged that depended upon music and dance. Consequently, much attention was given to developing secular music at the courtly level, and instruments, such as the lute, the harp, the zither, the flute (both vertical and transverse), the side-drum, the kettle drum, the oboe, the gong, and the clapper were perfected to accompany choral, narrative song. Thus, the Pear Garden tradition successfully combined the various performing arts (music, dance, dialog, and acting) into one art form, that is, opera; the linguistic basis of operas performed at this time was the vernacular that would later be classified as classical Chinese.

It is also important to note that, at this early stage, Chinese opera did not include what has become its traditional cast of characters: the clown, the male and female, and the strong male with the painted face; these innovations were introduced later during the Yuan dynasty (1279–1368). Whether choral song during the Tang period involved humor, elaborate costumes, and acrobatics is still debated among scholars. Also, given the penchant of Emperor Xuanzong, the majority of the students in the Pear Garden was choral song, which became further refined as art-song (xiaoling), a form that related tales in a dramatic fashion. Such songs were often concerned with courtly activity as well as the trials and tribulations of lovers beset by hardship and even political intrigue. Given their narrative emphasis of these songs, it was not long before another venue of dramatic recitation was engaged that depended upon music and dance. Consequently, much attention was given to developing secular music at the courtly level, and instruments, such as the lute, the harp, the zither, the flute (both vertical and transverse), the side-drum, the kettle drum, the oboe, the gong, and the clapper were perfected to accompany choral, narrative song. Thus, the Pear Garden tradition successfully combined the various performing arts (music, dance, dialog, and acting) into one art form, that is, opera; the linguistic basis of operas performed at this time was the vernacular that would later be classified as classical Chinese.
Garden and its subsequent graduates were women who were employed to provide entertainment both at courtly functions and at private performances solely for the Emperor. And given the breadth and extension of China during the Tang Dynasty, it is also assumed by scholars that many of these women were slaves from other countries. The importance and durability of the techniques engendered during the reign of Emperor Xuanzong are such that, to this day, actors are commonly referred to as “children of the Pear Garden.”

Pearl River
Zhū Jiāng 珠江

The Pearl River is one of China’s major river systems, extending through several southern provinces. Historically and today, its delta has been an important region for agricultural production and foreign trade.

The Pearl River (Zhu Jiang, 珠江, known also as the “Yue Jiang 粤江”) is the third-largest river in China and took its name from an islet in the river at Guangzhou (Canton) known as Ocean Pearl Island (Haizhu Zhou 海珠洲 or Haizhu Shi 海珠石). The Pearl River is formed from three main tributaries—the West River (Xi Jiang 西江), North River (Bei Jiang 北江), and East River (Dong Jiang 東江). The largest of these, the West River, originates in Yunnan Province and has a total length of about 2,200 kilometers; the North River originates in Jiangxi Province and flows approximately 460 kilometers; the East River also originates in Jiangxi Province and flows 532 kilometers.

The entire drainage area of the Pearl River basin includes parts of the provinces of Yunnan, Guizhou, Guangdong, Guangxi, and Jiangxi. The West River and North River tributaries of the Pearl River converge just west of Guangzhou; the East River joins them on the east side of that city. The Pearl River enters the South China Sea by eight major channels. Some definitions reserve the term “Pearl River” only for that portion of the river formed by the convergence of all three of its major tributaries, which flows into the Pearl River delta through the Hu men 虎门 (often known in Western sources as the Bocca Tigris or Bogue), and call the remainder of the system the “Pearl River basin.” This latter definition prevailed historically, and the use of “Pearl River” as a general name for the system emerged only in the twentieth century.

The Pearl River has played a significant role in Chinese history. After Han Chinese settlers began cultivating the Pearl River delta in the Qin (221–206 BCE) and Han (206 BCE–220 CE) dynasties the West River formed an important route of further exploration and settlement. The Pearl River system remained an important route of trade and settlement in southern China, connecting important inland markets. The importance of the Pearl River as a route of transportation was increased because the mountainous terrain of southern China impedes land transport. The Pearl River delta has also played a particularly important role in China’s economic history. Its fertility made it one of the most densely cultivated regions in China and the economic hub of Guangdong Province. The Pearl River delta is also associated with foreign trade: The former British colony of Hong Kong and the Portuguese colony of Macao are situated on the fringes of the delta, and from the mid-eighteenth century until the First Opium War the government of the Qing dynasty (1644–1912) permitted European trade only at Guangzhou. During this period foreign vessels docked at Huangpu (Whampoa) in the Pearl River. In the nineteenth and early twentieth centuries residents of the Pearl River delta accounted for a major portion of Chinese emigrants, particularly those going to North America. Today the Pearl River delta is known for its industrial production, which in Shenzhen and elsewhere accounts for a significant portion of China’s exports.

Peking Man
Bēijīngrén 北京人

Peking Man is a hominid of the species Homo erectus, discovered in the 1920s in Zhoukoudian, not far from Beijing (known then as Peking). Remains of more than 40 individuals have been found dating back c. 670,000–410,000 years ago, and Chinese researchers believe that the species intermittently occupied the area during this time, using stone tools and, in its later stages, controlled the use of fire.

The term Peking Man refers to a hominid—a species of the family Hominidae to which humans and their closest fossil ancestors belong—discovered during excavations that were begun in 1921 in Zhoukoudian, Hebei Province, approximately 50 kilometers southwest of Beijing. The area, declared a UNESCO World Heritage Site in 1987, has yielded remains of more than forty individuals dating back to 670,000–410,000 years before the present (an alternative dating puts the remains at 580,000–230,000 years ago), and Chinese researchers believe that Peking Man intermittently occupied the area during this time.

The excavations at Zhoukoudian were initiated by Swedish geologist and archaeologist Johan Gunnar Andersson 安特生 (1874–1960), who while working for the Geological Survey of China had shown a profound interest in surveying fossil deposits in China. He recruited Austrian paleontologist Otto Zdansky 仰丹斯基 (1894–1988) of Uppsala University in Sweden to conduct the excavations. During the first year Zdansky found a humanoid tooth, and a second one in 1923, while working on Zhoukoudian fossils at the laboratory in Uppsala. The discoveries were not made known to Andersson until 1926, who then announced the new finds on 22 October of that year. The Canadian physician and paleoanthropologist Davidson Black 葛利普 (1870–1946) of Peking Union Medical College examined the finds and wrote the first paper on the new species. It was based largely on photographs and a written report by Zdansky and published in the journal Nature on 20 November 1926. After the announcement American paleontologist Amadeus William Grabau 葛利普 (1870–1946) of Peking University coined the popular name “Peking Man,” and Black gave the find its official name, Sinantropus pekinensis, though it later was changed to Homo erectus pekinensis.

Joint excavations by China and Western nations were set up at Zhoukoudian. A third tooth was found in 1927 by Swedish paleontologist Birger Bohlin 步林 (1898–1990), and at the end of 1929, the first skullcap was identified by the Chinese paleontologist Pei Wenzhong 裴文中 (1904–1982). Based on the new finds, Black concluded that Peking Man was similar to Java Man, or Pithecanthropus erectus, a hominid first found in Indonesia in 1891. Both finds were later confirmed to be of the same species, and renamed Homo erectus. Erectus finds have also been made in Africa, and most paleontologists believe today that Homo erectus evolved and spread from Africa to Eurasia. During the Japanese occupation of China and World War II, the remains from the Peking Man discovery—apart from three teeth stored in Uppsala—disappeared in an
attempt to smuggle the remains to safety in the United States. New finds since have been made in Zhoukoudian and in other parts of China to confirm the existence of the species.

Peking Man had a long, low skull that was remarkably thick, with a large brow ridge above the eye sockets. Its brain size varied from 915 to 1,225 cubic centimeters, compared with an average cranial capacity of about 1,350 cubic centimeters in modern humans.

It used stone tools, as evidenced by the large number of chopping tools made of sandstone or quartz, and scrapers made of flakes of various sizes that have been found on the site. In 1931 Black reported the presence of what he believed to be burned animal bones and blackened layers containing quantities of carbon inside the cave deposits. Although no real hearths were found, it was believed that Black’s report indicated that Peking Man was able to control the use of fire. The evidence for this assertion was questioned in the 1980s and 1990s in a report by American archaeologists and anthropologists Lewis Binford and Nancy Stone, and later by a team led by Steve Weiner of the Weizmann Institute of Science in
Israel. The first study did, however, acknowledge episodes of roasting horse heads in the later phases of the occupation, and the latter noted burned animal bones in association with stone tools nearby.

A theory that Peking Man was a cannibal that lived in a cave on the site was put forward first in the late 1920s by Henri Breuil and in the 1930s by Franz Weidenreich, who continued Black’s work after his death in 1934. Weidenreich concluded that many remains found in the cave bore traces of physical wounds and that some of the crania seemed to have been broken, presumably to reach the brain within. Pei Wenzhong early disagreed with this conclusion and suggested instead that these skeletal wounds could have resulted from hyenas dragging their victims to the cave and eating them there. Pei’s view won fresh support in the 1980s and 1990s from research conducted by Binford and Stone, whose examinations of bite and tool marks on animal bones furthermore indicated that Peking Man was a scavenger instead of a hunter and that the cave mostly was occupied by denning animals. However, a cranium discovered in 1966 has recently been shown to have marks from stone tools, indicating that cannibalism in fact did occur. A long-held claim that Peking Man may have been the forefather of the people in Asia has been contradicted by recent DNA research.

Peking University
Běijīng Dàxué 北京大学

Peking University, China’s oldest university and today one of its best, was crucial to the development of Marxism in China. University professors Li Dazhao and Chen Duxiu, co-founders of the Chinese Communist Party, and Mao Zedong, eventual leader of the CCP, then working in the university’s library, all attended the school. The name “Peking University” lives on despite the modern usage of Beijing.

Peking University is the oldest and one of the best universities in China. It was founded in 1898 under the Qing dynasty (1644–1912) and was originally named Metropolitan University. After Republican China (1912–1949) was established, the university changed its name to Peking University in May 1912; it retained this name after the People’s Republic of China was established in 1949 and after usage of Beijing became more commonplace among Westerners.

Peking University has a tradition of academic freedom. From 1915 to 1923 it played a prominent role in the May Fourth Movement for intellectual and social change—the movement is most often associated with the demonstrations on 4 May 1919 for which it was named—and it became a center for the Chinese New Culture Movement to adopt a popular speaking language instead of the language of classical literature. The development of Marxism in China was begun at the university by professors Li Dazhao (1889–1927) and Chen Duxiu (1889–1942), and by Mao Zedong (1893–1976), who then worked in the university’s library but would go on to become leader of the Chinese Communist Party.

When Japan invaded China in World War II, Peking University was moved to Kunming in Yunnan Province. When the university moved back to Beijing in 1946, it consisted of six colleges with a total enrollment of three thousand students. By 1952 enrollment had increased to 10,671 students but declined during Mao’s Cultural Revolution (1966–1976).

The Library at Peking (locally known as Beida) University. The future chairman of the Chinese Communist Party, Mao Zedong, was working in the library when he met the party’s founders, former students themselves but professors by that time. Photo by Joan Lebold Cohen.
Today Peking University is a comprehensive university offering five fields of study: social sciences, humanities, science, medicine and information, and engineering. With a total enrollment of 36,982 students, it has 16 colleges, 19 departments, 80 undergraduate programs, 177 masters programs, and 155 doctoral programs. It also has 126 research centers and 98 research institutes.

The presidents of Peking University have included well-known scholars, including Yan Fu, the most famous Chinese translator of Western classics to Chinese; educator Cai Yuanpei, philosopher and author Hu Shi, and economist Ma Yinchu.

Completed in 1598 by Tang Xianzu and widely performed and printed thereafter, *Peony Pavilion* was among the first Chinese plays to explore the philosophical dimensions of passionate love. An instant success, scenes from the play entered the core repertoire of Kun Opera, the oldest continuously performed Chinese operatic form and now a UNESCO Masterpiece of Oral and Intangible Heritage of Humanity.

Together with the Yuan dynasty (1279–1368) *zaju* drama *Story of the Western Wing* (*Xixiang ji*) and the story of the Butterfly Lovers, Liang Shanbo and Zhu Yingtai, *Peony Pavilion* ranks among the famous romantic comedies in the corpus of traditional Chinese song-drama. Also known as *The Return of the Soul* (*Huanhun ji*), *Peony Pavilion* was written by Tang Xianzu (1550–1616), the most innovative dramatist of his era. Rather than letting musical and prosodic considerations constrain his compositions, Tang treated song lyrics not so much as mere libretti but as a poetic medium in its own right. Inspired by the aesthetic of Yuan *zaju* drama, which combined poetic and colloquial elements, Tang conceived of a fresh and often complex poetic language while juxtaposing scenes of great emotional delicacy and depth with episodes of hilarity and military valor.

Completed in 1598, staged in 1599, and widely published in the 1600s, the fifty-five-scene play follows the story of Du Liniang as she experiences sexual awakening with a young scholar in a dream (scene 10), draws a self-portrait and composes a poem on a silk scroll to
commemorate her beauty (scene 14), dies of lovesickness (scene 20), is sent back to the world by the Judge of Hell (scene 23), has her portrait recovered by the scholar Liu Mengmei (scene 24) and meets up as a ghost with Liu, the real incarnation of her dream lover (scenes 28–32), cajoles him into resurrecting her corpse (scene 36), and eventually convinces both her stern father and the emperor to accept her marriage to her dream lover (scene 55).

As Tang Xianzu announced in his famous preface to the play, the song-drama aimed to explore the mysterious power of authentic passion (qing) to transcend the conventional limitations of the natural world on the one hand, and to be accommodated and integrated within to improve upon the social contract on the other hand. In endowing a female heroine with the capacity to imagine a deeply sexual and yet profoundly pure love, Tang drew on established notions of women as the emotional gender (duoqing) but newly invested such a disposition with socially regenerative powers. An instant success in private and commercial performance venues, Peony Pavilion struck a chord with both popular and elite audiences. Gentry women in particular deeply identified with the romantic and literary aspirations of the heroine. Such sentiments culminated in the Joint Commentary to Peony Pavilion by the Three Wives of Wu Washan (1694).

Select scenes from the play quickly became fixtures in the operatic repertoire, particularly in the melodious string- and wind-based Kun opera (Kunqu), the oldest continuously performed operatic genre in China and since 2001 a United Nations Educational, Scientific, and Cultural Organization (UNESCO) Masterpiece of Oral and Intangible Heritage of Humanity. Since the late 1990s several major theatrical productions with renowned directors (Peter Sellars, Vienna, 1998; Chen Shizheng, New York, 1999; Guo Xiaonan, Shanghai, 2000; Bai Xianyong, Suzhou, 2004) have rekindled interest in Kun opera in China and abroad with new versions of Peony Pavilion. Filmic and novelistic adaptations of Peony Pavilion in Chinese and other languages underscore the renewed appeal of genuine passion in an age of mediated experiences.

People’s Courts
Rénmín fǎyuàn 人民法院

The current Chinese legal system is based on the 1982 constitution, which established a hierarchy of people’s courts to handle both civil and criminal cases. People’s courts are units of the government charged with advancing the interests of the state (i.e., maintaining the social and economic order), are subject to the direction of CCP officials, and do not involve an adversarial prosecutor/defender relationship, as is common in the West.

The Chinese legal system has undergone several substantial changes since it was established by the Constitution of the People’s Republic of China of 1954. The legal system under this constitution was based largely on early Soviet legal practices and included Western concepts such as freedom of religion, speech, and correspondence, and freedom from arbitrary arrest, unless those arrests were authorized by people’s procuratorates. In the Chinese system, procuratorates serve as both prosecuting attorney and public defender. By 1957 the emphasis on legal rights had come to be perceived as a threat to central authority, and arrest powers were granted to police forces. Judicial power was undermined by local officials who assumed the functions formerly assigned to the procuratorates.

The breakdown of constitutional legal authority contributed in part to the Great Proletarian Cultural Revolution (1966–1976), which ended with the promulgation of the new constitution of 1975. Procuratorates were not included as part of the legal authority under this constitution, and their functions were assigned to the police. This increased party authority but undermined the rights of citizens. Legal reforms continued with the 1978 constitution and again with the 1982 constitution, in which the legal organs of the 1954 constitution were brought back.

The current Chinese legal system dates from the 1982 constitution and is quite different from Western systems, in both criminal and civil cases. But China’s court systems, and its legal procedures as a whole, have been undergoing substantial change as China shifts from the hard-line socialist authoritarian regime it was in 1982 to a more market-based one that must address pragmatic matters and international observation.

Section 7 of the 1982 Chinese constitution directs the structure of the people’s courts and the people’s procuratorates. Unlike some Western judicial systems, courts are not independent. According to the Chinese constitution, the Supreme People’s Court answers to the National People’s Congress and oversees the operations of lower courts. These include military courts, special people’s courts, and local people’s courts. The separation of powers that exists in modern Western governments does not exist, and courts are subject to the direction of party officials. But the increasing openness of Chinese political activities serves to balance the decisions of the people’s courts.

Also within the judicial structure are the people’s procuratorates and the public security bureaus. Under
the 1982 constitution, all court proceedings are to be open to the public, except in cases of state secrets, private family matters, and children.

Article 135 under this Section 7 of this constitution directs: “The people’s courts, people’s procuratorates and public security organs shall, in handling criminal cases, divide their functions, each taking responsibility for its own work, and they shall coordinate their efforts and check each other to ensure correct and effective enforcement of law.” This points out that Chinese courts cannot exercise judicial review over legislative matters, and in this regard are not as powerful as many of their Western counterparts. The Chinese constitution does guarantee the right to appeal decisions of the lower courts, but only one appeal is permitted. The Chinese practice of encouraging people charged with crimes to confess (with the expectation of reduced sentences) leads to an extremely high rate of convictions and undermines the effectiveness of appeals.

The lowest level of the people’s court functions at the district and county level. Approximately 3,100 of these basic courts 基层人民法院, which operate at the county, city, and municipal level, have been established. The next level is the higher court, or intermediate court 中级人民法院. Thirty of these function in the major municipalities of Beijing, Shanghai, Chongqing, and Tianjin; in the autonomous regions of Guangxi, Xinjiang, Ningxia, Neimengu, Xizang (Tibet); and in the provinces. Separate judicial systems exist for the Hong Kong and Macao special autonomous regions. The highest level of people’s court is the Supreme People’s Court 最高人民法院.

Within the Chinese system, Western concepts such as the Anglo-American adversarial relationship between prosecution and defense are not used. Because Chinese courts are units of the government, socialist theory dictates that they should advance the interests of the state, including maintaining the “social and economic order,” which is often at odds with the interests of the accused. Another aspect of people’s courts that differs from Western systems is that judges in these courts can recommend mediation between the parties; the same judge acts as mediator.

Defense lawyers in the Chinese system do not become involved with their clients until after an indictment has been issued, further limiting their usefulness. Another barrier to defense is the “presumption of guilt” on which the Chinese system operates. Additionally, freeing a defendant on a legal technicality is seen as a threat to the security of society. Lawyers must have their licenses to practice law renewed by local officials, so challenging political authority puts lawyers at risk.

Nevertheless, the complexity of China’s legal system
has led to a need for trained legal professionals, particularly as China’s economic system has opened up to more foreign exchange. In the late 1980s, the numbers of professional lawyers did not meet the demand for their services. But since the late 1990s, the number of lawyers and law offices has increased. Since 1990, the number of cases in Chinese courts has doubled, and a new focus on social justice, rather than social and economic order, has developed. Since the late 1990s, people’s courts have had to deal with a more litigious population, and the number of civil cases, particularly those dealing with exploitation of migrant workers, has greatly increased.

People’s Daily
Rénmín ribào 人民日报

People’s Daily is the official newspaper of the Chinese Communist Party Central Committee, and is the most influential and authoritative newspaper in China to represent the voice of the Chinese central government. With a combined domestic and international circulation of over 3 million, it is ranked among the top ten largest newspapers in the world by UNESCO.

Beginning publication in 1948 in Pingshan, Hebei Province, as the newspaper of a regional branch of the Chinese Communist Party (CCP), the People’s Daily is the official newspaper of the CCP’s Central Committee. In March 1949 the People’s Daily moved from its Hebei location to Beijing as the People’s Liberation Army entered the city in preparation for the founding of the People’s Republic of China; it was named the official party paper in August 1949.

The People’s Daily is the most influential and authoritative newspaper in China, representing the voice of the Chinese Communist Party and the central government. It has a combined domestic and international circulation of over 3 million. According to the United Nations Educational, Scientific, and Cultural Organization (UNESCO), it ranks among the world’s ten largest newspapers in circulation. The People’s Daily has thirty-six correspondent branches in China and thirty-two foreign correspondent bureaus.

The People’s Daily carries the latest news about policies, resolutions, and viewpoints of the Chinese Communist Party and the central government. It also offers comprehensive coverage of major domestic and international news.

During the Cultural Revolution (1966–1976) the People’s Daily was one of the few sources of information from which either Chinese or foreigners could learn what the Chinese government was doing. During that period an editorial in the People’s Daily was considered a powerful statement of government policy. The People’s Daily is still the chief information source of the Chinese Communist Party, but editorials in the People’s Daily are only regarded as fairly authoritative statements of government policies. Although all editorials, commentaries, and other opinions published in the People’s Daily must be government approved, they differ sharply in the amount of official authoritativeness they contain.

The People’s Daily has three editions: Mainland Edition for readers in mainland China; Hong Kong Edition for Hong Kong readers; and Overseas Edition for readers outside the first two areas. Unlike the other two editions, the Mainland Edition does not announce that it is specifically geared for mainland readers. The Hong Kong Edition has much more content, whereas the Mainland Edition content is restricted from including party-sensitive subjects.

Since the mid-1990s the People’s Daily has faced a decline of government subsidies and has been challenged as well by increased competition from international news sources, smaller Chinese newspapers, tabloids, and online
news outlets. As part of its effort to modernize, in 1997 it began an online edition at its website (www.people.com.cn) and has expanded its content in language editions of simplified Chinese, traditional Chinese, English, Japanese, French, Spanish, Russian, and Arabic. The web content, such as that appearing in the Strong Nation Forum in the Chinese edition, has been more candid than that of the paper’s printed editions.

Published under the People’s Daily are several other publications, such as East China News, South China News, Market Daily, International Financial Daily, Jiangnan Times, Global Times, Securities Times, Health Times, Satire and Humor, and monthly magazines, including The Earth, News Front, Listed Companies, Times Trend, and People Forum.

People’s Liberation Army
Zhōngguó Rénmín Jiēfàngjūn
中国人民解放军

The People’s Liberation Army (PLA) is the ground, air, naval, and strategic forces of the Communist Chinese military. The PLA has been instrumental in the Chinese Communist Party’s (CCP) success in carrying out the revolution and in governing the country. Since the 1980s Chinese leaders have embarked on a series of reforms to professionalize and modernize the PLA.

The People’s Liberation Army (PLA) is one of the largest military forces in the world. In fact, its army, with more than 3 million members, is the largest in the world. It also has a fairly large navy and air force. Its nuclear forces, although small compared with those of the United States and Russia, are the fourth largest. However, many of the PLA’s weapons and equipment are antiquated and limited in their capacity to project military force beyond China’s borders.

The origins of the PLA date back to 1 August 1927, when the Chinese Communists established the Chinese Workers’ and Peasants’ Red Army to fight a guerrilla war against the Chinese Nationalist Party (Guomindang) forces, led by Chiang Kai-shek (1887–1975). During the Maoist period (1949–1976) the PLA was transformed from a loosely organized guerrilla army into a professional fighting force closely resembling the Soviet model, although some tension existed between those who wanted further professionalization and those who wanted the PLA to remain a revolutionary organization.

The former group included Marshal Peng Dehuai, the PRC’s first Defense Minister who was relieved of his post by Mao in 1959 after he criticized Mao for launching the Great Leap Forward. The latter group included Mao and Lin Biao, the Defense Minister who replaced Peng and was an important supporter of Mao during the Cultural Revolution until 1971, when Lin was declared dead after a mysterious plane crash in Mongolia. The official story is that Lin was fleeing to the Soviet Union after his plot to kill Mao had been uncovered.

Historically the PLA has been heavily involved in governance of the country, although it has always remained subordinate to rule by the Chinese Communist Party (CCP). Top CCP leaders, including Mao Zedong (1893–1976) and Deng Xiaoping (1904–1997), historically have had extensive experience in, and connections with, the Red Army. The PLA is one of the three pillars of power in the Chinese Communist political system, alongside the CCP and the Chinese government. The PLA enjoys equal rank with the State Council, the highest governmental body, and answers only to the Military Affairs Commission of the CCP. In other words, the Chinese Communist Party, not the government, commands the PLA. In fact, CCP control over the PLA has been so important that the only official position held by Deng Xiaoping, China’s preeminent leader during the 1980s, was that of chairman of the Military Affairs Commission. Another indication of the PLA’s involvement in domestic affairs is that until recently it ran a vast industrial and commercial empire that...
numbered over 10,000 enterprises with profits estimated at around S$5–10 billion a year. The growth of these enterprises was accompanied by high levels of corruption.

When Deng Xiaoping became China’s top leader in 1978, he began a series of reforms to professionalize and modernize the PLA in order to disentangle it from domestic affairs and redirect its mission toward external security from other countries. That reform continues into the twenty-first century, with one milestone being reached shortly after Deng’s death in 1997 when the PLA was ordered to transfer most of its commercial and industrial holdings to civilian control. Under the Jiang Zemin and Hu Jintao administrations, China has made major investments in upgrading its military force. The defense budget has risen consistently and significantly since 1989, a trend that has caused concern among China’s neighbors. China has purchased major weapons systems from Russia and Israel, and made substantial progress in developing its own military hardware. In 2007, China unveiled its new J-10 fighter bomber and is expected to introduce its own nuclear attack submarines in the near future.

Western opinion of China has oscillated between the positive and negative for nearly three hundred years. In the current era the media is an important force in China’s perception and reception.

China has made considerable efforts on the foreign policy front to offset Western perceptions of a “China threat,” instead stressing China’s “peaceful rise” (a phrase that quickly was replaced by “peaceful development”). But despite gains on the political front, the general cultural image of China remains clouded in the West.

China is becoming increasingly difficult to define ideologically because it is in a constant process of change. It is searching for national and international identities and for a fresh model of development. Its rate of socio-cultural and economic transformations is almost dizzying. In terms of Western perspectives of China, one can have either an essentialist view—which assumes that an authentic and clear set of definitively Chinese characteristics exists—or a nonessentialist view, which questions the concept of a “fixed” or “true” Chinese identity or essential “Chinese” qualities.

The Chinese government spent billions of dollars on new facilities for the 2008 Olympic games in Beijing. The Olympics were a great opportunity for the Chinese government and people to present a positive image to the rest of the world. PHOTO BY TOM CHRISTENSEN
Eleven “Ages” of Attitudes toward China

The scholar Harold Isaacs described six “ages” of attitudes toward China in the 1950s; in 1990 Steven Mosher added three more ages:

- Age of Respect (eighteenth century)
- Age of Contempt (1840–1905)
- Age of Benevolence (1905–1937)
- Age of Admiration (1937–1944)
- Age of Disenchantment (1944–1949)
- Age of Hostility (from 1949; Mosher saw this age as lasting until 1972)
- Second Age of Admiration (1972–1977)
- Second Age of Disenchantment (1977–1980)

To these nine append the following two:

- Age of Uncertainty (from 1997)

Each age has some distinguishing essentialist features:

- Confucian wisdom in the first
- Oriental despotism in the second
- A resilient civilization in the third
- The heroic Chinese in the fourth
- The ungrateful wretches in the fifth
- The evil Communists in the sixth
- Peaceful communitarian society in the seventh
- Excessive revolution in the eighth
- A modernizing nation in the ninth
- An unrepentant Communist state in the tenth

The eleventh age, the current “Age of Uncertainty,” is marked by concerns about human rights but more substantially by a sudden increase in coverage of China’s economic development as well as its increasingly important role in global issues.

For example, in mid-March 2008 the riots in Tibet triggered severe criticism of China’s record on human rights. American soldiers in China during World War II found Chinese girls who were educated in the United States to be good sports companions. Here Sergeant Ivan O. Stanbury of Pomona, California, waits with three young ladies for a turn on the tennis court. This photograph, circa 1942, conveys the Western view of China that Harold Isaacs calls the “Age of Admiration” (1937–1944). PHOTO BY TOM CHRISETSENSEN
rights by the media in the West. This criticism, reaching its apex in the Olympic torch relay in London, Paris, and Los Angeles in early April, galvanized so much public attention that it even threatened to derail the Beijing Olympics. But only a few weeks later the media responded positively to the Chinese government’s quick rescue attempts after the devastating earthquake in Sichuan. Later the early critical voice of the media was largely lost when the media joined the celebration of the success of the Beijing Olympics in August. The ravaging financial crisis in late 2008, however, brought China back to the other focus: China’s increasingly vital role in the world economy. The current uncertainty in the media’s portrayal of China may reflect uncertain changes within China and the challenges that these changes pose to formulating stable, long-term relations between China and the West. The theme of human rights versus the economy will continue to play out in the foreseeable future.

A prominent feature of the ages of attitudes toward China is that chronological pairs of them often represent two polarized positions. The image of China during the

An 1987 lithograph by J. Keppler, for Puck magazine, dating from the “Age of Contempt” (1840–1905, as named by the scholar Harold Isaacs). During the economic depression of the 1870s, white workers began to blame Chinese competition for the high rate of unemployment. As anti-Chinese sentiment grew, the American media depicted Chinese immigrants as opium addicts and rat-eaters, crowded together on bunk beds to save money. In this particular illustration a racist portrayal of Chinese immigrants is juxtaposed with that of an idyllic American family, implying that the Chinese laborers’ “standard of living” allowed them to settle for less wages than their American counterparts. Library of Congress.
1980s, for example, was dominated by hardworking people and harmonious families with the aspirations of an old civilization to modernize, whereas during the 1990s that image was replaced by an image of child abuse, prison labor, the death penalty, Taiwan, and Tibet. Perhaps it is not surprising that the 1980s brought the flowering in Great Britain of television documentaries about Chinese history and culture as the West tried to rediscover China after decades of isolation. At least eight such documentary series were produced during the 1980s, including Yellow River, The Heart of the Dragon, and Silk Road. However, during the 1990s this cultural China yielded, in the Western mind, to a largely political China.

The romantic-cynic pairing is another duality in Western perception of China. The West has had a love-hate relationship with China for as long as the West has studied China. That duality is reflected in U.S. policy toward China.

**Similar or Dissimilar?**

Because the West has a fondness for such dualities, it tends to see China through an either/or lens: China is perceived either as deviant and therefore negative or as like the West and therefore positive. During the oscillating ages presented earlier, with the exception of the Age of Respect (eighteenth century), positive ages were marked by qualities that the West sees itself as possessing and negative ages by what the West defines as “other.”

Therefore, on the whole, China’s receptiveness to Western influence has resulted in positive perspectives in the West, whereas China’s resistance to Western influence has resulted in negative perspectives. The one exception was the Age of Respect, when Europe used its idealized view of China as a means to criticize its own culture. The French philosophers of the eighteenth century grossly exaggerated the grandeur of China in order to address domestic problems. For example, the German philosopher and mathematician Gottfried Wilhelm Leibniz, disillusioned by the immorality of his own society, argued that China should send missionaries to teach natural theology to Europeans. But by the mid-nineteenth century the decline of China’s power with the advent of Western encroachment meant that such lofty perspectives could not be sustained. The technological progress that resulted from the Industrial Revolution and the opinion (common then in the West) that the non-Western world had no history to speak of meant that Westerners perceived China as backward.

**Media Role in Image Building**

We can easily see a parallel between image oscillation and changes in relations between China and the West. As the image shifts, so do relations. The reverse also is true: as relations shift, so do media perceptions. Indeed, the underlying force behind so many “back and forth” images concerning China is the change in the underpinnings of the relationship between China and the West.

The scholar Tsan-kuo Chang, writing on the influence of the media on U.S. policy toward China from 1950 through 1984, concluded that the media functioned more as a surrogate for foreign policymakers than as an independent voice. In reporting on China the U.S. media serve as an unofficial instrument for foreign policymakers to establish the rules of the game. During the 1980s the media reinforced the policymakers’ view of China as a counterbalancing force against the threat of the Soviet Union. When that threat disappeared during the 1990s after the Soviet Union collapsed, China seemed suddenly much more threatening. Policymakers and the media were now aware of China as the world’s most populous country, a country with rising economic power and an alien ideology. Since the 1990s the challenge seems to be to engage China productively and to balance economic and political interests.

**The Future**

China’s polity, despite having embraced economic (capitalist) globalization, remains unchanged for the most part. But it has reached a crucial crossroad: It has abandoned the Maoist development model but is not walking down a totally Western road to modernity, which is what some in the West, as well as in China, would prefer. The Chinese society and state continue to evolve, steered by a multiplicity of dynamics but mostly by a catch-up mind-
set and a renewed appreciation of their own traditional values and history.

The Chinese adage “groping for stones to cross the river” can be applied not only to China’s economy, which has already taken off, but also to China’s sociocultural and political institutions, which are seeking a sustainable development model. This fact is reflected in the Chinese Communist Party’s adoption of a scientific approach to development at its seventeenth National Congress in 2007. The Communist-versus-capitalist perspective linked to the Cold War is obsolete. Indeed, today the Chinese state resembles, if anything, more its predecessors in China’s long history of bureaucratic control and state intervention than anything described by orthodox Marxism. The groping-oriented approach initiated by Chinese Communist Party general secretary Deng Xiaoping to some extent shows that the Chinese political elite has made a complete reversal in its ideological struggle for China’s future: from embracing Soviet-style Communism early in the twentieth century to embracing capitalism in the twenty-first century. Both Dengist pragmatism and Maoist dogmatism are part of a search for a Chinese road to modernity in a journey that is far from being over in the first years of the new millennium.

Today China defies simplistic characterization, although some people in the West may still feel that China can be interpreted within existing Western frames. Mark Leonard, executive director of the European Council on Foreign Relations, wrote in What Does China Think? that although dozens of books about China’s rise have been written, most authors treat China as a political, economic, or military unit instead of as a generator of ideas that could influence the Western world.

If news reporting mediates reality rather than mirrors reality, how are the news media mediating the reality of China? How does China become news? How is newsworthiness determined? More important, how should China be presented to the general public? These questions are important because the media contribute greatly to the public perceptions and knowledge of China. The media often define what we say and think about China. The scholar Richard Hoggart concludes that news editors’ sense of what is news has been culturally conditioned and that such a sense structures reality. If his conclusion is true, news reporting involves an interaction between our internalized versions of the spirit of our time, influenced by cultural conditioning, and our external world.

Perspectives on the United States—Chinese

Zhōngguó rén kàn Měiguó 中国人看美国

After the People’s Republic of China was founded in 1949, relations between China and the United States were nonexistent until 1972. Since then, dealings have been complex and frequently changing; Chinese viewpoints of the United States often have been fueled by suspicion and distrust.

China, a cradle of human civilization and the birthplace of the dominant East Asian culture, is a large country with a rich, long history. Although China had trade and diplomatic relations with the United States in the nineteenth century, the focus here is on relations between the two nations since the founding of the People’s Republic of China (PRC) in 1949, and on Chinese perspectives on the United States from that date forward, with emphasis on the contemporary period after 1989. PRC-U.S. relations since the 1990s have become progressively more complex and have proceeded on two tracks, one of comprehensive engagement and one of strategic competition. The PRC-U.S. relationship will probably be the most important bilateral relationship in the world during the twenty-first century.

History of Relations with the United States

The history of relations between the PRC and the United States can be divided into four periods. In 1949, the Communists won the civil war against the Nationalists (Guomindang or GMD) and took control of mainland China; the Nationalists fled to Taiwan. During the first period (1949–1972), U.S. relations with the mainland regime, the Chinese Communist Party (CCP), were vituperative, estranged, and largely frozen.

The second period (1972–1989) began with the visit to China of U.S. president Richard Nixon (served 1969–1974) to meet with Mao Zedong, the chairman of the CCP. This led to the establishment of diplomatic relations between the countries for the first time, with the two sides sharing a common strategic concern over the threat posed by the Soviet Union. PRC-U.S. relations were further normalized in 1978 when the two countries reached an accommodation on the question of Taiwan’s status. (In 1949 the Nationalists had insisted that, although located on Taiwan, they represented the legitimate government of all China, a claim the United States initially supported; the PRC for its part regarded—and continues to regard—Taiwan as a constituent part of China that should one day return to mainland control.) As part of that accommodation, the administration of U.S. president Jimmy Carter (served 1977–1981) terminated official relations with the government on Taiwan. In 1978 the PRC, led by Deng Xiaoping, initiated economic reforms, and PRC-U.S. relations flourished in terms of trade, tourism, and cultural exchanges.

The third period (1989–2001) began with the Tiananmen Square incident in June 1989 and ended with the September 11, 2001, terrorist attacks on the United States. In June 1989 the Chinese government suppressed mass protests in Beijing’s Tiananmen Square, as well as elsewhere in China, sparking the most severe crisis in
PRC-U.S. relations since the 1972 rapprochement. Relations remained troubled throughout the 1990s. But the administration of U.S. president Bill Clinton (served 1993–2001) viewed the PRC as a strategic partner and actively sought comprehensive engagement with it. His successor, George W. Bush (served 2001–2009), reversed that view, calling China instead a strategic competitor. Yet PRC-U.S. relations during the fourth period (from the September 11 attacks to 2007) improved significantly as President Bush sought Chinese help and support for the global war on terrorism and in resolving the North Korean nuclear crisis.

**Perspectives on the United States**

China views itself as a victim of nineteenth-century Western imperialism and power politics. For Beijing, the power struggle between the United States and the Soviet Union during the Cold War was another example of Western power politics, by which Beijing means a type of foreign policy distinguished by a pursuit of national interests and power with no regard for moral principles. Beijing views the West in general and the United States in particular from this perspective, and it has colored the PRC’s perception of the United States in almost every context. To Beijing, U.S. pressure on China to democratize, grant more access to Chinese markets, lower its trade deficit, and limit its arms sales, not to mention U.S. support for Taiwan and effort to maintain dominance in Asia, are all examples of U.S. hegemony (that is, U.S. desire to dominate). The unilateralism of the foreign policy of George W. Bush in the post–September 11 era further bolstered this view. Both hegemony and power politics involve the excessive use of military force in solving foreign policy problems, while hegemony involves the unilateralist use of it.

Policy analysts in the United States have a “China threat” thesis, which claims that the PRC’s economic growth, population size, increasing military capabilities, and political influence threaten U.S. national security. It assumes that the Chinese and U.S. political systems and ideologies are irreconcilable, and consequently predicts that there eventually will be a confrontation between the two countries. From Beijing’s viewpoint, the thesis says more about U.S. aggressiveness than about China; Beijing
does not see China as being similar to the United States or other Western powers. To counter what it believes to be an unfair characterization of China, Beijing has come up with its own “Peaceful Rise” (heping jueqi) thesis. According to this, China does not threaten the United States because China does not have superpower military strength, China does not have a tradition of territorial expansion, and China does not have a single soldier overseas. Heping jueqi essentially maintains that China does not support or share the Western tradition of power politics and hegemony and therefore could not pose a threat to the United States.

**MAJOR EVENTS INFLUENCING PRC PERSPECTIVES**

In its opinion, Beijing’s view of the United States as a hegemonic world power has been reinforced by a series of events and issues in the post–Cold War era (since 1989).

**Iraq War (1991)**

First, Beijing was astonished by the advanced technological wizardry of U.S. weaponry and by the rapid defeat of Iraq’s armed forces in the 1991 Iraq War. It jolted China’s People’s Liberation Army (PLA) into initiating

---

A daguerreotype of white and Chinese miners hoping to strike it rich during the California Gold Rush at Auburn Ravine in 1852, when thousands of first-wave Chinese immigrants arrived to seek their fortune in Gum Shan, or “Gold Mountain.” CALIFORNIA STATE LIBRARY (DAGUERREOTYPE COLLECTION #912).
an aggressive program to modernize its military hard-
ware (equipment) and software (technology, doctrines).
NATO operations against Serbia in 1999 and yet again in 2003, when war in Iraq resumed, further shocked China.

**Taiwan Strait Crisis (1996)**

In 1996 Washington dispatched two aircraft carrier groups near China after China lobbed missiles across the Taiwan Strait in an attempt to influence the presidential election. James Sasser, the U.S. ambassador to China, warned President Clinton that running a carrier group through the strait might trigger a Chinese military response. The carrier groups moved away, China quieted down, and the relatively conciliatory Lee Teng-hui was reelected in Taiwan. The episode, however, started Beijing thinking about ways and means to deter similar interventions by the U.S. military in the future.

**Bombing of the Chinese Embassy in Belgrade (1999)**

During the 1999 Kosovo crisis, U.S. jetfighters “mistakenly” bombed the Chinese embassy in Belgrade. Washington apologized and paid a sum of $2.2 million for the loss of Chinese lives and damage to the embassy building. However, even today Beijing has not accepted the official U.S. explanation that it was an accident. From China's perspective, the bombing was planned by certain right-wing elements in the Pentagon to humiliate the Chinese and to sabotage President Clinton’s attempt to engage China.

**Cox Report (1999)**

In May 1999 the U.S. House of Representatives’ Select Committee on U.S. National Security and Military and Commercial Concerns with the People’s Republic of China, led by Representative Christopher Cox (R-CA), reported, among other things, that China used an elaborate system of espionage and exchanges to modernize its nuclear weapons capabilities, and that it stole U.S. data on thermonuclear warheads, missiles, and space technology. China’s State Council saw in the report a U.S. attempt to instigate anti-Chinese sentiments, to contain China, and to undermine PRC-U.S. relations.

Experts abroad and at home discredited the Cox report, arguing that many of its statements were factually wrong, overly politicized, or simply lacked understanding of the true nature of some of the issues (specifically regarding nuclear science and missile technology). Nevertheless, the report paved the way for Congress’s creation of the U.S.-China Security Review Commission (later Economic and Security Review Commission) in October 2000. The USCC’s mandate is to investigate, monitor, and report on how PRC-U.S. economic relations might affect U.S. national security. The question of the PRC’s strategic intentions toward the United States is foremost for the USCC. Its annual reports provide data that allegedly attest to the “China threat.” The reports claim that the PRC leadership perceives Washington as a formidable adversary and an overbearing bully, but also as a declining power with exploitable military vulnerabilities. Beijing, however, sees the reports as further attempts by U.S. right-wing groups to demonize China.

**EP-3 Spy Plane Landing on Hainan Island (1 April 2001)**

On 1 April 2001 a U.S. navy surveillance plane, the EP-3, collided with a Chinese F-8 fighter jet, causing the latter to crash into the South China Sea and forcing the former to make an emergency landing on Hainan Island in southern China, where its twenty-four crew members were detained until 3 July 2001. The two sides disagreed on who was responsible for the crash and whether the U.S. plane had ventured into Chinese airspace. The crisis was defused and the crew released only after Washington said that it was “very sorry” for the death of the Chinese pilot and for landing on Hainan without permission. However, the incident served to reinforce Beijing’s perception that continued U.S. reconnaissance and surveillance of China, a hegemonic practice, reflected Washington’s determination to contain China.

**The September 11, 2001, Terrorist Attacks and the Iraq War of 2003**

Prior to the terrorist attacks, the administration of President George W. Bush saw China as a potential peer competitor; after the attacks, the “China threat”
was temporarily overshadowed by the global terrorist threat. China’s president Jiang Zemin met with Bush (for the first time since the EP-3 collision) and offered help in the war against terrorism. By September 2003 the U.S. secretary of state, Colin Powell, said that bilateral relations were at a thirty-year high, an assertion he repeated a year later (in November 2004) while acknowledging China’s help with the crisis over North Korea’s nuclear capability. However, at the beginning of the second term of George W. Bush, Vice President Dick Cheney and Secretary of Defense Donald Rumsfeld continued to see China as a strategic competitor. Accordingly, Beijing and Washington continued to prepare for military confrontation over Taiwan and closely monitor each other’s long-term military capabilities and strategic intentions.

From Beijing’s perspective, then, bilateral cooperation on the war on terrorism and on North Korea is merely tactical. Writing in the People’s Daily, the former foreign minister Qian Qichen argued that Washington has gradually brought its post–September 11 strategy into alignment with neoconservative thought. First, Bush identified the “axis of evil” in his January 2002 State of the Union address, which prepared the way for bringing regime change to other countries. Next, the president’s September 2002 National Security Strategy Report shifted U.S. strategy to one of preemption. Finally, in March 2003, Washington defied its allies, the international community, and domestic public opinion, and launched the war against Iraq. The doctrines of regime change, preemption, and unilateralism deeply troubled Beijing, since that meant that the United States could intervene anytime in Tibet, in China’s Xinjiang Uygur Autonomous Region, or in Taiwan.

**The Global War on Terrorism**

Beijing believes that the United States is pursuing a kind of new imperialism under the guise of a global war against terrorism. It sees the wars in Afghanistan and Iraq as Washington’s attempts to use military power to push through its neconservative agenda and establish a U.S.-dominated world order. Beijing sees this agenda as a direct threat because the neoconservatives argue that China will inevitably challenge U.S. dominance in Asia and that the United States must not surrender its position there to China. From Beijing’s perspective, the neoconservative vision of the “New American Century” is merely the latest version of hegemony and power politics.

**Perception of U.S. Military Encirclement (2004)**

In August 2004 President Bush announced that the largest strategic redeployment of U.S. forces globally since the end of World War II would take place. While it remained uncertain how exactly the U.S. forces would be restructured, they were clearly reduced in Europe and moved toward Central Asia, Southeast Asia (Thailand, Philippines), and the West Pacific (Australia). In Central Asia, U.S. troops and warplanes were based or had flyover rights in Tajikistan, Kazakhstan, Kyrgyzstan, Afghanistan, Pakistan, and Uzbekistan. In South Asia, Washington has developed closer military ties with India. From Beijing’s perspective, the United States’ maneuvers in these regions were, and still remain, attempts to encircle China.

**Major Issues Influencing PRC Perspectives**

In addition to the events discussed above, certain long-term issues affect how Beijing and the Chinese people regard the United States.

**Human Rights**

Beijing sees U.S. confrontation on issues such as human rights, Internet dissent, Falun Gong, and Muslim Uygurs as intervention in domestic Chinese affairs and as attempts to destabilize the Chinese government. It also considers the United States’ human rights rhetoric to be hypocritical. Finally, it sees the United States as a morally degenerate nation, and as such, the United States is not in a position to judge China’s or other nations’ human rights records; the implication is that the United States should put its own house in order first. In response to the U.S. Department of State’s annual report on human rights conditions in China, China’s State Council publishes an annual report of its own—entitled Human Rights Record of the United States—“to make known to the world the human rights violations” of the United States. When Bush remarked in April 2003 that the Chinese people will eventually want their liberty “pure and whole,” China’s Xinhua news agency countered that China will pursue its own path to democracy. It slammed the United States.
for assuming the right to be the world’s judge while having serious human rights problems at home, including prisoner abuse, discrimination against women, police brutality, and the exploitation of illegal immigrants. In Beijing’s view, the United States is equally hypocritical in its foreign policy—for example, in its imposition of arms embargoes on others for alleged weapons proliferation while ranking first in the world in terms of arms sale. In the wake of September 11, Beijing notes worsening U.S. violation of human rights in Afghanistan, Iraq, and Guantanamo Bay, Cuba.

Taiwan
After September 11, President Bush appeared to shift course on the issue of Taiwan in favor of the PRC, which, however, regards this shift unsentimentally. Bush pledged in March 2001 that he would do “whatever it took” to defend Taiwan, and offered the island the biggest weapons package in a decade. But in December 2003, during a visit by PRC premier Wen Jiabao, Bush abandoned the long-standing U.S. policy of strategic ambiguity over Taiwan by making a statement opposing Taiwan’s efforts to change the status quo. In October 2004 Colin Powell remarked that Taiwan was not independent, and in a separate interview with the CNN news network, he referred to “an eventual outcome, a reunification that all parties are seeking” (Kahn 2004). This was the first time a U.S. official ever spoke so unequivocally about PRC-Taiwan reunification as an eventual goal. But given the larger strategic competition between China and the United States, Beijing could view this shift in U.S. position only as inspired by the same realpolitik that had led to the 1972 rapprochement. This time the dictates of the war on terror rather than those of the Cold War provided the context for Washington’s policy decisions.

Trade Deficit, Currency Problem, and Arms Embargo
Beijing reasons that because of U.S. vested interests in trade with China, Beijing need not give in to Washington’s pressures on a number of issues. In 2003 the U.S. trade deficit with China reached approximately $124 billion (by 2008 it had risen to $266.3 billion). U.S. industry and labor groups complained that this was the result of China’s currency—the yuan—being undervalued. Beijing has permitted U.S. exports to China to rise faster than its imports from China, but it does not float the yuan. Such a move could cause liquidity problems, leading to a banking crisis that would hurt many U.S. companies with Chinese subsidiaries. For this reason President Bush turned down petitions to force a rise in the value of the yuan. Beijing is also confident that once the European arms embargo, imposed on it after the Tiananmen episode in 1989, is lifted, U.S. arms manufacturers will pressure Washington to follow suit.

Popular Perspectives on the United States
Surveys indicate that the ordinary Chinese citizen is ambivalent about the United States: A duality of resentment and admiration characterizes popular Chinese perspectives on the United States. Many Chinese admire U.S. economic dynamism, international status, and scientific achievements, but many also believe that the United States deliberately bombed their embassy in Belgrade in

Mao Zedong and U.S. Ambassador Pat Hurley. The two were not fond of each other (to put it diplomatically). In a less than statesman-like moment Mao called Hurley “that turtle egg”; Hurley reciprocated by calling Mao “moose dung.” NATIONAL ARCHIVES.
1999 and that it was the U.S. spy plane's recklessness that caused the crash of the Chinese plane in 2001. Further, a recent poll reported that 90 percent of the Chinese public believes that the Central Intelligence Agency (CIA) planted the severe acute respiratory syndrome (SARS) virus in China in 2003.

In a 1995 poll of 1,050 urban residents, the United States was rated the “most impressive country,” and yet polls conducted among Chinese youth in 1994 and 1995 reported that the United States was also ranked first among the most disliked foreign countries. Some Chinese gloated at the humbling of the United States on September 11. Anti-American sentiments were particularly pronounced regarding the U.S. handling of the Iraq War. Half the respondents to a 2003 poll answered a resounding “no” when asked whether the United Nations should help the United States rebuild Iraq; 60 percent saw the quagmire in Iraq as one of the United States’ own making; and 76 percent said they admired France and Germany for standing up to the United States.

It is not always easy to differentiate popular and official Chinese perspectives on the United States. Government-regulated media is often used to forge public opinion, but public sentiments are not entirely the result of official manipulation. A freer press in recent years has led Chinese tabloids to market jingoistic stories. A 1996 anti-American book entitled *China Can Say No* was a sensational success; a number of similar works in this genre since have similarly fueled anti-American sentiments. Official and popular views tend to converge on the Taiwan question. When a (false) story circulated that the United States was planning a massive show of naval power off Taiwan, it spawned a firestorm in Internet blogs, where anti-American sentiments run high.

Any changes in Chinese perspectives on the United States will be determined by several factors that could influence them in either direction: first, if President Barack Obama favors treating China principally as a strategic partner rather than a strategic competitor; second, if neoconservative thinking in the United States does not continue to dominate U.S. foreign policy; third, if both the North Korean nuclear crisis and the Taiwan issue are peacefully resolved without American military intervention; and fourth, if the U.S.-led global war on terror diminishes the “terrorist threat,” which could return the “China threat” to the center stage of U.S.-China international politics.

China changes constantly, and the Encyclopedia of China will change and grow, too. Berkshire’s authors and editors welcome questions, comments, and corrections: china.updates@berkshirepublishing.com.
Piaohao were native draft banks which originated in Shanxi Province. The managing style of the piaohao had great influence in modern Chinese banking. This type of bank served local merchants and businesses all over China, as well as Russia and Japan.

The piaohao were draft banks created by merchants in Shanxi Province during the Qing dynasty (1644–1912). During the Ming (1368–1644) and Qing dynasties, Shanxi merchants were involved in both domestic and foreign trade ranging from the northeast provinces to Mongolia, Xinjiang, and even Russia and Korea. They made fortunes by distributing salt and iron from their own area to the whole nation and also traded rice, tea, and silk from southern to northern and western parts of China. By that time China had adopted a bimetallic currency system, mainly a silver standard; each trade required the transfer of a large quantity of silver. Although the Shanxi merchants often hired armed men (biaojun) to guard these transfers, robberies still occurred.

The piaohao were created to solve this money transfer problem by Lei Lutai (1770–1849), a Shanxi dye merchant in Tianjin. He used Tang dynasty (618–907 CE) “fly money” (paper draft) methods to invent a money transfer system called huipiao, which was similar to a bank check. Lei established China’s first piaohao, Rishengchang Piaohao, at Shanxi Pingyao in 1823.

Along with the development of Shanxi merchant trade with other provinces, several piaohao opened branches outside Shanxi and established a transregional business network. For example, Rishengchang opened its branches in Shandong, Henan, Liaoning, and Jiangsu provinces only a few years after it was established. In the 1840s Rishengchang expanded its operations to Japan, Singapore, and Russia. Over the next half century more than fifty other piaohao were established throughout the Qing dynasty. Twenty of them had their headquarters in Pingyao, which became a famous financial center in the modern history of Chinese banking.

Piaohao had multiple banking functions, such as remitting trade bills and even taking government transit tax deposits during special periods. Piaohao could provide merchants and long-distance travelers with a huipiao, a check that they could exchange for cash at specified branches after they reached their destination. The check reduced the risk of robberies by eliminating the need to carry large amounts of silver.

Piaohao also received savings deposits and granted loans. All large Shanxi piaohao had branches in Beijing and other major trading cities. They cultivated close personal relations with Qing officials and took private deposits. Piaohao made profits by taking advantage of the time elapsed between issuing huipiao and having to pay the actual remittance; they could loan the money to others and charge interest. Since the quality of silver was different in each location, piaohao also could profit by remitting a lesser silver quality when the huipiao was presented.

Piaohao developed some practices of modern corporate governance by dividing ownership and management functions. Rishengchang hired a general manager.
to oversee all business, hired customer relations experts to deal with daily business operations, and established an incentive system by offering stocks and dividends to employees. The incentives increased with the duration of employment, making employees loyal to the piaohao.

In internal management piaohao had a strict personnel system to hire and train new staff members. Each new employee had to have at least two reputable reference persons with a certain amount of money deposited in the bank to act as financial guarantors. Piaohao required all employees to study Confucianism to establish high moral standards of trustworthiness, truthfulness, and loyalty and self-discipline to avoid the temptation of gambling and prostitutes. Thus, efficient internal management reduced operational risks and moral hazards.

Piaohao was the major type of draft bank during the late Qing dynasty, primarily because there was no central bank until the establishment of the Hubu Bank in 1904. Some piaohao served as semiofficial treasury agencies during the Taiping Rebellion period. The managers of these piaohao developed close relationships with Qing officials, for whom they transferred funds for the Bureau of Revenue and served as fiscal agents by collecting local tax revenues and transacting these revenues, such as lijin, the transit tax on goods traveling from provinces to the capital. Thirty-two piaohao banks with more than four hundred branches had paid-in capital of 30 million tael (a unit of value based on the weight of silver) in 1893. This amount, plus the deposits and notes of the native banks, totaled 200 million tael.

Since piaohao held some government deposits without paying interest, they had larger financial resources than some qianzhuang or native commercial banks in various cities. Piaohao lent money to those qianzhuang. The Yangzi (Chang) River usually served as a natural dividing line that indicated that piaohao dominated the financial market in northern China, and qianzhuang dominated the financial market in southern China. Since Shanxi piaohao did not have their trading business base in Shanghai, they could lend money to Shanghai local qianzhuang and make a profit by receiving interest.

Piaohao declined with the collapse of the Qing dynasty in 1912. Due to the overthrow of Qing dynasty, and large quantity of loans made to Qing officials that were never repaid, many piaohao were driven into bankruptcy. The remaining piaohao declined and finally disappeared after private banks were nationalized in 1952. But with China’s financial reform and promotion of microfinance in rural and less-developed urban areas in recent years, some small private cooperative banks have revived. Piaohao are also reviving in Shanxi Province and other places.

Ping-Pong Diplomacy
In 1971, Ping-Pong—the “ping heard round the world”—helped to create the first person-to-person, and then diplomatic, ties between two Cold War enemies: China and the United States.

Ping-Pong, also called “table tennis,” came to international prominence in 1971 because of Cold War diplomatic maneuvering. China, the world’s most populous nation, had been cut off from diplomatic relations with most of the rest of the world for over two decades when, seemingly out of the blue, the U.S. table tennis team, visiting Nagoya, Japan, in April 1971 for the World Table Tennis Championship, was invited to visit the People’s Republic of China—a nation that no American citizen had been allowed to enter for twenty-two years. The visit took place three months later, in July.

From the perspective of the Chinese authorities, namely Chairman Mao Zedong and Premier Zhou Enlai, the Soviet invasion of Czechoslovakia in 1968 made it seem that the USSR was a more potent threat to China than the United States. They decided that improved relations with the United States would increase China’s international security as well as its stature. Meanwhile, President Richard M. Nixon believed that ties with the People’s Republic would counterbalance the Soviet Union, improve Nixon’s own political standing at home, and improve the United States’ position in the Vietnam War.

In 1970 the Chinese offered to arrange a meeting between high-level officials of both governments, which led
eventually to national security adviser Henry A. Kissinger’s visit to Beijing in July 1971. But that same month, during the U.S. table tennis team’s visit—an event that may have been spontaneous and personal, as is usually claimed, or may have been encouraged by diplomatic efforts, as some suggest—the young American and Chinese table tennis players, many of them teenagers, changed the way ordinary people in their countries thought about so-called Red or Communist China and the decadent, imperialistic United States. *Time* magazine dubbed the event the “ping heard round the world.”

By all accounts the trip was deemed a success, although not without its worries. One player was worried about being amongst atheists, while a player of Korean descent decided against going. The team was treated royally, sometimes being offered five meals a day. By all accounts the trip was deemed a success, although not without its worries. One player was worried about being amongst atheists, while a player of Korean descent decided against going. The team was treated royally, sometimes being offered five meals a day, and was besieged by news bureaus wanting first-hand information. This “people-to-people” exchange, which was extolled by the press and by both governments, provided President Nixon with a backdrop for the major diplomatic shift that was in progress. During the team’s visit, the United States announced the end of a twenty-year trade embargo against the People’s Republic. Nixon himself went to Beijing from 20 to 27 February 1972, the first visit by an American president to China.

**China Visits the United States**

The Americans reciprocated by inviting their Chinese opponents to visit the United States, which they did in April of 1972. In this case, a nongovernmental organization, the National Committee on U.S.-China Relations (NCU-SCR), stepped in to organize what became a huge media event, broadcast by every news outlet and publicized in magazines as diverse as *Life* and *Seventeen*. The two teams traveled on one charter plane to play in matches across the country; another plane was needed for reporters and camera people. The tour inspired both enthusiasm and protests. Upon their arrival in Detroit, the Chinese team was bemused at the sight of a welcoming crowd of people waving Mao’s “Little Red Book,” an embarrassment...
because by that time the Chinese Cultural Revolution was over and the book and its ideas had fallen out of favor in China. The Chinese players completely dominated the matches, but the U.S. players managed to win surprise victories when the tour landed in their hometowns.

Throughout the 1980s, there were many athletic exchanges that introduced Chinese athletes to huge U.S. audiences across the country, all in the spirit of “friendship before competition.” The table tennis matches of the 1970s helped to change, or begin to change, the negative images Americans and Chinese had of each other. Sports would continue to play a role in diplomatic relations with other countries after the International Olympic Committee (IOC) reinstated China. The Nagoya Resolution of 1979 that led to China’s re-admittance stipulated that China would use its name, flag, and anthem, while Taiwan’s team was required to use the name “Chinese Taipei.”

**Table Tennis at the 2008 Olympics**

Table tennis only became an Olympic sport in 1988, but it was a centerpiece at the 2008 Beijing Games because of its importance in China—and perhaps because of the role it has played in building bridges for China in the early
Ping-Pong Oddity

H. Roy Evans, president of the International Table Tennis Federation, reflects on the American sport that brought China and the United States together in the 1970s.

I never thought that I would be happy to see the words “Ping Pong,” and in a newspaper of all places—in fact, in many newspapers. These words are hated by all who struggled hard in the early days to persuade a general public, derisive because of the ping pong table in the basement, that table tennis is a first class sport, involving art and great physical stamina.

Yet in May, 1972 newspapers all over the World carried banner headlines—“Ping Pong Diplomacy”—and I was glad. It was scarcely to be expected that journalists anywhere would not leap to use an onomatopoeia which not only gave them a neat lead, but, by the very fact of their Chinese appearance, were a “must” in introducing a story which rocked the world!

The fact that British and Canadian teams were invited to tour China after the Nagoya World Championships was news enough, for all physical contact with the Chinese had terminated in 1965, and little if anything was known of their activities throughout the Cultural Revolution.

But when the Americans were invited, that really got the wires buzzing, and the implications were tremendous. Perhaps “tremendous” isn’t an exciting enough word to use to describe the impact in the United States. Probably there, for longer than anywhere, our game had suffered the indignity imposed by the name by which it was known. And the fact that such a game had been the means of establishing a detente between World Powers politically so far apart was almost unbelievable!

Little wonder then that, as President of the International Table Tennis Federation, I was so proud that our game had been used as a vehicle of approach that I instantly forgave all those who used those hated words.

The ping heard round the world. (1971, April 26). Time, 97, 17.

One of only a handful of towns and cities in China surrounded by their original walls, Pingyao, in Shanxi Province, was accorded UNESCO World Heritage Status in 1997. Significant restoration work has been accomplished to provide visitors with a sense of urban life in times past, including the role of the fabled piaohao, exchange facilities that served as nascent banks for merchant traders.
aspired to a courtly lifestyle, Pingyao over the subsequent century and a half nonetheless receded into a backwater status before resurging to prominence in 1997 when it was declared a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage Site.

Some 6 million visitors now see Pingyao annually, bringing with them not only resources to reinvigorate the city’s infrastructure but also myriad unintended negative consequences of tourism that lead many to ask how it is possible to protect a fragile cultural landscape.

Said to have been laid out in the shape of an auspicious turtle, Pingyao’s perimeter is marked with 10-meter-high walls that run 6,200 meters in circumference and is secured additionally with a 4-meter-wide, 4-meter-deep moat. Six gates—two each on the east and west sides and one each on the north and south sides—provided guarded access into the town. Mounted atop them are multitiered wooden structures. Faced with bricks on the outside and along the top but with its tamped-earth core visible from inside, the wall is an imposing crenellated structure that is 9–12 meters wide at the base but tapers upward to between 3 and 6 meters. Distinctive features of the wall are the three thousand crenels, which are indented openings that give the wall the look of a saw blade, and seventy-one embattlements, each about 50 meters apart, that project from the wall.

Shanxi Province always has had a reputation as a difficult place to make a living because of limited arable land and a dry, harsh climate. On the other hand, the location of the province midway between the imperial capitals of Beijing and Xi’an brought with it relatively easy access to the outside world by way of its north-to-south flowing rivers and old-style trunk post roads that crisscrossed the

region. Shanxi merchants during the fifteenth and sixteenth centuries dominated various commodity markets in towns along the border with Russia as well as in large cities along the coast. With increasing wealth from buying and selling salt, iron, cotton, silk, dyestuff, and tea, a need arose for the long-distance transport of silver cash. Pingyao merchants, especially because of their sense of business and loyalty to kinsmen, introduced paper notes called huipiao that could be redeemed for cash at piaohao (exchange shops). Piaohao were nascent banks, forerunners of a modern finance system, that made possible long-distance remittances.

In Pingyao piaohao were associated with merchant shops, which usually were housed in extravagant courtyard residential structures. Among the largest was Rishengchang, once merely a dyestuff store, which at its peak had forty branches throughout China, each staffed by loyal people from Pingyao. It is said that by the middle of the nineteenth century, of the fifty-one traditional banks in China, forty-three were owned by Shanxi natives, with those from Pingyao operating twenty-two—all of them benefiting from a close relationship with the Qing dynasty (1644–1912) imperial court, which also had a need to transfer funds around the country. By the latter half of the nineteenth century, on the other hand, as Western-style banks began to be established in China’s major cities, they siphoned off resources from the traditional piaohao, and by the end of the first decade of the twentieth century, Shanxi merchants and “traditional bankers” lost their primacy. Many once-prosperous businessmen retreated to their great manors in Pingyao to live out their days quietly. This stagnation led to the preservation of Pingyao’s network of narrow streets and lanes, along with some thirty-eight hundred Ming dynasty (1368–1644) and Qing dynasty structures, about five hundred of which remained in reasonable repair.

Pipa

The *pipa*, a form of lute with four strings, became an important solo and ensemble instrument in China over a period of two thousand years. It is used in a great variety of traditional genres as well as modern compositions.

The *pipa* is a four-stringed, pear-shaped, plucked lute that developed in China over a period of two thousand years. The instrument was originally based on Central and South Asian prototypes brought to China via the Silk Roads. The *pipa* spread to other East Asian nations such as Japan, where the characters are pronounced as “biwa.” The name for the instrument was originally a generic term applied to a variety of plucked lutes, but eventually came to be applied exclusively to the pear-shaped version.

The modern Chinese instrument has a hollow back basin made from a single piece of hardwood tapering into a carved tip that bears its tuning pegs; its front surface has a flat piece of porous wood. Slightly more than a meter in length (about 42 inches), it has four fret ledges (*xiang*) carved into the body as it approaches the tip, and an additional twenty-three bamboo frets (*pin*) glued to the porous soundboard. The Chinese characters (Hanzi) in the instrument’s name (*pi* and *pa*) are phonetic approximations of ancient terms indicating the alternate strumming up and down with a plectrum.
Pipa

The pipa is a four-stringed, pear-shaped, plucked lute that developed in China over a period of two thousand years. The instrument was modeled on Central and South Asian prototypes brought to China via the Silk Roads.

(pick); this was the original right-hand technique, preserved in Japan and in some regional Chinese ensemble genres. Modern right-hand technique is very complex and uses a variety of individually named strokes made by all five fingers, achieving contrasts in timbre and volume. Beginning during the Ming dynasty (1368–1644) and possibly earlier, players who used these right-hand techniques held the instrument vertically.

Initially, the instrument was associated with foreign travelers, including Buddhist evangelists who used it to accompany their songs, and virtuoso musicians who came to the Chinese court during the Tang dynasty (618–908 CE). Eventually, the instrument became popular in native Han musical genres, including regional ensemble music, narrative song accompaniment, and solo performances.

In the nineteenth century, printed collections of pipa scores were published using woodblock technology, and solo technique continued to expand. In the early twentieth century, new compositions were created by Liu Tianhua and other composers. After 1948, Lin Shicheng brought the virtuoso Shanghai traditions to Beijing, and several generations of professional soloists were trained in the nation’s conservatories, including Liu Dehai, who premiered the pipa concerto “Little Sisters of the Grassland” in 1973. Since the modern pipa, with more frets that were added in the 1950s, was now capable of playing chromatic melody and harmony, composers such as Tan Dun began to create more modern pieces for the instrument. Min Xiaofen, a pipaist living in the United States, has begun to utilize the pipa in jazz improvisation. Min and other players continue to maintain the traditional repertoire parallel to more recent musical styles.

Poetry
Shīgē 诗歌

Poetry has been the most celebrated and vibrant form of writing in China for more than three thousand years. Although China’s poets wrote in relatively stable, classical forms, they explored a vast range of situations, feelings, and concerns. More recently Chinese poets have experimented with vernacular language and Western poetic techniques.

For more than three thousand years, poetry has been the vehicle for the highest levels of literary art in China. To memorize large numbers of poems was necessary if one were to be considered learned. Even today students commit to memory selected works of major historical poets for recitation. Consequently, the past still exerts its influence on writers of the twenty-first century, despite its associations with old China’s political elite.

The Roots of Chinese Poetry

China’s earliest poetry was compiled into the Shijing 詩經 (most often called The Book of Songs in English) around 600 BCE, which some would argue was written by Confucius (551–479 BCE). The collection has regularly been considered a source of proper moral conduct as well as of inspiration for later writers. Its imagery is rich, and its range of subjects broad, from the founding myths of the royal house, through the banquets of the nobility, to the daily cares and joys of the common people. Some of these short poems seem very much like folk songs. Their immediacy has moved readers through the ages. A second major collection appeared about six hundred years later. Called Chuci 楚辭 (Songs of the South), it preserved poetry generally associated with the lands south of the Yangzi (Chang 長) River. Older sections of the text are associated with the court minister Qu Yuan 屈原 (fourth–third centuries BCE); exiled due to the slander of jealous rivals, he wrote of his loyalty and longing for recognition in the form of a lengthy allegory. Other poets represented in the collection take Qu Yuan’s life as their subject, but some of the more interesting poems clearly refer to religious rituals of the period, using rhythms quite different from those of the northern tradition.

Traditional Forms

Inspired, most likely, by the long compositions in the Chuci, poets of China’s first great dynasty, the Han (206 BCE–220 CE), wrote lengthy fu 賦 (rhyme prose or rhapsodies) that incorporated lush descriptions of objects, buildings, landscapes, human activities such as hunting, and even emotional states in alternating prose and rhymed verse. The greatest of these writers was Sima Xiangru 司馬相如 (179–118 BCE), who recounted the pleasures of his king. Other Han writers, such as Yang Xiong 楊雄 (33 BCE–18 CE), insisted that fu should serve to criticize excesses, not encourage them.
Fu were meant to be read aloud. Their varying cadences, alliteration, and complex rhyming schemes were designed to delight the ear. Virtually all other Chinese poetry was lyrical, often intended literally to be sung. By the end of the Han dynasty, writers drew on the subjects of folk songs, love, separation, and death to begin a new tradition of occasional verse that continues to this day. Most of these poems, called generally shi 詩 (lyrical verse), have lines of all the same length. The most common form is the five-syllable line, which in monosyllabic Chinese originally meant five-word lines. Shi poems were often written in couples, with the second lines of all the couplets rhyming with one another. Most are relatively short. During the Tang period (618–907 CE), strictly regulated verse forms developed. These forms, called jinti shi 近體詩 (modern-style verse), prescribed even the tonal patterns of syllables in each line. These “modern” forms were generally either four or eight lines and written alongside the freer, earlier gushi 古詩 (ancient-style) forms. Both forms continued to be written through the Qing (1644–1912) period.

A new form, the ci 歌, or song lyric, developed among Tang-period entertainers in response to popular music imported from Central Asia. Instead of all lines having the same length, these new poems were written to fit the varying lines of Central Asian melodies. (Later, when the music had been forgotten, poets—even those of the twentieth century, such as Chinese Communist Party leader Mao Zedong, an accomplished poet as well—would fill in the patterns of line length, tonal sequence, and rhyme scheme remembered from early poems that had been written to fit these named, then lost, melodies.) From the late Tang onward, poets generally composed ci that fit those original patterns. But efforts were made to update the melodies used for writing new song lyrics, called qu 曲, when arias for the theater became the primary venue for sung verse during Mongol rule in the Yuan (1279–1368) and subsequent dynasties. Some poets viewed the ci as inadequate for serious composition, but for others the full range of poetic topics was written into both shi and ci. Poetry in the ci form reached its first peak of development during the Song period (960–1279) and its second during the seventeenth century in the hands of Ming poets, such as Chen Zilong 陳子龍 (1608–1647), and Qing poets, including the Manchu writer Nalan Xingde 納蘭性德 (1655–1685).

**Major Poets**

China’s great poets are legion, but those of the Tang dynasty are generally considered the best. The great triad of Du Fu 杜甫 (712–770), Li Bai 李白 (or Li Bo, 701–762), and Wang Wei 王維 (701–761) are considered to embody the teachings of Confucianism, Daoism, and Buddhism, respectively. Other poets brought a personal voice to their poems, such as the reclusive Tao Qian 陶潜 (Tao Yuanming 陶淵明 365–427) and the failed statesman Su Shi 蘇軾 (Su Dongpo 蘇東坡, 1037–1101). Many were exceptionally capable craftsmen, but China’s literary history is crowded by people who dashed off poems to commemorate special occasions (banquets, birthdays, leave taking).

Although most of the best-known poets were men, China produced a striking number of distinguished women poets. Perhaps the most famous is Li Qingzhao 李清照 (1083–c.1149?) who, widowed early when her “Quatrain on Heavenly Mountain,” a poem by the Song emperor Gaozong (1107–1187). Throughout history many Chinese leaders were accomplished poets, including Mao Zedong.

© 2009 by Berkshire Publishing Group LLC
husband (and constant literary companion) died, left a legacy of haunting poems of love and loss. The Ming and Qing periods produced literary societies of women whose many members seldom, if ever, met but who maintained long correspondences in verse as the vehicle to convey their deepest feelings.

Themes

A large percentage of Chinese poetry has been devoted to love, given the system of arranged marriages that persisted for so many centuries. But poems in China have conveyed the most profound as well as the most light-hearted of emotions, have captured the daily lives and aspirations of many, and have narrated significant (and insignificant) events over more than two millennia. The poems of Song-period poets Su Shi (1037–1101) and Mei Yaochen 梅堯臣 (1002–1060) exemplify this range of experience. Religious thoughts have motivated many poets, but because there is no fundamental division between religious and secular lives, the material world is present even in religious poetry, especially in poems by Wang Wei and Shen Zhou 沈周 (1427–1509). Li Bai is well known for his wine poems (“Bring the Wine,” Jiang jin jiu 將進酒). Du Fu wrote many poems that describe people’s suffering in times of war and famine (“The Old Man With No Family to Take Leave Of,” Shihao li 石壕吏).

Modern Poetry

During the high tide of their “literary revolution” of the 1920s, China’s poets experimented widely with European images, rhythms, and literary trends. The strongest influence initially was that of romanticism, as seen in the work of Guo Moruo 郭沫若 (1892–1978). During the 1930s younger poets were more attracted by imagism and
symbolism. Although war with Japan (1937–1945), fought also in the context of World War II in Asia) and subsequent civil strife brought attention to China’s rich body of traditional folk songs as the vehicle for new, patriotic content, postwar poets produced a remarkable body of modernist verse. This tradition was later continued on Taiwan in the 1960s and 1970s. In the People’s Republic, leftist political movements enforced the production of verse simple enough to be appreciated by unlettered farmers and workers, but this provoked a strenuous reaction after the death of Mao Zedong in 1976. Within a few years menglong (misty) poets appeared. In contrast to their predecessors, who produced public poetry, these younger poets developed very personal styles and levels of significance. China’s poets began to experiment freely with a variety of styles, influenced by both twentieth-century trends abroad and their own literary heritage; such experiments continue as poets of a new generation come of age in the twenty-first century.

Many readers have felt that these engagements with other literatures were less than successful, in some cases reflecting the cadences of other languages more than of Chinese, especially because twentieth-century poets often wrote free verse in colloquial language. This was a dramatic shift from the indigenous poetic tradition in which verse was carefully structured in a few conventional forms. Similarly, the diction of classical verse was rich and seldom utilized true spoken language.

Poetry has been not only the greatest of Chinese art forms but also one of the clearest mirrors for reflecting the experience of the Chinese people over an enormous span of time. Enormous numbers of poem survive, more than fifty thousand from the Tang period alone, along with hundreds of thousands of poems from later periods.

Throughout China’s long history people have enjoyed little in the way of political participation. Although formal involvement has increased somewhat since China’s opening and the beginning of reform in 1979, the Chinese continue to use alternative measures—ranging from tax evasion to underground trade unions—to make their voices heard. The rise of the Internet in China has been especially useful in encouraging public debate.

China’s traditional political culture allowed the majority of the population only a small role in local and national politics. Confucianism established an individual’s duties to the ruler, the state, and the family, but not an individual’s rights. Independent political groups and parallel power structures were always suppressed. One exception was with the concept of the “Mandate of Heaven,” which gave the emperor his divine right to rule. The people were permitted to depose an incompetent ruler if the state were in political, economic, and social decline.

At times throughout history, Chinese villages and communities enjoyed a relatively large degree of autonomy. Clans, kinship groups, secret societies, temple organizations, and guilds organized around common political and social goals. Also, opposition to the state occurred informally through connections, corruption, negotiation, and strategy. But overall, political participation has nearly always been reserved for a chosen elite.

Politics Emerge

A legal system with laws and courts developed during the Republican China era (1912–1949). During this time political parties, professional associations, literary and artistic circles, and mass media emerged. In the early 1930s, attempts were made to conduct general elections for the offices of heads of villages or communities. But the consolidation of state power between 1912 and 1949 limited the development of a civil society and universal political participation.

Communist Control

The Chinese Communist Party (CCP) initially allowed various degrees of political participation in areas under its control. After the establishment of the People’s Republic of China (1949), however, the party controlled virtually all political and public life. Occasional reforms to allow general participation were short-lived; for example, Mao Zedong’s Hundred Flowers campaign, a brief period of open criticism of the government, lasted only several weeks in 1957. As dissatisfaction with the party spread, critics were arrested, branded as Rightists, and punished. From then on such movements were subject to stronger political and ideological control.

Mao’s “mass line”—the political, strategic, and
organizational framework of the CCP—included a model of leadership wherein leaders were to learn from the people. In theory it involved open meetings between the peasants and workers and party officials, with the aim of adapting party policies to the current situation. In practice, however, party officials listened to the people’s complaints and opinions and then interpreted them according to the party’s goals. It sought the people’s support, not their participation.

The CCP launched various campaigns to mobilize the masses to help the party reach its economic or political aims. Diverse opinions or new forms of organizations were tolerated only if they supported the goals of the party political elite. Mass mobilization was closely supervised by the political elite. The methods for participation endorsed by the party—criticism of officials, self-criticism, posted newssheets, ideological study groups—became ritualized and more a means of social control than of promoting political participation.

ERA OF REFORM

Various reforms since 1979 have opened up people’s possibilities for increased social and political involvement. New groups have joined existing groups that were not represented in the party—private entrepreneurs, professional associations, migrant workers, ethnic minorities, and religious organizations—and together they have sought economic, social, and political participation and the creation of channels to express and pursue their interests. This is true for both formal and informal structures.

Formal participation takes place both within and outside the party in mass organizations (unions, the Communist Youth League, Women’s Federation, People’s Militia); in the so-called Political Consultative Conferences (political advisory boards consisting of delegates from a wide range of political parties, organizations and individuals); and in many new associations, clubs, and nongovernmental organizations. The needs and actions of these diverse groups influence political decision making at the national level. The increasing separation between the public and private sectors and the state’s decreasing influence on many aspects of society have allowed these groups to strengthen their autonomy and create a social counterweight to state actions.

This leads to more direct political participation, as evidenced in new laws enacted in the early 1980s governing general elections at the county, township, and village levels. Although these elections have generally been limited in certain ways, they may generate a type of grassroots democracy, particularly at the village level. By the end of the 1990s, elections were being conducted in urban neighborhood communities (shequ) as well.

Informal Political Participation

Although the party exerts a powerful influence on formal political participation, a study of informal patterns shows that participation and decision making exist at all levels of society. Where there are few opportunities for formal participation, informal, or unofficial, participation by groups or individuals helps to advance particular interests.

On an informal level, the practice of guanxi, which literally means “social relationships,” is used to influence decisions or push interests. Guanxi functions through business relationships, friendships, patronage, nepotism, and bribery. It is a permissible and common way to make a deal, reach a compromise, and negotiate, as long as the practice does not disrupt the political framework of the CCP.

Informal political participation also includes illegal acts, such as organizing unauthorized demonstrations or strikes (this has especially become prevalent since the rise of the Internet and cellular phones), refusing to pay taxes, and forming illicit interest groups like underground trade unions, secret societies, underground churches, and hometown associations. Again, all of these activities have mushroomed with increased Internet usage.

Also on an informal level, a kind of regionalism has developed based on local resources and interests. In areas with strong local markets, local economic interests take priority over state interests. Communities underreport profits in order to pay fewer taxes and use the money for local development. They ban products to or from other provinces (a practice know as protectionism) to bolster their own markets. This localism also includes communities’ negotiating how much income tax to pass on to the central government or how to implement national policies, sometimes even ignoring certain state policies.
To better implement its policies and garner support, the CCP has been trying to include more people and groups in discussions and consultations. Special interest groups, which have been gaining political leverage at the unofficial level, have helped stimulate this attempt to widen political participation. The discourse, however, is limited because all parties involved must accept the policies and leadership of the CCP. Nevertheless, groups that in the past had no means of expressing their needs, desires, and interests now have the opportunity to do so.

Collective Action by Social Groups

For many years China’s peasants have practiced highly effective forms of protest. Protests originally deployed the “weapons of the weak,” a term used by the sociologist James Scott to describe forms of resistance by some of the downtrodden members of a society. These weapons included such actions as supplying falsified harvest figures; underreporting the amount of arable land and income; yielding the lowest quality products to the state; ignoring state directives; evading taxes; neglecting, stealing, or destroying state property; and organizing unofficial special interest groups. This kind of everyday resistance is a type of political participation by the disenfranchised. It can, in the long term, lead to political change because of its high social and economic costs.

An example of collective action leading to political change took place in the late 1970s. Because of decline and poverty, peasants in certain areas decided to divide collectively held land among themselves and return to family-run farming. The economic success of this unofficial form of participation led to the CCP’s approving it as “agricultural reform” and subsequently implementing new policy across the country. Collective action, or unofficial participation, provided a solution for economic difficulties and was, therefore, approved by the party.

The social scientist Yu Jianrong suggested that political participation of peasants changed from spontaneous “routine resistance” before the 1990s, to “lawful rebellion” (citing state policies or laws to oppose political arbitrariness at the local level) until 1998, and to “actively using the law to fight” since then. According to Yu, using the law to fight is characterized by a struggle for political rights and the enforcement of existing laws and regulations. It is directed toward local officials, not the political system. Peasants establish transvillage communication networks, demonstrate, and conduct sit-ins to enact change. Their actions are “permitted by law” but “prohibited by politics.” In the future this might change from securing rights by law to political participation by law. The peasantry could become a strong force for general participation.

Although direct participation in Chinese power structures still depends on membership in the CCP, political power and political influence do not stem only from party membership. More than ever before, China’s people have the opportunity to express their interests, to act, and to participate in the political life of the nation.

Rise of the Internet

The Internet is another field of participation that in recent years has spawned new forms of public activity. It has had an effect on the emergence of a new form of public space, the development of “virtual” social organizations, and of widespread protest activities that would have been virtually unthinkable before. Furthermore, by encouraging public debate and the articulation of problems it functions as a tool for social transparency.

In 2008 the number of Internet users in China reached more than 250 million. Yet this figure does not say much about how the Internet is used. A Chinese study found that 46.2 percent of those surveyed used the Internet for information, while nearly a third (32.2 percent) used it mainly for entertainment. Certainly Internet access provides an alternative source of information on domestic and international developments, yet it remains to be seen whether or not the Internet will function as a tool for political change.

Undoubtedly in recent years the number of Internet portals with news and up-to-date information, as well as the number of virtual communities, has significantly increased. In particular, the better-educated and younger people in urban areas participate more in public debates in the public space of the Internet, thus redefining the interrelationship between the state and society. The anonymity of the Internet has spawned a newly critical public. Active users who pick up information on social injustice, on the hush-up of local disasters, criminal activities, and
corruption, and spread the news and put it up for public discussion are called wang luo gong min—“netizens” (a portmanteau of Internet and citizen).

A prominent example was the case of a worker who, after a flagrant misjudgment, was executed in Shaanxi province in 2002. This provoked a public debate on the death penalty and legal procedures in China. Not only jurists and Communist Party–sponsored newspapers but also thousands of citizens via the Internet participated in the debate. The discussions were rather heated and many participants expressed fury and outrage. Although the party leadership finally put an end to the discussion, it did request that the legal authorities decrease the number of people scheduled to be sentenced to death. The Supreme People’s Court was ordered to reexamine each death sentence. The death penalty, however, is not yet abolished; in fact, China leads the world in numbers of annual executions (although it is the fourteenth in terms of per capita executions). But this case reveals that people increasingly use the Internet to disseminate information and to vent grievances. Moreover, the Internet contributes to making public opinion and trends more transparent.

Another noticeable case that gained Internet attention was that of Sun Zhigang, a rural college graduate who was seized by the police in Guangzhou because he did not have a temporary residence card in his possession and could not prove his identity. He was detained and put into custody. Three days later, when his friends tried to locate him, they were told that he died of a heart attack; when his parents asked for an explanation the police provided no details. With financial help from Sun’s classmates the family was able to have an autopsy performed, and it was determined that Sun had been beaten...
to death. A journalism student from Beijing posted this news on a cyber-forum, and immediately after that online discussions arose, growing more and more intense, on the general behavior of the police, the amount of freedom given to the press, and the necessity of reforming the legal system. Jurists demanded a revision of the laws regarding the treatment of rural working migrants in China’s cities and wrote to the national parliament (the National People’s Congress) to either negate or revise the existing regulations. They also demanded that the congress investigate the incident and punish the those responsible. An open trial resulted in thirteen arrests and convictions of policemen, prison guards, and detainees. Eventually twenty-three additional policeman and government officials were disciplined for their involvement in or lack of response to Sun’s death.

Such Internet movements are a form of collective action new to China: a more or less spontaneous concurrence of individual or group action that represents common interests and has an impact upon policies. These “e-social movements” include online petitioning, either against such things as software regulation and the censorship of Internet publications, or in support of such causes as the Tiananmen Mothers—an initiative of mothers whose children were killed during the 1989 Tiananmen Square incident—and the Living Buddha Zhaxi, who was detained due to alleged terrorist activities. Furthermore, since the mid-1990s autonomous virtual NGOs (non-governmental organizations) have increasingly used the Internet to organize online congresses and alternative groups. Numerous websites and virtual NGOs have arisen over the issue of environment protection, exposing environmental problems and disasters and thus inducing public debate.

Of course the party-state attempts to monitor Internet activities. It blocks discussions it considers to be too sensitive or too critical. As a further deterrent, from time to time people are arrested and sentenced to long imprisonments. Yet those measures essentially do nothing to dull the spirit of the Internet users or their debates.

POLO, Marco

Mǎkěbōluó 马可波罗

1254–1324  Venetian traveler

Marco Polo, a Venetian who was one of the earliest Europeans to travel all the way to China on the Silk Roads, left behind what is probably the best-known travelogue in history, The Travels of Marco Polo. He did not write it himself, however, but rather dictated it to a fellow prisoner of war who may have embellished what he heard.

Marco Polo (1254–1324) grew up as a member of a great trading house in Venice, a leading Italian city-state. Taking advantage of the ease of communication afforded by the Mongol empire, his family began trading in the East, and after an initial period of activity, reaching as far as Mongol China, young Marco himself became involved. He remained in China for seventeen years (1275–1292) and seems to have held some unnamed official post but, in any case, moved in elite circles, thus his knowledge of the inner workings of the Mongol East. He also seems to have traveled extensively, apparently on official business, thus the accounts in his well-known travel journal of such relatively remote areas as Mongol Yunnan, the first in European geographical literature. He heard of, but did not visit, Japan, but his notice of the Japanese islands was also the first for Europe.

Polo’s most responsible mission came in 1292 when, returning to Italy by sea—the land route by then cut off due to Mongol warfare—he was asked to deliver a Mongol princess to Ilkhanate Iran, then the principal ally of Mongol China. This he did successfully, acquiring substantial information about insular Southeast Asia and the Indian Ocean, finally returning to Italy in 1295, where he heard of the death of Khubilai Khan, Polo’s major patron.
in China. Soon thereafter Polo fought for Venice in a war against neighboring Genoa and became a prisoner of war. To pass the time, he dictated a memoir of his travels in Old French, then the international commercial language to a writer of romances.

Several versions of the text exist, differing substantially in detail, including some in languages other than Old French. In any case Polo’s memoirs were an immediate sensation, and in the centuries since few books have been more translated or had a greater impact on the European psyche. Columbus, for example, is said to have taken a copy of Polo along with him when searching for the fabled East as described by the Venetian.

But recently doubts have been cast upon Polo’s veracity. In fact, there is much in *The Travels of Marco Polo* that is truly fantastic and even legendary but also a great deal that we know to be absolutely accurate from other sources. Criticism has also in part been based on a misunderstanding of the character of Mongol China, its use of a variety of languages alongside Chinese, for example, and a misappraisal of what Polo would actually have seen.

Porcelain was first made in China about 850 CE. The essential ingredient is kaolin, a white clay that when fired at an extremely high temperature acquires a glassy surface. Porcelain wares were first exported to Europe during the twelfth century. By 1700 trade in Chinese porcelain was immense, with Ming dynasty wares, characterized by cobalt-blue-painted motifs, highly prized.

Porcelain is ceramic material made with kaolin, which is a fine, white clay. Porcelain wares were first made in China about 850 CE during the Tang dynasty (618–907 CE). An Islamic traveler who had visited China in 851 saw clay vessels that resembled glass. Evidence indicates that fine, white stoneware (pottery made from high-firing clay other than kaolin) was made in China as early as 1400 BCE, and potters appear to have been familiar with kaolin during the Han dynasty (206 BCE–220 CE). But the forerunner of modern-day porcelain was not made until the Tang dynasty. Tang dynasty porcelain is known as “hard-paste” or “true porcelain” and was made by mixing kaolin, which is formed by the decay of feldspar, a chief constituent of granite, with petuntse, which is a form of feldspar occurring only in China.

Kaolin is the essential ingredient in porcelain. Found throughout the world, kaolin is known for its white firing characteristics (that is, the finished product appears white rather than gray or brown or rust colored) and high fusion temperature (the high heat required to turn the ingredients into porcelain). Chemically kaolin is made up of kaolinite, quartz, feldspar, muscovite, and anastase. Kaolin and petuntse are fused by firing in a kiln at 980° C, then dipped in glaze and refired at about 1,300° C. Petuntse binds the clay particles and gives porcelain its translucency. The high firing temperatures vitrify the ceramic body, giving it its glassy characteristics.

During the Song dynasty (960–1279) some of the
most beautiful Chinese porcelain wares were made, including eggshell porcelain, which was thinner and more translucent than earlier porcelain. Ding ware, made in northeastern China, has a molded design that is emphasized by its typical ivory-colored glaze. Two other types of porcelain were produced slightly later during the Song dynasty: Longchuan and Jingbai wares. Longchuan wares had near-white ceramic bodies under a bluish-green translucent glaze (celadon) that was reminiscent of green jade, a favorite stone of the Chinese. Longchuan ware showed to great advantage the incised or molded decoration of the time. Jingbai ware, produced in Jiangxi Province (which eventually became the center of Chinese porcelain manufacture), was delicately formed and distinguished by a pale blue glaze with decorations of incised flowers and foliage.

Porcelain was not widely produced in China until the Yuan dynasty (1297–1368), when the Chinese began to use a kaolin-based compound to make a material that when fired at high temperatures turned both white and translucent.

**Spread to Europe**

Porcelain came to be called “china” because it originated in China; china was first taken to Europe during the twelfth century. Portuguese traders began importing china in the sixteenth century. The Portuguese introduced the term *porcelain* sometime between then and the beginning of porcelain manufacture in Europe in the late eighteenth century. The terms *china* and *porcelain* are used interchangeably today, although some people use the term *china* to refer to figurines and items for use with meals and use the term *porcelain* to refer to a wider range of products. Thus, a tea set is made from either china or porcelain, but a toilet seat is made from porcelain.

The Chinese formula for making porcelain long remained a secret. During the medieval period Europeans, who had an insatiable appetite for the beauty of kaolin clay, experimented with various materials, hoping to discover the Chinese formula, but it was not discovered until the early eighteenth century. Meanwhile, beginning in

---

the sixteenth century China exported porcelain wares in increasing amounts, particularly its blue and white ware (porcelain decorated with cobalt-blue designs under a clear glaze). The British and Dutch East India companies were the main exporters. By 1700 the trade in porcelain was vast. Porcelain ware of the Ming dynasty (1368–1644) was particularly prized.

Ming and Qing Ware

Potters of the Ming dynasty concentrated more on painted designs and less on the forms of the wares. They had great success with the blue and white wares. Wares with a yellow ground were made when the art of fusing enamels or colored glass onto the surface of the glaze was perfected during the reign (1505–1521) of the Zhengde emperor (1491–1521).

Jingdezhen (in Jiangxi Province), the center of porcelain production, reached its zenith during the reign of the Qing dynasty (1644–1912) emperor Kangxi (1654–1722, reigned 1661–1722). Jingdezhen produced wares for use by the court as well as large amounts of porcelain for the European market. Porcelain wares of great beauty were produced to commemorate the birthdays of emperors. Particularly popular during the reign of Emperor Kangxi was famille verte, which are wares in which shades of green predominate. Then a black enamel background was used, giving rise to the term famille noire and later the famille rose, which included a range of rose pink enamels. Such wares were in vogue during the reign (1726–1795) of the Qianlong emperor (1711–1795), grandson of Emperor Kangxi. Most of the enamel painting was done in Guangzhou (Canton), which was the main trading port.

OOI Giok Ling
Potala Palace, in the Tibetan capital of Lhasa, has been the home of Tibet’s Dalai Lamas since 1642. The palace has two thousand rooms. UNESCO has declared the palace a World Heritage Site.

A huge structure that dominates the Tibetan capital of Lhasa, Potala Palace has been the home of Tibet’s Dalai Lamas (the spiritual heads of Tibetan Buddhism) since 1642, when the unfinished building was consecrated. It was built by the fifth Dalai Lama, Ngawang Lozang Gyamtsho (1617–1682), to represent the cosmic mountain abode of the bodhisattva (deity) of compassion, Chenrezi, who is believed to dwell on Potala Mountain in south India and to be embodied in the Dalai Lamas. The Red Hill, 130 meters above Lhasa and already sacred to Chenrezi, was chosen as the site. The Potala was also built as a fortress, thus expressing its dual religious and political function.

So important was this palace that the death of the Dalai Lama was kept secret for twelve years so that the palace could be finished without political interference. The fifth Dalai Lama and his successors are interred in sepulchers in the palace.

The Potala consists of a huge central keep (secure inner fortress) painted maroon, the religious color, surrounded by the ancillary buildings of a white-painted palace.
representing the secular. This creates an effect of wings, so that the whole edifice, with its golden roofs, seems to soar. The palace has two thousand rooms, numerous temples and shrines, and the private rooms of the Dalai Lamas, now open to tourists. The United Nations Educational, Scientific, and Cultural Organization (UNESCO) has declared Potala a World Heritage Site. China claims to have spent $6.7 million between 1989 and 1994 on renovations of the palace.

The Potsdam Conference, held in 1945 in a suburb outside Berlin, was the occasion for the World War II Allies to focus on ending the war and to plan for the future. Leaders discussed possible strategies for an invasion of Japan, the reconstruction of Europe, and German reparations for the war. They also discussed the founding of the Council of Foreign Ministers, which included China.

Held at Cecilienhof Palace outside Berlin, the Potsdam Conference (17 July–2 August 1945) was the final of several meetings of Allied leaders during World War II. Present at Potsdam were the “Big Three” heads of state: U.S. president Harry Truman (1884–1972), Soviet premier Joseph Stalin (1879–1953), and British prime ministers Winston Churchill (1874–1965) and Clement Attlee (1883–1967). (Churchill played a major role at Potsdam but was replaced by Attlee at the end of July after the Labor Party’s victory in the British general elections.) Potsdam was the first conference held since Germany’s surrender on 8 May 1945, but World War II continued in Asia. U.S. victories at Iwo Jima and Okinawa in June had positioned the Allies for a planned invasion of Japan. Divergent national interests and competition, however, made consensus difficult. Many analysts point to the Potsdam Conference as a harbinger of the Cold War.

On 1 August Allied leaders agreed to the twenty-one-part “Protocol of the Proceedings.” Foremost were the procedures for the reconstruction of Europe, particularly Germany. The Allies divided Germany into four zones for the purposes of disarmament and demilitarization, called for the destruction of Nazism, and proposed trials for major war criminals. The controversy over German reparations was settled by giving the Soviets access to resources both inside and outside their zone, while the United States and England renounced claims to German assets in Soviet-controlled areas. National borders throughout Europe, with the notable exception of western Poland, were established in order to facilitate the resettlement of populations. The Allies also created the Council of Foreign Ministers, comprised of representatives of the five World War II allies—China, France, United Kingdom, United States, and the USSR—which would meet no later than 1 September 1945 to discuss many unresolved issues, such as peace treaties for Italy, Romania, Bulgaria, Hungary, and Finland; the disposition of colonies of former Axis states; and the withdrawal of Allied troops from Iran.

The conclusion of the war with Japan was the subject of the Potsdam Declaration of 26 July. At the earlier Yalta Conference (February 1945), U.S. president Franklin D. Roosevelt (1882–1945) had negotiated Moscow’s declaration of war on Japan and a joint invasion scheduled for August. Truman, who sought to limit postwar Soviet involvement in Asia, was bolstered by the news on 17 July of a successful test of the atomic bomb at the Trinity Site.
in New Mexico. Nevertheless, given the uncertainty of the new weapon, Truman forged ahead with the plans conceived by Roosevelt for an Allied attack. The final section of the Potsdam protocol demanded Japan’s surrender: “We call upon the government of Japan to proclaim now the unconditional surrender of all Japanese armed forces, and to provide proper and adequate assurances of their good faith in such action. The alternative for Japan is prompt and utter destruction.”

Poyang, Lake
Póyang Hú 鄱阳湖

Jiangxi Province’s Lake Poyang, aside from being China’s largest freshwater lake and a sanctuary for migratory birds and endangered species, is the metaphorically rich setting for legends retold throughout China’s long history. In the twenty-first century it retains its scenic splendor, but the lake and its wildlife inhabitants are threatened by environmental change.

In 1363 the largest naval battle in China’s history took place in Lake Poyang between a Mongol general of the Yuan dynasty and the soon-to-be first emperor of the Ming dynasty (1368–1644).
like a large shoe floating in the blue water. Thus the hill is also known as “Shoe Hill.” Another well-known spot in the lake is Nanshan Hill, near Duchang County, famous because a Han dynasty (206 BCE–220 CE) legend tells of a farmer living on the hill who turned down Emperor Wudi’s offer of the fame and rank associated with a government position. Named “Farmer Rock,” it is said to rise from water like a humble old man, and is the main attraction of Nanshan Hill.

In 1363, during the late Yuan dynasty (1279–1368), the largest naval battle in Chinese history took place as General Chen Youliang (1320–1363) fought Zhu Yuanzhang (1328–1398), the first emperor of the Ming dynasty (1368–1644), in the Battle of Lake Poyang. As legend recounts, Chen’s wife often watched the skirmishes from what is now called Lake-View Pavilion, frustrated that neither side seemed to dominate. She suggested a strategy to her husband, which he initially rejected but eventually used to win the ultimate battle. On his way home General Chen decided to play a trick on her, knowing she would be awaiting his return, and he laid down his commander-in-chief banner as he approached the shore. Seeing the banner flung down, his wife thought that her husband had lost the battle—had been killed because he had failed to take her advice. Distraught, she jumped into the lake and died.

In modern times environmental issues affect the Lake of Poyang. Sand dredging, an important local source of revenue, has become a mainstay of regional economic development. High-density dredging projects have been the principal cause of death of the local wildlife population. In 2007 Chinese scientists warned that the Chinese finless porpoise, known locally as “river pig,” might follow the baiji, the Yangzi River dolphin, into extinction. Scientists warn that only about 1,400 porpoises survive, with between 700 and 900 in the Yangzi River and 500 in Lake Poyang and Dongting Lake. Since 2002 the Chinese government has enforced a fishing ban on a 333,000-hectare area of the lake from 20 March to 20 June—the breeding season.

Operating under the auspices of the China Youth Development Foundation, a non-government, non-profit organization, Project Hope is considered by many to be the largest charitable project in modern China. Project Hope’s ultimate goal is to provide affordable education to impoverished children in China from primary school through college and to help them help themselves.

Project Hope is by far the most influential charity project in China. It was initiated, executed, and managed by the China Youth Development Foundation (CYDF), a non-government, nonprofit organization under Communist Youth League (CYL) Central Committee of China. Its goal is to assist dropout and at-risk children aged six to fourteen in poverty-stricken, rural areas of China in completing their primary school education with financial aid. At present, Project Hope has expanded its goals to help migrant youngsters in the cities and high school graduates who have been admitted to colleges but cannot afford tuition. CYDF has also increased its services to include enhancing educational facilities and teaching quality, establishing Stars of Hope Scholarships in high schools and universities. To qualify for the scholarship, a student has to (1) have excellent academic achievement, (2) actively participate in community activities, and (3) be in need of financial aid to finish school (different places have different standards, CYDF is also carrying out distance-education initiatives (virtual education, that is, providing education through internet or a closed-circuit TV system), training rural teachers, and reinforcing the nine-year compulsory education law as well as other related subprojects.

Since its launch on 30 October 1989, Project Hope has attracted support from home and abroad, both in financial aid and volunteer work. China’s top leaders, including Deng Xiaoping, Li Peng, and Jiang Zemin, have endorsed the project at different times to show their support. By 2006, the CYDF had raised over RMB¥ 35 billion (about $473 million) in total. The project provides its subsidization mainly through the following avenues:

- establishing long-term grant-in-aid programs;
- constructing and refurbishing schools;
- providing teaching aids, instruction materials and textbooks; and
- providing scholarships.

Within eighteen years, Project Hope has supported more than 2.9 million school children, built some 13,000 Hope Primary Schools (regular elementary schools) donated about 13,000 sets of Hope House of Books, trained about 35,000 primary school teachers in rural regions, and assisted more than 1,000 AIDS-affected children to continue finishing their education. Around 80 percent of the Hope Primary Schools and students aided by the project lived in China’s less developed middle and western regions (CYDF 2007).
Chronology

1989: The Communist Youth League Central Committee established the China Youth Development Foundation (CYDF) with donations from the public to respond to the severe dropout situation in poverty-stricken areas.

1990: The first Hope Primary School opened in Jinzhai County, Anhui Province.

1991: Taiwan artist Ling Feng established the “Overseas Love and Care Fund for Project Hope” (海外爱心基金). Ling initiated and hosted “100 Charity Concerts” to raise the funds for this foundation for seven years. The actual amount of funds raised is not clear, but all the proceeds were donated to Project Hope. His efforts motivated many other artists and famous people, as well as the general public, to contribute to the project in their own ways.

1992: The 1990s Development Program for Chinese Children promulgated by the State Council formally listed Project Hope as one of the main measures for ensuring the survival, protection and development of children. CYDF launched its first “Project Hope—Million Love and Care Action.” This was a public promotion action of fund raising for the project.

1993: CYDF sponsored the second “Project Hope—Million Love and Care Action.” The first Hope School funded by the United Nations Educational, Scientific and Cultural Organization (UNESCO) opened in Humaying Village, Humaying Town, Fengning Manchu Autonomous County, Hebei Province.

1994: The Government Work Report presented at the Second Plenary Session of the Eighth National People’s Congress stipulated that Project Hope should continue with the support of the Chinese society. The Project Hope National Supervisory Committee was founded. CYDF also established the six-level network—national, provincial, prefecture, county, town and school—for the project.

1995: “Project Hope Management Year.” CYDF partnered with publishers to compile a five-hundred-volume series entitled “Hope House of Books” that consists of seven subject areas: famous literary works, history, culture and arts, science and technology, ecology, dictionaries and reference books, and daily life skills. In July, the project started the construction of the first Hope Middle School in Wangcun Town, Yongshun County, Hunan Province.

1996: The China Administration of Posts and Telecommunications issued two million Project Hope phone cards. The funds raised from these cards went to the construction of fifteen Hope Primary Schools and the distribution of three hundred sets of the Hope House of Books.

1997: Project Hope received a registered service trademark from the Trade Mark Bureau of the State Administration for Industry and Commerce and became the first registered Chinese public charity organization with legally protected intellectual property rights.

1998: CYDF initiated a comprehensive audit of financial assistance to more than 1.8 million children.

2001: The project accomplished its initial goal of assisting dropout children in the poverty-stricken areas (Gu 2006). The new framework uses the Project Hope Distance Education Plan as its core, accompanied with election of Stars of Hope (students who have met those qualifications to receive scholarship) and their follow-up, teacher training, and construction of Hope School components, namely financial need. Most CYDF staff participated in the field research on the future direction of the project.

2002: The project expanded its financial aid to students at middle and high schools and colleges (Gu 2006). Meanwhile, a trust crisis broke out regarding CYDF’s investment and appropriate use of the donations for the project. In September, the first five graduates from the Stars of Hope Scholarship went to Canada for advance study.

2003/2004: CYDF launched the Project Hope Financial Aid Plan for Migrant Children, which offered assistance to more than twenty thousand migrant children, with each receiving an average of RMB¥600 (about $70) (Gu, 2006). Educating migrant workers’ children in the cities had been a serious problem. These children were either rejected by public schools or were charged extra fees; since their parents belong to a low-income population and cannot afford the high costs, they had to attend substandard, less-equipped schools run by individuals or philanthropic organizations. CYDF also held the first Red Dragonfly National Hope Primary School Sports Game: Representing thirty-seven delegations...
from thirty-one provinces and areas, 904 students participated in the game.

2005: CYDF partnered with China Central Television (CCTV) and launched “I Want to Go to College” fundraising drive. According to a 25 October 2005 report posted on a popular Chinese website (www.sina.com.cn), the drive identified five thousand college students who qualified for its financial aid, with each receiving RMB¥4,000, or about $500.

2006: Partnered with more than one hundred news media organizations and provincial youth development foundations, CYDF initiated “Dream-Coming-True Action” to help financially needy college students. This action raised RMB¥152 million, which assisted 38,892 students to realize their dreams of going to college (CYDF 2007).

Looking Ahead

In its next six-year plan (2007–2012), CYDF will keep the core values of Project Hope and continue serving children whose families have financial difficulties in poverty-stricken regions. As the foundation increases fundraising, it will also expand the cultural development of Hope Primary Schools, create Project Hope volunteer services, and better help farmers’ children acquire academic and development abilities.

Project Hope has been widely acknowledged as China’s most influential public charity campaign in the twentieth century and has received numerous awards, including the 2004 China Eliminating Poverty Award 中 国消除贫困奖 and the 2005 China Philanthropy Award 中华慈善奖 (CYDF 2007). It promotes its activities to the international community and has established relationships with similar organizations in countries such as Japan, South Korea, France, Germany, Spain, and United States.

Property Law
Wùyè fà 物业法

China is experiencing one of the greatest real estate booms in history despite a prohibition on private ownership of land, a stated adherence to Marxist principles, and the absence of a national property law until 2007. Although China’s formal legal system still has some catching up to do, its informal legal practices illustrate how real estate professionals have been able to thrive during the past two decades.

China has enjoyed a tremendous real estate boom in recent years, though operating under a different system of laws and customs than those familiar to Westerners. The Property Rights Law of the People’s Republic of China, China’s first modern property law, became effective on 1 October 2007, but there remains considerable confusion regarding its implementation.

While it is not possible to own Chinese land, an investor can acquire a land-use right. Like investors in Western nations, Chinese investors must consider the type of ownership entity they wish to use and also must address site selection.

Rule-of-law principles continue to grow in importance, but China’s strong cultural tradition of reliance on personal relationships (guanxi) remains a key factor in many business interactions. There also are significant gaps between what China’s few written laws state and how they are enforced in practice. When examining Chinese doctrine, the question is not only what the law says, but also how it actually operates.

Land-Use Rights

In 1988 China amended its constitution to allow the right to transfer the use of land. That right was further strengthened by a 2004 amendment requiring the government to pay compensation when it expropriates land. Nowhere, however, do these amendments allow private ownership of land. Instead, these constitutional provisions, along with laws that were enacted to implement them, clarify that the government may grant land-use rights for a specific term. This compromise created opportunities for sustainable economic growth and the flourishing of a private real estate market without formally abandoning Marxist principles.

The government may transfer land-use rights to residential property for a term of up to seventy years. For commercial property the maximum term is forty years. Industrial and other types of land-use rights may not be granted for terms greater than fifty years.

Land-use rights are limited by statute. Article 25 of the Law on the Administration of Urban Real Estate, for example, states that the land-use right may be reclaimed without compensation if the initial holder has not developed the land within two years, a rule that is frequently ignored. Rights holders may pay an additional fee to extend the term beyond two years, may initiate minimal construction before the two-year period expires as a means of formally meeting the statutory requirement, or may
seek extensions of this two-year term, which seem to be readily available.

The initial and subsequent nongovernment holders of land-use rights may further transfer them, with certain limits. For instance, the initial holder of a residential land-use right may not resell the right to a second holder until the initial right holder has completed at least 25 percent of the proposed construction. This rule apparently is ignored with great regularity, often because of confusion about exactly how much construction has been completed. The holder of the land-use right also must own the building constructed on that land. In addition, in parts of China, buyers have been unable to use borrowed funds to acquire a land-use right.

Despite apparent similarities, the Chinese granted land-use right differs significantly from the ground lease familiar in the West. Chinese land can be owned only by the government, so the granting of a land-use right, by definition, severs ownership of the land from ownership of the building constructed on that land, just as the Western ground lease does. In China, however, the holder of the land-use right also must own the building constructed on that land, which forces the developer to incur the capital expense of acquiring the land-use right in its entirety at the beginning of the construction process. The ground lease, by contrast, permits the developer to avoid all or most up-front land acquisition costs. The Chinese land-use right, in short, is not a financing device.

Sales of Land-Use Rights

The process by which the government sells a land-use right, like so many other procedures in Chinese law, derives from a combination of formal written rules and informal practice. Shanghai’s procedure serves as a useful illustration of these granting practices. The government initiates the sale process by deciding on the requirements and specifications for a tract. It asks the Department of Land Administration to place a value on the property, and this administration sets a minimum price for the land-use right. The government publicizes these requirements and specifications and makes the relevant documents available to prospective bidders, which then submit sealed bids. Each bid from a developer is solely a price bid, as the government already has established all of the specifications in advance.

Shanghai’s government is not required to select the highest bidder, a fact that leaves it open to charges of favoritism or corruption. Concerns about favoritism are widespread. The government’s response is that it is concerned with a bidder’s reputation, experience, skill, financial strength, and general capacity to complete the project, and not just with the amount of its bid. The government argues that there is greater public benefit if the project is actually completed, even if the government receives less money in the short run. Nonetheless, bidders who have good personal relationships with highly placed officials are widely perceived as enjoying an edge, and these perceptions are further enhanced by a belief that the specifications themselves sometimes seem to have been drafted with particular bidders in mind.

Shanghai’s method of auctioning land-use rights has improved dramatically in recent years. Before 2002, the municipality would negotiate privately with several reputable developers and then choose one, a process that still is followed in some of the less commercialized provinces. Whatever their flaws, Shanghai’s current procedures generally are recognized as among the most impartial in China.

Land-Use Planning

The Chinese land-use right system serves as a rudimentary zoning arrangement. When the government transfers land-use rights, it executes a formal document with the acquirer. In this document, the government limits the uses to which the land may be put.

The price for a land-use right is a function of the total buildable area that can be constructed on the land. If that number changes as the project moves forward, the price is adjusted accordingly. This fact illustrates the tension that local governments face between regulating land uses and maximizing revenues: A bigger building that may be undesirable for planning reasons will generate greater revenue.

Municipal planning bodies may devise land-use plans restricting certain types of developments in specified areas. These bodies are also aware of the tremendous revenue-raising possibilities from the sale of desirable land to developers who may wish to improve it in a manner that conflicts with those land-use plans. Pressure is mounting
both domestically and internationally for China to place greater emphasis on protecting the environment, and Shanghai officials regularly note the increasing amount of green space that is available to residents of that city. But if land that is slated for a downtown park proves to be considerably more valuable than anticipated to its government owner, there may be huge financial incentives to convey the right to use that land to a developer.

The Chinese real estate boom has made land-use rights extremely valuable in many urban areas. Governments in these regions often treat land-use rights as assets to be sold whenever the need for cash arises, and many provincial and municipal governments employ the sale of land-use rights as an indispensable means of keeping themselves solvent. But if they transfer too many land-use rights too quickly, they will impair the government’s long-term financial viability. The national government recognizes important reasons to slow the real estate market down, and because it is less dependent on revenues from the sale of land-use rights, it suffers less than the provinces and municipalities if it accomplishes this goal.

Business Entities Owning Land-Use Rights

Most real estate projects in Shanghai are owned by domestic limited liability companies formed in accordance with China’s Company Law. If a new limited liability company wants to develop real estate, the first thing it must do is obtain land-use rights. This company often is partly owned by a private developer/manager and partly by a unit of government, a fact reflecting the reality that a government entity controls the use of the land the developer needs. The government provides the land-use right to the company as its contribution to that company. The local government’s control of the land ensures that it can retain an interest in the company that will develop the land. The government’s partial ownership of the project allows it to control and profit from the development, with the other partner providing the professional know-how and much of the cash.

The government also may benefit by acting as a subdivider. It is quite simple for the government to profit in this role when it controls the right to use desirable land and holds the power to determine how that land can be used. In some less densely populated areas, a municipal government will establish a first-level developer company in which it holds a large ownership stake and then convey land-use rights to this company. This company subdivides the land, breaking a larger parcel into smaller ones and installing necessary infrastructure. It then transfers the land-use rights to the smaller lots to the real estate developers that actually will build on them.

State-owned enterprises (SOEs), like governmental units, may own land-use rights, or they may obtain these rights from local governments at little or no cost. These SOEs then contribute the land-use rights to a development entity that they jointly own with a local developer or, occasionally, a foreign partner. SOEs often are highly inefficient manufacturing operations that have difficulty competing against private businesses in the modern Chinese economy. They historically have been a key part of the “iron rice bowl” social service network, typically offering their workers a guaranteed job, housing, schools, and health care. Any time an SOE fails, the government must step in and provide these benefits, or else the SOE’s former employees will suffer the type of reduction in comfort and security that can lead to more generalized social unrest. The government obviously has a strong political interest in seeing that these SOEs survive, and SOEs that successfully diversify into real estate enhance their long-term prospects.

Just as SOEs have sought to profit from real estate investments, private companies that are not primarily engaged in the real estate business have been seeking to diversify their portfolios, and real estate has proved to be one of the most successful investments in recent years. The government has become so concerned about competition from these private companies that it has started limiting their ability to invest in real estate, even taking steps to encourage them to sell their real estate assets to state-owned real estate holding companies.

Guanxi and Real Estate Development

Although the government clearly profits from participating in real estate transactions, government units that wish to invest in development may not have the expertise to do so. Professionals who possess this skill and are willing to
share the gains with the government—or with certain officials within the government—are more likely to obtain the land-use rights they need. Even when there is no outright corruption, those professionals who master the nuances of a fluid, fast-changing legal system—and maintain amicable relationships with the government workers whose approval they need—hold a huge edge over their less well-connected competitors. Personal relationships, or guanxi, matter enormously in a nation in which laws are evolving rapidly and being applied inconsistently.

A local government sometimes will convey a land-use right to a company in which it holds an ownership stake for less than the fair market value of the land. The development company then can resell a portion of the land-use right at a higher per-square-meter price (reflecting the true market value) and recover all or most of its total cash investment before construction even begins. The restriction on reselling land-use rights for land that has not been developed does not appear to impede transactions of this type. The result of this two-step transaction is that the company obtains the right to develop its remaining land at little or no cost. In many of these cases, the private co-owner of the company is someone with close personal connections to the government, such as a former government official. Concerns about this type of corruption, or at least the appearance of corruption, are beginning to lead to change. For example, public auctions of land-use rights are becoming more common.

Some of the more established investors have even sought to cement their advantage by lobbying for legal changes that would reduce the very type of corruption from which they appear to have benefited themselves. Having built a huge lead under the original rules, they now seek to level the playing field. For example, the government may limit the bidding for desirable land-use rights to those developers who have demonstrated in their previous work that they have the skills to complete larger transactions, a group that often consists of the same first-generation developers who were able to acquire land-use rights under the more opaque procedures that were in place just a few years ago.

The importance of guanxi and experience helps to explain why so many developers in China are Chinese. The little foreign investment that there is in Chinese real estate mostly comes from overseas Chinese in Hong Kong, Taiwan, and the United States. Well-known Western corporations have also begun to enter China’s real estate market, recently acquiring trophy properties in desirable areas such as the Lujiazui Trade and Finance Zone in Shanghai’s Pudong New Area.

## Site Selection

When a Chinese real estate developer is deciding where to build, its choice is influenced by both the profit motive and government inducement or compulsion. Developers seek to acquire land-use rights and build structures in locations that will be profitable. At the same time, the government uses its power, including its ownership of the underlying land, as a means of channeling development where it wishes. If the government is seeking to intensify development in a thinly populated area, it benefits as well from the fact that it is advantageous for private developers to build on land from which they will not have to remove current occupants and structures, a controversial and expensive undertaking.

## Public Input

Chinese government entities do engage in land-use planning and zoning. Land-use plans in China are developed in a top-down manner, with little or no citizen input. Some government entities do invite public comment, but citizens’ suggestions are followed only rarely. Citizen input may have more effect on changes to existing land-use plans than on the initial enactment of those plans.

But it appears that the land-use planning process is becoming more transparent if not more citizen based. Practices in Shanghai again serve as an example of the multiple levels of planning. Step one is known as open planning, in which Shanghai’s municipal government comes up with a proposal that must be approved by both the Shanghai National People’s Congress and the State Council. Following completion of this first step, the Shanghai Municipal People’s Government (or, for less significant projects, the Shanghai Urban Planning Administration, an administrative arm of the municipal government) next specifies requirements for individual blocks of land. Subsequent rezonings, while occasionally available, are difficult to obtain. In step three, technical specifications are proposed.
for individual buildings. Steps four and five consist of bidding on the transfer of land-use rights and the execution of a contract with the successful bidder. These steps are not completely alien to the American real estate practitioner, but the Chinese process allows virtually no opportunity for input from outside the government, even by those considering bidding.

In the earliest days of the real estate boom in Shanghai, investors considering acquiring land-use rights could become involved in the planning process sooner. During the 1990s the government would ask developers to locate a development site and propose a project for it. This method is rarely used today. Instead, the government either makes its planning decisions in the manner described earlier and invites proposals from developers who must comply with these detailed specifications, or it invites proposals for specific blocks that it has designated but not yet planned in great detail so that the developer can participate in the later stages of the planning process. This newer approach allows the government to retain greater control over land-use policy and may reduce opportunities for improper behavior by government officials and bidders.

Government Control

The question of whether to slow China’s real estate surge offers a prime example of a conflict between the central government in Beijing and the government of a province or municipality. Lower-level government entities enjoy huge benefits when they grant land-use rights. They retain 70 percent of the proceeds from sales of land-use rights, while Beijing receives only 30 percent. China has no system of periodically taxing property according to its value, so municipalities must fund a significant portion of their ongoing capital and operations budgets by selling land-use rights.

Experts in China argue that China’s vast stock of government- and collective-owned land ensures that the Chinese economy will not collapse any time soon, as some Western experts have nervously predicted. The government can simply keep transferring land-use rights on the ever-expanding urban fringe at hefty prices that reflect the land’s increasing value for urban residential or commercial use. These experts argue that as long as the government has land-use rights that it can sell, it will never run out of cash.

Meanwhile, the central government, which receives less than one-third of the sales proceeds, fears that an overheated real estate market fueled by this sort of local government behavior may lead to social turbulence. Fear of upheaval may be the most important reason why the central government has tried in recent years to slow the real estate market. Developers and many private citizens, however, wish to see hot markets persist at least long enough for their next investment to pay off. Lower levels of government, which have their own economic incentives for wanting to see good times continue to roll, use their enormous control over local markets to encourage further growth.

An Exciting Market

China has accomplished much despite a prohibition on private ownership of land, a stated adherence to Marxist principles, and the absence of a national property law until 2007. Although China’s formal legal system still has some catching up to do, its informal legal practices illustrate how real estate professionals have been able to thrive during the past two decades. Overall, China is gambling that its central planners will be able to control the pace of growth in the real estate market and that its legal system eventually will attain the same level of maturity that its markets seem to be reaching.

China’s leaders have made significant progress, especially considering how recently they began this task and how stagnant the Chinese economic and legal systems were when they embarked on this project. For the interested real estate practitioner, it is difficult to imagine a more exciting market than China’s in the early twenty-first century.

Traditional sayings are an important means of passing on cultural wisdom. In China an especially rich accumulation of such sayings has been passed on for well over two thousand years. Today, despite political disruptions and an intrusive modernity, traditional sayings still play an active role, passed on largely by grandparents who often care for their grandchildren while both parents work.

All cultures have accumulated bodies of traditional sayings that constitute a common folk wisdom. China in particular has actively preserved an extraordinary number of sayings that many people use to make sense of what happens to them. From a cultural perspective, these sayings transmit fundamental cultural orientations and values. Although familiar sayings may sometimes be taught in school, their primary transmission is oral, reinforced by rhetorical devices that help make phrases memorable, especially to children. For the most part, learning them takes place informally within families and communities. The origins of Chinese proverbs are often ancient, indicating that all the intervening generations have found them useful.

It is difficult to estimate how many sayings have been acquired by people growing up in China (or for that matter in the West). Learning hundreds, perhaps thousands, of sayings was a common preparation for living under premodern circumstances. The sayings provided a pool of ready explanations and/or consolations for myriad events. Taken as a whole, proverbs did not necessarily have a single-minded philosophical orientation, but instead they preserved multiple or even contradictory ways of looking at things. One then chose an appropriate one according to the circumstances.

For example, the English proverb, “A stitch in time saves nine,” encourages people to solve problems when they are still small. A Chinese equivalent, “Xiao shi tou zhen, da shi tou jin” 小时偷针大时偷金, means “If a child can get away with stealing a needle, when he grows up he will steal gold.” This saying calls for the discipline of children when they are young. A more specific application of similar advice in English proverbs might be “As the twig is bent, so the tree shall grow.”

With an opposite implication, however, the proverb, “Look before you leap,” enjoins caution in the face
of risks. The Chinese equivalent, "San si er xing" 三思而行, means "Think thrice before you take any action." On one level, these proverbs seem contradictory—one urging immediate action, the other cautioning against it. Yet both recommendations circulate freely in the collective cultural wisdom. Their contradictions do not really matter because individual circumstances determine which seems more appropriate.

In fact, the function of this "wisdom" may lie less in the advice offered than in the availability of a communal, ready-made response for every circumstance. Drawing on the pool of proverbial sayings reaffirms allegiance to and participation in the community. This communal wisdom may provide glue for social continuity, as it does in today's China—or it may dissipate and gradually disappear, as seems to be happening in the West.

**Origins in China**

The origins of proverbs, clearly oral in form, have been recorded in China from the very earliest written texts that date from the first millennium BCE such as the Zuo Commentaries (Zuo Zhuan 左传) and the works of Kongzi (Confucius) or Mengzi (Mencius). Perhaps the best known collection of proverbs in use today is named *The Extended Virtuous Words* (Zeng guan xian wen 增广贤文), which was first compiled around 1600 during the Ming Dynasty.

Episodes in the lives of famous historical figures are frequently alluded to in Chinese sayings. Their message is often expressed in four-character set phrases known as *chengyu* 成语. Here is an example from a letter written in 93 BCE by China's first great historian, Sima Qian (145–86 BCE): “The loss of one hair from nine oxen” or *Jiu niu yi mao* 九牛一毛. To an outsider, this saying remains cryptic. It is not even a sentence that makes sense as a moral caution. To someone who grew up in China, however, this saying evokes Sima Qian's explanation for his refusal to commit suicide on the order of the emperor Han Wudi. Instead, he preferred castration so that he could live on to complete his pioneering history of China. His death, says Sima Qian, would have been no more significant than "the loss of one hair from nine oxen." But living on despite his humiliation would allow him to complete a great work whose importance would outlive the influence of the Emperor who had maltreated him.

An additional source of proverbial sayings is traditional Chinese poetry; this often culminates in a last line or two
that sum up a whole sequence of feelings in a few words. Example: “To extend one’s view to cover a full thousand miles, climb just one more story of the tower.” (Yu qiong qian li mu, geng shang yi ceng lou. 欲穷千里目更上一层楼.) These two lines are quoted from the poem “Climbing Stork Tower” (Deng guan que lou 登鹳雀楼) by Wang Zhizhuan (688–742 CE). Because the aim of much traditional Chinese literature has been the teaching of one lesson or other, a short and memorable way of encapsulating the moral in the last line invites later quotation. Thus many features of the Chinese cultural tradition are reinforced through the habit of speaking in short, proverbial sayings.

Not all proverbs and common sayings can be traced back to ancient times. Mao Zedong’s so-called Little Red Book (1966) prolonged the tradition as did stories propagated during the Cultural Revolution (1966–1976). During Mao’s time these permeated China’s social landscape. Used as inspirational phrases by which to live, these mottos were produced and disseminated as part of a campaign to spread Mao’s revolutionary message: for example, “Revolutionists are guiltless, and rebellions are justifiable.” (“Ge ming wu zui, zao fan you li” 革命无罪造反有理.) Another example is ”Revolution is by no means inviting guests to a banquet.” (“Ge ming bu shi qing ke chi fan.” 革命不是请客吃饭). Today’s young people often say they have never even heard of these sayings.

Despite the disruptions of the Revolutionary period and an encroaching modernity, the survival of traditional proverbs in China seems assured under present conditions. Two-thirds of China’s people still live in rural areas in fairly traditional circumstances. In cities, both parents are likely to work and to leave their child largely in the care of grandparents, who thus have many opportunities to pass on traditional wisdom. In addition, teachers may often incorporate venerable Chinese sayings into classroom instruction, though such sayings may be greeted with a certain amount of ambivalence by the more sophisticated students of today. Nonetheless, in Chinese culture and history, proverbs have provided a rich reservoir of handy mind-tools that allow people to categorize their experience and live with the consequences. They affirm that one can always find ways of coping with misfortune; everything has always happened before. Today these widely known rhetorical patterns also help to preserve and pass on a distinctively Chinese world view: Everything changes and everything that happens is connected. Thus the survival of proverbial sayings constitutes a powerful linkage between the present Chinese generation and all those that came before.

You think you lost your horse? Who knows, he may bring a whole herd back to you someday.
塞翁失马
Sài wēng shī mǎ
The publishing industry in China is growing, as can be seen by an increase in the number of new book titles, bookstores, consumer magazines, and a consolidation of imprints. The science, technology, and medical publishing sectors are making the transition to digital or online publishing, and there are now three major online retail booksellers in China.

As the country noted for its long literary history and credited for the invention of printing and paper, China would be expected to boast a thriving publishing industry, especially since it is home to the world’s largest population. Indeed, both book publishing and magazine publishing have been expanding in recent years as China’s thirst for knowledge and know-how grows. Concurrently the world’s interest in China increases as new translation rights and co-publishing agreements are reached, and attendance at the Beijing World Book Fair grows both in the number of publishers and countries represented.

Book Publishing

There are 527 officially designated book publishing companies (excluding imprints) in China governed by the General Administration for Press and Publications (GAPP), although a relatively small number of these are responsible for generating the majority of titles on the ever-growing list of new publications. Of these publishing houses 220 are in Beijing, 40 are in Shanghai, and the balance of 267 are in other parts of the country.

The number of new titles released in China each year continues to grow: 150,800 were published in 2004, about 172,000 in 2005, 222,000 in 2006, and 248,000 in 2007. According to the OpenBook Information Service’s statistics, the growth rate for national retail book sales grew an average of 9.2 percent over the same four-year time frame. Most of the books published in China are in the low-cost paperback format, whereas in other parts of the world, publishers produce multiple editions including hardcover, book club, quality paperback, mass paperback, and special editions.

The government controls and continues to administer the structure of the industry that has been identified as moving forward on “two wheels” (i.e., sparing no effort to develop), including the establishment of rules governing for-profit and not-for-profit publishers. Similar to a consolidation of publishers via mergers and acquisitions in the Western world, since 2004 the GAPP has been organizing small publishers into more productive clusters in China. The largest, China Publishing Group, was established in April 2003 and includes the following enterprises: Commercial Press, DSX Joint Publishing Company, Zhonghua Book Company, China National Publishing Industry Trading Corp., China National Publications Import and Export Corp., and the Xinhua Bookstore Company. It is a vertically and horizontally integrated conglomerate of publishing and distribution, information services, technologies, and import and export services.
The top fifteen publishers have been able to retain their dominance during this transition as they have focused on their specialized subject areas and have added new segments for growth. For example, the People’s Literature Publishing House and the Changjiang Literature and Arts Press are the leaders in trade and literature books. The Jieli Publishing House and Zhejiang Juvenile and Children’s Publishing House are the two leaders in children’s books. In March 2007, the Chinese National Bureau of Statistics reported that, by the end of 2006, children and teenagers up to the age of fourteen represented 20.3 percent of the total population, or 263 million young readers.

China International Publishing Group, Shanghai Translation Publishing House, New World Press, and the Foreign Language Teaching and Research Press are identified as the leaders in foreign-language learning textbooks, dictionaries, and reference books. Chemical Industry Press, Machine Press, and Science Press are three leaders in the scientific and technical professional cluster of publishers.

The single largest publisher in China is the Higher Education Press (HEP), founded in 1954. It specializes in media on all aspects of higher, vocational, and adult education, including textbooks, teacher training manuals, supplemental materials, multimedia software, and online digital information resources. The target audience for this publisher comprises more than 2,000 universities and 25 million students enrolled in universities. HEP is recognized as one of the top forty-five publishing houses in the world. The total market segment of all education publishing, an arena including university presses, represents an estimated 84 percent of all book-publishing sales in China.

University presses play an important role in China both to promote scholarship and disseminate research findings of their host universities and to publish a large share of the higher education textbooks. About a hundred of the 527 publishing houses are university presses, of which the top ten will each generate sales of over 150 million yuan (about $22 million) per year. The university presses are not regarded as not-for-profit institutions because a certain percentage of their profits are expected to be remitted to their universities each year. Some of the leading imprints are Tsinghua University Press, Peking University Press, Beijing Normal University Press, Zhejiang University Press, and Shanghai Jiaotong University Press.

Transitions to Privatization

The government has promoted the concept of shareholding reforms to have publishing companies publicly listed (although a foreign company cannot own a majority share of any one such publisher). Along with the trend toward a form of public ownership comes the related “marketization” or privatizing of publishing programs that will be increasingly responsive to the changing market. For example, in 2004 the Hunan Publishing Group was transformed to a major state-owned business under the new title of the Hunan Publishing Investment Holding Group, with twenty-five branch business units, including book, newspaper, magazine, video, digital online publishing, and other industry-related units. In December 2007 Liaoning Publishing and Media Group was one of the first to be listed on the Shanghai Stock Exchange, and a long-awaited new door opened for multinational publishers to invest in the dramatically growing Chinese book market. In July 2008 the Anhui Publishing Group was approved for listing on the Shanghai stock market, followed by the China Publishing Group, which registered in Hong Kong in August 2008. A survey conducted by the Chinese Research Institute of Publishing Science indicated that there are at least thirty private companies in the book business with assets over 100 million yuan (about $15 million) engaged in publishing and distribution in China.

Translation Rights

The purchase of translation rights, or what the Chinese publishers refer to as “imported” titles, plays a major role in the type and content of books published each year. The Kaijuan Book Market Research Institute, based in Beijing, reported that Chinese publishers purchased translation rights for an average of 12,000 titles each year between 2002 and 2007. In contrast, Chinese publishers sold translation rights for only 2,571 titles in 2007. Literature, children’s books, social sciences, and language learning represented 85 percent of the purchased translation rights in 2008, according to the Kaijuan Institute.

Early in 2008 the GAPP launched a new program to fund the costs of translations from Chinese into other
languages to facilitate the process of selling rights to publishers around the world. The amounts range from 17,000 to 60,000 yuan (about $2,500 to $9,000) per title. The first agreements for such supported translations rights were signed during the Frankfurt Book Fair.

**Cultural Content Providers**

Another unique factor in the publishing industry is the existence of an estimated 5,000 to 10,000 private creative studios, or packagers, as outsourced publishers, identified in China as content providers and cultural companies. These companies cannot publish because they cannot obtain the official ISBNs and, therefore, must work in partnership or under contract with official state-owned publishers. These private companies produce an estimated 30,000 new titles, or 15 percent of China’s total new book programs, because the state-owned companies have not been able to keep up with the demand of the rapidly changing and growing market.

**Book Sales and Distribution**

The Xinhua wholesale and retail bookstores form a government-owned and administrated book sales and distribution system on a national scale that has provided the channels for publishers to sell books throughout the country. In 2000 the state-owned Xinhua bookstore system represented 96 percent of the industry’s unit sales and 85 percent in terms of revenue value. Since 2003 there have been a rapidly growing number of privately owned bookstores. In May 2003 the government decreed that retail bookstores could be designated as outright joint ventures with foreign companies or owned by foreign companies. The government allowed the same designations for wholesale businesses in December 2004. A survey at the end of 2007 reported an estimated 119,900 bookstores, including the 11,879 state-owned Xinhua bookstores and more than 108,000 private bookstores.

The current focus is to develop the Chinese version of Western superstores. OpenBook Information Services reported at the end of 2006 that there were sixty-one superstores with a size of 5,000 to 9,500 square meters (about 54,000 to 102,000 square feet) and another thirty-one superstores larger than 10,000 square meters (about 108,000 square feet). BookCity, one such superstore in Shanghai, has an average of over 9,200 visitors each day. The next phase of development will be the establishment of chain bookstores within a province or on a national scale, as well as in the ten larger cities along the coast.

By 2008, there were 253 million Internet users in China, which helped lead to the development of online bookstores. Despite the lack of plastic credit cards across the country to facilitate direct retail sales, three major online bookstores are now functioning very effectively: www.bookuu.com, www.dangdang.com, and www.joyo.com. Amazon.com entered the market in 2004 investing $75 million to acquire the www.joyo.com online bookstore. (Amazon.cn)

The Beijing International Book Fair (BIBF) is ranked as the largest in Asia and as one of the four most important annual events in the world to promote the sale of books and rights. The first BIBF was officially approved by the State Council and organized by the China National Publications Import and Export Corporation in 1990. Since entry into the World Trade Organization in 2001, the Chinese government has strengthened its support of the BIBF’s role in going global. In 2007 fifty-eight countries were represented; 1,463 publishers exhibited more than 150,000 books, with the sale of an estimated 12,064 translation contracts.

**Magazine and Journal Publishing**

The magazine industry started from a comparatively much smaller base, with only 257 periodicals published in 1949 printing 20 million copies, according the China Periodical Association. Currently there are more than 9,400 titles published with an estimated annual distribution of 2.75 billion copies. The three prime centers for magazine publishing are Beijing, Shanghai, and Guangdong. The industry is divided into seven major market categories. The consumer segment includes 547 titles; the literature and art segment, 540 titles; the children’s segment, 160 titles; and illustrated magazines, 64 titles. Only a quarter of these are published by publishers that have national distribution. The balance of the titles is released by regional publishers. Circulation numbers are still small in comparison to other countries. Consumer magazines, for example, have an average print run of just over 1 million

© 2009 by Berkshire Publishing Group LLC
copies; children’s magazines have average print runs of only 170,000 copies.

According to Xin Guanwei, vice president of the Chinese Institute of Publishing Science, magazines in China are published as commercial publications sold in newsstands or via subscriptions and noncommercial magazines distributed within organizations or specific industry sectors. Subscriptions with related order fulfillment are carried out for all magazines by the government post office in China. The post office controls all aspects of the subscription system, including lists maintenance, renewals, and related promotion campaigns. Only a few of the best-selling magazines can be purchased at a newsstand, which is in China a distribution channel still under development. The Business Publication Audit Company based in the United States has authorized Global China Media Consulting Company in Beijing to be its agent in China and measure distribution and sales levels for individual magazines to establish certified circulation numbers to be used for advertising sales.

Hachette Filipacchi Média—the world’s largest magazine publisher, based in France—reached an agreement in 1988 with Shanghai Translation House and published the Chinese edition of Elle, which started a whole period of cooperation in the publishing of fashion and consumer magazines. In 1993 China’s Trends Publications launched its first fashion magazine, Trends, after which Hearst then moved rapidly into the market with International Data Group, and developed the Trends Publications joint venture to establish translations of Cosmopolitan and Esquire in 1998. In 2004 Reader’s Digest reached an agreement with the Shanghai Press and Publishing Administration, a branch of the central General Administration for Press and Publications in Beijing, to develop a Chinese edition of the magazine. National Geographic followed with a partnership agreement with the Trends group to publish Traveler, and Condé Nast signed an agreement with China Pictorial Press to publish a Chinese edition of Vogue. Currently the four fashion giants—Trends, Elle, Vogue, and Rayli dominate the consumer magazine segment as the market leaders.

The number of Chinese scholars who read and write scientific, technical, and medical journals has increased fivefold since 1996. The Intersection of Technology, Content and Academia Institute reported that China had a twentyfold increase in publications of articles in scientific journals from 1981 to 2003. The sector of natural sciences, technology, and research journals is the largest of the seven categories with more than 4,600 titles.

Copyright Protection

In recent years the Chinese government has made major efforts to strengthen and enforce copyright laws for protecting print and digital content for copyright. From the revised Copyright Law in 2001 to the new Regulation on the Protection of the Right of Communication of Information on Network established in 2006, the judicial protection system of copyright law has been revised, strengthened, and actually applied. The rapid growth of
the Internet and the public’s taking more notice of rights violations have led to an increase in the number of Internet infringement cases judged by the courts of the Peoples Republic of China.

Moving Forward

Information and related education are essential for a huge country to make the transition from an agrarian developing population and move forward on a national scale into the next century. In addition to a well-organized public education system, there is a growing development of continuing and professional adult education. An increasing number of the 1.2 billion population will read information for education, self-improvement and entertainment—in print and online. The size of the country and rapid acceptance of the Internet will provide a wide range of opportunities for both print and digital or online publishing.

Pudong New District

Even by the standards of rapidly developing China, Pudong New District, a designed economic zone to the east of Shanghai, is far beyond average. The district has shattered development goals, as well as expectations in education, social welfare, and the environment.

China’s port city of Shanghai is known as the “pearl of the East.” More than a pearl, Shanghai has been a magnet, attracting global attention for some time. As one of the cities in China with the most significant level of development, Shanghai is becoming an international city, and Pudong New District reflects this change.

As an area for experimental policies to promote harmonious development, Pudong sets an example for other areas in China in terms of government support, infrastructure construction, and function.

Location

Pudong New District is located east of Shanghai and the Yangzi (Chang) River delta. It lies between Nanhui and Minhang Districts in the south and Luwan, Huangpu, Hongkou, Yangpu, and Baoshan Districts in the west. The district covers 570 square kilometers and contains twelve subdistricts and eleven towns.

The area has a long history. Pudong New District was

Pudong Jinmao Dasha, Shanghai. The Jinmao Tower, built in 1998, boasts 88 floors (eight being an auspicious Chinese number—hence the starting time of the Beijing Olympics opening ceremony at eight minutes and eight seconds past eight p.m. on 8 August 2008). PHOTO BY JOAN LEBOLD COHEN.
called “Zhousha” in 535 CE and didn’t belong to Shanghai until 1292 in the Yuan dynasty (1279–1368). From that time to 1984 the administrative region of Pudong (Zhousha) was changed many times. In 1990 the central government and the State Council of China decided to develop this area, and the area was given the name “Pudong.” In 1993 the Pudong New District Management Committee was formed, and the name “Zhousha” officially became history.

**National Strategy**

On 18 April 1990 the central government and the State Council of China decided to develop Pudong New District in Shanghai, with follow-up implementation from Shanghai’s municipal government and the Chinese Communist Party Central Committee. In 2005 the State Council approved Pudong New District as an experimental site for comprehensive reform. The district was to be a “tripod” area: an area for applying new opening and reforming strategies, an area for innovation, and an area for a modern service industry, promising a new era in its development.

After seventeen years of planning, the construction of Pudong New District went well. The district has been commonly referred to as the “window of China’s opening and reform policies” and an “epitome of the modernization process in Shanghai.”

In terms of economic development Pudong New District has been solid and sustainable. The gross domestic product (GDP) of the district increased from 6 billion yuan in 1990 (the beginning of the development policy) to 210 billion yuan in 2005, with an average growth of 15 percent per year. Advanced manufacturing and modern service industries have been leading, with total production volume of the former exceeding 420 billion yuan in 2005. This accounts for 25 percent of the city’s total, of
which tertiary industry (banking, finance, insurance and tourism) accounted for 49 percent. In the same year the consumption of Pudong New District exceeded 40 billion yuan, and foreign trade volume reached $90 billion, with an export volume of $37.2 billion.

In addition, by 2006, more than thirteen thousand foreign enterprises from more than one hundred countries had invested in Pudong New District, with a contract value of more than $30 billion. More than ninety-three hundred domestic enterprises have invested in Pudong New District, with a contract value of more than 60 billion yuan. Pudong New District accounts for one-fourth of the GDP, one-half of the foreign trade volume, and one-third of the foreign direct investment in Shanghai and clearly has been a powerful engine for economic development in the city.

**Multifunction Center**

After more than a decade’s development Pudong New District is a multifunction center for Shanghai. Different kinds of development zones in the district enhance the city’s functions. For example, the Lujiazui Finance Zone contains 360 financial institutes from China and abroad, including a branch of People’s Bank of China. Securities, futures, and properties can be efficiently exchanged in the zone, and financial resources are allocated according to free market rules. More than 60 percent of foreign bank assets and 80 percent of security turnover are found in the Lujiazui Finance Zone, and the property exchange scale is one of the top ones in China.

The Waigaoqiao Bonded Zone promotes international trade and logistics for bonded goods, which strengthen the function of transportation and the communication of seaports and airports. The economic volume, sales income, and tax revenue of the Waigaoqiao Bonded Zone accounts for one-half of those from fifteen bonded zones in China, and the container throughput accounts for two-thirds of Shanghai’s total (12 million standardized containers per year), making it one of the most important ports and logistics centers in the Yangzi River delta or even all of China.

The Jinqiao Export Processing Zone excels in advanced manufacturing and research and development (161 research institutes from China and abroad are located there), with more than $11 billion in investment and at least ninety major projects (each has on average more than a $10 million investment). In 2005 the industrial production value reached 129 billion yuan, and sales income in the zone reached 150 billion yuan. Furthermore, the progress in microelectronics, biotechnology, and information technology in the Jinqiao Export Processing Zone has promoted technological innovation and industry upgrades.

**More Than Economic Development**

The strategy of developing Pudong New District does not focus only on development. Development can bring economic benefit, but sustainable growth will also bring
social benefits and promote a harmonious nation, which is a long-term goal of the Chinese government.

The ecological environment of Pudong New District has also been emphasized. Large gardens, ecological parks, and forests have been built on the edge of the district, and statistics show the result: By 2006, green space in the district increased by 3,000 hectares compared with the area covered in 1990, with 35 percent of Pudong New District being green space.

Water pollution and air pollution have also received attention. The policy of “develop first and protect later” was eliminated, and a policy of “prevent first” is taking the lead. Since the end of 2005 all rivers and streams have been properly monitored, sewage treatment plants have covered the whole water system (8.5 percent of Pudong New District is covered by water), and all industrial sewage has reached required standards. In an area with busy traffic, automobile emissions have been limited so that during 85 percent of days in 2005 the air reached grade II of the air quality system, with 90 percent being the next goal of Pudong New District.

As a busy area with a large population, Pudong New District works hard at noise control and rubbish collection. Since 2005 noise in Pudong has been held to 60 decibels during the day and 50 decibels at night. Measures have been taken to promote rubbish categorization and collection as well, and 80 percent of residents’ rubbish has been categorized and recycled.

Although Pudong New District is a busy area with high-speed economic development, it contains a national nature conservation area of 420.2 square kilometers of wetlands that migratory birds visit every year. It is the best-preserved space in the country.

**Urbanization and the Working Environment**

Urbanization is a sign of city progress and in China a sign of what is called a “harmonious society.” The integration of suburbs and urban areas is among the top five of Pudong’s development strategies in terms of city planning, management, system insurance, education, and medical care.

A positive employment and business environment is vital for people’s sense of security and enterprise stability in any area, and Pudong New District is no exception.

The government encourages industries, such as contemporary services and other labor-intensive industries, to create adequate employment opportunities, and private and community enterprises are also supported. An effective market-oriented mechanism is promoted for job hunters in which employment information is widely disseminated, and government macroadjustment is applied when needed. In addition, some facilitating policies, such as those that provide small loans and employment training workshops, are offered to encourage unemployed residents to start their own businesses, and an unemployment security system has been set up to provide an anxiety-free environment.
Future Directions

In spite of its success, Pudong New District has more to achieve, and the next stage of development is being planned. One goal of the district is building a top science and technology zone with solid innovation ability by international standards. Enterprise-centered innovation will be encouraged to promote and take advantage of the enthusiasm of entrepreneurs, and research and development centers will be built by Chinese and foreigners to improve competitiveness and attract enterprises to the district.

An innovative mechanism is only the core, and it needs a comprehensive service system as its coordinating periphery. Public information platforms will be built for better communication and understanding between enterprises and government, and a human resource reservoir is needed as a backup for high-speed development of science and technology (in 2005 more than fifty thousand employees worked in the Zhangjiang Science and Technology Park; more than fifteen thousand of them had more than one college degree). Investment and finance-related facilities, as a kind of policy guidance (including government financial support and finance mortgage), will be put in place to encourage new businesses to start or to coach investment decisions of existing investment companies and listed corporations. Public laboratories, hubs, technology evaluation centers, and other institutes are also required to make Pudong New District versatile and multifunctional.

New industries with high added value and great space for future development are expected to be the leading industries in Pudong New District. The most advanced

Pudong, Shanghai. The Shanghai International Exposition will come to Pudong in 2010. Under construction are a conference venue and a convention theme park that will host 20 million people and twelve hundred conferences annually.

PHOTO BY JOAN LEBOLD COHEN.
assembly line for complementary metal-oxide semiconductor (CMOS) chip production has been imported to Pudong, which was already a national leader in the field (as of 2005 there were ten CMOS chip assembly lines with more than 150 related enterprises). Pudong Software Park, with an annual income of 20 billion yuan, is also prominent: More than fifty thousand employees work there. Also booming is biomedication, which in 2005 had an output of 15 billion yuan from more than two hundred enterprises. Other industries, such as automobiles and new materials, have already started and are expected to develop in coming years.

Pudong's international airport and seaport offer the necessary transportation to build Pudong as a logistics center. Existing logistics, especially third-party logistics resources, can help to build a network of national or multinational shippers, shipping agents, purchase centers, and delivery centers, which can bring further commercial prosperity to the district. An efficient municipal traffic network will be improved based on existing river routes, roads, railways and subways.

Conferences and tourism can be the side products of the Shanghai International Exposition in 2010. Under construction are a conference venue and a convention theme park that can host 20 million people during a year and twelve hundred conferences annually. This development will make Pudong a conference and commercial tourism center.

With natural advantages, public expectations, and support from the government and other sources, Pudong New District has become a shiny pearl in the east of China.

Further Reading

Qi is an important concept in the Chinese philosophy that defines an animated force that can influence the human body.

The concept of qi is as important to understanding Chinese philosophy as the concept of pneuma (air, breath, spirit) is to understanding ancient Greek and Hebrew philosophy. The earliest pictographs of the Chinese character for qi represent rising steam or vapor. However, quite early in Chinese tradition qi gained psycho-physiological significance when the philosopher Confucius (551–479 BCE) described "blood and qi" as the vigor of the stages of a man’s life (Ames and Rosemont 1998, 198). Like the Greek pneuma, qi here is the “energetic fluid which vitalizes the body, in particular as the breath” (Graham 1989, 101).

By the early Warring States period (475–221 BCE) qi was further understood to be an animating force in the atmosphere that could influence the human body. A physician’s prognosis recorded in the Zuo Commentary to the Spring and Autumn Annals cites the six qi of heaven—shade and sunshine, wind and rain, darkness and light—which “produce the six diseases when they are in excess” (Legge 1861, 580). By the end of this period, when philosophical schools began to flourish, qi had become the primordial constituent of all phenomena. The cosmogony (a theory of the origin of the universe) that begins chapter 3 of the Huainanzi is illustrative:

The Dao arose in the nebulous emptiness;
The nebulous emptiness generated space and time;
Space and time generated qi.
Here qi is “the universal fluid, active as Yang and passive as Yin, out of which all things condense and into which they dissolve” (Graham 1989, 101). The original sense of qi was not lost but was now subsumed by the term jing (essence), as in the following passage from the Guanzi: “Where there is essence, life springs forth…. It is the wellspring of qi” (Rickett 1998, 51).

Along with the six qi of heaven, the Zuo Commentary identifies five xing or “movements” as belonging to Earth. These are the “five elements” or phases of qi, developed by Zou Yan (350–270 BC?), a late Warring States thinker. Zou perfected a theory of transmutation whereby the elements progress through cycles of mutual change. For example, wood produces fire (by combustion), which produces earth (as ash), which produces metal (as ores), which produces water (as condensate), which produces wood (as nourishment). Furthermore, these five categories were paradigmatic, correlating with other sets of fives (tastes, colors, grains, etc.). Mutual interaction among categories was conveyed by qi through the means of “mutual resonance,” a theory that probably also originated with Zou Yan. For example, because “the essence of the qi of water became the moon” (Major 1993, 62), water and moon share the same qi, which explains why the moon has an effect on ocean tides.

The term qi has entered the English lexicon mainly because of the popularity in the West of acupuncture and feng shui (the Chinese art of site orientation based on the belief that the house or tomb can be situated physically to take advantage of the flow of energy within the environment). The “flow” of qi in the human body is influenced by the pierce of the needle. The same flow in the terrain is supposedly influenced by the excavation of the tomb or foundation. The term qi (in its older spelling, ch’i) should not be confused with ji (in its older spelling, chi), which means “pole, utmost point” as in taiji (the Supreme Ultimate, a primarily Daoist philosophical concept) or taijiquan, a form of martial arts.

Qi Baishi 齐白石

1864–1957  Modern painter

Qi Baishi 齐白石 is possibly the best known Chinese painter of the modern era. His paintings, often sparse depictions of birds, plants and insects, reflect a strong connection with Chinese tradition, as well as Qi’s uniquely expressive and unrestrained brush style. In describing his philosophy of art he once wrote: “The sublime is found between likeness and unlikeness.”

Qi Baishi (1864–1957) is perhaps the best known and loved Chinese painter of the modern era. His life spanned the last half century of dynastic rule, and reached into the first years of the People’s Republic. These were some of the most trying times in the history of the Chinese people, yet Qi was able to rise above the cultural and political cataclysm to create a fresh, unique style of painting, still rooted in the venerable traditions of Chinese art.

Born into a peasant family in Xiangtan, Hunan Province, Qi Baishi received little formal education. After apprenticing as a carpenter, he began to teach himself painting by studying the Mustard Seed Garden Painting Manual (published in 1679). Later he studied portraiture and calligraphy with local artists and began to make a living as a painter. As his skill and reputation rose, he studied painting and poetry with some of the most important literary and artistic figures of the day. In his late forties, during the years from 1902 to 1908, Qi traveled extensively, not only acquainting himself with China’s most famous scenery, but also meeting fellow artists and encountering other styles of painting. While in Shanghai

he became aware of the Shanghai School of literati painting, and especially the work of Wu Changshi (1844–1927), which made a strong impression on him. He also accepted an invitation from friends to travel to Xi’an to study the historical stone inscriptions at Beilin. This experience was to be critical in the development of Qi’s unique style of seal carving. (The use of seals, or stamped calligraphs, on Chinese artworks dates back to the Zhou dynasty [1045–256 BCE]. A treasured work will include not only the seals of its maker but of those of its collectors through the centuries.)

In 1917, to escape unrest in Hunan, Qi Baishi traveled to Beijing and was introduced to a number of artists and scholars, including Chen Shiceng (1867–1923). Chen was to be perhaps the most influential figure in Qi’s development as a painter. Qi settled permanently in Beijing in 1919. He lived by selling his paintings and seals. By 1927 Qi Baishi was well enough established that he was given an appointment at the Beijing Art Academy, a position that he held until the Japanese invasion of Beijing in 1937. In response to the invasion, Qi withdrew to a life of seclusion. It was not until after the Japanese surrender in 1945 that Qi came out of retirement and resumed teaching.

After the establishment of the Peoples’ Republic of China in 1949, Qi Baishi was appointed Distinguished Professor of the Central Art Institute and chairman of the Chinese Art Association. In 1956 he received international recognition by being awarded the International Peace Prize by the World Peace Council.

Throughout his life Qi Baishi developed a large number of styles in his painting. His early training in the realistic gongbi style provided him with a strong foundation in the fine brush technique necessary for portrait painting. Later, his study of the individualistic styles of Xu Wei (1521–1593) and Bada Shanren (1625–1705), and his acquaintance with the work of Wang Changshi, led him to a more modern, expressive style. His association with Chen Shiceng eventually allowed Qi to escape the shadow of tradition and forge his own unique style. That style, often described as da xieyi, or “painting ideas in large,” was a progression from traditional calligraphic use of brush strokes to a liberated application of heavier strokes that sought to capture the spirit of the subject matter without being restrained by excessive attention to figural detail. Qi’s most famous description of his own approach to painting is the phrase, “The sublime is found between likeness and unlikeness.” That ideal

A Letter to Qi Baishi

It is customary in Chinese usage to address correspondence to friends by their personal names, rather than their family names, as a sign of intimacy. The salutation Xiansheng (Mr.), however, is retained. Here, Baishi is Qi’s personal name; this translation of a letter from Mao Zedong shows the familiar Chinese usage in correspondence.

Mr. Baishi:

I thank you heartily for the gift of your scroll painting Pu tian tong qing (Joyous Celebration of All in Heaven), which I have received. I would like to express my gratitude to all your co-creators: Messrs. Xu Shixue, Yu Feian, Wang Shensheng, Hu Peiheng, Pu Yizai, Pu Xuezai, and Guan Songfang.

Mao Zedong
October 5, 1952

is most fully exhibited in the simple paintings of birds, insects, plants, and everyday objects that he favored in his late years. Those late works also exhibit a nostalgia for the uncontrived styles of Chinese folk art.

The role of the qianzhuang, a traditional Chinese banking institution, evolved to a position of dominance until it finally succumbed to the power of foreign and state-owned banks in China during the twentieth century.

A native Chinese bank, qianzhuang 钱庄 prevailed in both the Ming (1368–1644) and Qing (1644–1912) dynasties. Originally, such banks functioned as “money shops” to deal with China’s bimetallic currency system and to exchange precious metals of copper coins, silver ingots, silver dollars, and gold with different degrees of weight and purity. Later, qianzhuang developed commercial banking functions, including accepting deposits, granting loans, and engaging in the settlement of international trade.

Qianzhuang were originally family-based or established through partnerships among family members and friends. With roots in a long standing agrarian economic society and a Confucian cultural background, qianzhuang emphasized the ethics of family values; a qianzhuang owner or a manager (in the corporate partnership) acted like a father overseeing all internal business and devising strategies to deal with external affairs. The owner or manager could efficiently operate the institution with a relatively small amount of capital by utilizing friendship and connections. Thus, building good “friendship networks” were critically important in carrying out business, primarily because borrowing and lending was based on personal trust and fidelity.

Qianzhuang were often divided into five different types, according to their capital and areas of operation (in Shanghai, for example): huihua zhuang (commercial bank); yuanzi zhuang (secondary commercial bank, meaning its capital and business size was smaller than huihua zhuang); hengzi zhuang (credit union); lizi zhuang (exchange house); and zhenzi zhuang (grocery shop with money exchange). Huihua zhuang possessed more capital and operated with a wider business trading circle. They had the authority to issue bank promissory notes (zhuang piao) by taking deposits and granting loans to merchants. These huihua zhuang were members of local native banker guilds, a self-regulated native banking institution, which determined the interest rate and exchange rate each day before foreign banks and modern national banks in China assumed that role.

The capital of a qianzhuang included zhengben (basic capital) and fuben (supplementary capital). Zhengben referred to the capital originally paid by the founder and partners of a qianzhuang; fuben referred to the capital later added to the original capital. Normally, the shareholders received a 7 to 8 percent interest rate annually on the deposit. According to a 1926 survey among 112 qianzhuang in Shanghai, the basic capital of a single native bank ranged from 20,000 to 360,000 silver tael (refers to weight measurement in old China; a silver tael weighed 37.8 grams [about 1.22 oz]).

Qianzhuang were usually organized into three levels: a managerial level with an associate manager or an assistant manager; a senior staff level that included accountant, money-market staff, street-runner (paojie), clearing clerks, banking clerks, and customer service staff; and a
supporting staff level that included cashier, assistant accountant, assistant clerks, apprentices, silver deliverer, and secretaries. Promotions and pay scales were generally determined on the lunar New Year. All employees, including apprentices, received cash bonus in a small red bag.

In China’s large cities, local banker guilds set up business rules and cleared interbank promissory notes. The Shanghai Native Banker Guildhall was built in a Ming-style garden connected to the city temple of Shanghai. This guild played a leading role in Shanghai financial markets from the eighteenth century to the early twentieth century by determining the daily interest rate (yin-zhe) and the exchange rate (yangli).

The financial role of the qianzhuang evolved from money shops into more self-sufficient and effective financial institutions in the late Ming dynasty. At this point, qianzhuang assumed the role of receiving deposits, granting loans, discounting bills, issuing bank notes, buying and selling gold and silver, and exchanging bimetallic money and foreign currency. These efficient financial tasks linked qianzhuang with foreign banks and modern-style Chinese banks throughout the entire modern financial history in China.

The qianzhuang performed all the functions of modern commercial banks prior to the entrance of foreign banks into China. When China opened to foreign trade in 1842, however, qianzhuang began to lose their predominant banking position. Faced with the challenge of strong foreign capital inflow, qianzhuang adjusted their business strategies. Instead of changing their traditional banking patterns and business behaviors, they mediated international trade settlements between local merchants and foreign trade companies. After many large, modern Chinese banks were established in the early twentieth century, qianzhuang still played important roles as independent microfinancial institutions to small private enterprises.

In the 1930s, the Chinese Nationalist government launched currency reforms. In 1933, it changed the monetary policy, abolishing silver tael and adopting the silver dollar instead, which substantially eliminated the basic money exchange function of qianzhuang. After the 1934 American Silver Purchase Act was issued, the world silver price rose dramatically. All foreign banks in China had shipped their silver reserve to the London and New York markets for profit, plus China lost mess silver (silver-plated cutlery belonging to the military) in the Northern area where silver was smuggled by the Japanese fleet. The Chinese government had no choice but to eliminate the silver standard as the monetary base. In 1935, China issued the Currency Reform Decree that forbade all private banks from issuing promissory notes, limiting the inter-regional business of qianzhuang and making them more localized. In 1937 after the Japanese army occupied all Northern China, the Chinese government used wartime banking controls to monopolize most Chinese banks, and qianzhuang lost most of their autonomy.

Partially due to its conservative business manner and limited financial resources and partially due to the government policy, qianzhuang eventually lost their banking position with the rise of state-owned banks. At the end of 1952, a Soviet-style socialist planned economic system replaced China’s traditional banking and financial markets. All qianzhuang were reorganized into a few joint state- and private-ownership groups; eventually they were nationalized. The name qianzhuang disappeared for several decades, but with the Chinese economic and financial reform in late 1970s, many “underground qianzhuang” reemerged all over China. But without the Chinese government’s permission, these qianzhuang are illegal financial
institutions and can be closed. But these underground qianzhuang are still doing business in some gray areas, such as rural areas in the Wenzhou of Zhejiang provinces that the state banks ignore. The matter of justifying the historical qianzhuang functions and legalizing them as a modern financial institution could be on China’s financial reform agenda. In the twenty-first century the Chinese government allows qianzhuang revivals in certain areas as private cooperative banks to promote economic development.

Qin Dynasty

Qín Cháo 秦朝

221–206 BCE

Although the Qin dynasty lasted for a scant fifteen years and was repressive, it was China’s first imperial dynasty and developed a centralized administration and a model of government that subsequent emperors followed for centuries.

Although it lasted only fifteen years, the Qin dynasty (221–206 BCE) was China’s first imperial dynasty. It developed a centralized administration and a model of government that later emperors followed until the emperor of the final dynasty, the Qing (1644–1912), abdicated in 1912. In fact, the name of China was probably derived from the word Qin (pronounced “chin”). The Qin rulers achieved their successes, however, by harsh, totalitarian acts that hastened their dynasty’s fall.

Rise of the Dynasty

After the Western Zhou dynasty (1045–771 BCE) fell, the state of Qin emerged as one of many small states that formed in the absence of a strong ruling house. The people of the Qin state, living in present-day Shaanxi Province among various nomadic tribes in the far west of early China, had long been fierce warriors. Rich deposits of iron ore found in their region aided their weapons industry. The Qin began their rise to prominence during the Warring States period (475–221 BCE), when Shang Yang (d. 338 BCE), a politician and scholar, took reforms that had been initiated by other states to their logical conclusion. His reforms concentrated on rural dwellers, who previously had played no part in the workings of the state and who were now to be granted land in return for performing agricultural labor and military service and for paying taxes. Under Shang Yang this reform was extended to all adult males in Qin, a development that required replacing the feudal aristocracy with a central government to administer a large population. Positions in this new bureaucracy were granted on the basis of merit rather than inheritance, as earlier. Fajia (legalism), a philosophy that stressed that rulers should have absolute power and should govern with the help of a strict legal code that favored no single class, pervaded Shang Yang’s concept of government.

The rise of the Qin state culminated in the years after 260 BCE, by which time only seven large states were left in the struggle for supremacy. A man who would be known posthumously as “King Zhuangxiang” (an early Chinese custom gave rulers posthumous names by which they would henceforth be known) ruled Qin. Lü Buwei was the chancellor or prime minister. He compiled guidance from classical texts for a system that was aligned to the cosmos and that would serve to govern a proposed imperial state. The thirteen-year-old Zheng (c. 259–210 BCE) came to the throne in 245 BCE; seven years later he instigated a palace coup to depose the regent who had ruled in his name. Between 230 and 221 BCE the Qin—who had once been regarded as too barbaric to pose a serious threat because they had absorbed various central Asian invaders into their state—annihilated their rivals. By 221 BCE Zheng had unified all the states that had emerged from the feudal rule of the once-mighty Western Zhou dynasty. Zheng,
having survived various assassination attempts, most notoriously one by the folk hero Jing Ke, proclaimed himself “Shi Huangdi” (first [literally, commencing] august emperor). He moved to the new capital of Xianyang in a region of the North China Plain associated with former dynastic capitals and took control of his territories.

**Fall of the Dynasty**

A morbid occurrence attended the end of Shi Huangdi’s reign. He died in 210 BCE in eastern China, but his death was not announced for two months more, during which time the imperial entourage traveled back to the capital at Xianyang. Senior minister Li Si, who had been a companion to the emperor on his journey, had decided to withhold news of the emperor’s death until members of the government could regroup, lest the news cause uprisings because of Shi Huangdi’s widespread unpopularity. Thus, the glittering cortege, the dead emperor in tow, trundled through the countryside while his subjects remained unaware of his demise.

Li Si was again at the center of intrigue concerning the question of succession. Shi Huangdi’s first son, Fusu, for a time had been exiled by the emperor at Li Si’s urging. Fearing for his life if Fusu come take the throne, Li Si and the chief eunuch, Zhao Gao, convinced Fusu that his father had ordered him to commit suicide. Thus disposing of Fusu, Li Si and Zhao Gao installed the emperor’s eighteenth son on the throne. Revolts broke out almost immediately among imperial laborers. The second emperor was essentially a puppet. Zhao Gao made all decisions. Two rebel armies were advancing on the capital by 207 BCE. Zhao, facing blame as the main architect of the disaster, tricked the second emperor into committing suicide. The throne then passed to a boy who was formally entitled “child-emperor.” In an intrigue of his own, during the coronation ceremony the boy assassinated Zhao. But...
within a couple of months the child-emperor was forced to surrender to the invading Han king Liu Bang and was not spared. With its child-emperor dead and its capital destroyed, the Qin dynasty ended in 206 BCE, just fifteen years after it had begun.

**Changes Made by Shi Huangdi**

After Shi Huangdi was in power as the first emperor he made sweeping changes to consolidate and support Qin authority. Some elements of Confucianism, such as the importance of ancestor worship and filial duty, were still emphasized; however, in organizational matters Shi Huangdi observed the philosophical tenets of legalism as modeled by Shang Yang. The empire was divided into thirty-six commanderies. Authority was carefully distributed to prevent too much power in any one man’s hands. Each commandery thus was ruled by a civilian governor who was assisted by a military governor. An inspector reported to the central government on the activities of both governors. The emperor enforced a strict penal code and relocated Zhou aristocratic families to the capital of Xianyang, where they could be monitored in mansions built for that purpose.

Shi Huangdi extended the military reforms of Shang Yang to the entire empire. His rule brought a number of technical innovations in warfare. For example, the imperial army was supplied with crossbows and lamellar armor (rows of overlapping leather plates sewn together). Swords were improved and distributed in large numbers. A nationwide system of canals and roads was established to enable troops to move quickly to quell revolts and to facilitate trade. Currency and weights and measures were standardized. The newly uniform width of axles allowed carts and carriages to travel the ruts dug to accommodate them on the freshly built highways. For both administrative and commercial reasons Shi Huangdi also supervised unification of the writing system, which had developed multiple regional variants during the Warring States period (475–221 BCE). These variants were regularized in a new script called *xiao zhuan ti* (small seal script), which was to be used for official documents throughout the empire.

The armies of the Qin dynasty expanded the empire’s borders by invading lands to the south. To the north they repulsed attacks by nomads from central Asia such as the Xiongnu but were unable to defeat them. As a result, huge numbers of peasants were drafted to build a long wall to defend the northern frontier. Over time most of the Qin wall, built of mud, crumbled, but it remained an inspiration for later dynasties, which initiated their own construction and reconstruction projects. The Great Wall of China is south of Shi Huangdi’s wall and was completed by the Ming dynasty (1368–1644).

**Cultural Developments**

The Qin apparently staged competitive martial displays known during the Warring States period as *jueli*, which combined the word *jue* (literally, horn/horning, suggesting an aggressive attacking quality) and the word *li* (strength). These ritual displays fell under the category of *wu*, which is normally translated as “martiality” but had a cosmic dimension lacking in the English word. *Wu* connoted the nature of the cosmos during the months of decay and death in autumn and winter as opposed to the life-giving months of spring and summer. The staging of acts of ritual violence during the winter was thought to bring the social order into accord with the cosmos itself. *Jueli* were great occasions of state and included chariot handling, archery, a team sport of kickball, as well as wrestling and strength competitions that pitted man against man, man against animal, and animal against animal. These displays were as much entertainments as they were religious rites. The Qin changed the term to *juedi* (horning-resisting), perhaps implying the to-and-fro of combat, and arguably made the dimension of entertainment more explicit. At the imperial retreat of Ganquan the second emperor was said to have enjoyed *juedi* and *youpai* (performers or entertainers such as musicians, jesters, singers, dancers, and acrobats). Such entertainments may not have originated on the North China Plain. The first emperor certainly enjoyed songs, music, and dance that were familiar to him from the former homeland in the far west with its nomadic contacts. A recently discovered bell that had been left behind by looters on the grounds of Shi Huangdi’s mausoleum was marked with the words *Qin yuefu*. The word *yue* refers to song-dance forms, and *fu* means “institute.” As documented for the Han dynasty (206 BCE–220 CE) office of the same name, this institute would have had as its purpose the
enrichment of court music and dance by incorporating forms from cultures, including nomadic ones, outside the borders of the empire.

**Quest for Immortality**

Shi Huangdi, seeking to deny death, sent thousands of youths in search of Peng Lai, the mythical islands of immortality, which were said to lie in the East China Sea. Some scholars believe that this search resulted in the settling of an area of Japan by the youths, who not surprisingly (because they faced execution if they failed on their mission) never returned to their homeland. The Qin founder claimed as an ancestor the mythical founder of the ancient Chinese people, Huangdi (yellow emperor; Huang here refers to a different Chinese character than the one in the first emperor’s name meaning “August”). This Huangdi reputedly never died but instead rose to tian (heaven) in a chariot pulled by dragons. Shi Huangdi employed alchemists to find the secret to immortality and took long journeys to sacred mountains, where he practiced sacrificial rituals for the same purpose. At Mount Tai he conducted the mysterious sacrifices known as feng and shan, also in the hope of cheating death. Ironically, Shi Huangdi was said to have died after ingesting mercury-based concoctions that, alchemists declared, held the key to eternal life (alchemists continued to peddle the claim for centuries, evidence to the contrary).

Shi Huangdi was buried just east of the modern-day city of Xian. Judging from the part of the imperial tomb complex excavated so far, it is apparent that the complex was planned as the final resting place of a man whose life would be continuing on some grand scale. The dimensions are impressive: The complex is 515 meters north to south and 485 meters east to west. The mausoleum itself, enclosed by a thick outer wall with a tower at each corner, is divided into an east vault and a west vault, of which the former has been largely uncovered. Here have been found royal chariots and horses sculpted in bronze and in 1974, most famously, an army of seven thousand life-sized terra cotta figures representing the imperial guard, cavalry, infantry, and chariot drivers. Each figure was sculpted wearing the uniform and carrying the weapons appropriate to his branch of service; remarkably, each face was individually molded. The figures were lined up in processional formation, as if setting out on a military campaign; the army presumably was to act as Shi Huangdi’s escort and protector. In the west vault as many figures again are believed to remain hidden.

Archaeological excavations of the future will be able to test the accuracy of the description of the mausoleum provided by China’s first great historian, Sima Qian. Sima, writing during the Han dynasty, observed that the massive and elaborate tomb was under construction from 245 to 210 BCE, that is, from when Zheng became king at age thirteen until the year of his death. Many laborers literally were worked to death building the tomb, and all surviving laborers were buried with the emperor. Sima described a huge central chamber with a ceiling studded with pearls and other precious stones to represent the sun, moon, and stars; snaking across the floor (the Earth), mercury “replicas” of the Yangzi (Chang) and Huang (Yellow) rivers flowed into a miniature ocean also made of mercury, the metal said to have such great regenerative powers. Lighting was provided by burning whale oil, the longest-burning fuel at the time. Within this and other chambers of the compound, which represented palaces, temples, and offices, armed crossbows were set, primed to fire on any intruders from this world.

**Reign of Shi Huangdi**

As mentioned, the reign of the second emperor brought breakdown and disorder rather than much that could be called “constructive.” Most of the achievements of the Qin dynasty occurred during the rule of the first emperor in just eleven years but came at the cost of harsh and repressive laws established to regulate his subjects in large, disciplined bodies. Overworked peasants not only served as agricultural laborers but also doubled as soldiers and as builders of the lavish architectural projects undertaken by the ruler. Prison sentences and maiming punishments commonly were meted out to dissenters or to those unfortunate enough to gain the emperor’s disapproval. Shi Huangdi reportedly executed officials who were late to their assigned tasks, even if their lateness was the result of weather conditions that made travel impossible. Shi Huangdi also made enemies among aristocrats who in the new meritocracy no longer were entitled to inherited court office. In 213 BCE, eight years into his reign, his
growing fear of the power of intellectual debate resulted in an order for the execution of hundreds of Confucian scholars and the burning of all books except those on the subjects of medicine, forestry, divination, and agriculture. A single copy of each of the condemned books was held in the imperial library—which itself was burned by the invading Han forces in 206 BCE. Fortunately for subsequent records of Chinese history, the brevity of the Qin dynasty meant that after its fall scholars lived on and were able largely to reconstruct the classical texts, which they had memorized.

As one might expect, Shi Huangdi lived in fear of attempts on his life and took great precautions to thwart assassins. He employed doubles of himself as decoys. An extensive network of tunnels connected his palaces, and he was said to have moved throughout this network, sleeping in different locations each evening. Death was the punishment for anyone who revealed Shi Huangdi’s whereabouts.

In their compilation The Crimes of Qin Han scholars condemned legalism and the ruler who had embodied its tenet stating that the law should be obeyed through fear rather than through respect. The consensus Confucian view was summarized in an essay entitled “The Faults of Qin,” written by the statesman-scholar Jia Yi. In this influential essay Jia ascribes the collapse of the Qin dynasty to the widespread discontent caused by Shi Huangdi’s harshness in pursuit of his grand ambitions. Nonetheless, although the Han replaced legalism with other ideological systems (Confucianism, Daoism, and a variety of state cults), the Han largely maintained and built on the military, economic, and political structures it inherited from the Qin. In fact, the traditional image of Shi Huangdi as a tyrannical monster recently has been giving way, in China and elsewhere, to a more nuanced assessment that from several perspectives seeks to set his ruthlessness of method against his lasting accomplishments as “China’s first unifier.”

Further Reading
The Qing dynasty, founded in 1644 by the Manchus, was the final imperial dynasty to rule China. The last emperor abdicated in 1912 following the dynasty’s overthrow by the Republican revolution of 1911. Over a period of 268 years, the Qing built the largest consolidated empire in China’s history and oversaw great changes in governmental administration, economic growth, regional integration, and intellectual achievement.

The Manchus, the founders of China’s last imperial dynasty, the Qing (1644–1912), were descendants of the Jurchen people of north China, who ruled the region as the Jurchen Jin dynasty (1115–1234). Behind the leadership of Nurhachi (1559–1626), the various Jurchen tribes organized into large feudal and military units called banners. In 1616 Nurhachi established a dynasty that he called the Hou (Later) Jin, using the Chinese political concept of tianming (Mandate of Heaven) as his right to rule. Hongtaiji (or Abahai, 1592–1643), Nurhachi’s successor, continued to copy Chinese customs and changed the name of his people from Jurchen to Manchu in 1635 and the dynastic name from Hou Jin to Qing in 1636.

Manchu emperor Shunzhi (1638–1661, reigned 1644–1661), who was guided by his uncle, the imperial regent Dorgon (1612–1650), entered Beijing in 1644 and crushed the rebellion that had recently overthrown the reigning Ming dynasty (1368–1644). The Qing conquerors also crushed the Southern Ming resistance and recruited the Han Chinese elite into the new Manchu government. Although the Manchu tried to repress antiforeign feelings among the conquered Han Chinese, they based their empire on...
the Chinese model. This plan for governing included Confucianism as the official state doctrine; administrative offices, such as the grand secretariat and six ministries; and a system of taxation. The new Qing government was ruled jointly by Manchu and Chinese. Equal numbers of Manchu and Chinese held office and worked side by side.

The next three Qing emperors—Kangxi (1654–1722, reigned 1662–1722), Yongzheng (1678–1735, reigned 1723–1735), and Qianlong (1711–1799, reigned 1735–1795)—guided the dynasty to the heights of its power and prosperity and built the largest empire in the world. Following its conquest of greater China, the Qing seized Taiwan in 1683, Outer Mongolia in the 1690s, Tibet in 1720, and Xinjiang in 1759. Beyond China proper, the Qing exacted tribute from Burma (present-day Myanmar), Annam (in present-day Vietnam), and Korea. As governors of their country, these three emperors strove to be model Confucian rulers.

During the eighteenth century, imperial authority became more concentrated through governing bodies like the Grand Council, which was established in 1729. An active bureaucracy enabled the emperor to manage all important government matters efficiently. The minority regions were brought under the control of the central government. Emperor Qianlong continued the policy of limited foreign contact. In 1760 he established the so-called Canton system, which restricted foreign trade to Pearl River delta ports in the area around Guangzhou (Canton).

**Nineteenth-Century Changes**

Events of the nineteenth century brought tremendous change to the Qing and to the whole system of imperial government in China.

In the 1840s foreign imperialist powers were granted political, economic, and legal privileges in certain Chinese
coastal cities, known as treaty ports. During the 1850s the Qing faced large-scale popular uprisings across the empire, including the Nian rebellion (1853–1868) in the east, the Muslim rebellion (1855–1873) in Yunnan, and the Taiping rebellion (1851–1864). These and other smaller rebellions led to a shift in power from the Manchu central government to members of the powerful provincial Chinese elite, who often led their own regional armies against the peasant rebels.

To revive the dynasty, Qing leaders established a number of programs to modernize the country. The yangwu yundong (self-strengthening movement) was implemented during the reigns of Tongzhi (1856–1875, reigned 1862–1874) and Guangxu (1871–1908, reigned 1875–1908), who were both directed by Tongzhi’s mother, Cixi (1835–1898), from behind a silk screen at court. The principle of zhongxue weiti, xixue weiyong (Chinese learning as the essence and Western learning as a practical tool) was further applied to modern industrial development. Led by Li Hongzhang (1823–1901), the program included building arsenals, machine factories, schools, railways, shipyards, telegraph lines, a postal service, and a modern army, navy, and press.

Although the self-strengthening movement helped to somewhat modernize the nation, it could not make the Qing powerful enough to fight off foreign imperialist interests. China lost Vietnam to France in the Sino-French war of 1884–1885. China surrendered Macao to Portugal in 1887. And China was forced by its defeat to Japan in the Sino-Japanese War of 1894–1895 to recognize Korean independence and to concede Taiwan to Japan. Other foreign powers began to compete for concessions (areas of land that were leased in perpetuity by foreign governments) in China.

Fearing the splitting apart of the country, Chinese from various social strata launched new social movements. In 1898 a group of intellectuals persuaded Emperor Guangxu to call for reform. Known as the Hundred Days of Reform, the movement called for sweeping changes in education, political administration, industry and commerce, and foreign relations. The reform movement, however, failed mainly because it was opposed by the powerful and conservative Empress Dowager Cixi.

Twentieth-Century Changes

During the first decade of the twentieth century, the Qing court enacted even more radical reforms in an effort to save the dynasty. In 1905 the civil-service examination system was abolished. Thousands of Chinese students went to study abroad. The government was restructured. And legal institutions were modified along modern precepts.

Meanwhile, foreign interventions in north China triggered a violent backlash known as the Boxer Rebellion (1900). In the late 1890s, a secret society called the Boxers United in Righteousness focused its frustration and anger on Christian converts and foreign interests—such as churches, railways, and mines—which the Boxers blamed for much of the misery in people’s lives. In 1900, with the support of the Qing court, the Boxers attacked foreign government offices in Beijing. Although popular with and bolstered by the people, the siege was broken by a military alliance of eight countries. The foreign powers forced the Qing to pay huge compensation and to accept the establishment of foreign military posts in Beijing. China at this time hung on to its sovereignty by a thin thread.
The Qing’s failure to deal with foreign aggression stimulated Han Chinese nationalism. The political tract *Geming jun* (The Revolutionary Army), written by anti-Manchu radical Zou Rong in 1903, called on the Chinese to overturn Manchu rule and seize their own destiny. The nationalists, led by Sun Yat-sen (1866–1925), considered the father of modern China, sought revolution to solve China’s problems. Guided by his Three Principles of the People—nationalism, democracy, and people’s livelihood—Sun mobilized various groups, such as secret-society members and overseas students. In 1905 he combined his organization with other Chinese radical groups and founded the *Tongmeng hui* (Revolutionary Alliance), which directed the revolution.

In 1908 the Qing government issued the *Xianfa dagang* (Outline of Constitution), which introduced constitutional monarchy to China and defined the rights and responsibilities of the people. In 1909 the government opened provincial assemblies and in 1910, a consultative national assembly. But these desperate reform efforts failed to satisfy the revolutionaries. The Republic of China was founded following the 1911 Revolution. The dynastic era in China officially closed when the last Qing emperor, Xuantong (1906–1967, reigned 1909–1912), abdicated on 12 February 1912.

**Socioeconomic Changes**

The Qing empire contributed to significant changes in Chinese society, in particular an intensive cultural integration of different peoples. The peoples of Mongolia, Xinjiang, Tibet, and other regions were incorporated into the Chinese nation but enjoyed considerable political and cultural autonomy. Even so, the Qing sought to preserve their ethnic character.

Ethnic Manchu were granted preferential political, legal, and social treatment and were encouraged to retain their native arts, including archery and horsemanship. Military units made up entirely of Manchu, the banners, were stationed across the empire. Manchuria was maintained as a homeland base from which Han Chinese were excluded. Manchu women were forbidden to engage in the Chinese practice of foot binding. Han Chinese males were forced to shave the front of their heads and to wear a long braid in the back in the Manchu style, which expressed political loyalty. Marriage between Manchu and Chinese was prohibited.

At the same, to build a Confucian empire, the Manchu rulers created a policy of sinicization, adopting Chinese values, institutions, cultural practices, and social customs. The Qing court encouraged the ruling elite, including the Han Chinese, to receive a Manchu-style education and to master the Manchurian language.

The economy thrived under the Qing. By the late eighteenth century, agricultural production had increased because of an increase in arable land, the cultivation of new crops from the Americas, and the use of improved seeds, fertilizers, and farming techniques.

Qing tax policy facilitated agricultural and economic development. In 1713 Emperor Kangxi permanently fixed the number of taxpayers, exempting the increased population from taxation. Emperor Yongzhen instituted reforms in which taxes were based on land and collected in silver, which greatly benefited poor peasant farmers. The textile, porcelain, paper, sugar, mining, and metalworking industries flourished. Efficient transportation networks...
and an effective banking system helped spur domestic trade and develop a thriving market across the empire and beyond. China traded with Japan, Southeast Asia, Europe, and North America. Foreign trade grew rapidly in China’s favor, and the country prospered. By the early nineteenth century, China’s prosperity reflected the most dynamic economy in the preindustrial world.

Foreign encroachment following the First Opium War (1839–1842) changed Qing economic and social structures, especially in the coastal areas. Enormous war indemnities drained the treasury. Foreigners held the important posts in the customs service. Foreign factories, railways, and banks dominated industry and commerce. Independent foreign communities built from the concessions in the treaty ports sprang up within Chinese society. Yet because of—or in some cases, in spite of—the introduction of foreign values and technology, the late Qing launched China’s modern enterprises, whether they were operated by the government or private Chinese entrepreneurs. Arms manufacturing, shipping, textiles, communications, mining, machinery manufacturing, and banking succeeded and transformed business patterns and the social fabric along the coast. The more traditional interior sections of the country remained mostly unchanged.

Along with changes in the economic structure came changes in the social order. Modern cities developed. Shanghai grew into the largest city in China and an important economic center of East Asia. In the treaty ports, the Chinese commercial class—entrepreneurs or compradores (merchants working for foreign firms)—adopted Western modes of life and ideas. Western-style education, in both China and abroad, trained a new class of people who challenged the supremacy of the old educated elite. Laborers who migrated overseas built economic and social connections in their adopted countries that stretched back to the mother country. A new military establishment, trained in Western methods and better equipped than the old imperial army, began to play an important role in Qing politics. “New women,” epitomized by the revolutionary Qiu Jin (1875–1907), appeared. They unbound their feet, joined sisterhoods, obtained educations, and took part in public life. By 1909 some thirteen thousand girls were attending schools in China and several hundred more were studying abroad. These new social elements, along with a growing discontent among the peasants from the countryside, overwhelmed the old order and helped topple the Qing regime.

### Cultural and Intellectual Changes

The Qing era marked a time of cultural flowering and intellectual searching. In the early years of the dynasty, the Manchu endeavored to reconstruct a world order based on neo-Confucianism. To control the intellectuals and the spread of knowledge, the state sponsored literary projects, including the *Gujin tushu jicheng* (Synthesis of Books and Illustrations Past and Present, 1726–1728) and the *Siku quanshu* (Complete Library of the Four Treasuries, 1772–1782).

Despite the government’s repressive policy, the intellectuals continued to produce great ideas and literary works. Many scholars devoted themselves to a literary work called the evidential research movement. This monumental work contributed immensely to critical studies of Chinese history, philosophy, and linguistics. Philosophers such as Huang Zongxi (1610–1695), Gu Yanwu (1613–1682), and Wang Fuzhi (1619–1692) searched for new meanings of life. Finely crafted works such as *Liaozhai zhiyi* (Strange Tales from a Chinese Studio) by Pu Songling (1640–1715), *Rulin waishi* (The Scholars) by Wu Jingzi (1701–1754), and *Honglou meng* (Dream of the Red Chamber) by Cao Xueqin (d. 1763) exposed social problems.

During the eighteenth and nineteenth centuries, Catholic and Protestant missionaries brought Western science, technology, medicine, education—and religion—to China. At times the Chinese forcibly opposed the missionaries and their ideas. For example, in 1704 Emperor Kangxi expelled a number of missionaries who were intolerant of Chinese culture. The Tianjin Massacre of 1870 and the Boxer Rebellion were demonstrations against Christian missions in China. Nevertheless, by the end of the nineteenth century, some 750 Catholic and 1,300 Protestant missionaries were serving in China. They converted about 200,000 Chinese to Christianity.

Foreign aggression after the Opium War impelled the Qing court to examine Western ideas for enriching the country and strengthening the military. Wei Yuan (1794–1856), in his famous *Haiguo tuzhi* (Illustrated Treatise on
Overseas Countries), advocated using the foreigners’ own methods to depose them. The Qing Self-Strengthening Movement adapted Western values and applied modern science and technology. Yan Fu (1854–1921), who studied naval sciences in England, translated the works of Darwin, Huxley, Spencer, and Adam Smith. The movement toward modern nationalism, furthered by Sun Yat-sen and his revolutionary followers, became yet another force that helped destroy the old imperial order.

The Qing dynasty commands a significant position in the history of China. During its long reign, the dynasty dealt with many difficulties and disasters from within and outside of China. Yet the Qing left a distinctive legacy of territorial, political, demographic, economic, and intellectual influence that continues to affect present-day China.

The Grand Council (Junjichu) was the high privy council that assisted the emperors of the mid- and late-Qing dynasty. Although its predecessor committees were organized almost midway through the dynasty during the reign of Emperor Yongzheng (1723–1735), the Grand Council was formally established only in 1738, near the beginning of the reign of Emperor Qianlong (1736–1795).

The archives revealed Emperor Yongzheng less interested in establishing a powerful inner-court organization such as the Grand Council and more interested in retaining power for himself. It is true that he depended on inner-court confidantes such as his younger brother, Prince Yi (Yi Qinwang), and two trusted Chinese officials, Zhang Tingyu and Jiang Tingxi. Beyond this inner circle Yongzheng added several informal, specialized offices to track and advise on particular problems such as financial corruption (Audit Bureau, Huikaofu), military finance (Junxufang), and military strategy (Junjifang). The advantage of these small working groups was that they could be summoned into existence and disbanded as necessary, leaving the emperor firmly in control. In fact, Emperor Yongzheng was content to maintain his father’s (Emperor Kangxi, reigned 1661–1722) policy of a divided inner court.

Arrangements swiftly changed at the beginning of Qianlong’s reign, when the Interim Council (Zongli shiwu wang dachen), the advisory committee for the imperial transition that was traditional at the outset of Manchu reigns, took over and ran the government for the new young emperor. Some of the same people who had served at high levels in Yongzheng’s inner court were now firmly in charge of the entire government, free of a strong imperial presence to challenge their actions. In spite of the traditional Confucian behest to respect a deceased emperor’s arrangements for three years, the Qianlong Interim Council instituted changes with unseemly haste. Most significant was the disbandment of the old informal committees and the Interim Council’s assumption of their responsibilities. Moreover, the Council itself was
enlarged. Most momentous of all was the fact that at the end of the mourning period the Interim Council was not disbanded but simply given a name-change that revived the name of one of the former inner-court committees, the Military Strategy Office. Today this is translated not in accordance with its original meaning of military strategy but with a term describing its involvement with the myriad details of governing, “Council of State” or, more commonly, “Grand Council.” The all-powerful Interim Council had thus transformed itself into a permanent high privy council, advising the emperor and managing the government.

Expansion followed. Part of this was necessity: a growing population required increased government activity. Other factors propelling Grand Council expansion in the eighteenth century included a traditional Chinese battle for supremacy between the outer and inner courts and certain singular governing arrangements of informality, secrecy, and concurrent posts. Informality meant that the new council’s powers were not limited by regulations in the administrative code; indeed, the Council did not appear in the code until 1818. Secrecy meant that it could perform and expand beyond the glare of publicity. Concurrent posts meant that an outer-court grand secretary with outer-court responsibilities (particularly of the Six Boards) took these with him when appointed to the inner-court Grand Council, while the same official’s outer-court links supplied an empire-wide network of informants. Ministerial ambition may well have played a role, although this is difficult to discern in the available sources. Another factor was that Emperor Qianlong, possibly on the advice of his key confidantes, often turned his attention to cultural matters, leaving other perhaps more crucial details to his grand councilors. By the final third of the reign, the emperor’s in-box was piled high, possibly with the intention of overwhelming him, with chapters
of campaign histories and draft biographies for the State History (Guoshi), all presumably to receive the required imperial scrutiny. Finally, the Council’s management of communications, even generally supervising outer-court documents, provided access to information and methods of withholding it from others.

In the Jiaqing reign (1796–1820), a reform of the Grand Council took place. This limited the Council’s power and prestige in small ways but made no serious inroads on its basic responsibilities of advising the emperor and managing the government. Even the Administrative Code of 1818 merely ratified the existing situation without constraining the Council. In spite of the Code’s specifics, it was possible, for instance, for the Council’s clerical staff to be increased during the Taiping Rebellion (1850–1864).

Nineteenth-century research has shown less interest in the Council than in the Zongli Yamen, a new organization created in 1861 to deal with foreign relations. Moreover, in spite of the Yamen’s rise, for two decades Grand Councilors retained a strong influence in the membership of that body. The Council was also essential to running the government during the era of baby emperors, going through the formalities of responding to memorials and drafting edicts in the emperor’s name but in reality directing much policy on its own.

In May 1911, the throne’s end-of-dynasty attempt to rectify a dangerous drift toward regionalization finally brought an end to the Council. Yet an examination of archival materials from the few final post-Council months of the dynasty show that records continued to be kept in exactly the same form as the defunct Council’s, so possibly the supposed abolition was carried out in name alone. In fact, the Council had served China well. In the eighteenth century it was a key element in the Qing rise to power and greatness. And in the dynasty’s waning years of internal rebellions and foreign aggression, it held the country together for a considerable period of time before the final collapse.

Qinghai Province

Qīnghǎi  青海

5.52 million est. 2007 pop. 720,000 square km

One of the largest official provinces in China (about twice the size of Germany), Qinghai is home to the world’s highest plateau, China’s largest inland lake, and the famous monastery Taer. Despite its harsh climate, the province is inhabited by a broad population including Tibetans, Chinese Muslims, and Kazakh and Mongol minorities.

A remote province in western China, Qinghai (Blue Sea) has a population that includes Han Chinese and Tibetans, as well as Mongol, Kazakh, Hui, Salar, and Tu minorities. The capital Xining (Western Peace) has an estimated population of 2.15 million, as of 2007. Qinghai is the fourth-largest official province in China, having six autonomous prefectures, thirty counties, and seven autonomous counties spread across 720,000 square kilometers (about twice the size of Germany, or half the size of the state of Alaska). Known as China's West, Qinghai hosts the Yushu Horse Festival, which includes horse racing, dance competitions, and commercial trading.

Bordering Sichuan Province (southeast), Tibet (Xizang) Autonomous Region (southwest), Xinjiang Uygur A. R. (northwest), and Gansu Province (northeast), Qinghai encompasses part of the Qinghai-Tibetan plateau averaging more than 4,000 meters (13,123 feet) above sea level, the world’s largest and highest plateau. From Qinghai arise three of Asia’s major rivers, the Yangzi (Chang), Huang (Yellow), and Mekong. Qinghai Lake (Koko Nor, in Mongolian) is China’s largest inland lake. More than 105 kilometers (65 miles) long, the turquoise lake is 3,205 meters (10,515 feet) above sea level. Its brackish waters host Niao Dao (Bird Island) sanctuary, where thousands of waterfowl congregate, including the rare black-necked crane. The Tsaidam (Mongolian for salt marsh) Basin of central Qinghai has an area of 240,926 square kilometers (93,022 square miles). Part salt marsh, part desert, and rich in minerals, coal, and oil, the area is of increasing interest for the exploitation of natural resources. Native fauna include wild yak, Przewalski’s horse, blue sheep, wolf, and a wide variety of birds. The saltwater-drinking camel, newly discovered in 2001, also inhabits part of Qinghai.

Qinghai’s harsh climate has an average winter temperature of −15° C (5° F) and an annual rainfall of 25 to 51 centimeters (10 to 20 inches). The east produces spring wheat, highland barley, peas, potatoes, and rapeseed (canola). The vast grasslands of the west are suitable for herding yaks, horses, sheep, and goats. Other products from the area include wool, animal skins, oil, natural gas, common salt, and minerals. Per capita income is small. China’s main nuclear facility and waste site are in Haiyan, by Qinghai Lake. Qinghai is known as “China’s Siberia” because of the large number of prisoners sent there from the rest of the nation to work in the prison factories.

Once part of Tibet (Amdo), Qinghai came under Mongol rule during the Yuan dynasty (1279–1368), becoming part of Gansu Province. About 20 kilometers (12 miles) southwest of Xining at Huangcheng is the famous Taer monastery, home of the reformer of Tibetan Buddhism Tsong-kha-pa (fifteenth century). After 1724, the Qing dynasty (1644–1912) continued to rule Qinghai, then called Koko Nor. In 1928 Qinghai became an official province.
of China. It contains autonomous districts for Tibetans, Chinese Muslims, and Kazakh and Mongol minorities. Xining is known for its Great Mosque and for the North Mountain Temple.

Qinghua University
Qīnghuá Dàxué 清华大学

Founded in 1911 and located in Beijing, Qinghua University is one of China’s most respected universities. Although it has a varied and comprehensive course of studies, it is especially well-known for its sciences and engineering departments.

Qinghua University, originally named Qinghua Xuetang and also called Tsinghua University, was established on 19 April 1911 as the preparatory school for students who wanted to study in the United States. It is located in the northwestern suburbs of Beijing, in the Haidian district; the campus was one of the former Royal Gardens and is called Qinghua Yuan. In 1912 it was renamed Qinghua School. In 1925, it established a university section, and was renamed National Qinghua University of The Republic of China in 1928; it consisted of four colleges and sixteen departments. At the start of the Second Sino-Japanese War (known in China as the War of Resistance against Japan), Qinghua University moved first to Changsha (Hunan Province), and finally to Kunming (Yunnan Province), temporarily merging with Peking University and Nankai...
University as National Southwestern Associate University during the period of World War II.

In 1946 Qinghua University moved back to its original location in Beijing. It then consisted of five colleges and twenty departments. After the establishment of the People’s Republic of China in 1949, Qinghua University was reorganized to become a polytechnic institute of engineering in a nationwide restructuring of universities and colleges, which was undertaken in 1952. After 1978–1979, when China opened up to the West, Qinghua University restructured as a comprehensive research university.

During Republican China (1912–1949), Mei Yiqi served the longest as president of the university, from 1931 to 1948. In 1955, the Republic of China set up another Qinghua University in Taiwan, with Mei Yiqi as president until his death in 1962.

Today, Qinghua University has 14 colleges and 56 departments; 123 doctoral programs and 159 master’s programs are available. Fields of study include science, engineering, the humanities, law, medicine, history, philosophy, economics, management, education and the arts. Qinghua University employs 7,777 faculty and staff members. There are 32,152 full-time students. Over 13,000 are undergraduate, over 13,000 are MA students, and about 5,000 are doctoral students. There are more than 1,700 students from over 46 countries, and about 9,000 students are enrolled under the “distance education” program, in which the students do not need to be physically present in the classroom.

The tradition of Qinghua University is to balance a liberal arts and science education, with emphasis on engineering, thus, Qinghua University often has been considered as the Massachusetts Institute of Technology (MIT) of China.

One special feature of Qinghua University is that some of its graduates have become political leaders in the People’s Republic of China (PRC), including Jiang
Qinghua University students train as cadet warriors. For two weeks at the beginning of their education, they live like soldiers. Seen here, Qinghua students participate in athletic exercises. PHOTO BY JOAN LEBOLD COHEN.

Qingke
Qǐngkè 请客

The proper treatment of guests has been an important duty and source of cultural pride for the Chinese for many centuries. A special term, qingke (guest hospitality), was, and continues to be, used to define this social phenomenon. Qingke refers both to a straightforward goal to maintain guanxi (interpersonal relationships) and, more generally, to social occasions that involve entertaining friends and guests.

In Chinese culture positive feelings of fellowship and individual and group identity are associated with the hospitality offered to guests. Since the Zhou dynasty (1045–256 BCE), daike (the proper treatment of guests) has been an important Confucian value. The Chinese refer to their country as liyizhibang (the kingdom of etiquette) and use words such as reqing (warm) and haoke (hospitality) to describe themselves. The opening passage of the Analects reflects the Confucian attitude toward entertaining friends and guests: "Is it not delightful to have friends come from afar?"

Hospitality remains central to the flow of everyday social life in present-day China, and the treatment of guests has become a highly developed and ritualized art form. On the down side, there is intense social pressure to uphold this cultural standard. During the 1980s and 1990s, as large sums of state, corporate, and personal funds were spent on lavish banquets and elaborate entertainments, qingke had come to also be associated with excess, waste, and corruption.

Invitations
Qingke can denote an invitation or a polite gesture of goodwill. Qingke can express an acceptance of the responsibilities of a host ("I will make you feel at home") or the desire to maintain harmonious social relations ("Let’s get together sometime"). Contextual cues—such as stating specific times and locations, and repeating offers—enable listeners to distinguish a sincere invitation from a simple courtesy. As a genuine invitation, qingke is a display of friendliness, openness, and a desire to deepen the bonds of the relationship. Qingke is also a way to confer face (respect) to the receiver of the invitation.

Entertainment of Guests
Qingke is associated with numerous events, occasions, and outings: holidays, festivals, weddings, birthdays, promotions, tea dates (or coffee dates), sharing a meal, seeing someone off or welcoming someone back from a journey, and, most important, maintaining guanxi. The type of qingke activity is prompted by the closeness among participants, with distinctions observed between in-groups and out-groups. In-group occasions tend to be private, relaxed, and focused on the exchange of feelings. They generally celebrate something good that has happened to the host. Typically, there is no strict adherence to ritual etiquette in
these occasions involving close friends. Out-group occasions are more formal and take place in restaurants, hotels, teahouses, and other public places. These occasions, frequently motivated by personal gain, involve large amounts of resources and are governed by adherence to traditional codes of proper etiquette.

**Tradition of Proper Etiquette**

During the Zhou dynasty, discourses on ritual, protocol, and etiquette governed the way people were to act. Works such as the *Liji* (*Book of Rites*), the *Yili* (*Book of Rituals and Etiquette*), and the *Zhouli* (*Zhou Rituals*) were taken quite seriously because without an understanding of ritual and etiquette, one could not become a functional member of society. Each member of society had a specific role with social responsibilities and expectations for behavior. Culturally defined customs of etiquette have created a complex web of social roles, defined the responsibilities associated with those roles, and shaped public behavior in China. In Zhou China, for example, *binke* (guests) were defined as one of the seven most important relationships but a category distinct from the category of friends.

As China becomes more integrated into the international community and social relationships become more complex acknowledging hierarchy, knowing one’s place in society, reciprocating, exchanging *ganqing* (feelings), and maintaining social harmony are behaviors still valued and maintained through the Chinese system of etiquette. These behaviors constitute a large part of the set of skills that socially competent Chinese draw on to manage interpersonal relationships. They are an integral part of hospitality. Most Zhou rituals have been simplified or have evolved over time, and much of the formal language associated with those rituals is no longer used. Nevertheless, guests (out-group members) and friends (in-group members) continue to have distinct roles in contemporary Chinese society, roles that have radically different responsibilities associated with them.

Guests are referred to as *guibin* (literally, esteemed guests), *jiabin* (distinguished guests), *guike* (esteemed visitors), and, more generically, as *binke* (guests), *laibin* (visitors), or *keren* (visitors). Social distance is maintained when interacting with guests and relaxed when meeting with friends. Guests receive special treatment and significant status. They are treated with courtesy marked by honorific titles and polite speech. Politeness mechanisms, such as the use of phrases such as *please* and *thank you*, are directed toward guests. In addition to these readily observable distinctions, guests are afforded more turns to speak, offered the right of way at doorways and elevators,

An example of *qingke*; a family treats some friends to dinner at a restaurant. PHOTO BY TOM CHRISTENSEN.
and praised with compliments. In general, guests hear what the host thinks they want to hear. Because guests are to be taken care of, hosts feel a sense of burden associated with their role, but most of these behaviors are dispensed with when interacting with friends.

**Regional Variations**

Because of its vast size and enormous population, contemporary China is characterized by tremendous cultural and regional diversity. Traditional protocol in the entertainment of guests is adhered to in developed urban centers, such as Beijing and Shanghai, much differently than it is in conservative rural areas, such as Shandong and much of inland China. Moreover, China’s numerous ethnic and cultural subgroups often maintain distinct social practices. Although notions of hospitality differ across region and subculture, most Chinese share an intense pride in their complex systems of etiquette and hospitality.

What can differ from location to location in China includes, of course, what regional specialties are served—the choice of staple foods, for example (wheat, millet and sorghum-based noodles and dumplings in the north and rice or rice-based foods in the south)—as well as a number of other details: the order in which dishes are served (soup last in the north and soup first in the south), the amount of food served (copious amounts in the north and small exquisitely prepared portions in the south), where guests and hosts sit (host facing the door in some regions, back to the door in others), the size and shape of the table (square, rectangular, or round), the number of ceremonial toasts (usually an auspicious number such as three or six), host and guest responsibilities, and what certain behaviors signify. For instance, in Shandong, if glasses are tapped when toasting, it is an indication that whatever beverage is being consumed should be completely consumed to display sincerity; in other areas tapping glasses may simply be a kind of salutation that does not require draining the contents of one’s glass. In northern China, eating events are characteristically raucous gatherings in which all guests are expected to contribute to the mood, while elegance and refinement are valued by southern Chinese. Surface level appearances, saving face, and ceremonial actions take on greater significance in these northern-style events, while thriftiness and style are key in southern events. In large urban areas in the south that have been exposed to more international contact, such as Shanghai, hosts tend to allow guests to order what they wish to eat or drink and tend not to put...
as much pressure on guests to consume large amounts of food or drink. In northern China, however, it is still the host’s responsibility to take care of all guests’ needs, which includes ensuring that they are provided with the best foods and sufficient amounts of food and drink. Thus, northern hosts often order for their guests, place food on their plates, fill their glasses, and spend significant energy urging guests to consume more food and drink.

Private and Public Contexts

The level of intimacy of the people involved in a social gathering determines how a particular qingke occasion unfolds. Invitations to visit private homes, for instance, signify the trust and closeness of a relationship that has either existed for a long time or has just taken on a new significance. Hosts spend tremendous amounts of time and energy cleaning, cooking, and preparing food and spirits before the arrival of their guests. Despite the initial efforts made to prepare for the event, these qingke occasions are relatively relaxed because they occur in the private setting of the home, involve small numbers of intimate friends and family, and are normally focused on strengthening existing bonds.

In the public arena, qingke occasions range from the least formal level, perhaps with an invitation to attend a movie or concert with a friend, or to gossip over a cup of tea and catch up on the latest news, to the most formal level, as with an invitation to a banquet. Informal qingke occasions are viewed as opportunities for friends to deepen ganqing through chatting, eating, drinking, or doing something interesting together. Formal banquets, on the other hand, are large-scale cultural performances involving vast quantities of food and drink and serve as means of interacting socially and maintaining guanxi. Banquets are a microcosm of Chinese society and are conducted with an emphasis on conforming to the proper norms of etiquette, with themes of modesty, sincerity, and mutual respect framing behavior.

Pattern of Occasions

In-group, out-group, private, and public qingke occasions are all social occasions that frequently involve eating and drinking and all tend to proceed according to a similar four-step pattern:

1. Yingke (welcoming guests)
2. Jingcha (offering guests tea, alcohol, or cigarettes)
3. Yanqing (treating guests to a meal)
4. Songke (seeing guests off)

In traditional China, important guests were ceremoniously welcomed by setting off firecrackers. Protocol dictated specified distances at which to meet guests, depending on their social rank. Phrases such as jiefeng xichen (“receive from the wind and wash off the dust”), still used colloquially to describe the welcoming of guests, reflect these traditional practices. These rituals have been replaced by the hosts’ meeting of guests at doors of restaurants or at train stations, airports, or harbors.

After greeting guests, the primary host, usually a man, begins the occasion with hanxuan (small talk) that may take place on a couch in a sitting room or anteroom. While one host, usually the lady of the house, prepares the meal, a second host offers tea, cigarettes, fruit, and candy. Although what is offered to guests during this period has changed—with candy, melon seeds, and bottled water replacing tea and cigarettes in some contemporary urban settings—most qingke occasions still begin this way.

The offering of tea is typically followed by a meal. Even if a guest visits at a time outside of normal meal times, the good host is expected to liuke (ask a guest to stay for a meal). When not arranged in advance, an offer to remain for a meal places a burden on a guest to decide whether the host actually has the time to continue the interaction or is simply being polite. Because of the cultural importance of food and eating, meals are most often the focal activity of qingke occasions.

When the meal is completed, hosts escort guests to a more comfortable setting to relax, chat, smoke, eat fruit, or sing karaoke. Qingke occasions end with the hosts’ seeing off of guests while urging them to stay longer and to visit again. Hosts are expected to escort their guests to their transportation and to wait until they are out of sight. For positive beginnings and endings that leave guests with good first and last impressions, particular emphasis is placed on welcoming and seeing guests off.
Hosting

During formal qingke occasions, hosts are divided into primary hosts, assistant hosts, and escorts. Guests are hierarchically differentiated as main and secondary guests. Participants must conduct the ritual behaviors and fulfill the responsibilities associated with their roles. Recognizing the hierarchy of an occasion and displaying mutual respect are keys for all participants. The standard rule that underlies all hospitality events in China is ke sui zhu bian (guests follow the host’s wishes). Hosts have assumed the responsibility to take care of guests during a particular occasion, which means that while during zuozhu (serving as host), one has the responsibility to arrange everything and to provide for needs of all guests without their having to ask for things.

Hosting involves a significant responsibility and provides an opportunity for enormous influence. Prestige, honor, and social status are associated with good hosting skills. Hosts are responsible for arranging a suitable location, sufficient food and spirits, interesting and amicable guests, transportation, seating assignments, and entertainment. Hosts are also responsible for maintaining the hierarchy of the occasion, creating a festive atmosphere, leading the conversation, maintaining harmony, facilitating the exchange of feelings, and ensuring a pleasant experience for every guest. While accomplishing all of this, hosts are expected to project humility, which is usually expressed through self-deprecating remarks about the inadequacies of hosting abilities, the location, or the amount and quality of the food and drink provided.

Hosts bear all costs, arrange everything, and accompany guests at all times, a practice many Western visitors to China find stifling but most Chinese guests expect. Hosts arrive early, welcome guests, lead toasts, order dishes, issue self-deprecating remarks, serve food, pour drinks, and control every aspect of the occasion. Hosts frequently offer hospitality with particular gusto because the assumption is that guests will politely decline, even if they plan to accept.

Guesting

The practice of zuoke (serving as guest) also carries responsibilities. Guests are expected to shower hosts with repeated compliments on the quality of the site; the interesting group of guests; the host’s hosting skills; the host’s thoughtfulness and attention to detail in preparation; and the amount, taste, and quality of the food and drink provided. Guests are further expected to remain humble, to avoid eating or drinking to excess, to avoid imposing upon the host or infringing upon the host’s time in the spotlight, and to give the host every opportunity to make a good impression (save face) while participating in the occasion.
These expectations frequently impose upon guests the burden of doing things that they may not wish to do in order to avoid damaging their host’s face (reputation). In formal situations Chinese guests work hard to convey the notion that they are enjoying themselves, thanks to the host’s efforts, even when they are not. Guests also frequently decline initial offers of food and drink and frequently apologize to hosts for burdening them.

Qingke occasions are participatory occasions. Neither guests nor hosts drink or eat alone. Participants toast and drink with each other; everyone eats together; and everyone participates through eating, drinking, toasting, complimenting, storytelling, telling tasteful jokes, playful verbal jousting, singing, and dancing. Failure on the part of any guest to actively participate in at least one of these activities is a direct insult and signals to all participants that the host has failed in his or her hosting responsibilities.

Western participants in qingke events need to adapt to certain protocols for eating and drinking as a group, and those differ from acceptable customs while eating as individuals. Dishes are served family-style, and it is also impolite to eat or drink if other participants present haven’t started yet or have finished with the meal. Chinese events tend to be highly structured; guests only eat when the host indicates, either with words or gestures, that it is time to eat. The controlled nature of such events, combined with a host’s incessant urging to eat and drink to one’s fill, leads to impressions among Western participants that the focal activity of qingke events is drinking and, in particular, getting guests drunk. In fact, the urging is not meant to be coercive—it is rather the host’s attempt to fulfill the responsibility associated with qingke, and drinking is merely one mode of interaction involved. The primary goal of the host is to create a mirthful atmosphere that facilitates the exchange of feelings among participants.

In addition to these confusing points, Western participants typically have difficulty in determining who pays the bill because guests and hosts frequently have heated arguments over the check. But face plays a critical role in qingke events. And details such as “who pays the bill” are nearly always determined prior to the event: Hosts pay, or they delegate the task to their assistant hosts so as not to have to leave their guests alone. Guests should offer to pay but should not steal the host’s limelight. That is, guests follow the host’s lead in all situations; failing to allow a host the face gained through paying can cause more damage to a relationship than such apparent generosity would bring. Hospitality demands reciprocity, but reciprocity at a subsequent event is the best rule to follow.

### Centrality of Qingke

Qingke occasions hold special significance in a culture where strict norms of etiquette dictate public interaction, human relationships are emphasized, and a balanced social ledger is the ideal. Entertaining guests is a crucial element of participating in social, political, and economic life in China. Qingke is the means for maintaining the flow of social capital, exchanging feelings, opening a relationship, repairing relationships, and paying back favors. Qingke is a method for affirming existing friendships, expressing gratitude, displaying status, conferring respect, and learning more about a person to determine whether further investment in feelings is warranted. And qingke is a way of accessing the group, managing social relationships, balancing social harmony, and celebrating special occasions.

Qingming Festival
Qīngmíngjié 清明节

Officially reinstated as an official holiday in 2007, the Qingming (clear and bright) Festival is a day of both sorrow and joy. While paying tribute to the dead, people go outdoors to enjoy the spring. Because of the festival’s legendary origin, it is customary to eat hanshi (cold food) on that day.

The Qingming (clear and bright) Festival falls on the first day of the fifth solar term, one of twenty-four terms, or points, marked on the traditional lunisolar calendar shared by the Chinese, Japanese, Koreans, and Vietnamese. The qingming term starts around 5 April and, like the other terms, lasts fifteen days. It is the real beginning of spring, when vegetation turns green and flowers burst into bloom.

For the Chinese, the Qingming Festival is a day of both sorrow and joy. On this day, all Chinese people mourn and remember their dead relatives. The Chinese either bury or cremate their dead. After cremation, they either leave the urns in public cemeteries or bury them. With the economic boom experienced in the 1990s and 2000s and its subsequent increased degree of social relaxation, the practice of burying the body has resurfaced, and Western-style

In the handscroll Peace Reigns over the River, by Zhang Zeduan and believed by art historians to depict the celebration of the Qing-Ming Festival in modern-day Kaifeng, street hawkers offer food, drink, and fans to passersby.
tombs have become fashionable among the wealthier Chinese vying to display their filial piety as well as their fortunes. Despite changes in the ways of laying the dead to rest, the custom of visiting the dead year after year persists. Sweeping the grave, tomb, or urn and offering up sacrifices constitute a large part of this ritual. Hence the day is sometimes known in the West as the Tomb-sweeping Festival. The rites also include setting off firecrackers and burning incense and joss money (paper money in offering to ancestors). Because this practice can cause wildfires, the government encourages the offering of flowers instead. So many people driving to their relatives’ grave sites on the

A scene from a copy after Zhang Zeduan’s scroll Peace Reigns over the River shows a residential courtyard. In one room three scholars debate as they relish a quiet moment away from the Qing-Ming Festival celebration.

Tightrope walking was one of the many entertainments depicted in this copy of the eleventh/twelfth-century scroll Peace Reigns over the River. An appreciative crowd attending the Qing-Ming Festival celebration looks on.
same day always cause traffic jams, so some choose to go a day before or after *qingming*, thus unwittingly stretching the length of the festival. Monuments of those who died in conflicts of modern history are always visited by schools and youth organizations as part of patriotic education.

*Taqing* (treading on the greenery) is one of the more joyous traditions of the Qingming Festival. Activities include outings and recreation, including ball kicking, kite flying, and swing playing. In the first decade of the twenty-first century, people increasingly choose to picnic while viewing flowers in gardens and parks.

The origin of the Qingming Festival is dubious. Most people, however, attribute it to a king named Chong’er and his subject Jie Zitui. Before he was king of the Jin state in the Spring and Autumn period (770–476 BCE), Chong’er (697–628 BCE) fled from the persecution of his murderous stepmother queen. The hardships he endured during his exile alienated all his followers, except Jie Zitui, who even fed the starved king with flesh cut from his leg. After ascending to the throne, Chong’er forgot Jie Zitui. By the time he remembered and sent for him, Jie Zitui had already gone in hiding to Mount Mian with his mother. Chong’er set fire to the mountain in the hope of driving out Jie Zitui; but Jie Zitui preferred to be burned to death. The regretful king then set aside the day in Jie Zitui’s memory and decreed that no fire be allowed on that day, resulting in a festival called *hanshi* (cold food). Later, *hanshi* and *qingming* were combined to create the Qingming Festival.

Around 713–742 ce, the Qingming Festival became an official public holiday. The festival was dismissed as a day of superstition after 1949. In December 2007, the Chinese government, in answer to a popular appeal for respecting tradition, reinstated it as a public official day. Koreans, Vietnamese, and some Japanese also remember their dead on the same day, as do people of Chinese descent in Southeast Asia and other parts of the world.

The Qinling Range is located in north-central China between the Huang (Yellow) River and the Yangzi (Chang) River. It is one of the last remaining places in China where pandas may be seen in the wild.

The Qinling Range, with an area of 55,000 square kilometers, covers about 20 percent of Shaanxi Province in north-central China. It is a part of the Kunlun mountain range, which spans about 1,500 kilometers. The highest mountain in the Qinling Range is Taibai, at 3,763 meters.

The climate on the south side of the Qinling Range is warm and humid year around, and the north side of the range is dry and cold in the winter. The Qinling Range is also a watershed between the Wei River, a branch of the Huang (Yellow) River, and the Han River, which flows into the Yangzi (Chang) River. The Qinling Range has been called a “God-given gift to the Earth.”

The Qinling Range is famous for its pandas, which are at the top of the International Union for Conservation of Nature Endangered Species List, with fewer than one thousand left in the world. The Qinling Range is one of the few places in China where pandas may be seen in the wild.

Economic development, however, has threatened much of the wildlife in the Qinling Range. The extraction of copper, manganese, lead, zinc, gold, and silver (much of it for China’s information technology industry, as well as for its space program) has increased in the northern and western parts of the range. In order to develop Xi’an, the provincial
capital, construction began in 1998 on the 18-kilometer-long Qinling Tunnel on the Xi’an-Ankang Railway; the project, completed a year ahead of schedule, received the first-place award at the State Science and Technology Award Conference in Beijing in 2003. This was the second tunnel to be built in the Qinling Range: During the 1950s the Chinese built the Raoji-Chengdu Railway using the first 2-kilometer-long Qinling Tunnel. Environmentalists do not know the future consequences to wildlife, including pandas, of these economic developments.

QIU Jin
Qiū Jǐn 秋瑾
1875–1907 Revolutionary and women’s rights advocate

Qiu Jin founded a women’s magazine, advocated equal rights for women, and worked against the government of the Qing dynasty until she was arrested and executed.

Qiu Jin, (Ch’iu Chin) meaning “Autumn Jade,” was born into a well-to-do family in Shaoxing, Zhejiang Province. She received a good education, but when she was twenty-one she was forced into a marriage arranged by her parents. Qiu Jin had two children before she left her family in 1904 and went to Japan, where she studied and was influenced by Western ideas. She unbound her feet while there, as well: an extremely painful act of rebellion. Returning to Zhejiang in 1906, she founded Zhongguo Nubao (Chinese Women’s Journal) magazine in Shanghai. In articles for the magazine, she condemned such practices as arranged marriages and foot-binding and urged equal rights and modern education for women. In her outward appearance, and with her participation in activities such as martial arts and horseback riding, she was often at odds with her community. She joined the revolutionary organization of Sun Yat-sen (1866–1925) and supported anti-Manchu (Qing) movements. With a male cousin, Xu Xilin, she coordinated several secret societies and planned a rebellion. In July 1907 both Xu and Qiu Jin were arrested and executed before the plans could be carried out. Qiu Jin remained silent about her activities under torture, and after her death became a martyr and a heroine in the fight against the government of the Qing dynasty (1644–1912). Although she was originally buried ignominiously, she was re-interred after the fall of the Qing dynasty and given an honorable burial.

A Song: Promoting Women’s Rights

A poem by women’s rights activist and revolutionary Qiu Jin, written around the time of her founding of the Chinese Women’s Journal in 1906.

Our generation yearns to be free;
To all who struggle: one more cup of the Wine of Freedom!
Male and female equality was by Heaven endowed,
So why should women lag behind?
Let’s struggle to pull ourselves up,

To wash away the filth and shame of former days.
United we can work together,
And restore this land with out soft white hands.
Most humiliating is the old custom,
Of treating women no better than cows and horses.

Compiled in 1705–06, the Quan Tangshi is the most complete collection of poetry of the Tang dynasty (618–907 CE) and Five Dynasties period (907–960 CE). It contains the works of more than two thousand writers.

Emperor Kangxi (reigned 1661–1722) of the Qing dynasty (1644–1912) ordered the compilation of the Quan Tangshi. Peng Dingqiu was appointed editor-in-chief, and Cao Yin (1658–1712) was in charge of organizing and publishing the project, which began in the spring of 1705 and was completed in the autumn of 1706. The relative completeness of the Quan Tangshi was the result of its incorporation of the efforts of a long lineage of previous collectors. Its basic framework was drawn from a compilation by Ji Zhenyi (b. 1630) under the same title; this, in turn, was based on a collection by Qian Qianyi (1582–1664), who himself had drawn heavily from Wu Guan’s (c. 1571) Tangshi ji (Records of Tang Poetry), itself an expanded version of Ji Yougong’s (flourished 1121–1161)
Tangshi jishi (Events of Tang Poetry). Furthermore, the Quan Tangshi absorbed all 1,033 fascicles of poems in Hu Zhenheng’s (1569–1644/45) Tangyin tongqian (Comprehensive Booktags of Tang Sounds).

The works collected in the Quan Tangshi are divided according to a fourfold periodization of Tang poetry into early, high, mid, and late periods, a schema first suggested by Yan Yu (c. 1230) in his Canglang shihua (Canglang Remarks on Poetry), which, although problematic, has long been followed in anthologies and in scholarship on the subject. Writers are arranged according to year of birth or, if that is unknown, the year in which they passed the jinshi (scholar) examination. Short biographical sketches appear at the head of each writer’s collected poems.

The Quan Tangshi has been criticized for certain shortcomings. For example, it is far from complete. Tang poems discovered in the Dunhuang caves in modern Gansu Province at the turn of the twentieth century were, of course, unknown to its editors; certain poems and fragments quoted in other sources were overlooked as well. Another recurrent problem arises from the abundance of incorrect or overlapping attributions, and other works are out of sequence. Finally, no source references are given.

In the pursuit of a truly complete collection of Tang poetry, studies on commentary, supplements, collation, and other critical issues concerning the Quan Tangshi have been published. These works will eventually contribute to the updated version of the Quan Tangshi now being compiled.

Quemoy and Matsu

Jinmén-Mǎzŭ 金门马祖

92,000 est. 2008 pop.

Quemoy and Matsu are part of a group of fifteen islands located off the coast of Fujian Province. In the 1950s the two islands, which belong to Taiwan, became the focus of political crises between China, which controls the other thirteen islands, and Taiwan.

The islands of Quemoy and Matsu are part of a group of fifteen islands located in the Min River estuary about 12 kilometers off the coast of Fujian Province in China. The two islands, which were occupied by the Chinese Nationalist Party (Guomindang) forces during the Nationalist evacuation of the mainland in 1949, belong to Taiwan. The larger island is Quemoy.
(also known as “Kinmen,” “Chin-men,” or “Jinmen”), which covers an area of 132 square kilometers, whereas the smaller island of Matsu (also known as “Ma-tsu” or “Mazu”) covers only 12 square kilometers.

The heavily fortified islands became the focus of political crises between the People’s Republic of China (PRC), which controls the remaining thirteen islands in the group, and Taiwan, 210 kilometers to the east.

Historically the islands have served as refuges for people fleeing wars on the mainland or as shelter for pirates. The pirate Cheng Cheng-kung (Koxinga) fought the Manchus and the Dutch from his stronghold on Quemoy. After the outbreak of the Korean War in 1950 the U.S. Seventh Fleet was placed in the Taiwan Straits to prevent the Chinese Nationalist Party and the Communists from attacking each other. Having just been elected U.S. president, Dwight D. Eisenhower withdrew the fleet in February 1953, and in August 1954 the Nationalist government in Taiwan moved fifty-eight thousand soldiers to Quemoy and fifteen thousand to Matsu. In September the two islands came under heavy bombardment from mainland forces, and the fighting spread to other islands in the East China Sea. In the early months of 1955 the fighting further escalated and involved coastal ports on the mainland. In the United States nuclear strikes against the PRC were considered, but this action was opposed by leading European members of NATO. In April 1955 the PRC offered to negotiate a cease-fire, and the bombardment of the islands stopped on 1 May 1955.

In 1958 the crisis flared again, and the islands were shelled once more. This time the United States extended its mutual security pact with Taiwan to include Quemoy and Matsu and once again deployed the Seventh Fleet to the area. Observers have proposed that large numbers of native Taiwanese soldiers were sent to the two islands in order to prevent them from staging an armed rebellion in Taiwan. The island of Quemoy has now been opened to tourism. Agriculture is the main occupation on Quemoy.

During the Cultural Revolution (1966–1976) Red Guard organizations, made up of hundreds of thousands of students, were devoted to a personal glorification of Chinese Communist Party leader Mao Zedong and a campaign against foreign or traditional culture.

Red Guard organizations were an important factor in the Cultural Revolution (1966–1976), particularly from 1966 to 1968. They were created from junior and senior high school students and college students who made it their cause to become the personal guards of Chinese Communist Party (CCP) leader Mao Zedong (1893–1976) and China’s socialist revolution. The Red Guards were founded on 29 May 1966 at Quinhua University Middle School in Beijing as a reaction to criticism of Mao in the play Hai Rui (Dismissed from Office) by the historian Wu Han. They used demonstrations and slogans to express their disapproval of their schools and faculty.

Mao, using the Red Guards as a powerful tool in his political struggle with his rivals in the Communist Party and the government, gave his blessing to the Red Guards by sending them a personal letter in which he praised their campaigns and by witnessing the participation of almost 10 million Red Guards in six huge rallies in Beijing late in 1966.

The Red Guards, encouraged by Mao, quickly spread to other schools and colleges in Beijing and then to the rest of the country. Red Guard activities centered on a personal glorification of Mao and on an assertive campaign against foreign or traditional culture. Such activities were focused by Mao’s campaign to eliminate the “Four Olds”: old thought, old culture, old customs, and old practices. His campaign began in late 1966, and the activities were in large part those of the Red Guards. Mao’s attack on the “Four Olds” was a personal campaign, and the Red Guards implemented physical measures based on his philosophies. These measures included attacking foreign fashions and hairstyles, renaming streets, and attempting to redirect street traffic after determining that the color red should signify “go.”
measures turned violent as Red Guards began torturing and killing people who were deemed to have “bad class backgrounds,” destroying stores that sold luxury goods, burning theater and opera props, smashing Confucian tombstones, and ransacking cultural treasures such as Han dynasty (206 BCE–220 CE) archaeological sites, the Ming portion of the Great Wall, and religious sites such as mosques and Buddhist monasteries. Only direct intervention by the Central Committee of the Chinese Communist Party kept the Red Guards from storming Beijing’s Imperial City.

The Red Guards by 1967 had splintered into factions whose members violently contested one another’s loyalty and commitment while continuing to arrest, torture, and harass those Chinese whom they regarded as threats to the revolution, including scholars, translators, and

---

This poster from the Cultural Revolution shows Red Guards and members of the People’s Liberation Army sporting red bands on their arms and holding copies of Mao’s “Little Red Book.” The Red Guards’ initial patriotic glorification of Chairman Mao and the Communist Party turned quickly into violence. These student groups mobilized by Mao in the late 1960s targeted “reactionaries”—including a number of artists, intellectuals, scientists, and teachers—as well as symbols of both bourgeois and traditional Chinese culture. The Red Guards were responsible for the torture and death of many victims they thought as “feudal” thinkers, as well as for the looting of shops that sold luxury goods, the burning of theater and opera props, and the smashing of Confucian tombstones and other ancient artifacts. COLLECTION STEFAN LANDSBERGER.
military officials. Red Guards confiscated gold, jewelry, and valuable real estate and destroyed art collections and priceless records. Alarmed by the horde of Red Guards, in March 1967 the government took the first step in curbing their activities by ordering them to cease national networking and travel. In 1968 the army was dispatched into schools and colleges to restore order and to control the Red Guards.

In the end the Red Guards, although deeply committed to Mao and the revolution, created nothing new, but they terrorized China for more than two years in the name of tearing down the old. The Red Guard organizations, which mobilized hundreds of thousands of students, were too dangerous to be allowed to continue. They had to be stopped by official force and ceased to be an important element of the Cultural Revolution.

After the death of Mao Zedong in 1976, and a brief power struggle, China commenced an era of economic liberalization and social reform that is still going strong at the beginning of the twenty-first century. During this process, China has opened up to the outside world, become a global economic power, and profoundly linked itself to the world’s economy. But it has also created massive, ongoing political, environmental, and economic challenges.

The most recent period of China’s development dates back to two years after the death of Chinese Communist Party leader Mao Zedong and the change in leadership to Deng Xiaoping, which occurred over the period 1978–1979.

Each attempt by Mao to identify a successor had met with disastrous results. Liu Shaoqi, who for almost the first two decades of the history of the People’s Republic of China (PRC) was the number two man in the party, had been purged from the CCP in 1968, was beaten and tortured, and died without being given adequate medical care in 1969 during the Cultural Revolution (1966–1976). Lin Biao, who had replaced Liu, fared little better. After falling out of favor in 1970 and reportedly being involved in an attempted coup, Lin decided to flee to the USSR in 1971; en route his plane crashed in Mongolia, and he died as a result. The youthful Wang Hongwen, who had been groomed from 1972 onward, had proved a poor and highly inexperienced administrator. Deng Xiaoping, who had been rehabilitated in 1974 as vice premier, was politically unacceptable to the radicals grouped around Mao who later labeled the “Gang of Four.” This situation led to Deng’s second fall from power in 1976. Mao’s final choice had been the former party secretary of Hunan Province, Hua Guofeng, a man whose only merit, so many claimed, was that he vaguely resembled Mao. Mao’s final words of affirmation for Hua in late 1976 before his death were “With you in charge, I am at rest.”

Although Hua had been able to move quickly with other senior moderate leaders such as Yang Shangkun and Peng Zhen to arrest the Gang of Four members a mere nine weeks after Mao’s death and had secured the main leadership positions in the party, including party chairman, general secretary, and chair of the Central Military Commission, respect for him within the party and the country generally was not high, and he was soon seen as an interim leader. Perhaps his most fateful move was to stick resolutely by the acts of Mao Zedong, with the famous statement that “Whatever Mao Zedong said is right, and whatever Mao Zedong did is correct.” Hua was condemned mockingly as a “whateverist” throughout 1977 and into 1978, and all eyes were on the immensely experienced Deng Xiaoping, who was to make his final comeback, being instrumental in instigating and then implementing the reforms that were to start in 1978 and that in many ways continue today in 2009. These reforms have, in essence, pushed China toward being the world’s third-largest economy, its second-largest exporter, its largest destination for foreign direct investment, the largest user...
of all energy sources apart from oil, and the holder of the largest foreign currency reserves. This was an economy that was effectively enclosed and isolated in 1971, with hardly any foreign reserves, poor infrastructure, and human capital deeply degraded by the wholesale closure of universities during the early period of the Cultural Revolution.

The reform period, however, did have links to China’s past and was not wholly unprecedented. Mao himself had admitted that he was economically illiterate and for most of the 1950s at least had left economic management to people around Deng, party secretary at the time, and the main economists such as Chen Yun. Although they had never repudiated heavy state control and had effectively returned large parts of the economy to central planning control by 1956, they had seen the value in encouraging enterprise in limited areas. After the Great Leap of Forward of 1958–1961, the worst period in the PRC’s economic history since 1949, ensuing famines in 1963–64 had caused the deaths of up to 30 million people; Deng had reintroduced limited reforms, allowing farmers to sell surpluses on a highly managed free market and sanctioning small landholdings. These reforms continued throughout the Cultural Revolution, although by then the aspiration was to create communes nationally and to effectively set up autarky (national economic self-sufficiency and independence) with central planning in control of all areas of the economy.

Back from the Brink

By 1978 China was economically on its knees, its infrastructure highly limited, and 80 percent of its population engaged in backbreaking agricultural work. It exported very little and manufactured hardly anything, and its central bank reserves were empty. It also had the even graver problem of a population that had few skills and that had been exhausted by almost three decades of political campaigns. Many of the youngest of the population had received no education because of the disruption caused by the Cultural Revolution. China’s self-enforced isolation had been partially corrected by the opening to the United States in 1972 after the visit of U.S. president Richard Nixon. But there remained real tensions with the USSR and a realization that China was not only economically weak but also militarily backward, its army working with out-of-date equipment. This fact was proved in the embarrassing defeat in the invasion of Vietnam in 1979, when the Chinese People’s Liberation Army was effectively shooting at its own troops when the Vietnamese simply disappeared.

Discussions throughout 1978 culminated in the Third Plenum of the Eleventh Congress in December 1978, a meeting that, with its earnest intentions to bring about political, economic, social and cultural reforms, was genuinely to change the course of Chinese history. (The Fourth Plenum, in September 1979, went hand-in-hand to further those efforts with a formal statement that acknowledged the Cultural Revolution—and, implicitly, Mao Zedong—as the worst setback to the socialist cause since 1949. The meeting was indeed a setback for Hua Guofeng, whose days in a position of influence were numbered.) Chen Yun was one of the key movers in China’s economic reform, arguing forcefully during the 1978 meeting that marketization should be reintroduced into selected areas of the economy. A decision was also made to allow foreign investment, although tightly controlled, and to encourage what were called the “Four Modernizations”—science, industry, agriculture, and defense. Foreign investment was therefore angled at gaining access to intellectual property that China lacked. Chinese were gradually sent abroad to study in initially the United States and then Europe to gain skills to bring back to China (this policy was to have mixed results—from the first wave of students sent abroad in 1980 to the present day, 720,000 have gone, but only 130,000 have returned to China). Deals were signed, mostly with Japanese companies, to supply advanced technology. The Chinese started importing again. But economic problems in the early 1980s meant that many of these deals were either cancelled or only partially honored, creating tensions, particularly with Japan. China simply overstepped itself with ambition in the early period of the reform process.

People had hopes in 1978 and at moments throughout the 1980s that China’s economic reforms would lead to political reform. And yet, although China’s economy has reformed dramatically in the last three decades, democratization—what dissident and political activist Wei Jingsheng argued was the Fifth Modernization—was not likely to happen, or not at least for many years. Deng’s government, in which Deng himself occupied the
somewhat nebulous but extremely powerful position that came to be known outside China as “paramount leader” (he was never to occupy any formal position except chair of the Central Military Commission until 1989), made clear from early on that political reform would have to wait.

China faced enormous challenges in the early part of the reform process. It had been an enclosed economy for much of the last two decades—since the withdrawal of Soviet aid and personnel in the late 1950s. In 1971 only Hong Kong had been a substantial trading partner. Ports such as Shanghai and Xiamen were barely active. The greatest problem, however, was that China had had no rule of law under Mao, with decisions basically emanating from him. The “rule of man” rather than “rule of law” tradition was seen as a fundamental problem. China had no contract law, bankruptcy law, or investment law. Beginning in 1978 it had to create, literally from scratch, a legal infrastructure, a task not helped by the lack of qualified lawyers. Much of China’s legal system was to be borrowed from Japan and is still being refined. The first joint venture law, passed in 1979–1980, allowed foreign investment in China as long as it was in partnership with a Chinese organization. In the same year Coca-Cola became one of the first importers into the PRC, allowed to sell its drinks in hotels and stores authorized to accommodate foreigners.

**HOUSEHOLD RESPONSIBILITY SYSTEM**

The most radical and far-reaching reform, however, was not one dealing with foreign investment but rather the move to create the sort of system that Deng and Liu had attempted first of all in 1963 and 1964: a household responsibility system in which farmers were allowed to sell grain and other crop surpluses back to the government for a small profit. This reform freed up the entrepreneurial energies of the Chinese people and from its real inception in 1984 was to have startling results, not the least of which was to make China self-sufficient in food by the mid-1980s and to dramatically improve efficiency in the agriculture sector, leading to the creation of town and village enterprises (TVEs). Even Deng was to be surprised at the success of the TVEs, which today are the employers of over half of all Chinese people and one of the real engines of China’s economic growth.

Chen Yun had argued famously that partially embracing the market economy did not need to lead to anything like freefall toward a capitalist system. Many people were puzzled because what had been considered anathema only a few years before was now promoted as acceptable, but the formula Chen used was that free enterprise was like “a bird in a cage,” allowed latitude in certain areas but surrounded by the parameters supplied by Marxist-Leninist Mao Zedong Thought. This formula was to evolve into the idea of “market socialism,” something that would have been regarded, in the Maoist period, as wholly unacceptable but that, from the 1980s onward, became the central creed of the reforming PRC. Mao’s position had been effectively dealt with by Deng in the Resolution on Party History issued in 1981, which had recognized Mao as a great revolutionary but had accorded him a correctness ratio of 70 to 30 and had roundly condemned his role in the Cultural Revolution. With Mao now parked out of the way, the party was able to justify its use of a raft of new ideas. Deng soon gained the reputation of being highly pragmatic, using the famous saying that “it doesn’t matter if a cat is white or black as long as it catches mice.” He was to proclaim that “it is glorious to grow rich” and allowed the government to tolerate the appearance of economic inequality in the PRC, with the first generation of entrepreneurs starting to emerge.

**SPECIAL ECONOMIC ZONES**

This element of control is best illustrated by special economic zones (SEZs), which were established from 1982 onward. China’s memory of foreign companies had not been a happy one. A century before, toward the end of the Qing dynasty (1644–1912), British companies had controlled something like 70 percent of China’s energy sector and many of its key strategic industries. Such economic activity had contributed little, if anything, to Chinese firms, which had remained stuck in the handicraft, low-technology area. The devastation of the Second Sino-Japanese War from 1937 to 1945 (called in China the War of Resistance against Japan, and fought in the context of World War II) had blown much of this away, with the vast majority of foreign companies simply leaving China after 1949. Beginning in 1980 Deng’s government, under Party Secretary Hu Yaobang, who with Zhao Ziyang, had
introduced some of these reforms while running Sichuan Province in the late 1970s, decided to allow joint ventures, in which foreigners could have a 50 percent Chinese partner and could be based only in SEZs. The first five of these SEZs were placed in strategic positions where they could take advantage of key trading partners. Zhuhai was just across the border to the then-Portuguese colony of Macau (returned to Chinese sovereignty in 1999). Xiamen faced Taiwan. Guangdong, of course, had been one of the main trading ports a century before. The whole of Hainan Island was proclaimed an SEZ. The most important, however, and the one that was effectively constructed from scratch, was Shenzhen, just across the border from the British colony of Hong Kong. Shenzhen was simply a fishing village with a primitive entry and exit port until 1983. Originally planned to accommodate 300,000 people, it grew quickly to several million and had the most rapid economic growth, chalking up figures of 40 percent or more for much of the 1980s.

Showcase SEZ
Shenzhen existed to encourage Hong Kong businesspeople to look at investing in their home province (many originally hailed from Guangdong Province). Indeed, it proved a masterful stroke. Hong Kong investment, whatever its role and function, was to make up the bulk of the first wave of foreign money and know-how coming into China. Taiwanese investment, although also significant, came in any volume only later. Japanese, U.S., and European investment, although important, was also later in coming. China’s reforms really started with the initial wave of Hong Kong money. In 2007, unsurprisingly, 90 percent of Hong Kong’s external investment still went to mainland China.

The SEZs allowed for preferential tax treatment and supplied support and security for foreigners coming into the market. But initially they were allowed to exist only to manufacture goods for immediate re-export—a rule changed only in 1996 when goods manufactured in Shenzhen were allowed on the domestic market. Although SEZs were a great success, Deng Xiaoping admitted later in his life that perhaps his greatest mistake had been not to include Shanghai in the first wave of SEZs until 1990. The SEZs served their purpose well, however, and China was to post growth rates nationally of up to 10 percent throughout the first decade of the reform process.
In the Market for Change

Market socialism was to change the face of China dramatically, allowing for the appearance of what might be called a private, or nonstate, sector, with many Chinese going into small businesses, and much more freedom of movement from countryside to the city and from work units into private work. But from 1980 onward social and political side effects of this change became evident, among them the erosion of the secure “iron rice bowl system,” the appearance of increasing inequality, and the first signs of the impact of China’s economic development on its fragile natural environment. Deng had bluntly stated in the early stages of the reform and opening-up period that “flies would get in through the windows” from time to time. Campaigns against “spiritual pollution” were waged, particularly in 1982 and again in 1986. However, the mid-1980s came to be remembered as a particularly liberal period, with Chinese experimenting with ideas and exposed for the first time to an array of Western concepts and techniques. Economic slowdown, corruption, and inflation were to appear toward the end of the decade, contributing to the tragic events in the summer of 1989, which brutally made obvious that although the PRC under Deng was in the market for economic change, political change and the introduction of multiparty elections were a long way off.

China’s reforms since 1978–1979 have delivered the country that exists now—a place fast approaching economic superpower status in perception if not in fact. But the issues that the whole process was meant to address remain surprisingly resistant. Foreign investment was meant to be a means to bring in foreign technology and to address China’s critical human capital problems. Almost three decades after the reforms started, however, China still had massive issues in this area. In fact, 88 percent of China’s high-tech exports in 2006 were produced by foreign companies. In becoming an open economy China has also allowed foreign companies to exploit its supply of cheap labor but to contribute little to the strengthening of indigenous companies. China’s economic model had remained surprisingly stable. Manufacturing remains the basic activity, although it has moved far beyond the confines of the SEZs. Instead, cheap labor lies at the heart of what China does. The aspiration to become a knowledge economy still lies some way off, with over 60 percent of investment in China being in manufacturing, most of it in low-tech goods. This model has also had devastating effects on China’s environment.

On the positive side, however, the Chinese government, in pursuing this path, has certainly lifted more people from poverty into well-being than any other government in the history of civilization. The government has unleashed the entrepreneurial energies of the Chinese people and moved light-years away from Maoist enclosure. The challenge of moving to a new level of development, one that is sustainable and that addresses China’s considerable problems, is something China is still struggling with. Realistically, however, it is hard to see what other choices Chinese leaders could have made in 1978–1979 when they looked at the options for the future. Some people have argued that so momentous has been the impact of their decision that the twenty-first century could be argued to have started on that day in December 1978, when the plenum decided to go in the direction it did.

Further Reading

Throughout the history of China, folk religion maintained its fundamental importance to the people, even after the development of Daoism, Buddhism, and Confucianism. The beliefs, rituals, and morality of these latter streams of institutionalized religious belief intermingled and coexisted with folk religion to create an eclectic spiritual culture that characterizes Chinese culture to this day.

Since their beginnings more than 2,000 years ago, the major organized religions of China (Daoism, Buddhism, and Confucian-based state religion) were never powerful or popular enough to displace completely the communal religion of the people. Instead, they have had to remain satisfied with sharing the spiritual loyalties of the people with community- and family-based religious observances. But these textual religions have been successful in infusing communal religion with some of their doctrines and traditions. For example, the Buddhist vision of Hell and the afterlife became the commonly accepted vision among all Chinese, Confucian morality penetrated deeply into the everyday morality of the common people, and the Daoist pantheon was largely fused with the pantheon of communal religion. This was one of the ways that Daoist priests were able to establish themselves as the elite religious authorities for both the common people and the state, but the masses of the Chinese people, most of whom lived in small rural villages, always remained faithful to their local gods. Only under the most dire circumstances, when famine, military unrest, or natural disaster destroyed their villages and livelihoods, did they voluntarily throw their support behind charismatic religious leaders from a variety of religious persuasions. Such leaders often promised to lead the people out of their misery and into some divine utopia, but often the final destination was dystopian rebellion.

Because Chinese culture has been spread over a vast geographic area, it developed many regional variations. It is therefore extremely difficult to give a definitive description of the general characteristics of the national communal religion, or even say for certain if such a religion existed. Despite regional differences, however, Chinese culture was remarkably integrated, and that makes it possible to identify some universal qualities. Also, because the major religious traditions worked hard to infiltrate the religion of the people, they inevitably left their marks and these factors serve to provide some consistency of belief from one region to another.

**Characteristics of Popular Religion**

To the common people of premodern China, as for those in most premodern societies, the natural world was inhabited by a great number of unseen forces and beings. The objective of popular religion always was to enlist the assistance of the more benevolent of those forces to protect the social and economic interests of the local community. On the other side of the spiritual spectrum, a variety of
methods were used to defend against malevolent forces. Certain divinities were identified as being primarily responsible for maintaining order in the unseen world, just as certain authority figures were charged with ensuring the smooth functioning of the material world. One of the most striking features of the Chinese conception of divinity is the manner in which the gods were thought to operate through a centralized bureaucratic government, undeniably patterned after a vulgar vision of the imperial government in traditional China. Gods were endowed with titles and often were responsible for well-defined administrative tasks. They were also surrounded and waited upon by legion subalterns and personal attendants. The means of communicating with the gods also, fairly naturally, replicated the manner of dealing with officials of the mundane imperial government: Requests were made via formally worded memorials and necessarily passed through the hands of lower-level functionaries. Sacrifices and temple celebrations were compared with official banquets at which local people entertained visiting government representatives with lavish offerings of food and wine.

Another curious but significant aspect of the relationship between humans and the divine in China was the fact that the gods were assumed to be subject to human authority in some respects, or at least that they existed in a relationship of mutual obligation with humans. Priests of various affiliations, as well as government officials, could issue orders to the officials of the unseen world. Depending on the level of their bureaucratic rank, mundane officials could even promote or demote those holding positions in the divine bureaucracy. Punishment for spirits who had not fulfilled their correct roles was also sometimes necessary. The official titles carried by certain prominent gods were often bestowed by the imperial government in recognition of the gods’ service to humans.

In any village or city of medieval China it would have been possible to find many temples, large and small, that housed gods who were believed to possess powers specific or general. They might protect against natural disaster, cure illnesses, assist women in childbirth, or save sailors at sea. Sometimes there were legends to explain how a god had acquired his or her powers, sometimes there were not. The temples of these gods were maintained by the surrounding community, and for the most part there was no full-time priest in residence. When the occasion called for it, such as the celebration of the god’s birthday, or the arrival of an important juncture in the cosmic cycle, certain members of the community would preside over ceremonies. For the more important rituals, such as the annual Pudu 普渡 (Ulambana) rite wherein the disenfranchised and unattended spirits in Hell, commonly referred to as “hungry ghosts” (eguí 饿鬼) were invited to enjoy a feast donated by the community, Daoist priests with specialized knowledge of ritual procedures would be invited; in other cases, the local magistrate would stand in as the master of ceremonies. This latter phenomenon is significant because, at least since the time of the Han Dynasty (206 BCE–220 CE), the state, which considered itself the only legitimate intermediary between the world of humans and Heaven, had maintained a religious presence in the local communities by giving their local representatives the responsibility of conducting rituals of various sorts, especially those directed toward controlling the forces of nature. Memorials addressed to the responsible
Religion, Folk

divine officials begging for rain, seeking to end pestilence, or in one famous instance, asking that crocodiles refrain from consuming local village folk, were commonly composed and delivered by government officials who may have also offered gifts of cooked food and wine, or simply fragrant incense smoke as inducement.

One of the most characteristic tendencies of Chinese folk religion was the deification of real historical personalities. This usually occurred on a local level, but sometimes the popularity of such a figure might spread to other areas, or even become a national phenomenon. Very often those deified were cultural heroes, people who had distinguished themselves by their moral strength or military prowess. Perhaps the most famous example of this is that of the god Lord Guan (Guangong 關公), whose fearsome bearded image can often be found presiding over Chinese restaurants and retail stores. Lord Guan was in life a famous and popular general from the Three Kingdoms (Sanguo 三國) period (220–265 CE) who captured the popular imagination with his valiant defense of a failing imperial court. The process of deification in China was very much like the canonization of saints by the Catholic Church. The major difference was that in China, no central authority had control over who should and should not be deified. In theory, the imperial government held that authority, and it constantly tried to enshrine those whom it felt embodied values it wished to promote. Lord Guan, for example, was given several titles over the centuries, including a title indicating his divinity bestowed upon him by the Song Dynasty emperor in 1120 CE. In the vast majority of cases, however, it was the people themselves that determined the survival and popularity of a given cult, and if the people did not feel that the god was effective in helping them, his or her temple fell into disuse and disrepair in a relatively short time.

The God of the Locale

One of the most widely dispersed and oldest divinities in China is the God of the Locale (Tudi gong 土地公), precursors of whom can be found mentioned in the predynastic classics dating from as early as 1000 BCE. Virtually every village and urban neighborhood in traditional China recognized their own version of this deity. He was the protector not only of the people of the community, but also of their livelihoods. Most people saw him as a police chief of the local underworld, and it was through his power to keep the often unruly spirits of the deceased in check that he was able to provide security on earth. While this divinity can be approached by individuals seeking assistance with a personal matter, especially a matter concerning deceased family members, the God of the Locale often was worshipped by the community as a whole. Worship was carried out in times of crisis, but also on special days, such as the god’s birthday. On these latter occasions lavish offerings of food and drink, as well as music and dance, were made, and a generally festive
atmosphere prevailed. Such celebrations were a natural opportunity for the members of the community to mix informally with each other, lifting the spirits of all those involved.

The City God

Another god found in many urban Chinese communities is the City God (Chenghuang 城隍). City God temples are still found in virtually all Chinese cities whose founding predates the end of the dynastic period in 1912. Frequently a city will have several gods distributed among its different wards. Cults of the City God are not as old as those of the God of the Locale; they begin to appear more widely in the Tang dynasty (618–907 CE) and Song dynasty (960–1279) as the result of increased urbanization during those periods. City Gods have a somewhat different role to play in the community than Gods of the Locale. They are usually recognized as the direct superior of the God of the Locale, and while the God of the Locale is most often seen as a local personality with no official position, the City God represents the higher authority of the heavenly bureaucracy. They too, have an important responsibility to protect the area under their control from disaster and to bolster its prosperity, but their influence is usually felt to be more far-reaching than that of the God of the Locale. Also, because they are considered to be appointed to their positions by higher powers, those same powers, or sometimes the local representative of the mundane imperial government, could relieve them of their posts and replace them if they did not carry out their duties properly. City Gods are generally accommodated in impressive urban temples that can serve as community centers as well as religious institutions, very much in the same way that the plazas in front of European cathedrals served as meeting places for the citizens of the city.

Family-Based Religion

The family has probably been a center of Chinese ritual activity since Neolithic times. But the nature of family religion changed significantly over time as values and concepts originating in the Confucian and Buddhist traditions seeped slowly down through the social ladder from the elite to the common people. Due to its missionary efforts among the common folk, Buddhism had probably changed the basic worldview of the peasant masses by the beginning of the Tang period. But we can quite safely posit that up until the Song period Confucian ethics were primarily the exclusive preserve of the educated elite. With the explosion of printing and publishing, as well as due to expanded social mobility and the popularity of certain forms of entertainment such as professional storytelling and theatre, by the Ming Dynasty (1368–1644) Confucianism had finally brought its normative, or universal, values to the common people of all regions of China, providing them with standard rituals and standard ethics. This was particularly so in the case of the cult of the ancestors. Although ancestor worship appears in the earliest records of the Shang dynasty (1766–1045 BCE) emperors, formal and ideological aspects of such things as funerals, weddings, and posthumous rites steadily became more imbued with Confucian values over time. This process accelerated with the acceptance of neo-Confucianism among the educated class of the Song dynasty and the Ming dynasty. Yet even today there remains considerable regional diversity in such rites.

Traditionally the Chinese believed that human destiny was not determined by effort alone: it was necessary to enlist the help of superhuman agencies to protect the interests and bring prosperity of the living. The closest, most obvious place to look for such assistance was among one’s ancestors. Ancestors were very much considered part of the family. They had moved on to a different level of existence and had special needs, but they were dealt with as if their interest in family affairs remained as strong as when they were alive.

Rituals for the ancestors were aimed at making their afterlife as comfortable as possible. Some ceremonies were also intended to assist passage through otherworldly purgatories in which the past conduct of the ancestors was judged by divine authorities. Not surprisingly, since it was Buddhism that brought the very concept of Hell and reincarnation to China in the first place, it was usually through Buddhist rituals that the ancestors awaiting delivery from Hell could be provided assistance in their progress. It was also popularly believed that only if the ancestors were well provided for materially
and free from the clutches of hellish officials, that they could give their protection and assistance to living members of the family. This meant that altars to honor the ancestors were maintained in every household, and tablets with the names of the ancestors were placed there, along with offerings of food and drink. On special occasions, such as Chinese New Year or the Grave-sweeping Festival (Qingming Festival), more elaborate rites were enacted before those altars, at the graveside, or at a temple. On such occasions, more lavish offerings were also provided, and joss (paper) money was burned in the belief that it would be transformed by the flames and conveyed to those in the afterlife. Anyone who visits an area where traditional Chinese religion is still practiced will see small metal containers filled with ashes on the sidewalks in front of people’s houses and businesses. These are for the sole purpose of burning money for the ancestors of the family.

The ancestors were not the only spiritual presence in the Chinese household. Gods and spirits were believed to inhabit strategic locations inside and out. No doubt the most important of these was the God of the Stove (Zaoshen 灶神). His dominion over the cooking hearth and food-preparation area of the home guaranteed his prestige. The God of the Stove was responsible for watching over the activities of the family, and for reporting those activities to the gods in the heavens. This yearly ascent to make his report was believed to take place shortly before the New Year, and the family would prepare a feast for him to ensure that he would make only favorable comments about them.

Many houses would also have an altar to the God of the Foundation (Diji zhu 地基主) placed close to the ground. This deity was charged with protecting the family against low-lying evil spirits that resided near the ground. In the Chinese worldview there is general association between things issuing from the low-lying earth, and noxious, yin (as opposed to yang) vapors. Ghosts and legions of hostile demons also had an affinity for the cold earth. The role of the God of the Foundation was especially important to the preservation of spiritual and physical health in the household. Door gods (menshen 門神), whose images were painted on or beside entranceways, also protected against the entry of unwelcomed spirits and ghosts. Statues of the God of Wealth (Caishen 財神), the Buddhist Goddess of Mercy (Guanyin 觀音), and other popular divinities swelled the ranks of the Chinese pantheon during the late imperial age (Ming and Qing dynasties, 1368–1912). The help and protection of these gods was considered critical to the preservation and prosperity of the family.

Shamanism in Chinese Religion

Shamanism is a form of religion that focuses on direct contact with the world of spirits. It is the main religious and cultural tradition in many preliterate cultures. The classical description of shamanic religion was constructed by Russian anthropologists working in southern Siberia during the late nineteenth and early twentieth centuries. Since that time, shamanic practices have also been identified and studied among North and South American native peoples, among the Bushmen and other tribes in Southern Africa, and among Australian aboriginal tribes, to name just a few examples. The shaman is a person,
either male or female, who has can communicate with the spirits. Communication is often affected when the soul of the shaman temporarily is released from its physical body and travels to the spirits’ world, where he or she (since in many cultures the shaman is usually a woman) can speak directly with the spirits and request their assistance in human affairs. Shamans also can cause their souls to vacate their bodies, allowing the spirits to make use of their voices, and sometimes hands and feet, to address humans directly. One of the most important roles of the shaman was to cure illness. Both spiritual and medical means are employed to this end. Often it was necessary to exorcise evil influences, and the shaman was an expert at this task as well.

Although purely shamanic religion has not been practiced in China since prehistoric times, shamanic elements have remained an important part of religious practice. The kings of the Xia 夏 (2100–1766 BCE) and Shang 商 (1766–1045 BCE) dynasties relied on the services of priests who were capable of contacting the spirits to plan their every move. Among the common people, mediums, traditionally known as wu 巫 (female) or xi 玄 (male), could enter a trance and allow spirits to speak through their mouths or write with their hands; they have been a basic part of village religion since at least the Zhou period (1045–256 BCE), and continue to be so today. Many temples still employ mediums who hold regular sessions during which popular divinities enter their bodies and provide assistance to people in need. Generally, people attending these sessions are concerned about medical issues, either their own or those of family members, but questions about business and domestic affairs are also common. This type of activity usually occurs in the local temples and without the sanction of government or organized religion. The spirits who descend to provide advice are...
seldom highly placed in the popular pantheon, but they do have a strong following among people at the lower end of the socioeconomic ladder.

**Ledgers of Merit and Demerit**

Although the role of popular Chinese religion is not primarily to provide moral and ethical guidance, moral behavior is often seen as a prerequisite to the achievement of spiritual goals. As societies become more sophisticated, they require more satisfying explanations about the existence of evil. People want to believe that there are forces that provide compensation to those who have been wronged, and punishment for those who have wronged. In Chinese religion, it is believed that there are gods whose primary function is to keep track of the deeds of humans; at death, the deceased individual is brought before a tribunal of spirit-officials for judgment. Since the Chinese adopted the Buddhist concept of rebirth beginning in the period of political division following the Han dynasty when Buddhism first gained currency in China, it is often a case of determining not only which punishments or rewards should be given, but also how long these will be in force before rebirth occurs. Living descendants can modify the sentence by undertaking certain ritual activities, such as reciting Buddhist scriptures and employing Buddhist priests to intercede on behalf of the departed souls.

Beginning in roughly the third century CE in China, another variation on this theme of morality and retribution developed: the practice of maintaining one’s own personal record of good and evil deeds. The fourth-century Daoist text *Baopu zi*, by Ge Hong (c. 280–343) details that it was necessary to do a specific number of good deeds to proceed with the quest of immortality. Evil deeds were marked off against the total number of good deeds at a high ratio, and divine authorities ultimately verified the correctness and validity of these records. This belief continued to gain popularity until the late Song dynasty; scriptures that give detailed information on which sorts of deeds count for how many points, and how many points are required to achieve a given reward have been found dating from that time have been found among the texts recovered from the Dunhuang oasis in Gansu Province.

By the Ming dynasty, the practice of recording one’s own merits and demerits had become even more widespread and formalized. Registers for keeping track of merit and demerit points were being published both commercially and by religious establishments. Belief in the validity of the practice had also spread from Daoism and popular religion to Buddhism and Confucianism. Well-known Confucian officials and Buddhist priests were actively keeping their own records and writing about the subject. By the late Ming, moral principles from the major religions had become thoroughly mixed and universalized. This mixing and unifying of moral values is symptomatic of the strong forces of integration at work in the realms of religion and philosophy in late imperial China. Such integration, or syncretism, remains one of the most important aspects of Chinese popular religion today.

Religious Practice, Contemporary
Dàngdài zōngjiào huóđòng 当代宗教活动

Contemporary China is a country of diverse but strictly regulated religions. People continue to practice the traditional Chinese religions—Confucianism, Daoism, and Buddhism—along with Islam and Christianity, but under control of the state.

Most world religions are or have been at one time practiced in China. Several—Confucianism, Daoism, and Buddhism—either originated in China or underwent history-altering transformations there. The Chinese Communist Party, in keeping with the tenets of Marxism, is atheist and requires its members to reject religious belief. At the same time, however, Chinese law officially supports religious freedom for its populace at large, though only in sanctioned channels, which can cause conflicts. The government’s appointing of Roman Catholic bishops without seeking approval of the Vatican has led to tension and, in the past, even to excommunications. Similarly, in 1995 the Dalai Lama and Chinese authorities chose rival reincarnations of the tenth Panchen Lama, the second-highest figure in Tibetan Buddhism.

Religious Demographics

China’s basic religious heritage comprises the san jiao (three traditions, 三教)—Confucianism, Daoism, and Buddhism. According to official Chinese reports, there are more than 100 million religious believers in China, and most profess faith in one of these three traditions. As of 2007 China had about 13,000 Buddhist temples and 200,000 Buddhist monks and nuns, and more than 1,500 Daoist temples and more than 25,000 Daoist priests and nuns.

Islam and Christianity were introduced into China in the seventh century. As of 2007 there were some 18 million Chinese Muslims and 30,000 mosques. Christianity is catching up, with 4 million Roman Catholic adherents worshipping at more than 4,600 churches and 10 million Protestants worshipping at more than 12,000 churches.

The Chinese government has paid special attention to ethnic religious beliefs. The Law of the People’s Republic of China on National Regional Autonomy, promulgated in 1984, grants the right to freedom of religious belief to all Chinese. Since the reform movement initiated by Deng Xiaoping in 1978–1979 to modernize China, Tibetan Buddhism and Islam have been practiced all the more vigorously in Tibet and Xinjiang, respectively. The Chinese government reports that since 1980, it has invested about ¥200 million (about $29 million) for the maintenance and reconstruction of religious sites in Tibet, including Potala Palace—the residence of the Dalai Lama—and the Jokhang Temple and Tashilhunpo and Samye monasteries. Because these sites are also tourist attractions, the investment also yields economic benefits to the Chinese state: over 1,700 places of worship and religious activity in Tibet, housing 46,000 resident monks and nuns. It is difficult, however, to evaluate precisely the level of religious freedom in Tibet, for, as a 2002 report...
Religious Practice, Contemporary

Chinese Religions and the Chinese Communist Party

The ultimate goal of the Chinese Communist Party (CCP) is the creation of a Communist social system. To fulfill that goal, and in accordance with China’s constitution, the party takes Marxism-Leninism and Mao Zedong Thought as its guide. Atheism is a central tenet of Marxism. Marxism holds that God is a mere fabrication, invented by people to soothe the misery of this world, a fabrication exploited by the ruling classes to oppress the working class. From the Marxist perspective, the abolition of religion and the abolition of the capitalist system go hand in hand. The party requires its members to profess Marxist atheism and to educate the masses in the Marxist perspective on religion.

After the party came to power in 1949, the Chinese government began to monitor and regulate all religions, cutting Chinese religious organizations off from foreign countries. In 1950 the first Chinese Christian conference drafted the Christian Manifesto: The Direction of Endeavor for Chinese Christianity in the Construction of New China, which launched the Three-Self Movement. The movement was based on the Three Self-Principles—self-administration, self-support, and self-propagation—originally introduced by Christian missionaries in the mid-1800s. These principles stressed that Chinese Christians must organize their churches themselves, not let Chinese people clamoring to touch the stone lion at the 1,700-year-old Guangxiaosi Buddhist temple. There are reportedly more than 100 million religious believers in modern China, and most profess faith in one of these three traditions—Confucianism, Daoism, and Buddhism. As of 2007 China had about 13,000 Buddhist temples and 200,000 Buddhist monks and nuns. PHOTO BY ROBERT EATON.
them be organized by foreigners, and that Chinese Christians must support the new socialist China. Many believers felt that the Three-Self Movement was evidence of the government’s plotting actively against all religions. During the ten years of the Cultural Revolution (1966–1976), all religions were denounced, all religious believers were persecuted, all religious meeting places were closed, all religious activities were prohibited, and property belonging to religious institutions was confiscated.

After the Cultural Revolution, the Chinese government tried to restore freedom of religious belief and reopened sites for religious activities. Reports on religious activities, including the celebration of religious festivals, have been published regularly in the official press. In the 1990s China began to join international religious groups and to participate in international religious activities, such as the World Council of Churches, the Fifth World Conference on Religion and Peace, and World Catholic Youth Day. The associations of Buddhism, Daoism, and Islam have also developed international exchanges. Roman Catholicism has developed slower than Protestantism and other faiths have because of the Vatican’s recognition of Taiwan and the Chinese government’s consecration of bishops without Vatican approval. In 2007 Pope Benedict XVI demanded that all Chinese bishops declare allegiance to the Vatican, but he also approved the four government ordinations made in 2007, which Chinese government authorities took as a sign of improving relations.

### Nature of Religious Freedom and Practice in China

Under the Chinese constitution in all its incarnations, the Chinese people have the right to religious freedom. Every version of the constitution protects freedom of speech, assembly, association, procession and demonstration, and religion. The Constitution of 1975 even stated that citizens have the freedom to practice a religion and the freedom to not practice a religion and to promote atheism. Still, only five religions are constitutionally protected: Buddhism, Daoism, Islam, Protestant Christianity, and Catholic Christianity.

In South China attached houses are built of cement and have tiled roofs, and at the New Year they all display traditional decorations. Paintings and calligraphy honor the Kitchen God and other auspicious guardians who will keep the evil spirits away from the door. Photo by Joan Lebold Cohen.
Normal and Abnormal Religious Activity

To control Chinese religions, the Chinese government makes distinctions between what it designates normal and abnormal religious activities. According to the Chinese government, abnormal religious activities are usually conducted by “a small number of people, actuated by some abnormal purposes, who conduct religious activities in an excessively frequent and long manner.” To prohibit abnormal religious activities, the Fifth National People’s Congress adopted a law in 1979 that banned people from organizing secret societies and sects to practice “feudal superstitious beliefs” to carry out counterrevolutionary activities. Later the term counterrevolutionary was deleted from the statute, but the party has applied this term in practice—for example, in making distinctions between the activities of Falun Gong (a system of mind-body cultivation involving meditation and exercise, which has been treated as a religion) and so-called normal religious activities, and considering Falun Gong counterrevolutionary.

CCP’s Religious Hierarchy

Party organs and a state hierarchy manage religions in China. The party/state controls Chinese religion first through promulgation of official Chinese ideology, Marxism-Maoism-Dengism. All schools, colleges, and universities educate students in Marxism, communism, and atheism. Second, the state controls religion through religious policy, which is made by the party and put into practice by the associations of different religions, for example, the Buddhist Association of China, the China Daoist Association, the China Islamic Association, the Three-Self Patriotic Movement Committee of Protestant Churches of China, the China Christian Council, and the China Catholic Patriotic Association. These associations act as liaisons between religious institution and the government. The Religious Affairs Bureau, a government agency, mediates between religious organizations and the party. The United Front Office represents the party in making religious policy. The Public Security Bureau ensures that all religious groups and believers implement party policy. If religious believers

Central Beijing churches are carefully controlled and mostly locked tight when not in use for worship. After the Chinese Communist Party came to power in 1949, the government began to monitor and regulate all religions. Based on the Three Self-Principles (self-administration, self-support, and self-propagation) that were originally introduced by Christian missionaries in the mid-1800s, the CCP’s Three-Self Movement established three criteria for Chinese Christians: (1) They must organize their churches themselves, (2) must not let their churches be supported by foreigners, and (3) must support the new socialist China. Photo by Robert Eaton.
or organizations violate party policies, the Public Security Bureau punishes them according to the criminal law.

Religious Policies

On 31 March 1982, the central committee of the Chinese Communist Party issued an important statement of religious policy: Document 19. Document 19 summed up the historical experience of the party on religious matters; promoted a moderate religious policy; and called for restoration and administration of churches, temples, and other religious sites. At the same time, the document also declared that religion must not interfere with politics, education, or marriage and family life, and reaffirmed that the government prohibited criminal and counterrevolutionary activities committed under the cover of religion.

Regulations Governing Venues for Religious Activities—Decree No. 145—and Regulations Governing the Religious Activities of Foreign Nationals within China, issued by Premier Li Peng in January 1994, were subsequent important regulations for religious organizations and believers. Registration is the key to the Chinese government’s control of religion. According to Decree 145, registration is required for the establishment of a venue for religious activities. Registration requires three things: patriotic association, a fixed meeting place, and activities confined to a specific geographic area. The regulation reaffirms that venues for religious activities shall not be controlled by persons or organizations outside China. Land, mountains, forests, and buildings cannot

Falun Gong (also known as Falun Dafa) is a movement founded by Li Hongzhi in 1992. A system of mind and body cultivation partially derived from qigong (气功, traditional Chinese breathing patterns, which are practiced with physical postures and movements). Since its ban in China, it has become a familiar name in Western media. Falun Gong grew quickly in the 1990s, perhaps because, according to the Economist, “Falun Gong [claimed] that it could heal without the need for medicine” when China’s “cash-strapped state-run hospitals usually sell medicines to patients at inflated prices in order to boost their revenues.”

Falun Gong’s practitioners say their goal is to develop the principles of truthfulness, compassion, and forbearance and that they are a peaceful group, following a philosophy that leads to spiritual awareness and improved health. The Chinese government accuses them of “spreading fallacies, hoodwinking people, inciting disturbances and generally jeopardizing social stability.” The exact number of Falun Gong practitioners is not known, but the Chinese government estimates that the movement has as many as 70 million followers. In 1999, alarmed by Falun Gong’s organizational prowess (it organized a massive demonstration outside the Longnanhai government compound) and its challenge to the official ideology, the Chinese government declared it a “heretical organization” and launched a full-scale campaign against Li and his followers. The campaign included arrest and re-education of Falun Gong’s followers. Since that initial crackdown, the Chinese government has continued to arrest Falun Gong members and to suppress the spread of Falun Gong propaganda. In July 2002, the U.S. House of Representatives expressed disapproval of Chinese policy by passing a resolution calling on China to stop persecuting Falun Gong practitioners.

While the organization has attracted sympathy from Western activists, many view it as a cult. Around the world, followers of Falun Gong stage protests against the Chinese government and publish a newspaper filled with articles attacking the Chinese government.

The Editors
be used for religious purposes without the government’s permission. Donations from persons and organizations outside China cannot be accepted. And the publication of religious articles and artwork is forbidden. If violation of this regulation threatens public security, the public security organs are empowered to mete out penalties in accordance with the relevant sections of China’s Public Security Administration Penal Code. If the violation constitutes a criminal act, the judiciary is to undertake an investigation to determine criminal responsibility.

The Regulations Governing the Religious Activities of Foreign Nationals within China stipulate that foreign nationals may participate in religious activities in religious venues in China, including monasteries, temples, mosques, and churches, which are recognized by the Religious Affairs Bureaus of the People’s Government at or above the county level. They may invite Chinese clerics to conduct such religious rituals as baptisms, weddings, funerals, and prayer meetings. However, they are not permitted to establish religious organizations, liaison offices, or venues for religious activities or run religious schools or institutes within China. They are not allowed to seek to convert members of the Chinese public or to appoint clergy or undertake other evangelistic activities. When foreign nationals enter China, they may carry printed materials, audio and visual materials, and other religious items for their own use, but if greater quantities are brought in, the materials will be dealt with according to the relevant Chinese customs regulations.

**The Outlook for the Future**

In recent years, the Chinese government has begun instituting more liberal policies for Chinese religions, but the government retains authoritarian control. Traditional Chinese religions, and especially imported religions such as Christianity and Islam, continue to experience difficulty. Nevertheless, even in the face of difficulties, religion continues to flourish. The number of Chinese Christians, for example, is expected to continue to grow by 7 percent annually, a sign that religions and religious feeling remain robust even when restricted.

**Further reading**

The global exchange of religious belief was part of China's imperial history. The populace practiced China's three main religions—Buddhism, Daoism, and Confucianism—along with traditional folk beliefs and imported faiths such as Christianity and Islam.

During China's imperial era, the religions that had the most influence on Chinese culture and intellectual thought were Confucianism, Daoism, and Buddhism. Of these, the first two were homegrown; Buddhism came to China from India by way of Central Asia.

Confucianism

Of China's three traditional religions, Confucianism is considered the basis. Confucius (551–479 BCE) was one of China's first great teachers and philosophers, and his teachings were studied by centuries of Chinese scholars. Confucius taught the principles of benevolence, loyalty, righteousness, propriety, and knowledge. He also espoused the five relationships: between ruler and subject, between father and son, between husband and wife, between elder brother and younger brother, and between friend and friend. Confucianism went through two phases in imperial China. The first stretched from Confucius's lifetime to the Tang dynasty (618–907 CE) and is known as traditional Confucianism. In the Song dynasty (960–1279), Confucianism entered its second phase known as neo-Confucianism. Neo-Confucianism assimilated Buddhist cosmology and made Confucian ethics and political theory more metaphysical. The most significant neo-Confucian scholars—such as Wang Yang-ming, Zhu Xi, Cheng Hao, and Cheng Yi—introduced important new interpretations of Confucian theory.

Confucianism has served both secular and religious functions throughout history. Some scholars refuse to call Confucianism a religion because Confucius did not perform miracles or discuss death and the existence of gods and because Confucianism does not have religious texts, systematic rituals, and formal organizations. The Analects (a collection of Confucius's teachings), however, records Confucius's prayers, fasting, and regular attendance of worship services. Confucius discusses god using the term shàng dì (天, heavenly god, or ancestors) and heaven using the term tian (天). Confucius as a sage was worshipped by the majority of Chinese people in imperial China. Confucian temples were established everywhere, using identical designs. In a Confucian temple, religious rituals were held twice a year, in midspring and midautumn, to worship the ancestors of Confucius. These ritual services were convened by state officials and Confucian scholars, not by priests.

Daoism

Daoism comprises many disparate components, including witchcraft, yin–yang theory, ideas regarding ghosts, the theory of Chinese medicine, and the religious ideas
Religious Practice, Historical

of Laozi, sometimes known as Lao Tzu (c. sixth century BCE according to some scholars, while others date him to the forth or third centuries BCE). Daoists synthesized these sources and formed a unique religious system, which is reflected in the Daoist canon, comprising about 1,120 volumes. Daoism is a salvation religion that guides its believers beyond this transitory life to a happy eternity. Daoism associates human weakness and sickness with sin and tries to heal such ills with the confession of sin, forgiveness, and prayer and penance. Early on Daoism was associated with Chinese peasant rebellions, but in the third century CE it shifted its emphasis from the present world and its concerns to the transcendental values of nihilism, the belief in nothing. Daoist priests live in temples and can marry and have children.

Buddhism

Buddhism began its journey in China in the first century BCE, arriving via the Silk Roads from India. At first Buddhism was treated as a foreign religion, but it gradually became integrated into the Chinese way of life after its concepts were made understandable with Daoist terminology. As Buddhist scriptures and teachings were translated into Chinese, Buddhism opened the way of Buddhahood to Chinese believers. By the fourth century, Buddhism had penetrated into the highest social and economic circles. Wealthy Buddhists founded temples, supplied the monks with necessities, and paid for the translation of Buddhist texts. Buddhist scholars became advisers to the imperial court. Although Buddhism faced resistance from supporters of Confucianism, it continued to develop and spread rapidly among the populace. Buddhism in China reached maturity during the Tang dynasty and reached its peak at the beginning of the Song dynasty, after which it began to decline. The four most important factors contributing to this decline were the moral corruption of high-level clergy, the institution of civil service examinations that forced Chinese scholars to seek office through a study of the Confucian classics, diminishing support of Buddhism from India, and the introduction of Western culture.

Christianity and Islam

Beginning in the seventh century, Western religions found a footing in China. The Persian Bishop Alopen (d. c. 451 CE), of the Nestorian Christian Church, was the first Christian missionary to China, beginning the Nestorian mission in 635 in Chang’an (present-day Xi’an), the capital city of the Tang. Emperor Taizong (reigned 627–649) honored Alopen after his death with a monument, erected in 781 outside the city. Although there was considerable collaboration between Buddhists and Nestorians, the Nestorians had little impact on Chinese society.

The second wave of the Christian mission was the Franciscan mission, a Roman Catholic missionary movement of short duration. Giovanni da Montecorvino (1247–1328), the first Catholic missionary and a zealous monk, arrived in China from Italy in 1292 during the Mongol-ruled Yuan dynasty (1279–1368), which had
adopted a tolerant religious policy. Catholic missionaries were allowed to build churches and to baptize Chinese believers. But the Catholic mission did not have much influence until Jesuit missionaries came to China in 1583 during the Ming dynasty (1368–1644).

At the beginning of the Ming dynasty, foreigners were permitted to establish churches only in Macao, but the Jesuit Matteo Ricci (1552–1610) finally opened the way for a Christian mission in the rest of China. Ricci, who was originally from Italy but ordained in Goa, India, developed the Christian mission in new ways, learning Chinese culture and tradition and using the Chinese concepts of tiān and shàng dì to explain Christian principles.

As a result, the Christian missionary movement in the sixteenth century was relatively successful.

Protestant Christian missionaries did not make much progress in China until China was defeated in the First Opium War (1840–1842), which resulted in five treaty ports being opened to Western countries and their citizens. Soon thereafter, large numbers of Christian missionaries made their way to China, but Christianity continued to be regarded as a foreign religion, only just tolerated by the Chinese government.

Although Christian missionaries worked in China for centuries, the Chinese response was always minimal, and the church never constituted more than 1 percent of the national population. Theologically, the central Christian doctrines—creation, sin, and incarnation—contradicted traditional Chinese culture. Politically, the contacts between China and Christians from the West before the nineteenth century were mutually beneficial, but then the interaction became more unbalanced, with the West in an exploitative position. Some Western missionaries disparaged Chinese culture and went so far as to assume that destroying traditional Chinese culture was the first task of the Christian mission in China.

In the seventh century Islam came to China from Southeast Asia. Unlike Christian missionaries, the Muslims came to China as immigrants or traders, setting up their families in China and continuing to practice their Muslim faith. Muslims in China gradually assimilated into Chinese culture and society and became isolated from the rest of the Islamic world. The development of Islam in China was a slow process, and Muslims did not build their own religious temples until the Song dynasty. There was a large Muslim infiltration in the Yuan dynasty, especially in the western provinces of Gansu, Sichuan, and Yunnan. The Muslim population continued to increase throughout the Ming and the Qing (1644–1912) dynasties. It is estimated that there were about 15 million Chinese Muslims in 1912.

**Characteristics of Chinese Religion**

The English word *religion* had no equivalent term in Chinese until the Chinese created the word zòng jiào (宗教) in the late nineteenth century. Zòng refers to clan, tribe,
Religious Practice, Historical

and ancestor; jiao refers to teaching. When the Chinese people put the words zong and jiao together to mean "religion," they were reinforcing the Chinese understanding of the role of ancestral religion. The basic content of the ancestral religion in imperial China was to worship ancestors as well as the land, clouds, sun, moon, mountain, river, and spirits. The ancestral religion recognized four types of gods: heavenly gods, earthly gods, human spirits, and material gods. Correspondingly, there are four types of worship: heaven worship, land worship, ancestor worship, and grain worship. The Chinese people believed that their ancestors were still alive in heaven after their death and had the power to bring harm or good fortune to their descendants. Sacrifices to honor them were a basic part of religious ritual from the Zhou dynasty (1045–256 BCE). The I Ching (Yijing) is a classic text from that time that codified ancestral religion for the first time. Some important concepts, such as the Mandate of Heaven (the notion that heaven bestowed authority to rule upon the emperor) and the Son of Heaven (the emperor), were employed to justify social order and religious rituals. In imperial China there was no meaningful distinction between divine power and political power.

The Influence of the Ancestral Religion

Traditional ancestral religion had a profound impact on Chinese society. It deeply influenced all religions in China. Traditional Chinese ancestral religion had more adherents than any other religious faith in China and was an important unifying force within China. In imperial China almost every city had a temple to the city god, every village had a temple to the village god, and every Chinese home had a religious shrine for ancestor worship. For most people, both noble and common, ancestor worship came first, and belief in other religions came second. Traditional ancestral religion actually dominated other religions even though it did not have a formal religious structure. Other religions were not permitted to contradict the ancestral religion in ideas, moral code, belief, or rites.

Ancestral religion affected daily life. Everyday religious rites, prayers, festivals, and ceremonies arose from it. Ethically, it maintained human moral behavior and social order through ancestor worship; economically, it maintained order through grain worship, land worship, and nature worship, and it sanctified the process of agricultural production and the natural environment.
Ancestral religion affected Chinese culture. Confucianism, the mainstream of Chinese culture, had a profound influence on Chinese society because the central principles of Confucianism preserved traditional Chinese familial values. Filial piety is not merely an ethical value but a religious principle.

Ancestral religion also affected Chinese politics. The development of ancestor worship in China went hand in hand with the evolution of the dynastic political system. Important sacrificial rites were national events and were presided over by the emperor, thereby indicating that the emperor’s power was received from heaven.

The Influence of the Government

In imperial China the central government controlled religions—not only Daoism and Buddhism but, later, also Islam and Christianity—from the national level to local levels through ideology and force. Beginning in the Zhou dynasty, all local religious officials were appointed by the central government, and that degree of control continued in subsequent dynasties. During the Han dynasty, Dong Zhongshu, a Confucian scholar and chief minister, suggested that the dynasty espouse only Confucianism and abolish all other religions. But after the Han dynasty, adherents of Daoism and Buddhism gradually gained ground and even participated in politics. During the Tang dynasty, the government laid equal stress on all three religions. After Islam and Christianity came into China, the central government extended its reach to regulating foreign religions. The state of affairs in contemporary China, with the government exercising considerable oversight and control of religion, can be seen as the continuation of a pattern that was established in the imperial period.

Sun Yat-sen’s revolution, beginning with an uprising in October 1911 and officially bringing down the Qing dynasty when its emperor abdicated in February 1912, ended more than two thousand years of imperial rule and established Asia’s first republic. But many historians question Sun’s leadership abilities and the conclusiveness of his revolution.

By the end of the nineteenth century nearly every political and intellectual leader in China saw the need for change. Some leaders, such as Sun Yat-sen (1866–1925), felt that revolution rather than mere reform was needed. Consequently Sun called for the formation of a new republic based on his “Three Principles of the People”: nationalism, democracy, and socialism (often translated as “people’s livelihood”).

Sun and his fellow revolutionaries (organized as the Tongmeng Hui or Revolutionary Alliance) traveled throughout the country during the late nineteenth and early twentieth centuries to promote their republican form of government. Sun’s actions led to his political exile, but his followers infiltrated the military and spread Sun’s revolutionary ideals. On 9 October 1911 an accidental explosion rocked the revolutionaries’ secret headquarters in Hankou. Police raided the building, discovering a stash of weapons and membership rolls. Knowing that the rolls had revealed their identity, those soldiers who were loyal to Sun quickly mutinied. By the afternoon of 10 October they had captured the entire city. Over the next several weeks province after province declared its independence from the national government in Beijing. Sun, who had been in the United States at the time of the explosion, returned to China and on 29 December 1911 was elected provisional president of Republican China. The Qing court was helpless as events spiraled out of its control. As a result, the Qing dynasty (1644–1912) emperor unceremoniously abdicated the throne in February 1912, ending more than two millennia of imperial rule.

Nevertheless, the early years of the republic were fraught with confusion and civil war, leading many historians to question the leadership abilities of Sun and the conclusiveness of his revolution. Although the leaders of 1911 failed immediately to create a stable and lasting government system, they did topple the imperial system and establish Asia’s first republic. For this reason 10 October—the tenth day of the tenth month—was celebrated as National Day (Double Tenth) in China until 1949 and continues to be celebrated on Taiwan today. With the perspective of a century the events of 1911 still appear quite revolutionary.

China’s turbulent twentieth century was marked by a series of violent revolutions from 1911 to 1949 and then the “revolution within the revolution” that occurred during Mao’s last years. They changed every aspect of Chinese life and society, but perhaps not so completely as it seemed at the time. It is unwise to completely ignore the potential legacy of past revolutions for inspiring future social movements.

Evolution is a twentieth-century phenomenon in China, although the three-thousand-year-old empire had a long history of peasant rebellions and dynastic overthrow. During much of the second half of the twentieth century, the founding of the People’s Republic of China in 1949 was seen as the decisive revolution, or perhaps the completion of earlier incomplete or “failed” revolutions. With the cooling-off of the Communist revolution in recent decades, that metanarrative is open to question, and the earlier revolutions of 1911–1912 and 1927 acquire more prominence in the long process of transforming an ancient agrarian-bureaucratic empire into a modern nation-state and industrialized society.

Even the word revolution was new in China in the late nineteenth century. Along with many Western ideas about modernity, it came to China from Japan as a neologism formed by taking the ancient Confucian term for a heavenly mandate to rule and putting the word remove before it. Thus, geming literally means “to remove the mandate” (political legitimacy), but by the early twentieth century Chinese radicals already understood the word in the sense of the French or American revolutions—the establishment of a new political order. Closely associated with ideas of popular sovereignty and progress, the word was manifestly foreign and new, in fact, a response to the military and political humiliations that China had suffered at the hands of industrialized Western powers since the middle of the nineteenth century.

1911–1912: Republican Revolution

The first revolution came rather unexpectedly, although for more than a decade there had been revolutionary agitation and small-scale uprisings, especially in the south. Most of these were led by Sun Yat-sen (1866–1925) and drew support from overseas Chinese business communities and the new generation of young intellectuals studying what was known as “Western learning.” Sun’s call to overthrow the “alien” Qing dynasty (1644–1912; the imperial family during the Qing dynasty was ethnically Manchu, not Han Chinese) strongly appealed to the ethnic nationalism that the young intellectuals had learned largely from the West.

The revolution broke out, almost accidentally from a botched military coup in the city of Wuhan in eastern central China on the Yangzi (Chang) River. Lack of effective
leadership in Beijing (the emperor was only a child) combined with widespread frustration over the Qing court’s inability to strengthen and modernize China, caused imperial authority to collapse rapidly throughout southern and central China. Sun Yat-sen became president of a short-lived provisional government, but the revolution was soon hijacked by China’s most powerful military man, Yuan Shikai (1859–1916), a different kind of modernizer. Yuan used his military muscle to squeeze out Sun Yat-sen and his party’s elected representatives in the new National Assembly.

The revolution thus ended in apparent failure, with no democracy, no progressive political program, and China torn apart by civil wars after Yuan Shikai’s demise. Nevertheless, the rather premature revolution of 1911–1912 officially ended—with the Qing emperor’s abdication in February 1912—2,100 years of imperial bureaucratic government, replacing the hereditary emperor with a (supposedly) elected president, the Mandate of Heaven with the doctrine of popular sovereignty, and the old type of Confucian scholar-official with “modern men,” whether they were trained in modern military academies or Western-style universities.

1927: Nationalist Revolution

Such modern men—and, with the growth of coeducation in the new schools, some women, too—carried the revolution to its next stage. The revolution of the 1920s was nominally led by Sun Yat-sen and his revived Chinese Nationalist Party (Guomindang), but it mobilized much broader and more radical social forces than the revolution begun in 1911.

The radicalism grew from several sources. First, there was the disappointment with the results of Sun’s revolution as the country fell into political chaos and remained under the domination of the foreign imperialist powers. Second, there was more rapid growth of the modern sector of the economy, with factories and new social classes—Chinese capitalists and a nascent industrial working class—appearing in the coastal cities. Finally, of most direct import, there was the cultural iconoclasm of the New Culture movement, which blamed traditional culture and social habits (Confucianism was a prime target) for China’s backwardness. The new universities, notably those in Beijing, were at the center of this intellectual revolution, which emphasized “enlightenment” and a broader concept of revolution.

However, two external events were crucial in politicizing this cultural radicalism. One was the deep disappointment with the decision of the Western democracies to allow Japan to retain control over China’s Shandong Province, which the Japanese had taken from Germany during World War I. To Chinese nationalists, this decision was a gross violation of U.S. President Woodrow Wilson’s principle of self-determination. The second was the Bolshevik revolution in Russia, which offered an alternative, anti-imperialist vision of national salvation to the pro-democratic capitalist path that had originally attracted Sun Yat-sen. When recruiters from the Comintern, Russian Communist leader Vladimir Lenin’s association of national Communist parties, came to China in the early 1920s, they found eager converts to Marxism and social revolution. They also used financial, military, and political aid to persuade Sun Yat-sen to reorganize his Nationalist Party and launch a renewed revolution against imperialism and warlordism. The newly formed Chinese Communist Party also followed Moscow’s guidance by accepting a subordinate position in a revolutionary united front with the Nationalists.

In an ironic way the events of 1927 confirmed the Comintern’s thesis. After Sun Yat-sen’s premature death from cancer in 1925, tensions grew between the radicals and moderates in the revolutionary movement. In 1926 Chiang Kai-shek (1887–1975), commander of the new Nationalist Party army based in Guangzhou (Canton), launched the Northern Expedition (1926–1927) against the warlord armies. After successfully liberating the Yangzi River valley, including the modern metropolis of Shanghai, he broke with his radical allies, massacred the Communists, and brought the Nationalist Party under
his control and formed a new government with its capital in Nanjing.

This marked an abrupt turn away from the radical agenda of the 1920s. Chiang abandoned most of the revolutionary social and economic policies, including Sun Yat-sen’s plans for redistribution of land, in favor of militarily imposed political unification and nation building. Chiang and the Nationalist government achieved some success with this course during the Nanjing decade (1927–1937), before a Japanese invasion brought the government and the nation new challenges.

1949: Communist Revolution

The Chinese Communist Party had been urban based in the 1920s, organizing industrial workers along conventional Marxist lines. After its defeat in 1927, it moved into the countryside, where Mao Zedong (1893–1976) emerged as the most successful leader of peasant-based revolution. After relocating from south central to northwestern China in the famous Long March of 1935–1936, a reorganized party under Mao’s leadership was positioned to take advantage of the withdrawal of Nationalist government authority from northern China to organize the peasantry in broad areas there to resist the invading Japanese.

During the eight years of war, while the Nationalists’ morale and power waned, the Communists grew in military power and popular support in the countryside of northern China. Combining anti-Japanese nationalism with social and economic improvements for the peasant majority, the Chinese Communist Party, now free of Russian influence, was much more ready for renewed conflict with the Nationalist government after Japan’s surrender in 1945. The party’s experience during these years—the “Yan’an spirit” of self reliance, political will power overcoming material difficulties, and faith in the rural masses’ innate revolutionary consciousness—was instrumental in gaining popular support and overcoming Nationalist military superiority in the seizure of national power by 1949. It also left a legacy of populist activism and guerrilla war mentality that was not always well suited to solving problems of economic development on a national scale.

The victory of the Communists in 1949 was in part the result of the Nationalist government’s collapse from rampant corruption, administrative inefficiency, poor military strategy, and unsolved economic problems such as runaway inflation. But it was also due to the Communists’ success in tapping into the main currents of modern nationalist aspirations for a strong, prosperous, and united country as well as the older socioeconomic grievances of the peasantry. That mixture was a potent revolutionary formula that seemed to have potential application throughout much of the Third World.

1966–1976: Cultural Revolution

In the first two decades of the People’s Republic, the Communist Party oscillated between following the Soviet model of a centralized, bureaucratic planned economy and more populist, rural-based strategies for building a modern, industrialized economy and an egalitarian, socialist society. The Great Leap Forward of 1958, with its rural communes, backyard steel furnaces, and frantic mobilization of the masses, was the most dramatic experiment in the Yan’an-inspired unorthodox developmental strategy that Mao favored. A disastrous economic failure, it was followed in 1966 by the Great Proletarian Cultural Revolution. Mao, appalled by the loss of revolutionary fervor in the Soviet Union and its new society of entrenched bureaucratic privilege, thought to prevent the same from happening in China by mobilizing frustrated students, low- and mid-level party members, and some elements of the military in a “revolution within the revolution.” This would not only remove those high-ranking leaders who were “taking the capitalist road,” but also revitalize the entire revolution.

With the help of the politically ambitious commander of the People’s Liberation Army, Lin Biao (1908–1971), Mao purged almost all the top party and government leaders, inspired vast numbers of fanatically loyal revolutionary youth (the various bands of Red Guards), and put the country in turmoil for two years. He drew back, however, from completely dismantling the party apparatus that held China together, and the last eight years of
his life were characterized by a complicated and somewhat paralyzing covert struggle between the acolytes of the Cultural Revolution’s radical socialism and more cautious, economically oriented party bureaucrats.

1978 to the Present: Postrevolutionary China

With Mao’s death in 1976 everything changed, but not right away. After a brief interlude under Mao’s chosen heir, Hua Guofeng (b. 1936), Deng Xiaoping (1904–1997) emerged by 1978 as Mao’s real successor. Also a veteran revolutionary from the Long March and Yan’an era, Deng abandoned Mao’s revolutionary rhetoric, above all the idea of class struggle and continuing revolution, and proceeded to systematically dismantle all of Mao’s social and economic policies. Technological expertise replaced mass mobilization as the key to rapid economic modernization, and this meant both educational reform (no more politics before knowledge) and opening the country to advanced scientific technology from the West. Furthermore, economic incentives replaced socialist ideology as the motivator for economic growth. The communes were broken up into family farms. Private enterprise, at first on a small scale, but then on a large scale, was revived, foreign capitalist investment encouraged, and China embarked on the kind of export-driven industrialization that Japan, Taiwan, and South Korea had pioneered so successfully. As market economics gradually eroded the position of state-owned economic enterprises and consumerism spread throughout society, China became an integral part of the new globalized capitalist economic system. As market economics gradually eroded the position of state-owned economic enterprises and consumerism spread throughout society, China became an integral part of the new globalized capitalist economic system.

Did all this mean that the revolution was over, or in Deng Xiaoping’s formulation, was China just entering a new phase in building “socialism with Chinese characteristics”? The official ideology remained socialist, and Communism remained the ultimate goal. However, for the present capitalism was being allowed to develop its full productive potential, and successful capitalists were being recruited into the Chinese Communist Party. But the party retained its absolute monopoly on political power, Deng himself sanctioning the ruthless suppression of the most serious challenge in the Tiananmen Square crisis of 1989. Whether that makes the government still a revolutionary regime or just another one-party dictatorship is a moot point.

Communist Revolution in World Perspective

All great revolutions reverberate far beyond national borders, and the Communist revolution was no exception. For a time, mainly in the 1960s and 1970s, China appeared to have inherited the mantle of Marxist world revolutionary leadership from an increasingly ossified Soviet Union. This was especially evident in Third World peasant societies, where the Chinese Communists vigorously promoted their experience with peasant-based revolution as a way to break free from capitalist imperialism and achieve rapid modernization. Lin Biao’s short essay “Long Live the Victory of People’s War!” (1965), succinctly expressed this ambition.

But Maoism and the Chinese model have had little real impact on political evolution in the Third World. The Naxallites in Bengal failed in attempts to import Maoist-style revolution into India. The most successful practitioners of “people’s war,” the Vietnamese Communists, depended on the Soviet Union for most of their military hardware, and in any event harbored a deep historic distrust of Chinese. The Khmer Rouge in Cambodia came the closest to being followers, but their ruthlessness exceeded anything in the Chinese experience, and their failure was more absolute. In Africa, Marxist movements leaned towards the Soviet Union. To be sure, there were some echoes of Maoism in Peru’s Shining Path in the 1980s, and more recently rural insurgents in Nepal have proclaimed themselves Maoists, at least until they abandoned guerrilla warfare for a share of political power. But on a global scale, it now seems that the Chinese model was much more specific to China’s particular historical experience than relevant to peasant societies elsewhere.

There is also the overriding reality that since 1949 the percentage of peasants in the world’s total population has continued to drop, until it is now well under 50 percent.
With the poor and downtrodden of the twenty-first century more likely to live in urban shanty towns than on the land, how relevant is a rural-based revolutionary strategy? Similarly, the model of radical egalitarianism that appealed to young Western radicals during the 1960s and 1970s has been almost completely discredited by the revolvements of Cultural Revolution atrocities and post-Mao China’s cozy relations with the international capitalist order.

Has the Communist revolution then left any global legacy? Perhaps, in the post-2008 crisis of global capitalism, the Maoist slogan, “Where there is oppression there will be resistance” may acquire a new relevancy. Ironically, it is in China itself where the government leaders most fear an economic slowdown will trigger social unrest, especially in the underprivileged rural population. The revolutionary twentieth century is well past but it is not so clear whether its legacy is completely dead.

**Mao Zedong on Policy**

*This inner-Party directive was written by Mao Zedong in December 1940 on behalf of the Central Committee of the Communist Party of China.*

**ANTI-ESPIONAGE POLICY**

Our policy towards prisoners captured from the Japanese, puppet or anti-Communist troops is to set them all free, except for those who have incurred the bitter hatred of the masses and must receive capital punishment and whose death sentence has been approved by the higher authorities. Among the prisoners, those who were coerced into joining the reactionary forces but who are more or less inclined towards the revolution should be won over in large numbers to work for our army. The rest should be released and, if they fight us and are captured again, should again be set free. We should not insult them, take away their personal effects or try to exact recant taxation from them, but without exception should treat them sincerely and kindly. This should be our policy, however reactionary they may be. It is a very effective way of isolating the camp of reaction.

A missionary respected for his expert knowledge of China and the West, Matteo Ricci was the first Jesuit to live in Beijing. His deep understanding and tolerance for Chinese beliefs aided his missionary work and allowed for a greater acceptance of Catholicism among his converts.

Matteo Ricci (Li Madou) was the first Jesuit to reside in Beijing. Among his converts were noted Chinese scholars such as Xu Guangqi. Using Allessandro Valignano’s (1539–1606) accommodation method, which demanded missionaries to show respect of local cultures, Ricci paved the way for generations of Jesuit scholar-missionaries, with their technical expertise in mathematics and astronomy, to serve the Ming dynasty (1368–1644) and Qing dynasty (1644–1912) governments. To this day Ricci’s name stands for a cross-cultural dialogue based on mutual understanding and respect in both China and the West.

Born in Mazzerata, Italy, in 1552, Ricci joined the Jesuit order in 1571. At the Collegio Romano he received an education in theology, the sciences, and the humanities representative of the broad interests of the Renaissance period. Among his teachers and subsequent friends was the mathematician Christopher Clavius, designer of the Gregorian calendar. Clavius’s course in mathematics included its practical application in astronomy and timekeeping, geography and surveying, optics and music—skills that greatly enhanced Ricci’s reputation in China.

After years as a missionary apprentice in Portuguese-controlled Goa, Ricci was selected by Valignano to join Michele Ruggieri (1543–1607) in the conversion of China through the accommodation method. Ricci first entered China in 1583. He was allowed to reside in Beijing in 1601, where he died. Ricci’s tomb can still be found in Beijing today (12 Maweigou Road, Fuchengmen district).

Ricci reached Beijing as an expert in both Chinese and Western knowledge (xixue). In dress and lifestyle, in all but his celibate state, Ricci had followed the model of a Chinese scholar and gentleman since 1594. He had also memorized the Confucian canon and had demonstrated a deep understanding of Chinese literary style and argument in his publications Tianzhushiyi (The True Meaning of the Lord of Heaven) and Jiayoulu (Treatise on Friendship, 1596). He had created the first world map (mappomondo in Italian, kunyu wanguo quantu in Chinese) with China at its center, which had been widely copied and distributed. He had also translated the Greek geometer Euclid into Chinese and introduced his teacher Clavius as the Renaissance Euclid. He impressed his friends with inventions such as the astrolabe (an instrument used to observe and calculate the position of celestial bodies before the invention of the sextant). A gift of two clocks that struck on the hour, a painting that used the technique of perspective (unused by Chinese artists at the time), and a musical instrument called a spinet gained him access to the emperor and the palace. Through his openness, wisdom, and integrity Ricci won the trust of educated Chinese at a time when the weakened state of the Ming government, paired with foreign military encroachment, strengthened
xenophobic tendencies. Most of his friends and converts among the literati had ties to the tonglin group striving for government reforms.

Ricci’s contributions to Catholic missions in China are manifold. Limiting his association with Portuguese and Spanish colonial settlements while in China allowed him to present his missionary work in the light of cultural exchange rather than as part of colonial conquest. Ricci presented Catholicism and Western learning, particularly mathematics and astronomy, as an organic whole capable of supplanting Chinese accomplishments in philosophy and science. He was also committed to the basic tenet of the accommodation method: that missionary work needed to understand and respect Chinese culture. Careful interpretation of Chinese texts allowed him to claim an early Chinese monotheism. He thus presented Catholic
Christianity as both a continuation and a restoration of Chinese traditional thought and offered a way to integrate Chinese Confucian learning into Catholicism. He was, however, highly critical of contemporary neo-Confucian thought and Chinese Buddhism. Ricci believed in gradual change. Examination of the ritual practices surrounding the commemoration of personal ancestors and of China’s philosopher Confucius convinced Ricci that converts could participate in such ritual practices with slight modifications. Wherever he stayed he won converts from all social classes, starting Catholic congregations in cities such as Zhaoqing, Nanchang, and Nanjing.

Ricci’s claims of an early Chinese monotheism and his tolerance toward Chinese ancestral rites have been disputed to this day and fueled the Rites Controversy. While Ricci and many Jesuits considered the ancestral rites to be civic, representatives of the mendicant orders, Benedictines, and Franciscans saw them as religious and therefore incompatible with Catholic practices. But Ricci’s integrative approach led to the baptism of several important scholar-officials whose patronage allowed Ricci, Chinese Christians from all social classes, and future Catholic missionariness—even those from mendicant orders highly critical of Jesuit missionary techniques—to evangelize and weather the storms of repeated persecutions in relative safety.

RICHARD, Timothy

Li tímótài 李提摩太

1845–1919 Welsh missionary, educator, and reformist

Timothy Richard was a Welsh Baptist missionary who laid the groundwork for the rise of the Chinese Republic through his articles in the newspaper, Wan Guo Gong Bao, in which he detailed methods that would lead to economic, legal, and cultural reform.

Still considered one of the most influential foreigners in China, Reverend Timothy Richard was a missionary, educator, writer, publisher, and reformist. Indeed, his efforts established a viable education system in which Western sciences and the humanities were stressed within the borders of China; and his writings awoke the newer generation to the potentials of a life unbounded by tradition. This new spirit of reform and change enabled the eventual establishment of the Republic of China, with its break from an age-old imperial system of government.

Born in the small village of Ffaldybrennin in South Wales, Richard was not content to follow in the footsteps of his family and take up farming. Working at various jobs, he earned enough money to get an education and to become a teacher. But this did not satisfy him, and he realized that his true calling lay in mission work. At the age of twenty he entered the Haverfordwest Theological College and became a Baptist minister. While there, he decided to become a missionary in China.

In 1870, sponsored by the Baptist Missionary Society, Richard arrived in the coastal town of Yantai, Shandong Province, where he spent five years with other missionaries. He soon came to criticize their methods of preaching in public places and advocated instead the emphasis of education along with the tenets of the Christian faith, for he believed that missionary work needed to go hand-in-hand with education and reform. Before long, he adopted Chinese dress and moved further inland, where he handed out Christian and educational literature that he himself had written and provided whatever medical care he could. This too didn’t yield enough results for Richard; he realized that his efforts were best directed at the men in power—the scholar-officials—the very backbone of imperial China.

When the great famine of 1876 hit northern China (in which some 13 million people died), Richard immersed himself in relief efforts. But all that he did was vitiated by the scholar-officials, who cared more about personal agendas than aiding their own people. Thus Richard realized that China’s greatest need was for Western-style education, as well as Western philosophical principles, which could be used to end human suffering. As a result, he began to advocate sweeping changes at the governmental and institutional levels, by way of his articles in the newspaper Wan Guo Gong Bao, or The Review of the Times, which was published, by another missionary, Young John Alen, from 1868 to 1904, and wherein topics such as the establishment of a just government, the necessity of universal education, and the elimination of feudal practices were discussed. Such a message found an eager audience among the younger generation, which began to follow his views.
Richard’s opinions were not met with universal approval. His fellow missionaries thought his approach untrustworthy. This led to conflict, but Richard held firm to his belief that what China most needed was Western-style education and Western ideas, such as humanism. In 1891 the Baptist Missionary Society appointed him to the Society of the Diffusion of Christian and General Knowledge among the Chinese, which in a few years time became the Christian Literature Society. It was during these latter years that he was able to do the kind of work he had always sought to do in China—spread Western-style education to as broad a segment of the population as possible; he hoped that such an educational program would eventually lead to reform. And perhaps as a result of his efforts, the years that followed brought the Chinese national reform movement of 1897, the Boxer Rebellion (1899–1900), and, finally, the Republican Revolution of 1911; all three forever changed China.

Richard only returned to England in 1915 when his health began to fail him, and he settled in London, where he died in 1919.

When the great famine of 1876 hit northern China (in which some 13 million people died), Richard immersed himself in relief efforts. 

The 1988 television documentary River Elegy criticized Chinese culture and major national symbols, while indirectly attacking Chairman Mao's legacy. Both the film and the book version drew an immense audience and generated significant controversy within and without mainland China.

River Elegy (Heshang)

Heshang is the title of a television documentary in six parts, which was broadcast twice by Chinese Central Television, in June and August of 1988; is also the title of a book based on the series. The character he 河 of the title refers to the Huang (Yellow) River, long regarded as the cradle of Chinese civilization; the character shang 殇 means "to die young" as well as "elegy or threnody." The title, rendered in English as River Elegy, implies a lament for the death of Heshang culture, or Chinese culture. Although aired only twice, Heshang was viewed by hundreds of millions of people in China, while the text was excerpted in newspapers and published in several different editions, with an estimated million copies printed. Because of its controversial attitude toward Chinese tradition and Western culture, Heshang created a shock wave among Chinese intellectuals inside and outside mainland China and gave rise to heated debates. It was praised by Zhao Ziyang, then general secretary of the Communist party, but vigorously opposed by hardliners such as the vice president Wang Zhen.

Historical Context

Heshang represented a collaboration between several young intellectuals led by Su Xiaokang (b. 1949), a veteran writer of the literature of reportage. As intellectuals, they expressed a strong sense of mission and social concern. In the decade from 1978 to 1988, Deng Xiaoping’s policy of “reforming the economy and opening up to the outside” 不改革开放 had gradually given intellectuals greater freedom to express themselves. The increasingly liberal climate gave rise to New Wave Films and New Era Literature. From 1985 to 1987, in particular, intellectuals focused on the themes of cultural reflection 文化反思 and the search for roots 寻根热. They were acutely conscious of China’s past greatness and modern weakness, and sought to find the roots of backwardness in its traditional culture. But by 1988, difficulties in economic reform, including inflation, had generated public uneasiness. It was under these circumstances that Heshang was conceived and produced. Its creators proclaimed that its purpose was to “arouse the whole nation to self-questioning” and to motivate people to ponder China’s old culture and destiny.

While Heshang’s narration often adopts a scholarly tone, the miniseries is better viewed as a work of art, combining literary and cinematic techniques to push the envelope of permissible discourse at the time. Those whom it offended certainly considered it a political commentary, and in the aftermath of the crackdown of 4 June 1989 at Tiananmen Square, it was officially blamed for provoking the student protests.
CRITIQUE OF CULTURAL ICONS

In searching for the sources of China’s weakness, *Heshang*’s creators took an iconoclastic approach, questioning major icons of Chinese national identity such as the Great Wall, the Huang River, and the dragon. The writers’ primary strategy was to place China’s conservative and inward-looking civilization in opposition to the dynamic and expansionist world of Western civilization.

In the twentieth century, as China defended itself from Japan, the Great Wall became a major symbol of China’s nationalism. The national anthem says, “Let’s make our flesh and blood into a new Great Wall,” while the People’s Liberation Army is called a “Great Wall of steel.” *Heshang* points out, however, that throughout China’s history, the Great Wall never stopped “barbarian” invasions, and its maintenance cost untold lives and treasure. The real effect of the wall was to isolate China from the outside and to assist the ruler in consolidating centralized power. *Heshang* condemns the wall as “a gigantic and tragic gravestone,” representing an isolationist psychology and a defensive civilization, unable to take risks or make progress.

While the Huang River basin is revered as the birthplace of Chinese civilization, *Heshang* notes that the river’s heavy load of sediment rapidly raises the river bed, leading to frequent floods. Flood prevention requires an enormous network of dikes and ditches as well as a system of forced peasant labor to keep the dikes in repair. The need for collective labor tied peasants to the soil, creating a mentality of subservience to authority and resistance to change. The river’s heavy load of sediment is compared to the oppressive weight of the Confucian bureaucratic tradition, which in turn led to the periodic rebellions and insurrections that have devastated the Chinese landscape no less thoroughly than the river’s floods.

Chinese culture regards dragons as benevolent guardian deities, as river spirits that shower the thirsty earth with needed rain, just as China’s emperors, in theory, bestow blessings on a grateful people. Emperors were considered incarnate dragons, and a popular song in the 1980s called the Chinese “descendants of the dragon.” *Heshang*’s creators remind their audience that the spirit of the Huang River used to require human sacrifice and that reverence for the charismatic dragon created a tradition of totalitarian rule. An unspoken comparison, made possible by matching scenes with newsreel footage of the

The 1988, six-part television documentary *River Elegy*, hugely popular and controversial, was blatantly critical of traditional Chinese culture (and implicitly of Chairman Mao). The plot centered on the Yangzi River as an analogy of China’s decline from a great civilization to an isolated country teetering on the brink of obsolescence. Here men gather earth to rebuild dykes along the Yangzi River in Sichuan Province. PHOTO BY JOAN LEBOLD COHEN.
Cultural Revolution, suggests that Chairman Mao inherited the role of dragon and dictator.

Yet another Chinese icon is the city of Yan’an in northern Shaanxi province, where Chairman Mao led Communist forces after the Long March. While official history regards Yan’an as Mao’s revolutionary base during the anti-Japanese war, the makers of Heshang show footage of a modern Yan’an that is still poor and backward.

**A THEORY OF CIVILIZATIONS**

*Heshang* boldly proposes that world civilizations can be categorized as either yellow or blue. Yellowness suggests the birthplace of Chinese civilization in the region of loess, or yellowish brown soil, while blueness suggests the open ocean, which Western countries daringly crossed to found empires and to create modern industrial civilization. China is a yellow civilization in that it is agricultural, inward looking, and defensive; Europe and America are blue in that they are industrial, outward looking, and aggressive. Politically, yellow civilizations are despotic and have an ethical creed that forbids opposing views; blue civilizations are marked by the liberation of productive, industrial forces, which in turn require democracy, science, and diversity of opinion as prerequisites. Intellectuals should lead the way in helping China transition to a new blue culture because the only way for China to survive in this competitive world is to bring about modernization and Westernization, according to *Heshang*. The twenty years since the broadcast of *Heshang* have indeed witnessed China’s transformation into a “bluer” civilization, though economic reform has been much more actively promoted than political reform. China is now a major world economic power, one in which the state has given up monopoly control of the economy in favor of markets, created an urban middle class, and pulled large numbers of peasants out of poverty, while also somewhat loosening restrictions on dissent and expanding the freedom of individuals.

**INTERPRETATION**

*Heshang*’s critics accused the authors of the television series of being in favor of “total Westernization,” while its supporters saw the creators as the embodiment of China’s social conscience and the inheritors of the May Fourth Movement of 1919. The TV series and the debate it aroused have been studied by historians of Chinese popular culture as the reflection of an identity crisis in contemporary Chinese society.

Romance of Three Kingdoms is one of the four classic fictions and the first chaptered novel of ancient China. Based on the efforts of historians, storytellers, and dramatists, it gives a vivid account of the saga of the rise and fall of the kingdoms of Wei 魏, Shu 蜀, and Wu 吴 between 169 and 280 CE. Its influence on the Chinese psyche and culture is profound and far-reaching.

Sanguo yanyi (Romance of Three Kingdoms), short for Sanguozhi tongsu yanyi (Popularized Romance of the Record of Three Kingdoms), is one of the “Four Classic Novels” of ancient China and the first chaptered novel in its history. Although Luo Guanzhong is credited for writing it between the Yuan (1279–1368) and Ming (1368–1644) dynasties, the novel was also indebted to the efforts that historians, storytellers, and dramatists had made in the previous five centuries. Sanguo zhi (Record of Three Kingdoms) by Chen Shou (233–297 CE) was the first historical record of the Three Kingdoms (220–265 CE). Shishuo xinyu (New Stories of the Past) by Pei Songzhi (372–451 CE) added more tales and legends about them. By the tenth century biased or fabricated tales about the protagonists proliferated, as in the popular Sanguo stories, which made Liu Bei the legitimate descendant of Han royalty. During the Yuan dynasty, more than forty zaju dramas depicted additional famous characters and scenarios that would eventually appear in Romance of Three Kingdoms, and later scripts for storytelling suggested a rough outline of the ultimate novel.

Romance of Three Kingdoms is a saga of the rise and fall of the kingdoms of Wei, Shu, and Wu between 169 and 280 CE. The first thirty-three chapters recount the contention for supremacy among multiple strongmen, resulting in the rise of Liu Bei of Shu, Cao Cao of Wei, and Sun Quan of Wu. Chapters 34–50 depict the decisive Battle of Chibi (Red Cliffs) leading to the sharing of power among the Three Kingdoms. Chapters 51–115 are devoted to Liu Bei and, after his death, his chancellor Zhuge Liang and his military exploits. Chapters 116–120 tell of the Sima family usurping the throne of Wei and establishing the state of Jin after conquering Shu and Wu.

The twenty-four-volume Sanguozhi tongsu yanyi, block-printed in 1522, is the closest text to the lost original. Different editions with varied volumes, chapters, and versions appeared later. The 120-volume Romance of Three Kingdoms, edited by Mao Lun and Mao Zonggang between 1654 and 1722, proves to be the most popular among readers. The framework is largely true to history although the details are products of imaginative re-creation.

Romance of Three Kingdoms represents the highest attainment in the romance genre of Chinese literary history. It manages to weave a century’s schemes and wars into an orderly, relevant, and interrelated whole. It depicts one battle after another with a well-measured flowing rhythm, analyzing the strategies used in them in great detail. Characters such as Liu Bei, Cao Cao, Zhuge
Liang, Guan Yu, and Zhang Fei are so vividly portrayed that they are deeply rooted in the Chinese spirit. Some have become deities worshiped by the millions. The code of conduct promoted in the novel still guides today’s behavior in many aspects. Zhuge Liang, who is known “to spare no effort in the performance of one’s duty,” served as a role model for China’s premierses Zhou Enlai and Wen Jiabao. A part of the Chinese lexicon is also owed to the novel.

*Romance of Three Kingdoms* continues to inspire tremendous artistic and literary creativity. The novel has been rendered in various contemporary media, including television series, movies, and arcade and computer games. An eighty-four-episode television serial aired in China in 1991, for instance, while a forty-seven-episode cartoon serial ran on TV Tokyo simultaneously. The game series *Dynasty Warriors*, which is based on characters in the novel, is available for most video game consoles.

Ruan Lingyu was a famous actress of the silent screen during the “golden age of Chinese cinema.” She appeared in twenty-nine films before committing suicide at age twenty-four.

One of the most famous actresses of the silent screen, Ruan Lingyu was wildly popular in China during her lifetime, and posthumously became well-known throughout the rest of the world. She appeared in twenty-nine films in Shanghai during the 1920s and 1930s, the “golden age of Chinese cinema.” Historian Frederick Wakeman Jr. has written about how films and their stars affected audiences during that period: “It is difficult to exaggerate the centrality of cinema to Shanghai’s mass culture. Movie actors and actresses were national celebrities and popular idols” (Wakeman 1995, 11). Ruan Lingyu was a goddess among deities in these entertainment circles after her rise to stardom from humble origins.

After her working-class father’s death when Ruan Lingyu was six years old, her mother worked as a maid-servant in a wealthy Shanghai household to support her family. At sixteen Ruan Lingyu started to earn her own income as an actress for Ming Xing Film Company. Her first film with the studio was released in 1927, after which she made four more films with that studio. Then she made six films with Da Zhonghua-Baihe Film Company before she changed studios again in order to headline films for Luo Mingyou and his Lianhua Film Company. Ruan Lingyu starred in her most impressive and influential films at Lianhua, including Spring Dream in the Old Capital (Gudu Chunmeng, directed by Sun Yu, 1930), Three Modern Women (Sāngē Mode Ng N✉xīng, directed by Bu Wancang, 1933), Small Toys (Xiaoy Wanyi, directed by Sun Yu, 1933), and The Goddess (Shennu, directed by Wu Yonggang, 1934).

Ruan Lingyu’s films ranged from costume dramas to contemporary melodramas, and many of her films dealt with political issues of the day. For example, in New Woman (Xin nùxing, directed by Cai Chusheng, 1934) massive navy destroyers filmed in the harbor at Shanghai bring an immediate association with the theme of anti-imperialism. But Ruan Lingyu’s emotional performances are often thought to stand out the most. In New Woman Ruan’s character pleads, “I want to live!” as doctors try to revive her after a suicide attempt. In Small Toys Ruan plays a village woman named Ye who loses her home to warlords in the early 1920s and her daughter (played by Li Lili) to the Japanese during the 28 January 1931 Incident. At the end of the film, with no living immediate family members, the long-suffering and partially insane Ye addresses the camera/audience directly, screaming: “Resist!” And in The Goddess, in which Ruan is a single mother who turns to prostitution in order to raise her son, each scene emotes an intense pathos from an actress at the height of her prowess.

On a night in 1935 Ruan Lingyu attended a party with her employers and colleagues from Lianhua Film Company. During this gathering, immortalized in Hong Kong
director Stanley Kwan’s postmodern biopic Centre Stage (1992), staring Maggie Cheung as Ruan Lingyu, the actress had more on her mind than the evening’s festivities. After enduring financial struggle, a love life publicized by the intruding eye of the tabloid press, and—where speculation regarding motive has yet to cease—a career spent portraying forlorn characters, the twenty-four-year-old actress committed suicide.

Ruan Lingyu (1910–1935) performed in twenty-nine films in Shanghai during the “golden age of Chinese cinema.” She was one of the most famous actresses in the history of the silent screen, but the news of her suicide at age twenty-four brought to the spotlight enduring financial struggles and a love life publicized by the intruding eye of the tabloid press.
Plagued by unstable markets, incompetent government, and local welfare, China’s Rural Reconstruction Movement developed in the 1920s and 1930s as a collation of projects committed to non-revolutionary reform of village life. Although they did not succeed in their immediate purpose of saving the Chinese countryside, they helped to shape the perception that rural China was in crisis.

The Rural Reconstruction Movement 乡村建设运动 (xiāngcūn jiànshè yùndòng) of the 1920s and 1930s was a loose coalition of several hundred independent projects, government experimental districts, missionary projects, and schools. The best known projects were at Ding Xian, Hebei Province, under the leadership of Y. C. James Yen (Yan Yangchu), and at Zoup ing, Shandong Province, under the leadership of Liang Shuming. These diverse groups shared a commitment to reforming village life by nonrevolutionary means but to be independent of the Nationalist government. They did not succeed in their immediate purpose, but they shaped the perception that rural China was in crisis and that any government of China should be judged by its ability to deal with that crisis.

The rural economy in imperial times was considered the responsibility of the emperor and his officials; the weakening of central governance in the early twentieth century left the countryside on its own. In the late nineteenth and early twentieth centuries the village economy in coastal commercial China actually improved, but the 1920s and early 1930s brought unstable world markets, incompetent government support, local warfare, disruption of access to markets, deterioration of the land, drought, and little access to credit. In addition, the gap between urban intellectuals and the countryside widened. The imperial Confucian cultural world had not been divided into “city” and “country,” per se, but with the opening of China to the world and the new prestige of foreign schooling, many educated youth lost touch with the village. New Culture intellectuals of the 1910s held rural values to be responsible for China’s weakness. Li Dazhao, for instance, wrote in 1919: “The blackness of the Chinese village has reached its nadir, and the common people are all blind to their situation, not knowing how to protect themselves or band together for mutual aid . . . From morn ’til eve they work in the fields like horses and oxen” (“Youth and the Village,” Chen Bao 1919). In 1923 radical Nationalist and Communist activists organized the Peasant Training Institute in Guangdong. These activists, including future Chinese Communist Party leader Mao Zedong, saw China’s rural problem as “feudalism” and destruction of the landlord class as the answer.

Emergence of Rural Reconstruction

In response to the rural challenge and the radical revolutionary program, a number of intellectuals of liberal and conservative persuasions in the New Culture generation...
made their own “discovery” of the countryside. They saw the problem not as class exploitation but rather as social disorganization and lack of support. The answer was neither to return to the past nor to import Western scientific techniques, which were expensive and not fitted to China, but rather to go to the countryside and create a basis for China’s own modernity.

In 1923 Y. C. James Yen and Tao Xingzhi founded the National Association of Mass Education Movements (MEM) to organize and coordinate urban literacy campaigns but quickly decided to start programs in the countryside where the vast majority of the Chinese people lived. Tao founded a teachers’ training school in Xiaozhuang, a village outside Nanking (now called Nanjing), which combined training and activism, but it was closed down, probably for political reasons, in 1927. In 1926 the MEM started a pilot program of “People’s Schools” (minjian xuexiao) in Ding County, Hebei Province. These schools, unlike expensive government schools, met at times convenient for the students, in rent-free places such as temples or homes, and used local volunteer teachers. They were cheap, indigenous, and effective. However, one graduate complained, “Dr. Yen, my stomach is just as empty as my illiterate neighbor’s” (Hayford 1990, pp. 53–59). Yen responded by recruiting a team of experts, many of them with foreign graduate degrees, to live in the villages and make a “laboratory county” to develop scientific techniques that suited poor, agrarian China.

The Ding Xian Experiment, as Yen called it, produced the integrated Fourfold Reconstruction Program to attack the “four weaknesses” of village life—poverty, disease, ignorance, and misgovernment. The U.S. journalist Edgar Snow visited in 1933 and proclaimed that “rural China is being remade.” The program coordinated culture, economics, health, and political divisions. The People’s Schools remained the entry point. Graduates became “little teachers” to spread literacy and create an organizational network. Demonstration farmers tested new techniques, seed, and breeds of pigs, which led to economic buying cooperatives and eventually to cooperative marketing of cotton. Village health workers, trained to form the base of a public health pyramid, kept records, spread public health knowledge, gave vaccinations and other simple medical care, but referred harder tasks to trained nurses in the market towns or to the hospital in the county seat. The MEM also developed a village theater and local publications. In 1932, after the global depression devastated the rural economy, the national government created an institute run by Yen and his colleagues to take control of the county government, collect taxes, and plan for political reform.

A woman separates wheat from chaff in the Lanzhou, Gansu Province. Over 60 per cent of China’s population still lives in rural areas. Because the media so often focuses on “China’s economic miracle” and its booming urban population, many Westerners are unaware that China’s vast hinterland is in a dangerous state of crisis. PHOTO BY JOAN LEBOLD COHEN.
Zouping (Shandong)

In 1926 Liang Shuming, a Confucian scholar who drew from the past but did not want to return to it, was frightened and inspired by the radical peasant movement in Guangdong. Partly borrowing from the Ding Xian Experiment, partly drawing on the precedent of the shuyuan (the traditional Confucian academy), he obtained the political backing of the Shandong provincial government to set up a rural reconstruction program in Zouping. Confucian moral education and group organization were emphasized over technical development, leading some to distinguish “scientific Ding Xian” from “philosophical Zouping.”

By the early 1930s the experiments in Ding Xian and Zouping caught the imagination of the public and the eye of the Nanking government. Almost every provincial government sponsored rural training programs and experimental districts, and colleges sponsored local projects. Liang Shuming and Y. C. James Yen organized the Rural Reconstruction Movement, which held national meetings in 1934 and 1935. The Rockefeller Foundation sponsored the North China Council on Rural Reconstruction to coordinate university, government, and private groups. On the eve of the War of Resistance against Japan the national media reflected a new rural consciousness; the village was the foundation of the nation, China’s path to a unique modernity, and the basis for national defense.

After 1937

The war destroyed the local rural reconstruction projects, and national priorities shifted to military control and political competition. The wartime Rural Reconstruction Party did not achieve major influence. In 1948 Y. C. James Yen obtained funding from the U.S. Congress for the Sino-American Joint Commission on Rural Reconstruction (JCRR). The JCRR carried out land reform and development projects on the mainland, but only after moving to Taiwan in 1949 did it achieve major results. In the late 1980s and 1990s the New Rural Reconstruction Movement, based in Beijing, explicitly modeled itself on the earlier one.

Russia-China Relations

É luó sī he Zhōng guó de wàijiāo guān xì

俄罗斯和中国的外交关系

China and Russia have a long history of political and ideological differences. Territorial disputes, especially concerning the Far Eastern frontier, also have strained relations. China’s economic growth and Russia’s economic decline have shifted the balance of power between the two countries.

Differences deeply embedded in a long history of conflict and territorial disputes complicated China-Russian relations long before Communist regimes came to power in either China or Russia. Political and ideological differences exacerbated this relationship during the Soviet era. Russian Cossacks pushed into Siberia in the seventeenth century as hunters and trappers. In the later 1600s these settlers moved into the Amur River basin to establish agricultural settlements. This expansion of czarist Russia into regions claimed by China’s Qing dynasty (1644–1912) eventually resulted in confrontation along the Far Eastern frontier. The two powers concluded the Treaty of Nerchinsk in August 1689, delimiting the Far Eastern sector of the China-Russia boundary in an effort to avoid further conflict. The 1727 Treaty of Burinsk delimited the middle sector (roughly the current Mongolian-Russian boundary).

During China’s decline in the nineteenth century, Russia continued to advance into the Far East. Concluded in 1858, the Treaty of Aigun redrew the boundary between the two countries along the Amur and Ussuri rivers, but left territory east of the rivers in “joint possession” for future negotiations to settle. Two years later Russia prevailed on China to negotiate the Treaty of Peking (Beijing). This treaty granted the territory between the Amur and Ussuri rivers and the Sea of Japan to Russia.

Russia also advanced into Central Asia, where China claimed control over the area that is today China’s autonomous region of Xinjiang. The 1864 Chuguchak Protocol and the 1881 Treaty of Saint Petersburg (Treaty of Ili) defined generally the boundary between Russian Central Asia and Chinese Central Asia. Following the 1881 treaty, many boundary commissions worked to demarcate precisely the China-Russia boundary in Central Asia. This work was completed, except for one sector in the Pamir Mountains that was delineated by the 1884 Protocol on the Sino-Russian Boundary in Kashgaria (modern Chinese Turkestan, in Xinjiang) but was never demarcated. Russian troops occupied the area in the early 1890s, and the Qing court protested by sending Russia a note stating that it retained its claim to the region even if it did not maintain a garrison there.

Following the Japanese defeat of China in the First Sino-Japanese War of 1894–1895, Russia prevailed on a weakened China to grant it the right to build a railroad across Manchuria to Vladivostok, with a southern spur running southwest through Manchuria to the Chinese port city of Lushun (Port Arthur), which eventually became Russia’s principal naval base in East Asia. Just days before the fall of the Qing dynasty, Russia compelled China to sign the 1911 Qiqihar Treaty, which ceded to Russia several hundred square kilometers near the eastern trijunction of Russia, Mongolia, and China.

© 2009 by Berkshire Publishing Group LLC
legacy of Russian encroachment into regions that the Chinese consider their territory continued to plague China-Russia/Soviet relations until the final decade of the twentieth century.

The Sino-Soviet Alliance of the 1950s

Following the establishment of the People’s Republic of China in 1949, China and Russia signed a treaty of friendship and alliance. For the next decade, China followed the Soviet development model, adopting a centrally planned economy with state-owned factories emphasizing heavy industry. Thousands of Russian advisers went to China to train Chinese technicians, and Chinese students were sent to the Soviet Union to study. With time, however, China’s growing resentment of Soviet domination, ideological differences between the two countries, and boundary disputes left over from the past sowed the seeds of conflict that led to the Sino-Soviet split in 1960, and eventually a border war in 1969.

Territorial Issues in China-Soviet Relations

Following the 1917 October Revolution, the new Soviet government issued the Karakhan Manifestos of 1919 and 1920, which renounced all the treaties concluded by the
czarist government with China. However, new boundary treaties were not a high priority in subsequent negotiations, which dealt with the issues of Outer Mongolia and the Chinese Eastern Railway controlled by Russia.

Mao Zedong raised territorial issues in early 1950, while he was in Moscow negotiating the Sino-Soviet alliance. The two nations discussed the status of the Mongolian People’s Republic (MPR) during this first Sino-Soviet summit. Mao stated his desire for the eventual reunion of Mongolia with China and raised the boundary issues as well. The Soviet Union was apprehensive about China’s ambitions in Mongolia and Stalin insisted on a Chinese declaration acknowledging the MPR’s independence. Several times during the next ten years China raised the boundary question with the Soviet Union and in 1960, with the open split in the Sino-Soviet alliance, the boundary dispute became a major source of tension.

As ideological and political tensions escalated between the Soviet Union and China, the Soviets grew concerned that the boundary question had become so salient an issue in Sino-Soviet relations. In May 1963 the Soviet Union proposed holding boundary consultations. At the talks, which began in February 1964, Mao blocked progress toward an agreement when he raised historical issues. He contended that during the czarist period, China had ceded more territory to Russia than to any other imperialist country and that czarist Russia had expanded its borders at the expense of China. Mao stated that the list of “lost” Chinese territory was long and the Chinese had not yet “presented their bill” for it. Russia accused China of betraying socialist internationalism, fostering a Maoist personality cult, and adopting radical Maoism. China accused Russia of Soviet imperialism and abandoning Marxism. After this polemical exchange, the two powers made no progress on boundary questions.

During China’s Cultural Revolution (1966–1976), the boundary dispute flared up again. In March 1969 a military confrontation at Zhenbao (Damansky) Island in the Ussuri River proved that the boundary dispute could easily spark a larger military conflict. In the wake of the March clashes, tensions also rose along the border in Xinjiang, and during the summer of 1969 several other military incidents occurred. Moscow became increasingly alarmed and even contemplated a preemptive strike against China’s nuclear facilities. Both China and the Soviet Union understood the real possibility of escalation and agreed to renew boundary negotiations.

Boundary Settlement

During the 1970s and early 1980s the two countries made no progress toward a boundary settlement. But with the

Shanghai Exhibition Hall (formerly the Palace of Sino-Soviet Friendship). In 1992 President Boris Yeltsin of Russia and President Jiang Zemin of China both began promoting a strategic partnership between China and Russia. This new focus on China-Russia cooperation resulted in several high-level meetings and agreements. The two leaders formally announced the strategic partnership during a summit meeting held in April 1996 in Shanghai. Photo by Joan Lebold Cohen.
rise of Mikhail Gorbachev in the mid-1980s, Chinese-Soviet relations began to improve. A significant breakthrough came when Gorbachev, speaking in July 1986 in Vladivostok, showed a clear willingness to improve China-Soviet relations and publicly stated that Russia was willing to adopt the international standard and draw its eastern boundary with China by using the main channel of the Amur and Ussuri rivers rather than China’s shoreline, as it had previously insisted. This significant leadership change, and Russia’s new position on a boundary settlement, resulted in renewed negotiations.

Coupled with Gorbachev’s Vladivostok initiative was the Soviet Union’s growing willingness to withdraw its military from Afghanistan, which it had invaded in 1979, end its support for Vietnam’s occupation of Cambodia, and dramatically reduce its troop strength along the Chinese-Russia border and in Mongolia. Progress in satisfying these three Chinese preconditions for normalization of relations resulted in the first Sino-Soviet summit in twenty years in May 1989, when Gorbachev and Deng Xiaoping met in Beijing, formally ending the thirty-year-old Sino-Soviet split.

Mutual interest in improving bilateral relations as both Russia and China pursued economic and political reform led to a quick resolution of the boundary dispute. At the outset of new negotiations, both sides agreed to use the old treaties as the basis for determining the border and to delimit the boundary according to internationally accepted principles of international law. In June 1990 China and the Soviet Union agreed to sign a treaty covering areas on which they had reached a compromise. They signed the boundary treaty when Chinese president Jiang Zemin traveled to Moscow in May 1991. The newly established Supreme Soviet of the Russian Federation ratified the accord on 3 February 1992, and the Standing Committee of the Chinese National Peoples Congress ratified it on 25 February. Russia and China concluded a treaty delimiting the short fifty-three-kilometer boundary to the west of Mongolia in September 1994. In April 1999 demarcation of the entire Chinese-Russian boundary was finally completed with the exception of a few islands along the eastern border and a remote mountainous area in Central Asia; the detailed maps and comprehensive documentation weighed more than thirty kilograms.

The areas that remained unsettled were a never-before-demarcated region in the Pamir Mountains of Central Asia and the islands at the confluence of the Amur and Ussuri rivers. Moscow was willing to accept the watershed principle in establishing the boundary in the Pamirs; that is, it was willing to draw the boundary along the highest peaks of the mountains. Nevertheless the issues remained complex, and both sides agreed to postpone a final settlement until after negotiations were completed for the eastern sector of the boundary. However, with the breakup of the Soviet Union in 1990, China was faced with negotiating boundary settlements with the newly independent Central Asian states of Kazakhstan, Kyrgyzstan, and Tajikistan. China negotiated boundary settlements with the three Central Asian states relinquishing approximately seventy percent of the territory Beijing claimed historically belonged to China. Ownership of the controversial islands was eventually resolved and a supplementary boundary treaty was signed in November 2004.

Post–Cold War Relations

With the collapse of the Soviet Union and the end of the Cold War, China-Russia relations entered a new phase. This sudden and fundamental shift in the global balance of power made it imperative for China and Russia to develop closer relations. In the mid-1990s, Chinese and Russian leaders formed a Sino-Russian “strategic partnership” to counterbalance American unilateralism in world affairs. These closer military and strategic relations between China and Russia are due in part to both countries’ intensely nationalistic response to American power in the post–Cold War world. China and Russia, both undergoing a difficult transition from Communism to a market economy, have bruised national identities that make them natural allies against America’s global cultural, economic, and military influence.

In 1992 President Boris Yeltsin of Russia and President Jiang Zemin of China both began promoting a strategic partnership between China and Russia. This new focus on China-Russia cooperation resulted in several high-level meetings and agreements. The two leaders formally announced the strategic partnership during a summit meeting held in April 1996 in Shanghai. The two countries now have a thriving military relationship, with Russia’s cash-strapped military industries supplying China’s
The present China-Russia strategic partnership is unlike the Sino-Soviet alliance of the 1950s. China and Russia do not have a formal military alliance. Nevertheless they cooperate closely to improve military-to-military relations and to develop confidence-building measures. Closer relations have reduced tensions along the border, as well as over nuclear weapons, and made both countries more secure in the face of the threat they perceive from the United States.

Economic relations have improved more slowly than the military relationship. Trade over the past several years has grown reaching $48.16 billion in 2007, a 44.3 percent year-on-year increase, and they have a goal of increasing bilateral trade to between $60 billion and $80 billion by 2010. A robust border trade has developed over the past decade, and several border towns have become “open cities” to facilitate this dynamic local trade. The slow development of economic and trade relations was due largely to the problems Russia was experiencing with the transition from a centrally planned command economy to a market economy.

The greatest potential for cooperation is in the developing energy sector. China’s rapid economic development during the past several decades has increased its demand for imported oil and gas. Estimates are that China will import 1.3 million barrels of oil a day by 2010. In October
2008 China and Russia reached agreement to construct a pipeline connecting Russia’s oilfields to China. The Russian Far East has vast undeveloped oil and gas fields. However, Russians living in the Russian Far East are reluctant to develop closer relations with China because of their apprehension about the socioeconomic consequences of a stronger Chinese presence in the region. This apprehension is rooted in the deep historical differences and the history of conflict along the long mutual boundary. The demographic imbalance in the Far Eastern regions of Russia and northeastern China is also a point of concern. The Russian Far East has a population of roughly 8 million, while northeastern China has a population of approximately 100 million; the Russians fear Chinese immigration will cause them to become a minority in their own country. Regional leaders in the Russian Far East have been more skeptical than leaders in Moscow about developing closer economic relations with China. They would rather develop closer relations with Japan, South Korea, and the United States.

**Future Concerns**

Although in the post–Cold War world China and Russia share common strategic concerns and some complementary economic interests, they will not easily overcome the deeply rooted historical and geopolitical legacy of conflict. Many inherent tensions are simply due to the fact that China and Russia share a long border. More fundamental causes of friction are the result of China’s dynamic economic growth and Russia’s economic decline, resulting in a shift in the balance of power between the two countries over the long term. Russian anxiety, especially in the Russian Far East, over what is perceived as a demographic time bomb just across the border in northeastern China will stymie closer economic cooperation and integration for the foreseeable future. Nonetheless, if China and Russia effectively manage the inherent tensions in their bilateral relations, closer military and economic cooperation is possible. One factor that will determine the closeness of Russia-China relations is the relationship between the United States and China and between the United States and Russia. Certainly for economic reasons, both countries would value a better relationship with the United States more than a closer relationship with each other. But concern over American “hegemony” or unilateralism could cause a closer China-Russia strategic relationship that may form the cornerstone of an anti-American coalition seeking to undermine U.S. influence in important regions of the world, including the Middle East and Northeast Asia.

Sanxingdui

Sanxingdui 三星堆

The Sanxingdui site is one of the most important bronze-age sites in the Chengdu Plain of Sichuan Province. Archaeological discoveries at the site, for which the Sanxingdui culture is named, include remnants of city walls and two sacrificial pits. The pits have yielded thousands of bronze and jade objects, which have provided evidence for reconstructing bronze culture in the Chengdu Plain.

Sanxingdui, the most important archeological site and center of the Sanxingdui culture (c. 2800 – c. 1000 BCE), is located 40 kilometers north of Chengdu, the capital of Sichuan Province. The site covers an area of about 12 square kilometers and includes more than thirty locations. It was known to the public as early as 1929, when a local farmer dug up more than four hundred objects made of jade and hard stone and sold them on the antique market.

The Museum of the China Western University (Museum of the Sichuan University today) conducted a brief excavation of the site in the 1930s. Archaeological surveys and small-scale excavations were carried out from the 1950s to the 1970s. Large-scale excavations from 1980 to 1994 revealed remnants of city walls covering an area of 2.6 square kilometers. The walls were constructed by the pounded-earth technique in the first half of the second millennium BCE, contemporary with or even earlier than the early Shang dynasty (1766–1045 BCE) city at Zhengzhou in the Central Plain. The walls at Sanxingdui meander in three directions except in the north, where the Yazi River runs through, and were protected by trenches. The trenches were connected to the Mamu and Yazi rivers, creating a solid defense for the city. In addition, archaeologists have found a pottery kiln and over fifty building foundations inside the city and a group of twenty-eight graves outside the city.

The most exciting discoveries at Sanxingdui are two large sacrificial pits 300 to 400 meters north of the southern city wall. The pits, accidentally discovered by local brick factory workers in 1986, have since yielded thousands of bronze and jade objects. These objects, with distinct and astonishing styles, have drawn great attention around the world to this mysterious ancient culture. They are the primary material evidence used in reconstructing the Sanxingdui bronze culture in the Chengdu Plain.

Pit 1 is 4.5 to 4.64 meters by 3.3 to 3.98 meters at the top and 4.01 by 2.8 meters at the bottom. It is dated to a period contemporary with late Yinxu Phases I and II of the Shang dynasty. Objects excavated from the pit include 420 artifacts made of bronze, gold, jade, and hard stone, pottery, and amber; fragments of 10 bone objects, 13 ivory tusks, and 62 seashells. About 3 cubic meters of burned bones were also found in the pit. Pit 2 is 5.3 by 2.2 to 2.3 meters at the top, 5 by 2 meters at the bottom, and 1.4 to 1.68 meters in depth. It is dated to the period from late Yinxu Phase II to Yinxu Phase IV. It yielded 1,300 objects laid in three layers, including 735 bronzes, 486 pieces of jade, 61 pieces of gold, 15 stone objects, 3 pieces of turquoise, 67 elephant tusks, 4 fragments of ivory objects,
120 ivory beads, 2 tiger teeth, and 4,600 seashells. Many of the objects were burned and destroyed before being dumped into the pits, suggesting the practice of rituals at the site.

**Mask Mystery**

The most fabulous findings from the pits are two large bronze standing figures; forty-four bronze heads, some of which are covered with gold foil; and twenty-three anthropomorphic masks and nine animal masks executed in sculptural form. These artistic representations have no parallel among the bronze productions at the Shang center at Anyang. One of the two standing figures from the pit was reconstructed. It is thought to represent a wu shaman, a shaman king, or a shaman leader. Interpretations of the bronze heads and anthropomorphic masks are even more diverse. They are identified as ancestors, wu shamans, gods, and other deities. All the bronze heads lack torsos, implying they may have been dressed or attached to other objects originally. The animal masks might represent the ancestors of the later Shu people. In addition to these impressive figurative representations, six large bronze trees, bronze architecture elements, and numerous small bronze pendants in various shapes such as birds and flowers further indicate a complex system of ritual ceremony with a spectacular display of social wealth.

The majority of the bronzes and jades from both pits exhibit distinct local styles. A small number of bronze vessels, including fourteen zun and six lei wine containers similar to the Shang style, have been found, suggesting that cultural interactions took place between the Sanxingdui and the Shang. Nevertheless, Sanxingdui culture clearly had its own cultural and ritual traditions that were distinct from those of the Shang.

The material remains from the two sacrificial pits suggest that the Sanxingdui culture must have possessed sophisticated jade-making and bronze-casting technology. A centralized, complex political organization must have existed to support the workshops and organize large-scale productions. Religion and ritual practices seem to have played a significant role in the society. At its peak the Sanxingdui culture had expanded beyond its homeland on the Chengdu Plain to surrounding areas such as southern Shaanxi Province, the upper Han River valley, and western Hubei, where objects of typical Sanxingdui styles have been discovered.
Beginning and End Debated

The predecessor of the Sanxingdui culture is still a matter of debate. Some scholars trace the culture’s roots to local Baodun culture during the Neolithic period (8000–5500 BCE), while others argue that it developed from the culture that migrated into the Chengdu Plain. The fate of the Sanxingdui culture is as puzzling as its origin. It is not clear whether the Sanxingdui culture suddenly collapsed, moved out of the area, or transformed into a society of different social and political organization. Discoveries of more than five thousand gold items, objects made of jade and hard stones and bronzes, and ivory tusks and pottery at the Jinsha site in the western suburb of Chengdu since 2001 could provide clues to this puzzle.

明枪易躲，暗箭难防

Míng qiāng yì duǒ，àn jiàn nán fáng
Severe Acute Respiratory Syndrome, or SARS, is a virus which caused a pandemic when it struck eastern Asia in 2002 and 2003, with large rates of infection recorded in the cities of Hong Kong and Guangzhou, the island of Taiwan, and other southeast Asian areas. The initial outbreak’s media coverage was not accurately reported to international authorities, the exposure of which prompted reform in international disease monitoring.

Severe Acute Respiratory Syndrome, or SARS, is caused by the SARS coronavirus, also known as SARS-CoV, which infects and replicates within the bloodstream. Symptoms of the virus include respiratory difficulties, fever, throat and mouth inflammation, occasionally myalgia (muscle pain), and lethargy. Most fatalities associated with the SARS outbreak were due to pneumonia and were largely confined to the very young and the elderly. The World Health Organization (WHO) estimated the final mortality rate at 9.6 percent.

Diagnosis in the early days of the outbreak was usually either the common cold or influenza, but increasing numbers of patients with similar symptoms and a history of contact with one another helped distinguish SARS as a new disease. The first WHO report identifying SARS by name was in March 2003, four months after the first case. The source of SARS was originally thought to have been from masked palm civets, which are common in south and Southeast Asia, after SARS was found in the blood of civets found for sale in a Guangzhou market. As a consequence, thousands of civets were killed to prevent new outbreaks of the disease. In 2008, genetic studies at the State University of Ohio traced SARS back to several species of bats living in the area, but the connection between the bats and humans is not known.

Outbreak and Containment

The first case of SARS has been tracked back to the city of Guangzhou (Canton), in southern China, to a rural farm worker who became ill in November 2002. The disease began to spread in rural areas either from person-to-person contact, or from the original source. This outbreak was reported by the Chinese government as an outbreak of influenza to the WHO in the early days of February 2003. On 21 February, an unnamed doctor, who had been treating patients in the countryside, visited Hong Kong, where he transmitted the virus to other guests at his hotel; once his own symptoms manifested and he was hospitalized, the hospital staff were infected as well. It is estimated that between 70 percent and 85 percent of all SARS cases can be traced back to this one doctor. Outbreaks in Singapore, Thailand, and Taiwan, and Vietnam were reported in March, and the first non-Asian case of the disease emerged in Canada. The forty-five days from the middle of March to the end of April were the most active times of the epidemic in the south of China, as schools, public buildings, and residential areas were all shut down. By the end of April, the virus had been
identified, and the quarantine was lifted in Vietnam. The United States withdrew its diplomatic staff from Guangzhou and Hong Kong facilities, but they quickly returned, when the WHO lifted its warning level due to a lack of new infections in April.

SARS didn’t arrive in northern China until early April 2003, which is remembered as a particularly disruptive time in Beijing. International media sources focused on images of Beijing’s efforts to control the outbreak, as the Peking University campus was shut down and residential area were sealed off. Many public areas, including subways and restaurants, were uncharacteristically empty.

Containment of the outbreak was accomplished primarily through public space restrictions and awareness...
campaigns. During the event, large public announcements warned against risk and encouraged sanitary behavior. Quarantines were enforced in large parts of several cities, and hospitals were given increased support from central authorities. By the end of April 2004, these measures were effective, and the rate of new cases of the disease reported fell.

Aftermath

SARS was the first international epidemic of the twenty-first century. It tested the international community’s ability to share information and to develop solutions for disease control in a time when ease of travel can quickly result in the spread of disease far from its initial occurrence. In the first months of the outbreak, the central Chinese government restricted information about the epidemic. Once the emergence of the disease became public knowledge, the central authorities increased media coverage, until by March and April, coverage of the outbreak was front-page news almost every day. Major international media attention to the outbreak was not given until a Westerner, James Earl Salisbury, died in the first week of April, having been sick for a month. There was a relatively intensive personnel shakeup as well, with the replacement of the mayor of Beijing and reorganization of the Ministry of Health.

After coverage of the spread of SARS began to spread to international media outlets, rapid international quarantine efforts began, and systems to prevent the spread of the virus were implemented. These were primarily through travel restrictions, warnings, sanitary efforts, and screenings at major travel hubs for persons with greater than average body temperatures. These screening stations are still in place today. Overall, the WHO reported 8,096 cases of SARS and 774 deaths.

The socioeconomic impact of SARS is debated. In all of the major cities affected, conferences and events were cancelled. In the United States and other western countries, business in Chinese restaurants declined during and in the months after SARS. The impact was still felt several years after, despite the fact that all major Chinatowns in North America did not report any cases of SARS. In Toronto, the hardest hit non-Asian city, a WHO travel warning led to a major decline in tourism, which recovered after celebrity concerts and other efforts by the Canadian government. After the two-to-three month period in 2003 when the SARS epidemic was at its height, the only cases have been at virology institutes in isolated contamination incidents in April and May 2004.

Less well-known than his contemporary Marco Polo, Rabban Sauma was a Christian Uygur monk who traveled in the opposite direction as Polo, from China to western Europe. In France he presented to the king a proposal by the Mongol governor of Baghdad to form a Mongol-Christian alliance to recover Jerusalem from the Muslims. The alliance never materialized.

Rabban Sauma, a Christian Uygur monk, and his young colleague Rabban Markos traveled from Beijing to western Europe in the mid-thirteenth century. Christian missionaries from the Nestorian, or Syrian, branch of the Church had reached China in the seventh century and had created a small but learned Christian community during the Tang dynasty (618–907 CE). When the Mongols under Chinggis (sometimes spelled Genghis) Khan conquered China in the thirteenth century, they found the Nestorians to be useful ambassadors, counselors, doctors, and merchants. Mongol leader Khubilai Khan (grandson of Chinggis Khan) embraced all religions equally, but he found it helpful to set Christian and Muslim advisors against the predominant Confucians and Buddhists in China. When Rabban Sauma and Rabban Markos proposed a journey to Europe, Khubilai Khan gave them a travel permit guaranteeing safe passage through his vast empire.

Crossing central Eurasia was a dangerous mission, but Sauma and Markos took shelter in a Nestorian community in Khorasan (in Persia), then passed through Azerbaijan and reached Baghdad, the seat of the patriarch of the Nestorian Church. They toured famous churches and monasteries as they moved on to Jerusalem. Because they knew the Chinese, Mongol, and Persian languages, they had excellent qualifications not only for religious service but also for diplomatic service. In 1280 the patriarch appointed Markos head of the Nestorian Church of China. The Mongol governor, or ilkhan, of Baghdad had grander plans for Sauma. The governor’s greatest enemies were the Muslims who held Jerusalem, Egypt, and Syria, and he knew that the western European crusader kings likewise considered the Muslims enemies and shared his goals of conquering them. In 1287 he sent Rabban Sauma to contact King Louis IX of France (who, however, had died in 1270) and ask the king to consider a Mongol-Christian alliance to recover Jerusalem. The governor gave Rabban Sauma official orders, money, animals, and travel passes and sent him with gifts for the king of the Franks, the king of the Greeks, and the pope. Rabban passed through the Byzantine empire to Constantinople (modern Istanbul), met the king of Byzantium, and toured the great churches of the city. He went on to Rome, where he passed on his letters to the pope and the king of the Franks. He astounded the cardinals of Rome with the news that Christian communities had spread all across eastern Eurasia as far as China and told them that many Mongols had been baptized Christians. After touring Italy’s famous churches, Rabban Sauma moved on to Paris, where he
met the French king Philippe IV, and, according to his account, he then met the king of England, Edward I, in Bordeaux.

Ultimately the grand alliance of the Mongols and Christians against Islam never formed because the Christian powers distrusted each other too much, and the Mongols had other wars to fight. Rabban Sauma’s mission presented a surprising opportunity that could have changed the course of history. Christians in western Europe had heard mythical tales of a Christian kingdom of Prester John far off in Asia: Now they had actually met a Christian from China. Everyone has heard of Rabban Sauma’s famous contemporary Marco Polo, who claimed to have crossed Eurasia from west to east. Fewer people know of Rabban Sauma, but his story is more plausible than Marco’s. Sauma traveled with official documents from the Mongol khan on a diplomatic and religious mission; a learned man, he impressed the nobles and religious elites of every country he visited. Compared with Rabban Sauma, Marco Polo seems little more than a jailed, bankrupt merchant and tall-tale teller. Rabban Sauma’s adventures show how the Mongol conquests had united the entire continent of Eurasia and made it possible for learned men to cross great distances and still find themselves in a common religious community.

Ou duan si lian
Johann Adam Schall von Bell was a German Jesuit missionary, mathematician, and astronomer. He modernized the Chinese calendar during the Ming (1368–1644) and Qing (1644–1912) dynasties and contributed to the introduction of Western contemporary science to China. After the Qing takeover in 1644, Schall became head of the imperial astronomical bureau, which remained in the hands of Jesuits until 1776.

Johann Adam Schall von Bell (Tang Ruowang) was born into an aristocratic family in Cologne, Germany in 1592. He joined the Jesuit order in 1611 and finished his education at the Collegio Romano in Rome. He reached Macao in 1619 and spent more than a decade working for the Jesuits in Beijing and Xi’an. In 1630 Schall was asked to assist in the reform of the Chinese imperial calendar, a project initiated by the Christian official Xu Guangqi (1562–1633). In collaboration with Giacomo Rho (1592–1638) and a staff of Chinese astronomers, Schall completed the project and published extensively on mathematics and astronomy. He also made converts to Christianity at the imperial court.

Having supported the Ming dynasty’s failed efforts to stay in power through battle plans and the casting of cannons, in 1644 Schall nonetheless moved his allegiance to the new Qing dynasty. He soon became head of the imperial astronomical bureau, which remained in the hands of Jesuits until 1776.

“P. Adam Schaliger a German Mandarin of ye first order.” An engraving of Johann Adam Schall von Bell, an eminent seventeenth-century Jesuit missionary to China, for a book by Johannes Nieuhof (1618–1672).
astronomical bureau—the first European to hold high office in China—and subsequently prepared the annual calendar for the Qing empire based on Western mathematics. Schall’s position and proven expertise provided some protection for all Jesuits in China during this period of transition.

Schall’s experience at the court in Beijing included great achievements and great setbacks. Schall became a teacher of Western science and a friend to the Shunzhi emperor (reigned 1644–1661). In 1650 Schall received permission to establish the first Catholic church in Beijing. In 1658 he was promoted to mandarin of the first and highest rank. However, the emperor’s sudden death left Schall vulnerable to intrigue. In 1664 he was accused by the anti-Christian activist Yang Guangxian (1597–1669) of having caused the emperor’s death by choosing an inappropriate day and site for the funeral of his infant son. Schall was thrown into prison, and most of his fellow missionaries were asked to leave Beijing for Guangzhou (Canton). On 15 April 1665, Schall, who had lost his voice in a stroke, was sentenced to death. However, a major earthquake the next day convinced the judge of Schall’s innocence. Schall returned to the Jesuit residence, where he died the next year.

Regardless of his success at the Qing court, Schall’s work faced heavy scrutiny among Jesuits and the Catholic authorities in Rome. He was accused of holding an office contrary to the rules of the Jesuit order and of supporting idolatrous practices by editing the imperial calendar. Both claims were judged insubstantial under the specific circumstances. In 1668 the Kangxi emperor (1662–1722) had Schall’s rank fully reinstated and ordered a state funeral for him at the Jesuit cemetery at Shala.

Four kinds of organizing principles formed the basis of traditional science in China: Heaven and Man, yin–yang duality, the wu xing or Five Phases, and qi. They were combined to build a complex theoretical structure for the relationships and patterns that Chinese doctors and scientists found in nature.

Just as it did elsewhere in the premodern world, scientific thought in China emerged with early attempts to think about the natural world abstractly and systematically. One of the earliest attempts to organize the phenomenological and natural world was the ancient divination text known today as the Book of Changes (I Ching). Although today writers find antecedents for many modern scientific ideas in this text, to early Chinese science and many other areas of Chinese philosophy, the Book of Changes was a way to organize and classify natural phenomena—the first step in any scientific tradition.

Because many of the terms used in this system of classification came from ancient mystical traditions of shamanism and divination (the practice that seeks to foresee future events or discover hidden knowledge, usually by the interpretation of omens or by the aid of supernatural powers), assigning them strict definitions is particularly challenging for Western students of Chinese life and science. The terms yin and yang, wu xing, and qi have been the subject of much debate in the vain quest for precise Western equivalents. But the fact that these terms are still used in schools of traditional medicine in China testifies to their usefulness in Chinese science.

Organizing Principles

From these beginnings emerged four kinds of organizing principles to form the basis of all premodern Chinese scientific thought: Heaven and Man, yin–yang duality, the wu xing or Five Phases, and qi.

The relationship between Heaven and Man is central in Chinese scientific thought and is expressed in several ways. In astrology and astronomy not only is man part of the natural world, but also heaven reflects and responds to the human world below. The fenshu (field allocation theory maps) of the second century BCE divided the heavens into political regions in the human world and then into specific agencies within the imperial government. Specific constellations corresponded to specific government ministries, and the unpredicted appearance of an object in a ministry’s constellation was interpreted as an ominous sign.

Chinese medicine interprets the relationship between nature and man in terms of both microcosm and macrocosm. The human body can be interpreted as both a natural world in miniature and as an integral part of a larger natural world. As a result, ailments are diagnosed as either dysfunctional imbalances within the microcosm of the human body or as imbalances between the human body and the external world.
Light and Dark, Male and Female

Yin and yang were terms used in early Chinese thought to express the basic duality of all phenomena. The earliest examples can be found in the Book of Changes, and some scholars claim that conscious expression of the notion of polar dualities can be seen in the art of the Shang dynasty (1766–1045 BCE). The terms yin and yang are used to express the observation that many things have a dual nature: both light and dark, hot and cold, male and female. The Chinese characters for yin and yang literally describe the dark and light sides of a hill. In medicine the terms are used most frequently as adjectives, qualifying things based on their observed qualities, such as yin qi or yang qi.

Metal, Wood, Water, Fire, and Earth

Chinese science uses the Five Phases (wu xing) to further describe and classify phenomena, especially processes. An emphasis on process and interaction is a distinguishing characteristic of Chinese science and medicine. Whereas much of early Western medicine stressed the mechanical relationships of organs and other body parts, Chinese medicine looked at how the many characteristics of the body and nature interact and sought ways to describe and classify these interactions. The Five Phases, often confused with the Aristotelian “elements,” are the metal phase, wood phase, water phase, fire phase, and earth phase. The word xing means “to do or act, action, activity.” The Five Phases or activities of qi are often used to explain cyclical transformations found in medicine and elsewhere.

The Five Phases and Qi

Qi is the most important term in Chinese science and one of the most difficult to translate. Today most scholars choose not to translate the term, but some of the better Western equivalents for the term qi include “vital energy or substance” or “matter-energy.” The science scholar Nathan Sivin explains that qi is simultaneously “what makes things happen in stuff” and “stuff in which things happen” (Sivin, 1977). Qi can either take form and become visible and substantial or can be an agent that activates processes and influences their development. As a result, the concept

Historical illustration of Chinese metal casting. The Five Phases (wu xing)—metal, wood, fire, water, and earth—can be used to describe and classify relationships and processes at work in the realm of science.
of qi is central to Chinese medicine. Qi circulates through the body as a kind of vital energy, but, unlike blood, it has no substance. Qi instead activates and influences how blood and the organs function. Often qi is beneficial, but sometimes qi, especially from an outside source, can upset the balance within the body to create an ailment. The responsibility of the Chinese doctor is to diagnose this imbalance and take corrective measures.

The Five Phases describe five aspects of qi and their cyclical relationship. The wood phase does not describe the texture of qi but rather qi that is growing and developing a certain potential. When qi moves on to the next phase, fire, it realizes this potential and becomes active. The fundamental sequence of the Five Phases is sometimes called the “cycle of mutual production.” The sequence of the cycle is based on early empirical observations, but in practice its use is much more theoretical. When wood is burned it produces fire; fire produces ash (earth); ores from the earth become metal; water condenses on cold metal; and wood can grow with water. The logic behind this sequence is more mnemonic than practical. What was important to the Chinese doctor or scientist was the relationship between the different aspects of qi.

All of these basic concepts—Heaven and Man, yin and yang, the Five Phases, and qi—can be combined to build a complex theoretical structure for the relationships and patterns that Chinese doctors and scientists found in nature. Even though Chinese and Western thinkers confronted the same physical universe—human bodies in China differ only superficially from bodies elsewhere in the world—Chinese science and medicine developed a unique theoretical structure for understanding the phenomena in the universe, a system of understanding that Chinese scientists refined for almost two thousand years.

Self-Strengthening Movement
Yāngwù Yùndòng 洋务运动

The Self-Strengthening Movement, which began in 1861, was an effort by the Qing dynasty to restore power so China could resist Western encroachments, especially after the Second Opium War, which resulted in the burning and looting of the Summer Palace in Beijing by British and French forces.

The goal of the Self-Strengthening Movement (1861–1895) was to employ Western technology while retaining traditional Chinese values to meet the threat of Western imperialism. The Chinese assumed they could adopt Western technology, but not the values and philosophies that produced such technology. With their superior wisdom and intelligence, the Chinese believed, they would first learn from the West, then equal it, and eventually surpass it.

With such a mindset the Qing dynasty (1644–1912) government and various provincial officials began a series of self-strengthening projects. The most urgent goal of these projects was to develop military industries by building arsenals and shipbuilding dockyards to bolster the navy. The projects centered on military modernization initially and subsequently on economic self-strengthening. Thus China built Jiangnan Arsenal, Shanghai Arsenal (supervised by Zeng Guo Fan), Fuzhou Dockyard (supervised by Zuo Zong Tang), Nanjing Arsenal and Tientsin Arsenal (supervised by Li Hong Zhang), and Tianjin Machine Factory. China also sent students to the United States and constructed the Beiyang Fleet, one of the four modernized navies in the late Qing dynasty. The navies were sponsored by Li Hong Zhang, viceroy of Zhili, and became the dominant navy in East Asia before the First Sino-Japanese War (1894–1895). The Beiyang Fleet was said to be the best in Asia during the late 1880s.

Prince Gong, a member of the ruling clan of the Qing dynasty and one of the chief proponents of liberal reform that aimed to strengthen the empire against Western encroachment.
The Self-Strengthening Movement also created the Zongli yamen (foreign affairs office). Prince Gong (1833–1898), aided by a new generation of leaders, was made head of the Zongli yamen. In contrast, the Empress Dowager Cixi (1835–1908) was staunchly antiforeign but was resigned to accommodating Prince Gong because he was influential in the Qing court. But as her political influence grew, she became a formidable opponent of reform.

The time period of the Self-Strengthening Movement roughly approximates that of the Meiji Restoration of the Meiji period (1868–1912) in Japan but with differences. For example, Japanese leaders were more willing to part with the past and to alter the structure of government and society because of the strong desire to resist imperialist encroachments. By contrast, Chinese leaders were unwilling to change dramatically the system of government or the social hierarchy, and as a consequence struggled at the margins. China’s defeat by Japan in the First Sino-Japanese War exposed the weaknesses of the nearly four-decades-long Self-Strengthening Movement.

Shaanxi Province

Shānxì Shěng 陕西省

33.93 million est. 2007 pop. 205,000 square kilometers

Shaanxi Province (not to be confused with neighboring Shanxi Province, which has a comparable population) is a mostly mountainous northwestern province about twice the size of Iceland. The capitals of the Qin, Han, and Tang dynasties were located near the capital city of Xi’an. In 1935 the Chinese Communist Party established its headquarters in Yan’an on the northern plateau. Important agricultural products are millet, wheat, rice, and tubers.

The northwestern Chinese province of Shaanxi (Shensi, Shanxi) borders on Gansu Province and Ningxia Hui Autonomous Region on the west; Shanxi, Henan, and Hubei provinces, following the course of the Huang (Yellow) River, on the east; Inner Mongolia Autonomous Region on the north; and Sichuan Province on the south.

Covering 205,000 square kilometers, Shaanxi is geographically divided into a large northern and a much smaller southern part by the Qinling mountain range. The northern region is a high, eroded loess (unstratified loamy deposit believed to be chiefly deposited by the wind) plateau about 1,000 meters above sea level. This is a fertile but dry steppe, with a temperate climate and an annual precipitation of 300–500 millimeters. South of the Qinling range the climate is subtropical, with annual rainfall of 750–1,000 millimeters. All of Shaanxi has a continental climate, with monsoon rain from July to September. The capital is Xi’an (estimated 2007 population 7.64 million), which is situated in the valley between the Wei River and the Qinling range. Shaanxi is divided into eight regions and ninety-three counties.

The Wei River valley was inhabited by settled peasants before 5000 BCE, and it was the homeland of the Zhou people, who overthrew the Shang dynasty (1766–1045 BCE) and founded the Zhou dynasty (1045–256 BCE). The capitals of the Qin (221–206 BCE), Han (206 BCE–220 CE), Tang (618–907), and some minor dynasties were located in the vicinity of modern Xi’an. After the Tang dynasty fell the capitals of succeeding dynasties were founded in eastern China, and Shaanxi lost its importance as a political center and declined to become one of the most destitute areas in China.

Rebellions, civil war, and famine wreaked havoc in the province well into the twentieth century. In 1935, after the Long March, the Chinese Communist Party established its headquarters in Yan’an on the northern plateau, from where it fought Japanese occupying forces from 1937 to 1945 in the War of Resistance against Japan (known outside China as the Second Sino-Japanese War).

The majority of the population lives in the valleys of the Wei and Han rivers, and the most important agricultural products are wheat, millet, rice, and tubers, but rapeseed, tobacco, and soybeans also account for a considerable part of the agricultural economy. Sheep breeding is important on the northern plateau, and south of the Qinling range corn, beans, fruits (especially apples), tea, and medical herbs are grown. Industry, which is concentrated along the Wei River, has a relative high output of light industrial...
products such as sewing machines, cloth, television sets, and watches, but heavy industry is also significant.

**Further Reading**

Puppetry began as a performing art in ancient China. Its high point was the Qing period (1644–1912). Although puppetry survives in the twenty-first century, it has declined in recent decades. Several different forms exist, including rod puppets, marionettes, and shadow plays. Some features differ according to region, but the stories tend to be the same across China.

Shadow plays are among the large array of ancient performance arts using artificial figures in Chinese puppetry. Despite earlier prototypes, the first confirmed reference to manipulated puppets in theater performance is to the debauched Emperor Gao Wei (reigned 565–576 CE) of the short-lived Northern Qi dynasty (550–577 CE), who is said to have loved puppet performances; according to the marionette specialist Robin Ruizendaal, Gao was himself ridiculed in later puppet performances as “Baldy Guo.” The Tang emperor Xuanzong (reigned 712–756 CE) included puppetry in his Imperial Academy of Music (established 714 CE), and puppet shows were popular in the marketplaces and even with officials under the Tang dynasty (618–907 CE).

Puppet shows reached a height of popularity in the urbanized and sophisticated culture of the Song dynasty (960–1126), with some puppeteers achieving considerable fame. Writings about the Northern Song dynasty (960–1126) capital Kaifeng and about Hangzhou, the Southern Song dynasty (1127–1279) capital, attest to various kinds of puppets. These included water puppets (shui kuilei), which have died out in China but remain popular in Vietnam, rod puppets (zhangtou kuilei 枝头傀儡), manipulated from below, marionettes or string puppets (xuansi kuilei), and shadow puppets but not yet glove puppets.

The Qing dynasty (1644–1912) represents the acme of China’s puppet theater. Rod puppets were spread virtually all over the country, while glove puppets flourished in Hebei, Henan, Hubei, Sichuan, Hunan, and Fujian Provinces and marionettes in Shaanxi, Zhejiang, Jiangsu, Guangdong, Hunan, and Fujian provinces, the latter being home to several particularly ancient and famous forms of puppetry and theater.

**Shadow Puppetry Origins and Development**

The earliest definite references to shadow plays date from the Northern Song dynasty, just before the earliest authenticated human-acted dramas. In the capital cities of the Song dynasty at least thirty-three troupes existed, and many Song shadow play performers were female, probably the earliest female puppeteers in history. Shadow puppetry was found in the entertainment quarters, public spaces, private houses, temples, and even the imperial court.

Although the Song dynasty was a great age of shadow theater, the highpoint was the Qing dynasty. By that
time a substantial range of shadow puppet traditions had emerged, perhaps the most important being those of Shaanxi and Shanxi provinces. According to the theater scholar Chen Fan Pen Li, Shaanxi shadow puppetry “spans the widest area of influence and features the largest number of minor traditions” (2004, 5). By the Qing dynasty all puppeteers were male.

Shadow plays (yingxi 影戏) combine “design, carving, and painting with music, song, dialogue, and manipulation of the shadow figures” (Chen 2004, 1). The shadows that distinguish this form of theater from other puppetry result from “pierced, painted, and jointed leather puppets, cast onto lamplit screens” (Liu 1988, 4), these translucent parchment screens being usually made from the hides of domestic animals such as oxen, donkeys, and goats. In the earliest shadow plays some puppets were made of paper or cardboard, and nowadays some are made of celluloid.

**Shared Features**

Chinese puppet shows are generally like regional operas in that the role types are the same, and song and instrumentation are of vital importance, within regional variations. The plots of the plays derive mainly from the oral tradition of the storyteller; the authorship of almost all puppet plays before 1949 is anonymous. During the centuries a great commonality has developed in the stories of the various puppetry forms and the regional operas. Chen stresses the role that women warriors played in the plots of the shadow plays.

**Social Context**

Puppetry in all its forms is intrinsic to Chinese society. Although some among the educated classes, and even emperors, have loved puppetry, it has mostly been a popular rather than an elite art. Puppet performances are a natural part of festivals, including those marking deities’ birthdays. Spring performances ask the gods for good harvests, while those in autumn give them thanks. Because puppeteers are much cheaper to hire than whole troupes of human actors—sometimes just one or two people can manipulate the puppets and sing the various roles—puppeteers have often been invited to private houses for weddings, birthdays, or other family occasions. Puppetry is part of the secular entertainment of the cities, but its role in religious ritual should also be recognized. Writing of one form of puppetry, Chen says: “popular religion informs the traditional shadow theatre and has been a major underpinning of this performing since the Yuan dynasty [1279–1368]” (Chen 2007, 15). Ruizendaal (2006, 2) describes the marionette theater of Quanzhou (now Fujian Province) as “still an intrinsic part” of regional religious culture.

**Modern Change and Survival**

Although change followed the fall of the Qing dynasty, puppetry did not experience the same radical transformation as did human-acted theater. Because of puppetry’s religious connections, the antireligious movements of the twentieth century negatively affected it. On the
other hand, intellectuals introduced various reforms in Shanghai, including: the use of modern spoken plays for puppetry; other Western-influenced phenomena such as using scenography (the art of perspective representation, especially as applied to the design and painting of stage scenery); and having scripts written by individual playwrights.

Under the People’s Republic of China (1949) the government professionalized the folk puppet arts. It took over and controlled most of the puppet troupes, founding others at public expense. In 1955 the Ministry of Culture set up the China National Puppet Arts Company (Zhongguo muou yishu jutuan). In the 1950s a modern puppetry developed, using animal fables and revolutionary stories as well as revised traditional plays. The government organized the first puppet festival in Beijing in 1955, and puppet performances took place in theaters, restaurants, or teahouses more often than before. Trainees included girls as well as boys.

The Cultural Revolution (1966–1976) suppressed all traditional themes. Surviving puppetry followed the party-sanctioned themes of the model operas. The traditional puppet forms largely revived in the 1980s. But the troupes tended to dwindle in number in the 1990s. The state has given less money to puppetry in a commercialized age when organizations are mostly expected to keep themselves alive by making profits. Theaters and restaurants remain the preferred venues for urban performances. Rural outdoor puppet shows are still common, however, and folk puppeteers still perform at festivals or occasions such as banquets and weddings. Although in decline, puppetry is not dying out.

Shandong Province

Shēndōng Shěng  山东省

Shandong Province is located on the country’s northern coast, across the Yellow Sea from the Koreas, and is home to China’s second-largest provincial population (after Guangdong Province on the south coast). Shandong is home to a large portion of the Huang (Yellow) River and once was home to many Neolithic cultures and ancient philosophers such as Confucius. It is now known for its production of wheat, cotton, and sorghum.

Shandong is a large, densely populated northern coastal province on the Shandong Peninsula, which separates the Bohai Gulf from the Yellow Sea. Shandong Province, bordered on the southwest by Henan Province, on the south by Anhui and Jiangsu provinces, and on the northwest by Hebei Province, is about the size of Mexico in both land area and population. It covers 153,000 square kilometers, and its population density of 579.5 persons per square kilometer ranks it second only to neighboring Henan Province in Chinese provincial population density. Emigrants from the crowded province became a major source of the present population of China’s northeast (Manchuria) during the nineteenth and twentieth centuries.

China’s Grand Canal historically traversed the province, carrying grain and other trade to Beijing from the lower Yangzi (Chang) River valley, but today this commercial route is of little importance. Today the Huang (Yellow) River is Shandong’s dominant geographic feature, crossing the North China Plain to empty into the Bohai Gulf near the Shengli (Victory) oilfield. Before 1950 flooding by the Huang River caused great suffering, but flood-control projects and water diversions have decreased the river’s flow, and the river has posed no threat in the past half-century.

During the Neolithic period (8000–5500 BCE) Shandong was home to several cultures that made up parts of ancient Chinese culture. During the Zhou dynasty (1045–256 BCE), modern Shandong encompassed several important states, including the powerful state of Qi and the lesser state of Lu, closely associated with the Zhou ruling house and its traditions. The ancient philosophers Confucius (551–479 BCE) and Mencius (371–289 BCE) lived in what is now southern Shandong.

In the central mountains Mount Tai has been a major northern China religious site since prehistoric times. The Boxer Rebellion (1899–1901) began in Shandong as attacks on Chinese Christians and foreign missionaries, but in 1900 the uprising shifted its center north to the Beijing-Tianjin area. German imperialism built the port of Qingdao and Shandong’s first railroad after 1898; in 1915 during World War I Japan took over German interests and remained the dominant foreign presence there until 1945.

Agriculturally, Shandong produces sorghum, wheat, and cotton. Its largest cities and richest land are located from Jinan, the provincial capital, eastward through Weifang to Qingdao. Shandong Peninsula has good ports at Yantai, Qingdao, and Weihai. These ports have grown quickly since 1978, when Chinese Communist Party General Secretary Deng Xiaoping (1904–1997) began China’s reform era.

Further Reading

The Shang inherited the ancestor cult and the use of bronze for ritual purposes from advanced precursors. Much of the information on them comes from inscriptions written on oracle bones used in divining. Later dynasties perpetuated the Shang legacy through continuing practices of ancestor worship, elaborate burial ritual, the calendar, divination, writing, and the layout of the capital’s administrative and ritual center.

Despite mythical accounts of an early Neolithic dynasty known as the Xia (2100–1766 BCE), the Shang (1766–1045 BCE) is the first dynasty clearly identifiable as such from the archeological evidence. At Erlitou in present-day Henan Province, however, remains were found in 1959 of what was arguably China’s first full state formation, and has indeed been identified by some scholars with Xia. Certainly the Erlitou culture (c. 2100–1500 BCE) passed to the Shang a number of material innovations and cultural motifs. Among these was the form of a capital city and ritual center. Covering some three square kilometers, Erlitou was an urban complex bigger than any of the multiple city-states which had preceded it. At the center was a “palace-temple” compound where, among other religio-political ceremonies, feasts were apparently held in honor of the ancestors. The same compound also housed workshops, whose output included bronze drinking vessels for use at these feasts. The aim of the ancestral cult was to take the relationship of authority that had once bound subjects to their king and make it operative across the divide between life and death. The ancestors’ spirit-power was therefore presumed to be very great. At the same time, however, they were taken to be dependent on their descendants for the performance of rituals to keep their memory alive and provide them with the nourishment they continued to need in the afterlife. This ensured a reciprocity between ancestors and descendants which was continued by the Shang in a much more elaborate ritual structure.

The significance of the ritual bronzes introduced in the Erlitou ceremonies was also great, extending through the Shang dynasty and beyond. Most pre-Shang ritual vessels were ceramic. The bronzes, however, were harder and more enduring, and spoke, moreover, of a highly exclusive, even magical production process, redolent of power at every level—not least because Erlitou, occupying the Yiluo alluvial valley with the Huang (Yellow) River just north of it, and generally surrounded by mountains, was well-situated for agricultural yield and natural defenses but entirely lacked the copper, tin, and lead needed for bronze. The need to acquire the materials for its all-important ritual productions in the form of tribute from neighboring polities drove Erlitou’s military and diplomatic expansion. The Shang, which took from Erlitou both the ancestor cult and the use of ritual bronzes—Shang tombs display a greater quantity of bronze than any other world culture—also relied on forced tribute for their basic ritual materials.
Early Shang

From c. 1800 to 1500 BCE, Erlitou underwent a protracted decline; over the next century or so, performance of religio-political authority reached new heights in Zhengzhou, 100 kilometers east of Erlitou and apparently the site of an early Shang capital. According to the founder of Chinese historiography, the Han-dynasty historian Sima Qian (c. 145–86 BCE), there were several Shang capitals; movement from one to the other may have been occasioned by religious obligations, military disadvantage, or food imperatives. It seems that the center of the dynasty’s power was secured above all in the person of the king, whose political authority in turn was reaffirmed in the state worship of the royal ancestral line, rather than through persistent dwelling by the people in a specific geographical locale.

The dynasty resided in Zhengzhou during what is sometimes called the Erligang period, named after a section of the present-day city. Like Erlitou, Zhengzhou enfeoffed (invested with a fief or fee) neighboring polities to acquire the raw materials for a thoroughgoing commitment to ritual performance. This Shang capital, building on the Erlitou model, had two city walls, an inner and an outer; the former enclosed a palace-temple area, the latter three cemetery sites, two bronze foundries, a bronze casting area, and a bone workshop. The inner wall, in other words, bound together the political elite and the craft specialists on whose skill their ritual authority was dependent, and the outer served above all to exclude the city’s other inhabitants. Both human and animal sacrifices were staged for dwellers in the inner area; the human victims may have been common inhabitants of Zhengzhou or prisoners taken in warfare, perhaps for the express purpose of ritual killing.

In the bronze foundries and casting area, craft specialists used key technical innovations to increase and standardize the number of bronze vessel types, as well as to add visual designs. The principal motif found on the Zhengzhou bronzes, and indeed on all subsequent Shang ritual vessels, was later given the name taotie, although the Shang name for it is unknown. At Zhengzhou it began as scarcely more than a pair of eyes in a narrow band of linear ornamentation; through the decades the latter increased in area, the patterns becoming denser and busier. The taotie seems to have figured in some pervasive kind of metamorphic magic.

On all the vessels used to prepare food and drink for offering to the ancestors, for example, officiants and audience would have been aware of taotie eyes watching: the eyes of some kind of tutelary spirit, perhaps, or an opener-up of links between the performers on earth and the absent-present dead of the spirit world. These eyes stood out amidst the dynamic whorls which unfurled around them; the whorls themselves, suggestive of endless metamorphosis and later known as “cloud and thunder patterns,” may have constituted a visual aid to the participants’ imagining of the transformational action under way, in which humans and spirits engaged with each other.

Early Shang power extended as far as the city of Panlongcheng, 450 kilometers south of Zhengzhou, and conceivably to other sites further yet from the middle Huang River valley; at any rate, bronzes using Zhengzhou techniques and often in the Zhengzhou style spread over a rather large area, although this could indicate a sharing of techniques by a number of linked “nodal” sites rather than implying dominance by a Shang center. Zhengzhou itself fell into decline toward the end of the fifteenth century BCE, perhaps as a result of conflict among members of the royal house. Knowledge of developments during the years from circa 1400 to 1200 BCE remains sketchy. At the next and final Shang capital, however, a wealth of prototextual materials abruptly appears, opening up the historical record.

Writing

Extant written records left by the Shang cover the reigns of the last nine kings (Wu Ding, c. 1200 BCE, through Di Xin, c. 1045 BCE), usually known as the Late Shang period. The writing, which has every appearance of a script with some history of development (although the details of that history are still unknown), exists as brief inscriptions on bronze ritual vessels and also as myriad oracle-bone inscriptions, recording an extensive divinatory practice that by the dynasty’s end was the exclusive preserve of the king. The oracle bones, consisting of cattle scapulas and turtle shell plastrons, were “asked” questions concerning ritual matters, the conduct of military campaigns, royal hunts and other excursions from the capital, all aspects of agricultural production, the king’s health, any potentially ominous royal dreams, tributes from surrounding polities,
and many other things. The divinatory method was to apply a hot poker to hollows carved into the bones, causing roughly T-shaped cracks to appear on the opposite side. The king interpreted these according to the degree of angle between perpendicular and cross-bar, and uttered a prognosis based on the divination’s verdict. Following this, the day of the divination, the name of the diviner, the questions asked by the diviner, and the king’s final verdict were inscribed on the bone or plastron, which was stored away with its fellows as records of state.

Late Shang Capital and Sphere of Influence

The Late Shang capital of Anyang was settled along a bend in the Huan River some 180 kilometers north of Zhengzhou; by the dynasty’s end, Anyang covered an area of more than 20 square kilometers. The royal cemetery of Xibeigang was on the eastern side of the Huan; to the southeast, on the river’s other side, the district of Xiaotun included an elite residential area, a palace-temple complex, two altars, a hall of ritual vessels, the great bronze foundry where these vessels were cast, and multiple quasi-subterranean (pit-house) servants’ quarters. The city was located in the area known as Zhong Shang (Central Shang). Outside this state heartland lay “the lands” (tu), inhabited mainly by enfeoffed allies; beyond these were the fang, whose inhabitants tended to be hostile. As concepts, moreover, tu and fang comprised not only the geographical regions and the people who inhabited them, but also the spirit powers believed to inhere in the regions. The tu powers were considered by the Shang broadly benevolent; they presided over regions where...
much of the grain destined for Anyang was grown, and were regularly offered harvest tribute. The fang powers were liable to send baleful, drought-bringing winds into Central Shang, and had to be pacified with Shang sacrificial rites as well as harvest offerings. These rites may have required the king’s journeying to the region(s) in question, as did the frequent military and diplomatic ventures in which the Shang kings engaged.

Within the often ad hoc nature of the dynasty’s alliances and enmities, the dynasty contrived to take in sufficient tributes to meet their ritual requirements, whether in the form of human victims for sacrifice or bones and plastrons for the all-important divination ceremonies; Xiaotun, the administrative center of Anyang, also received a share of the grain production of various labor units, which figured in rituals devoted to commemorating and perpetuating agricultural fertility. State rites were scheduled in accord with a formidably complicated calendar, which resulted from combining two sequential sets of terms (later called zhi, “[Earthly] branches,” and gan, “[Heavenly] stems”) according to a formula that produced sixty gan-zhi pairings. Each of these pairings designated a day in a cycle made up of six ten-day weeks; in turn, six of these sixty-day cycles produced the greater cycle of a 360-day Shang ritual year. The magnitude of the task of having everything in place—musical instruments (notably bronze bells), trained performers, objects for burning, sacrificial victims—to accord with this intricate temporal scheme meant turning, again, to writing; evidence shows that the Shang kept records of the constantly changing stock of ritual materials. It is also known that their protobureaucratic system included variously titled officials, although it is not certain that the titles related to specific responsibilities. It would seem clear, however, that the Late Shang was driven to an increasing degree of managerial efficiency in order to cope with the many and many-leveled demands of staging a variety of ritual performances on a daily basis, as well as managing a range of practical activities that included settling new sites, building ever greater bronze foundries, and keeping track of the incoming tributes as more and more of the land fell under the sway of organized agriculture.

At the height of their power, Shang influence extended over a remarkable range. Over five hundred sites that were culturally, although not necessarily politically, Shang have been found in Henan, Hebei, Shanxi, Shaanxi, Anhui, Shandong, Jiangsu, Zhejiang, Hubei, Jiangxi, Hunan, Sichuan, Inner Mongolia, and Liaoning; together these make up an area covering much of present-day China.

Legacy

The fall of the Shang at the hands of one of their enfeoffed polities, the Zhou, did not cut short their influence on subsequent mainstream Chinese developments. The Zhou (1045–256 BCE) and successive dynasties perpetuated the legacy of the Shang (which was, to a degree, the legacy of Erlitou) through continuing practices of ancestor worship, a patrimonial system of inheriting political status, elaborate burial ritual, the calendar based on Earthly branches and Heavenly stems, divination as a means of state advisement, writing, and a layout of the capital’s administrative and ritual center, found even today in such structures as Beijing’s Forbidden City.

Dallas L. McCURLEY

Further Reading:

China’s most populous city first rose to world prominence in the nineteenth century. In the twentieth century, it has been at the forefront of China’s economic and international development.

The city of Shanghai is the largest in China; of China’s four province-level municipalities (the other three are Beijing, Tianjin, and Chongqing), only Chongqing outranks Shanghai, due to its larger rural population. Shanghai is the eighth-most-populous city in the world.

As an administrative district, Shanghai is the equivalent of a province. It covers an area of 6,341 square kilometers (for comparison, Tokyo is 2,187 square kilometers and the London metropolitan area is 2,263 square kilometers.) It is located in the center of eastern China on the coast, at the mouth of China’s largest river, the Yangzi (Chang), which enters the East China Sea.

Shanghai is divided into eighteen districts and one county—Chongming Island. The city center of Shanghai is on the west bank of the Huangpu River. The inner nine districts are in the east-bank area, as is the new district of Pudong, which belonged to Chuangsha County until 1992. The outer eight are further away from the urban center.
History

There is evidence of human settlement in Shanghai from as early as 6,000 years ago. Historically, Shanghai was a fishing town, though from the Ming dynasty (1368–1644) onward, it also was an important region for cotton manufacture and for shipping. Its ascendancy on the world stage began when the 1842 Treaty of Nanjing, which ended the First Opium War with Great Britain, designated Shanghai one of five seaports to be opened for foreign trade. The British, Americans, and French all leased land in Shanghai for their international settlements. These areas were autonomous zones that were outside the jurisdiction of Chinese law.

In 1927, Shanghai was officially established as a city of the Republic of China; it became a municipality with the status of a province in May 1930. In the lead-up to World War II, Japan invaded China; it occupied Shanghai from 1939 to 1945. In 1943, Great Britain and the United States (joined later by France) signed a treaty with the Republic
of China to renounce their leased territory in Shanghai, which they returned to China at the end of the World War II. The five years from 1945 to 1949 were the only period during which Shanghai was purely under the control of the Republic of China; in 1949 that control shifted to the new People’s Republic of China.

Shanghai has special significance in China’s political development and international relations during the twentieth century. Shanghai was the place where the Chinese Communist Party was founded and where it held its First National Congress in 1921. On February 28, 1972, Shanghai was the place where the “Shanghai Communiqué” between the People’s Republic of China and the United States was signed—the outcome of President Richard Nixon’s visit to China (the first visit of an American president) and the start of normalization of relations between the United States and China.

**Economic Growth**

Shanghai was able to become a center of international trade and finance as a consequence of the national policy of reform and openness laid down by Deng Xiaoping, who led China after the death of Mao Zedong in 1976.

When China adopted market socialism, Pudong (East Shanghai) was declared a “special economic zone.” Economic development was encouraged in this region, which flourished. This led to Shanghai’s expanding its development of the new area of eastern Shanghai while at the same time renovating the old area of western Shanghai, divided by the Huangpu River. Six bridges across the river were built to connect the two zones, along with two tunnels under the river and a new international airport in Pudong to supplement Shanghai’s Hongqiao International Airport. In 2005, Shanghai was ranked the world’s...
busiest port in terms of cargo throughput. Shanghai’s port is also the largest in the world, and Donghai Bridge, which links Shanghai to the Yangshan Islands, is the longest cross-sea bridge in the world, with a total length of 32.5 kilometers.

Special Features

The Pudong district in eastern Shanghai has developed into a modern international trade center and is home to one of the tallest towers in Asia, the landmark Oriental Pearl Tower, as well as the Jin Mao tower, which is the tallest skyscraper in China.

The city center is in western Shanghai. One can find old, historical buildings, including the old headquarters of foreign trading houses, in the part of Shanghai known as the Bund, along the bank of the Huangpu River. Shanghai’s most modern architecture, including the Shanghai Museum and Shanghai Grand Theatre, are found in the People’s Square.

Shanghai has more universities than any other city in China, being home to sixteen national universities, one military medical university, eleven public universities below the national level, and six private universities. The most famous, Fudan University, is a comprehensive research university. Its late president, Xie Xide, established China’s first center for America studies at Fudan University, and under Xie’s tenure, presidents Ronald Reagan and Bill Clinton both gave speeches at the university when they visited China.

Shanghai is not only a leading city in the economic, educational, and international arenas, it also is a cradle of national leadership. The positions of secretary and mayor of Shanghai became stepping stones to national power in the People’s Republic of China. Jiang Zemin was party secretary of Shanghai before he became the general secretary of the Chinese Communist Party and eventually chairman of the People’s Republic of China. Zhu Rongji was mayor of Shanghai before becoming prime minister. Xi Jinping, party secretary for Shanghai, was elected in 2007 by the Seventeenth National Congress of the Chinese Communist Party and the National People’s Congress to be vice chairman of the People’s Republic of China and possible successor of Hu Jintao when his term as general secretary of the Chinese Communist Party and chairman of the People’s Republic of China ends.

Looking Forward

Shanghai is at the forefront not only in economic development, but also sustainability initiatives. With nearly half the nation’s rural population expected to move into urban areas by 2030, sustainable cities are a high priority, and one notable initiative was planned for Dongtan, near Shanghai, although the project has run into considerable difficulties, including the 2006 arrest of its main Politburo sponsor, Chen Liangyu. The future of the project is uncertain.

Shanghai’s hosting of the 2010 World Fair (Expo 2010), with the theme “Better City, Better Life,” has prompted the city to develop four new subway lines and to implement improvements and extensions on four others. Organizers have announced that the expo will center on innovation and interaction, with participants focusing on the urban theme. China hopes to attract two hundred nations and 70 million visitors to Expo 2010.

Further Reading

The Shanghai Communiqué of 1972 is the agreement between the United States and China that led to the restoration of diplomatic relations between the two nations. Because they had unresolved issues, each government stated its positions in order to facilitate cooperation. The Communiqué resulted in the establishment of scientific, cultural, and educational exchanges as well as trade ties between the U.S. and China.

The Joint Communiqué of the United States of America and the People’s Republic of China (Shanghai Communiqué) announced on 27 February 1972 at Shanghai’s Jinjiang Hotel began the process of normalizing relations between the two nations after twenty-two years of nonrecognition. It was the culmination of a weeklong visit to China by U.S. President Richard M. Nixon (1913–1994) and his wife, during which they toured Beijing, Shanghai, and Hangzhou. On February 21 Nixon, the first U.S. president to travel to China, met with Communist Party Chairman Mao Zedong (1893–1976) at a much-celebrated occasion marking the renewal of ties between the two nations and the opening of weeklong discussions. The principal negotiators for the United States were Nixon National Security Advisor Henry Kissinger (b. 1923) and Secretary of State William P. Rogers (1913–2001) and for China, Premier Zhou Enlai (1898–1976), Foreign Minister Ji Pengfei (1910–2000), and Deputy Foreign Minister Qiao Guanhua (1913–1983). The communiqué asserted:

Richard Nixon, President of the United States, in 1972. Nixon thought his diplomatic efforts with China to be one of the high points of his presidency. National Archives.

The leaders of the People’s Republic of China and the United States of America found it beneficial to
have this opportunity, after so many years without contact, to present candidly to one another their views on a variety of issues. (Shanghai Communiqué, 1972)

The first steps leading to the communiqué took place in October 1971 when Kissinger met with Premier Zhou in Beijing at a time when both governments agreed on the need to settle decades-old conflicts and to use new strategies to solve international problems. The Chinese sought to break out of the diplomatic isolation resulting from their role combating United Nations forces in the Korean War (1950–1953), the Nixon administration hoped that China could assist in ending the Vietnam War, and Beijing and Washington both shared a threat from the USSR. (Despite both being Communist nations, the USSR and China diverged on ideological and boundary matters and officially parted ways in 1960.) Nevertheless, negotiations were difficult since the two nations’ foreign policy interests often conflicted. Both sides made concessions while acknowledging the “essential differences between China and the United States in their social systems and foreign policies” (Shanghai Communiqué, 1972).

The communiqué announced that “both governments wish to reduce the danger of international military conflict” and “neither should seek hegemony in the Asia-Pacific region and each is opposed to efforts by any other country or groups of countries to establish such hegemony” (Shanghai Communiqué, 1972). The latter statement alluded to tensions with the Soviet Union at the time. China and the United States also proposed opening bilateral trade and maintaining contact with the goal of facilitating “new prospects for the relations between the two countries” (Shanghai Communiqué, 1972). On the other hand, viewpoints on several topics proved to be irreconcilable. Zhou Enlai is credited with suggesting an unusual format for the communiqué by which each nation stated its positions on contentious issues rather than trying to reach a compromise. Both governments put aside significant ideological differences in order to reestablish ties.

**Major Obstacle**

The major obstacle to restoring diplomatic relations between the United States and the People’s Republic of China in 1972 was U.S. recognition of the Republic of China (ROC) on Taiwan since 1949 and the close military and economic ties between Washington and Taiwan’s Nationalist Party (Kuomintang, KMD). Chinese leaders would not accept the United States having close ties with both China and Taiwan. Sections 11 and 12 of the communiqué summarize the two governments’ positions. The Chinese side reaffirmed its position:
...The Government of the People's Republic of China is the sole legal government of China; Taiwan is a province of China...; and all U.S. forces and military installations must be withdrawn from Taiwan. (Shanghai Communiqué, 1972)

The U.S. side declared:

The United States acknowledges that all Chinese on either side of the Taiwan Strait maintain there is but one China and that Taiwan is a part of China... The United States government... reaffirms its interest in a peaceful settlement of the Taiwan question by the Chinese themselves. (Shanghai Communiqué, 1972)

The Nixon administration made its boldest moves by not allowing Taiwan’s status to stand in the way of developing a new relationship with Beijing. Nixon ran the risk of alienating his conservative supporters who backed the Chinese Nationalists. Nevertheless, in the Shanghai Communiqué the United States announced its “ultimate objective of the withdrawal of all U.S. forces and military installations from Taiwan” (Shanghai Communiqué, 1972) and its adherence to a “one-China” policy that is the basis for U.S. relations with China today.

Discussions also focused on the general political situation in Asia. Other difficult issues on which there was little agreement included the ongoing conflict in Southeast Asia, plans for the reunification of North and South Korea, Japan’s close ties to the United States, and the self-determination of Kashmir, a disputed area in northern India. Each side introduced its policies with general statements, highlighting the two nations’ incompatible outlooks for the future. The Chinese side stated:

Wherever there is oppression, there is resistance. Countries want independence, nations want liberation and the people want revolution—this has
become the irresistible trend of history… (Shanghai Communiqué, 1972)

The Chinese side stated that it firmly supported the struggles of all oppressed people and nations for freedom and liberation.

The U.S. side stated:

Peace in Asia and peace in the world requires efforts both to reduce immediate tensions and to eliminate the basic causes of conflict. The United States will work for a just and secure peace: just, because it fulfills the aspirations of peoples and nations for freedom and progress; secure, because it removes the danger of foreign aggression. The United States supports individual freedom and social progress for all the peoples of the world. (Shanghai Communiqué, 1972)

Normalization Delayed

The signing of the Shanghai Communiqué improved Sino-U.S. relations, allowed cultural and educational exchanges, and opened trade, but it did not immediately lead to normalized relations. In the United States other problems, such as the conclusion of the Vietnam War, the Watergate scandal, and finally Nixon’s resignation, took precedence. Full diplomatic relations between China and the United States were established in January 1979 when President Jimmy Carter (b. 1924) and Vice Premier Deng Xiaoping (1904–1997) reaffirmed the principles outlined in the Shanghai Communiqué in a second joint communiqué.

Originally a fictional locale, Shangri-La is now a Chinese township (originally named Zhongdian) in Yunnan Province—although India, Pakistan, Nepal, and Tibet have also claimed to be the inspiration behind British writer James Hilton’s vision of Utopia. The surrounding area, now a UNESCO World Natural Heritage Site, has experienced both recognition for its beauty and controversy over development.

The word “Shangri-La” originated from the Tibetan language, meaning a “bright moon in one’s heart.” The Chinese have renamed a township (originally named Zhongdian) in Yunnan Province “Shangri-La,” based on experts’ identification of it as the place that inspired the British writer James Hilton’s portrayal of a fictional Shangri-La as an earthly paradise in his 1933 novel *Lost Horizon*. Based on the novel, the term Shangri-La has also come to represent, in general, the perfection sought by humans in the form of love, happiness, and other Utopian ideals. In the book, the secluded valley locale known as Shangri-La is gently governed from a monastery and is enclosed by mountains. India, Pakistan, and Tibet have also claimed sites as Hilton’s inspiration. In 1992, Nepal also began to use the name of Shangri-La to attract tens of thousands of foreign visitors.

In 2003, the United Nations Educational, Scientific, and Cultural Organization (UNESCO) listed the area surrounding the newly renamed Shangri-La as a World Natural Heritage Site—the Three Parallel Rivers of Yunnan Protected Area—reportedly taking only twenty minutes to make the decision to include the area for protection. The area covers eight clusters of land adding up to about seventeen thousand square kilometers (approximately the size of Connecticut) and including the upper reaches of the Yangzi (Chang), Mekong, and Salween rivers, which run parallel to one another, north to south. They course through gorges that become at times three thousand meters deep and are surrounded by 6,000 meter peaks. The site, in a temperate region, is considered extraordinary in regard to its biodiversity.

Near the World Natural Heritage Site, controversy has brewed over the issue of building dams in the rivers to produce hydropower and to divert water to Kunming, the provincial capital of Yunnan. In 2004, after much public outcry, Premier Wen Jiabao halted a plan for such a dam and called for an environmental study. Many people then considered that the damming project was dead. However, in 2008 officials in Yunnan continued to support damming in order to bring economic development to the region.

Shangri-La: Where Fact and Fiction Meet

Visions of utopia exist everywhere, and sometimes influence the real world. One of these is Shangri-La, the fictional Buddhist monastery in the Himalayas that is now the name of a recently renamed township in Yunnan Province. The area surrounding the new “Shangri-La” has been recognized by UNESCO as the “Three Parallel Rivers of Yunnan Protected Area.” The following passage comes from British writer James Hilton’s 1933 novel, describing the main character’s first view of the Himalayas from the air.

Then he turned to the window and gazed out. The surrounding sky had cleared completely, and in the light of the afternoon there came to him a vision which, for the instant, snatched the remaining breath out of his lungs. Far away, at the very limit of distance, lay range upon range of snow-peaks, festooned with glaciers, and floating, in appearance, upon vast levels of cloud. They compassed the whole arc of the circle, merging towards the west in a horizon that was fierce, almost garish in coloring, like an impressionist backdrop done by some half-mad genius. And meanwhile, the plane, on that stupendous stage, was droning over an abyss in face of a sheer white wall that seemed part of the sky itself until the sun caught it. Then, like a dozen piled-up Jungfraus seen from Mürren, it flamed into superb and dazzling incandescence.

China changes constantly, and the Encyclopedia of China will change and grow, too. Berkshire’s authors and editors welcome questions, comments, and corrections: china.updates@berkshirepublishing.com.
Located in northern China, Shanxi Province (not to be confused with neighboring Shaanxi Province, which has a comparable population) is known mainly for its coal industry, as it contains one third of the country’s coal deposits. Shanxi also contains significant amounts of other natural resources including iron and copper. Though two major Chinese dynasties were established from Shanxi, the area went through times of poverty and Japanese occupation.

The northern China province of Shanxi borders on Shaanxi Province on the west, Inner Mongolia Autonomous Region on the north, Hebei Province on the east, and Henan Province on the south. Shanxi covers an area of 156,300 square kilometers (roughly the size of the state of Georgia) of highly eroded plateau at an altitude of about 1,000 meters above sea level. On the western, northern, and eastern fringe, mountains rise from 500 to 2,000 meters above the plateau. The Huang (Yellow) River constitutes parts of the border to Hebei and Henan. Sheltered from winds from the ocean by the eastern mountains, Shanxi has a typical continental climate, with cold winters and dry summers, and an annual precipitation of 400 to 650 millimeters, which makes irrigation necessary. The capital of Taiyuan (estimated 2007 population 3.46 million) is situated in the center of Shanxi, which is divided into six regions and one hundred counties.

Shanxi was inhabited by farmers as early as 5000 BCE, and during the Western Zhou dynasty (1045–771 BCE), the state of Jin was established in the area. After the unification of China in 221 BCE by the short-lived Qin dynasty (221–206 BCE) Shanxi often came into play as a crucial part in the Chinese empire’s defense against nomad invasions. Both the Northern Wei (386–534 CE) and the Tang (618–907 CE) dynasties were established from Shanxi, but when succeeding dynasties set up their capitals in eastern China, the area declined into a poverty-stricken region ruled by warlords or nomad chiefs. Shanxi was occupied by Japanese forces from 1937 to 1945.

The province is sparsely populated in the northwestern mountainous parts where sheep, cattle, and other livestock are raised. In the agricultural areas, relatively little wheat and rice is grown, the major products being millet, soybeans, and potatoes. Other main crops are cotton, sugar beets, tobacco, fruit, and vegetables. Shanxi has the largest known deposits of coal in China, accounting for one third of the country’s total. The coal is of high quality and the coalfields cover an area of over 57,000 square kilometers and are easily mined near the surface. Other natural resources in significant amounts include iron ores, copper, and gypsum. The industry is concentrated around Taiyuan and Datong in the north. The coal industry is, of course, by far the most important, but important industrial products also include locomotives, automobiles, and tractors. The light industry produces consumer goods such as watches, television sets, and washing and sewing machines. Shanxi
is home of the famous Yungang caves from the Northern Wei dynasty, containing fifty-three grottoes with about 51,000 statues of various Buddhist deities.

Shen Congwen wrote poetry, novels, essays, short stories, and novellas. After the Chinese Communist Party took control of the government in 1949, Shen was branded a conservative, and his books were banned.

Born in Fenghuang Chen (Phoenix Town), a scenic village populated by the Miao minority in Hunan Province, Shen Congwen briefly attended primary school and then went to a military training camp to carry on the family tradition of soldiering. Shen began writing after witnessing the horrors of military campaigns. At age twenty he went to Beijing, became co-editor of the journal *Modern Critic*, and gradually gained recognition for his literary talents. Shen wrote in many genres, including poetry, novels, and essays, but was best known for short stories and novellas, including “Three Men and a Girl,” “The Lovers,” and “Gazing at Rainbows.”

Like his contemporaries, Shen was influenced by Western writers such as Guy de Maupassant, Anton Chekhov, and James Joyce. Later he moved to Shanghai, where he continued to write. Shen’s main sources of inspiration were the Chinese countryside, military life, and the Miao minority ethnic group of Hunan. In 1949 Shen’s productive streak ended after the Communists took power. The Chinese Communist Party labeled Shen a conservative and banned his books. For several decades Shen ceased to write fiction and instead studied porcelain making and the history of Chinese costume, a subject about which he published a renowned study. In the 1980s, as an old man, Shen began to write again, and enjoyed a resurgence in popularity, until his death.

Shenyang

Widely known as the birthplace of the Manchu Qing dynasty and an industrial stronghold throughout the socialist era, Shenyang is the capital of Liaoning Province and an economic and cultural hub that conjoins China proper with the three northeastern provinces of Liaoning, Jilin, Heilongjiang that together make up Manchuria.

One of China's largest cities, with an estimated population of 7.2 million and a total administrative area of 12,980 square kilometers, Shenyang is the capital of Liaoning Province and the political, economic, cultural, and transportation hub of northeast China. Situated at 122°25′–123°48′E and 41°11′–43°2′N, Shenyang is centrally located in the hinterland north of Liaodong Peninsula. Its four distinct seasons are typical of northern temperate continental climates.

Archeological discoveries at Xinle Relics date the earliest settlement in Shenyang to 7200 BCE, during China's Paleolithic period. Burial sites from the Warring States period (475–221 BCE) and Han dynasty (206 BCE–220 CE) have also been discovered since the 1960s. Shenyang, then known by the name of Shenzhou, became a major jurisdiction under the Liao (907–1125 CE) and Jurchen Jin (1125–1234) dynasties. Recognizing the locale's geostrategic location as a military garrison, Ming emperor Zhu Yuanzhang (1368–1399) ordered the initial deliberate city planning in Shenyang. Its ensuing economic prominence as a regional trading and handcraft industry center during the Ming dynasty (1368–1644) led to Manchu Qing dynasty founder Nurhachi (努尔哈赤, 1559–1626) choice of the town as the power base for his Jurchen regime, the Late Jin 后金, and his construction there of the Imperial Palace in 1625 (today a big tourist draw, nearly rivaling Beijing's Forbidden City in its magnificence). Nine years later, in 1634, Nurhachi's son and successor Huang Taiji (皇太极, 1627–1643) renamed the Jin dynasty the Qing (1644–1912) and Shenyang was redubbed Mukden (奉天, or Shengjing 盛京). The city has since been most widely known as the birthplace of the Manchu Qing dynasty.

The founding of the Mukden Machine Bureau in 1895 marked the beginning of modern industrialization.
in Shenyang. The year 1898 saw the first Russian-built rail station in the city, incorporating the city into the South Manchurian railway system. Following Japanese occupation in 1931 and the founding of the Japanese-controlled puppet state of Manchukuo (1932–1945), northeast China fell prey to the Japanese colonial projects of military occupation, economic encroachment, and mass migration. Shenyang, with its proximity to the iron- and coal-mining complexes in Anshan and Fushun, quickly became the heavy industrial base and so-called industrial capital of imperialist Manchukuo. Tiexi Industrial District, China’s oldest and largest comprehensive industrial base, took shape under this period of Japanese occupation. As World War II reached its destructive climax, the Japanese destroyed most of the productive capacity in the city; the Soviet Red Army then acquired as booty many of the remaining machines, equipment, and supplies. Subsequent social turmoil further disabled the industrial capacity of Shenyang.

The city’s industrial infrastructure was revived during the first Five-Year Plan period (1953–1957), and it remained an industrial stronghold throughout the Maoist socialist era. Shenyang’s comprehensive manufacturing industries include nonferrous metals, chemicals, automobiles, aviation, machine tools, defense, building materials, electronics, textiles, food processing, pharmaceuticals, and light industrial products. As China transitions from a planned economy to a market economy in the first decade of the twenty-first century, and with a significant number of formerly state-owned enterprises gone bankrupt or privatized, the city has been diversifying its industrial base, a project that has benefited tremendously from the government’s “Revitalize Northeast China” campaign since 2003.

人无远虑，必有近忧

Rén wú yuǎn lǜ, bì yǒu jìn yōu
The Shenyang Imperial Palace, located in the capital city of Liaoning Province, was the imperial residence of the Later-Jin kingdom (1616–1644) prior to their founding of the Qing dynasty (1644–1912). Serving as an administrative center for the Manchus, the royal complex’s architecture represents not only the material culture and artistic aspects of its time, but the political necessity as well.

The Shenyang Imperial Palace, or Mukden Palace, was constructed in 1625 when Shenyang (modern capital of Liaoning Province, in northeast China) became the site of the capital city for the Later-Jin kingdom (1616–1644), a Jurchen outpost in Manchuria that rose to power toward the end of the Han Chinese Ming dynasty (1368–1644). The palatial complex served as the administrative headquarters and royal residence until the Manchurians breached the Great Wall in 1644 to rule China as the Qing Empire. The architectural complex is particularly noted for its unique synthesis of ethnic Manchu and Chinese attributes. It also provides invaluable data for understanding its owners’ native past and their assimilation into Chinese mainstream culture.

The palace complex covers 60,000 square meters and comprises three groups of architectural structures in parallel north-south axial lines. Completed by 1626, the eastern sector exemplifies the incipient phase of Manchu official architecture and is reminiscent of a military encampment. The Grand Hall of Administration, as the palace’s principle building, was a stage for the Great Khan (as the Manchu emperor was called) to hold court, to inspect his army, and to perform grand rites.

Detail of a carved column at Shenyang Palace, former capital of China during the Manchu-ruled Qing dynasty.
This octagonal, south-facing, double-eaved pavilion on an elevated base incorporates hybrid decorative schemes originating from Tibetan, Mongolian, Manchurian, and Chinese cultures. On its front are ten smaller square pavilions in two equal rows extending outward to embrace an elongated quasi-trapezoidal courtyard. These buildings were offices for the chiefs that were leading military divisions called “Banners,” or administrative precincts in the Manchu government. They allude to the collapsible tent barracks previously used at court assemblies to house Banner chiefs, who were regularly summoned to collaborate with the Great Khan for policymaking. In conjunction with a carriage house behind the Grand Hall, the layout of these buildings visually explains the unique Banner administrative system, which was deeply rooted in a nomadic tribalism.

The main body of the palatial complex is the newer middle section, which consists of rows of mid-eighteenth century additions flanking structures built during 1627–1634. Across a large courtyard from the main entrance in the south is the administration building called the Hall of State Affairs. Beyond is the central courtyard in front of the Phoenix pavilion, a conspicuous, multi-story, hip-roofed structure whose façade doubles as the entrance to the northern courtyard still further behind. The northern sector is the venue of a ritual totem and the Pure Tranquility Hall, in which altars dedicated to ancestors and facilities for shamanistic rites are set next to the emperor’s and empress’s chambers. The entire complex of living quarters, consisting of the Pure Tranquility Hall, the Phoenix pavilion, and four lesser residence halls nearby, is planted on top of a terrace (3.8 m high) that is physically divided from the administrative offices to the south. The use of a high platform to elevate architectural structures from the ground level, in particular, is a distinct Manchurian trait reminiscent of the mountain dwellings of older days. These resident halls also are remarkable showcases of rich regional features of Manchu architectural forms. Among the unique features are variegated roof-ridge ornaments and eave trims, carved frontal animal masks on pillar tops, wooden dragon sculptures as beams under the eaves, along with heated platforms inside.

To the west is the site of a two-story book repository and an operatic performing center. Added to the complex in late eighteenth century, they were constructed to comply with official codes used nationwide. Comparable to typical Ming/Qing official architectures aesthetically and structurally, they appear distinctive yet blend well with older constructions within the palatial compound. Although the royal complex of Shenyang is a fraction of the size of the more famous Forbidden City in Beijing that succeeded it as the seat of Manchu power, its distinct character, rich history, and multifaceted architecture contribute to its status as a unique and irreplaceable element of the complex tapestry of Chinese imperial life.

Shenzhen Special Economic Zone

Shēnzhèn Tèqu 深圳特区

8.62 million est. 2007 pop.

Created as an economic experiment in 1979, the Shenzhen Special Economic Zone (SEZ) was originally intended as a means to promote growth and export for China. This zone quickly became one of China’s most important centers of export, technology, and economic reform.

Shenzhen is a city in the south of China’s Guangdong Province, on China’s south coast. It borders Hong Kong and the Pearl River, with an area of 2,020 square kilometers (slightly less than the size of Rhode Island), 327.5 square kilometers of which have been designated as a special economic zone (SEZ) since 1979. Shenzhen was only one of four SEZs established to carry out experiments with greater economic freedom. But the transformation of the former rural community into a major export center is the showcase of economic reforms in post-Mao China and has attracted worldwide attention, especially from other developing countries.

Historical Background and Foundation of Shenzhen SEZ

Since the 1960s, so-called export processing zones (EPZs) have been established in various parts of the world with the goal of attracting foreign direct investment (FDI) and promoting industrialization. While Latin America’s experience with EPZs has been mixed, East Asian countries such as South Korea and Taiwan have made their EPZs centers of export-driven growth.

Until the end of the Maoist era in 1976, the People’s Republic of China followed a strategy of development that was diametrically opposed to that of EPZs. The open-treaty ports of the nineteenth century, which had to accept free trade as a result of unequal treaties with the Western powers and Japan, were symbols of national decay. Therefore, Communist China followed a policy of self-sufficiency and isolation. However, China’s Great Leap Forward (1958–1961) and its Cultural Revolution (1966–1976) resulted in economic and political catastrophe.

After the death of Mao Zedong (1893–1976) and the arrest of the Gang of Four, his hard-line supporters, new leadership under Deng Xiaoping (1904–1997) changed China’s economic-development strategy. In July 1979, Guangdong and Fujian provinces were granted the right to carry out economic experiments, and four SEZs were set up: Shenzhen, Zhuhai, and Shantou of Guangdong Province, and Xiamen of Fujian Province. Later, in 1988, the island of Hainan (formerly a part of Guangdong Province) became the fifth SEZ, as well as its own province. All of these were coastal regions, rich in labor, and located close to the successful market economies of Hong Kong and Taiwan. The economic opening of these regions was intended to promote growth and exports, but the possibility of growing economic ties with Hong Kong and Taiwan was also seen as facilitating eventual reunification.
Development of Shenzhen SEZ

The newly established town of Shenzhen had originally been a county called Baoan, whose residents earned their living mainly from fishing. When Shenzhen city was established in 1979, it had 314,000 inhabitants. In 2000, it was a town of around 4 million inhabitants; by 2007 the population had doubled.

The development of Shenzhen SEZ can be divided into four phases. The first phase, lasting from 1979 to 1984, saw the establishment of some legal preconditions for the existence of a special economic regime in the SEZ, but only slow changes in economic activity. In 1984, Deng Xiaoping set up an economic framework for the SEZs as “windows to technology, management, knowledge, and foreign policies,” opening a second phase in the institution of preconditions for growth. The inflow of foreign capital, mainly from Hong Kong, slowly accelerated from the mid-1980s, but production processes, contrary to expectations, were mostly characterized by low-technology intensity and were based on the comparative advantage of Shenzhen’s low labor costs. Twice, in 1985 and after the events in Tiananmen Square in 1989, the SEZs were criticized by conservative Communist Party leaders.

In the early 1990s, the third phase of development began. During this takeoff period, foreign companies from all over the world rushed in, and by 1997, fifty-one of the world’s top five hundred enterprises had taken root in Shenzhen. The export volume of Shenzhen increased to around one-seventh of China’s total ($26 billion in 1998). Deng’s much-publicized trip to Shenzhen in 1992 (as part of his “Southern Tour”) helped gain the trust of domestic and foreign investors. The technology intensity of production also increased, and in 1998 more than 35 percent of Shenzhen’s production was in the high- and new-technology sectors.

The fourth phase of development began with the challenge of the Asian financial crisis in 1997 and China’s preparation for entry in the World Trade Organization (WTO). While competition in the domestic market is tougher due to market entry of new competitors and more domestic competition, the WTO accession in 2001 has opened the world market even wider for Chinese exports.

Characteristics and Economic Effects of SEZs

When the EPZs were first established in various parts of the world, they were delineated as areas to provide procedural and operational ease for producers and to offer tax holidays, tax reductions, and duty-free import of capital goods and raw materials for export manufacture. This policy was designed to attract foreign direct investment (FDI), generate employment, earn foreign exchange, and eventually link the less-developed hinterland and facilitate technology transfer and transfer of modern-management practice. Infrastructure in the EPZs was limited to industrial estate development.

The Chinese SEZs, by contrast, additionally focused on the provision of supportive infrastructure such as housing, airports, roads, ports, telecommunications, electricity, and transportation. Also, the reform activities expanded to include agriculture, commerce, development of the financial sector, including the opening of a stock exchange, tourism and the service sector, and increasingly since the mid-1990s, privatization of state-owned enterprises and housing. This expansion enabled
Shenzhen SEZ to escape from the fate of many EPZs, which attracted only labor-intensive, low-technology production processes with few possibilities for economic development of the hinterland. Since a general liberalization of the Chinese economy was not possible because of political considerations, the SEZs served as a model for the reform of the rest of the economy in a politically closely controlled area. This indirect effect of the SEZs as models for the economy is as important as the direct effect of the attraction of FDI and the transfer of technology and modern management practices.

**Future of Shenzhen SEZ**

Shenzhen SEZ not only became one of the centers of export, technology, and economic reform in China, but it gradually was able to cope with such early problems as growing inequality, the fate of migrant workers, and environmental degradation.

As China moves through the early years of the twenty-first century, however, the economic position of Shenzhen SEZ must be redirected. Labor costs are increasing, and firms are migrating to cheaper locations. The mushrooming of SEZs and the introduction of open ports and special zones for technological development as well as general economic reforms in China make competition for FDI harder. In the future, the upgrading of production and infrastructure, especially in areas such as education, will be crucial for Shenzhen SEZ.

Shenzhou Space Project
Shènzhōu Jīhuà 神舟计划

China began work on its Shenzhou Space project in 1992. Since 1999, the project has successfully launched seven spacecraft, three of which were manned (starting with the Shenzhou-5 in 2003), and one of which (in 2008) included a space walk. The space program is a source of national pride, a demonstration that China has the technology to keep pace with other developed countries.

China began planning for manned space flight in the late 1970s. Because of shifting political and economic priorities, though, no serious work was begun until 1992, with the creation of Project 921. In 1994 the project name was changed to the Shenzhou Space project. The project reportedly was named by then President Jiang Zemin (in office 1993–2003). Shenzhou 神舟 means “divine craft.” To date, there have been seven Shenzhou missions. The first manned mission was Shenzhou-5 in 2003. The project has become a tremendous source of pride for China, as it became the third country capable of independently rocketing humans into earth orbit.

After mastering ballistic reentry techniques in its space program, China began the Shuguang-1 (meaning “Dawn”) project in the late 1970s to launch Chinese astronauts into space. However, the project was postponed for two decades because of political and financial reasons, although during the 1980s Chinese experts debated whether to use a modest ballistic capsule design or a highly advanced two-stage reusable space shuttle.

On 21 September 1992, Project 921 was begun, with some help from Russia, to develop a spacecraft with the capacity for human flight by 2000. In 1994 the spacecraft was formally named Shenzhou.

The early Shenzhou spacecraft were similar to the Russian Soyuz spacecraft but larger and with all-new construction. The spacecraft had three modules: the orbital module at the front, the reentry capsule in the middle, and the service module at the base. Unlike the Soyuz, the orbital module was equipped with its own propulsion, solar power, and control systems, allowing autonomous flight. Since the late 1990s, Shenzhou spacecraft have been launched on Long March-2F (LM-2F) booster rockets from Jiuquan, Gansu Province, in northwest China.

The first launch of a Shenzhou spacecraft was on 21 November 1999. It orbited the Earth fourteen times before it landed under parachute in Inner Mongolia twenty-one hours after liftoff. The Shenzhou-2 spacecraft was launched on 9 January 2001. It completed 408 orbits over a seven-day flight. Shenzhou-3, launched on 26 March 2002, carried human physical monitoring sensors and dummy astronauts. The last unmanned flight, Shenzhou-4, was launched on 30 December 2002. It also carried a test dummy and performed several scientific experiments.

The first piloted spacecraft was Shenzhou-5, launched on 15 October 2003. Yang Liwei was China’s first astronaut, or taikonaut (taikong means “space” or “cosmos” in Chinese) or yuhangyuan (Chinese for “space navigators”). Yang orbited the Earth for twenty-one hours and became a national hero. The second manned flight, Shenzhou-6,
was launched 12 October 2005, carrying two taikonauts, Nie Haisheng and Fei Junlong. By most accounts this flight is considered the event that proved China was capable of carrying out its own space program. Finally, on 25 September 2008, Shenzhou-7 was launched from the Jiuquan Satellite Launch Center, carrying a crew of three. The three-day mission featured a successful space walk. China joined the United States and Russia as the only countries to have completed a space walk.

Thousands of Chinese engineers and technicians from more than three hundred organizations have contributed to the research, design, assembly, test, launch, and recovery of Shenzhou spacecraft. By the end of 2003, when the first flight carrying a person was accomplished, China reportedly had spent $2.3 billion on the project, of which $1 billion was spent on the building of infrastructure. Despite the cost, the space program is a tremendous source of pride for millions of Chinese. When Shenzhou-6 was launched on 12 October 2005, President Hu Jintao watched it live at the Beijing Aerospace Control Center and had a brief conversation with the two astronauts, telling them “the motherland and people are proud of you” (People’s Daily, 2005).

Hailing the successful five-day space flight, Premier Wen Jiabao reiterated China’s policy of peaceful use of space. Many people view the project as a way for China to demonstrate its world power status, and countries around the world have had quick and generally positive responses. The U.S. State Department congratulated China on the successful launch, and the Russian Federal Space Agency welcomed another power to the “space club” and looked forward to further cooperation in all areas.

Inspired by its success, China has ambitions for future space exploration. Although no official projects have yet been begun, China hopes to put a space station in orbit by 2010, to land an unmanned probe on the moon by 2011, and to land a taikonaut on the moon by 2017.

The *Shijing*, roughly translated as “classic songs,” are a collection of folk songs, hymns, and narratives that date back to at least the fourth or fifth century BCE and are considered the foundation of literary and cultural tradition in China. Scholarship on the *Shijing* involves studying the songs as guides to character enhancement, records of political history, and reinterpretations of the language.

The *Shijing* (also translated as "Classic of Songs," "Book of Songs," "Canon of Odes," or "Classic of Poetry") stands at the fountainhead of the Chinese literary and cultural tradition. In the earliest stratum of the Confucian canon the *Shijing* is referred to simply as the *Shi* (Songs); not until the second century BCE do texts begin to call it a *jing* (classic). Recorded in the historian Sima Qian’s (c. 145–86 BCE) *Records of the Grand Historian* is a much-debated legend that the *Shijing* was drawn from a large body of Western Zhou dynasty (1045–771 BCE) songs and was refined and edited by Confucius (551–479 BCE) into a fixed canon of 305 songs. Modern research substantiates at least two aspects of this account: First, the *Shijing* had indeed evolved into its final form by the fifth or fourth century BCE; second, many songs in the anthology are genuine artifacts of Western Zhou performances regularly held as part of state ritual apparatus.

By the Warring States period (475–221 BCE) the original music, dance, and other elements of the songs' performance had been lost and were no longer centerpiece of state rites. This loss of ritual context around the *Shijing*, however, did not end transmission of the songs. During the politically chaotic fifth and fourth centuries BCE the *Shijing* was widely chanted, quoted, and alluded to during diplomatic exchanges. It was also firmly established among the elite classes as a source of didactic, morally suasive power and was considered privileged access to the morally enlightened times of antiquity. Transmission of the *Shijing* as a didactic social and literary force was to continue throughout imperial times.

**Mao Songs**

The only complete version of the *Shijing* still extant is the *Mao Shi* (Mao Songs), containing 305 songs together with a strain of commentary dating to Han dynasty times (206 BCE–220 CE). This version was named after its senior compiler, Mao Heng, a scholar in the employ of Prince Xian of Hejian (d. c. 130 BCE). The discrepancies we observe between the *Mao Shi* and fragments of other *Shijing* versions datable to the Han dynasty or earlier seem to stem from scribal variations of one single orally stable prototext. These discrepancies among written versions of the *Shijing* were the impetus for the polemics of the “Three Schools,” namely, Qi, Lu, and Han. These state-sanctioned traditions of *Shijing* scholarship produced different strains of commentary, which are now lost except for fragments scattered in quotations in other early texts. The *Mao Shi* assumed orthodoxy sometime after
the Confucian scholar Zheng Xuan (127–200 CE) wrote his commentary to this edition.

The Mao Shi is divided into four sections, with narrative content as the organizing principle. The largest section is called the “Airs of the States” (Guo feng). It contains mainly gentrified folk songs from fifteen feudal states. The second section is the “Minor Elegantia” (Xiao ya), with content similar to the “Airs” but with more emphasis on articulated political grievance. The third section, called the “Greater Elegantia” (Da ya), contains songs of grandiose texture, many of which are now understood to be third-person scripts of ritual performances. The last section is called the “Hymns” (Song). It contains solemn lyrics to collectively performed liturgy from the states of Lu, Zhou, and Shang. Scholars have construed some of the hymns of Zhou intertextually, with transmitted texts and bronze inscriptions of the Western Zhou dynasty, to reconstruct the kingdom’s important multimedia ritual performance that commemorated the conquest of the Shang dynasty (1766–1045 BCE).

The language and literary devices of the Shijing deeply influenced Chinese poetics throughout the ages. The “Airs” in particular were cited by later poets as a literary ideal of elegant simplicity and directness. Furthermore, the Mao Shi carried on an earlier tradition that associated one of three literary devices with each song. These are the fu, bi, and xing, terms originally understood as something akin to “narrative,” “analogical,” and “evocative stimulus.” These terms evolved during the next millennia and played a central role in Chinese poetics.

Scholarship and Interpretation

From the Warring States period through Republican China (1912–1949) there were roughly four distinct phases of Shijing scholarship and interpretation. The earliest, dating from the fourth and third centuries BCE, is focused on studying the Shijing for character enhancement and career advancement. In the Analects, for example, competency with the Shijing is typically promoted as a means to improving an individual’s ceremonial conduct and rhetorical capabilities. The prevalence of this perspective in the fourth century BCE is supported by a cache of bamboo strips dated from this period that were recently recovered by the Shanghai Museum from tomb thieves. One of these texts is retrospectively entitled the Kongzi Shi lun (Confucius Discusses the Songs). No consensus exists on many paleographic (relating to writings of former times) and other basic questions regarding this important monument in Shijing history.

The second phase of Shijing scholarship focuses on the role of the songs as records of political history. Fully mature in the Han dynasty, this kind of scholarship produced synoptic (affording a general view of a whole) prefaxes and glosses recorded, for instance, in the Mao Shi. Han scholars read the Shijing by reconstructing for each song a geopolitical context. This contextualization allowed scholars to find in the Shijing politically oriented praise or blame allegories.

The third phase is represented by the Shijing zheng yi, a centerpiece of the monumental Zheng yi (Correct Significance) project of the seventh century. Chief editor Kong Yingda (574–648) followed the Mao Shi text, including the Mao-Zheng commentaries, and appended important glosses by Lu Deming (556–627). Kong and his editorial committee added extensive new commentaries that laboriously expand on, rather than question, the interpretations reflected by the Mao-Zheng commentaries. This new hermeneutic is one of synthesizing a definitive orthodox reading of the Shijing.

The most recent phase of scholarship is marked by a renewed attention to the language of the Shijing as it may be understood by painstaking philological research rather than by the normative interpretations of the Han dynasty and later periods. Qing dynasty (1644–1912) scholars such as Ruan Yuan (1764–1849), Chen Huan (1786–1863), and Ma Ruichen (d. 1853) are the most representative.

Today the Shijing continues to intrigue scholars, particularly as new intertextual methods are applied to understand the ritual context surrounding the songs. Archaeological findings also continue to invigorate the field of Shijing studies, which remains as lively as it ever was.

Translation from the Shijing

The songs of the Shijing have been translated into English by a number of prominent scholars since the eighteenth century. The translation of this song is by James Legge (1814–1897).

黍离  SHU LI

彼黍离离，彼稷之苗
行邅靡靡，中心搖搖
知我者，謂我心憂，不知我者，謂我何求
悠悠蒼天，此何人哉

彼黍離离，彼稷之穗
行邅靡靡，中心如醉
知我者，謂我心憂，不知我者，謂我何求
悠悠蒼天，此何人哉

彼黍離離，彼稷之实
行邅靡靡，中心如噎
知我者，謂我心憂，不知我者，謂我何求
悠悠蒼天，此何人哉

There was the millet with its drooping heads;
There was the sacrificial millet into blade.
Slowly I moved about,
In my heart all-agitated.
Those who knew me,
Said I was sad at heart.

Those who did not know me,
Said I was seeking for something.
O distant and azure Heaven!
By what man was this [brought about]?

There was the millet with its drooping heads;
There was the sacrificial millet in the ear.
Slowly I moved about,
My heart intoxicated, as it were, [with grief].
Those who knew me,
Said I was sad at heart.
Those who did not know me,
Said I was seeking for something.
O thou distant and azure Heaven!
By what man was this [brought about]?

There was the millet with its drooping heads;
There was the sacrificial millet in grain.
Slowly I moved about,
As if there were a stoppage at my heart.
Those who knew me,
Said I was sad at heart.
Those who did not know me,
Said I was seeking for something.
O thou distant and azure Heaven!
By what man was this [brought about]?

The old neighborhoods of Shanghai are characterized by the dense juxtaposition of narrow multi-storied residential buildings called shikumen. These iconic dwellings are packed tightly in neighborhoods that are often separated from each other by gates.

Whereas in Beijing siheyuan are the quintessential courtyard dwellings, and hutong are the associated lane-neighborhood communities, in Shanghai the distinctive multistoried residences and neighborhoods are called shikumen and lilong (also longtang), respectively. Beijing’s traditional urban fabric emerged over more than half a millennium, from the Yuan dynasty (1279–1368) onward, whereas Shanghai’s emerged only during the late nineteenth and early twentieth centuries. Thus, it is not surprising that shikumen housing reveals a blend of Chinese and Western elements that reflect the city’s emergence as China’s most important entrepôt.

Built first to accommodate Chinese who were moving in large numbers from other places into the foreign concession areas in the nineteenth century, shikumen and lilong subsequently proliferated throughout the metropolitan area to meet the needs of those with different incomes even to the 1940s. Variations in structure and ornamentation, which are still observable today, reflect changing styles and varying real estate markets. Domestic urban architecture with a European flavor is found in other Chinese coastal and riverine cities, but shikumen and lilong represent a uniquely hybrid house type and community.

Shikumen, small townhouses located off of narrow alleys, are the traditional building style of Shanghai. Photo by Tom Christensen.
typically includes a central main room and two secondary rooms, used usually as bedrooms, which open toward a small courtyard or skywell that admits light and exhausts heat. A staircase reaching to the second story is usually located at the back of the central room. In the rear, sometimes adjacent to a narrow skywell, are a kitchen and storage rooms. In some areas of Shanghai these rear rooms open onto a narrow service lane. Unlike in Beijing hutong, where one encounters horizontality created by the gray walls—with only decorated gates breaking the line—multistoried shikumen draw the eye upward to catch glimpses of variegated gables as well as tall, ornamented gates.

The entryway to individual shikumen is usually through a prominent stone gate with framing pillars as well as lintels and pediments above. The affinities with Western classic orders and carved or molded adornment in European styles are often striking. Frequently one encounters bold numbers above the doorway that indicate the year of construction, clearly a Western convention, while carved Chinese characters declare a name, which reveal its Chineseness.

Lilong neighborhoods are arranged in a hierarchy involving streets, lanes, sublanes, and individual shikumen that provides a layering of public space, semipublic space, semiprivate space, and private space. In the past gates and lanes served to modulate activities and define relationships. Neighborhood shops in lilong generally face outward along a series of broader streets. Set into the row of shops is typically a gate leading into the residential lanes and sublanes. It is especially in the lanes and sublanes that neighbors gather to socialize on hot evenings and during the day. Since many of the interior sublanes terminate as dead ends, their spaces are used by nearby residents as places to safely store bicycles and other belongings.

In recent years lilong neighborhoods with countless cramped shikumen, some beyond salvaging but many others still inhabitable, have been demolished to make way for contemporary high-rise residential and commercial buildings as well as improvements in transport infrastructure. In the wake of the extensive razing of old neighborhoods, more voices have belatedly been raised concerning conservation of the architectural fabric of Shanghai. Seen by some as a success and by others as a failure in conservation is Xintiandi, a high-profile development to adapt a neighborhood of shikumen as a shopping, dining, and entertainment area. Occupying a small fraction of a once-vibrant urban community now razed and uprooted, Xintiandi is in many ways a mere shell gutted and reconstructed to serve only commercial rather than mixed residential-commercial purposes.

Sichuan Province ▸
Sichuan Province, renowned worldwide for its cuisine, is one of China’s agricultural heartlands, thanks in part to the 2,300-year-old irrigation system still in use. The province, one of China’s most populous, played a key role in the early years of Deng Xiaoping’s reform program to decentralize the economy. The 12 May 2008 earthquake killed more than seventy thousand people in Sichuan.

Sichuan (Szechwan) Province is located on the upper reaches of the Yangzi (Chang) River. With a land area of 485,000 square kilometers (slightly smaller than Spain) and an estimated population of 81.27 million, it is one of China’s most populous provinces. It borders Qinghai, Gansu, and Shaanxi provinces to the north; Hubei and Hunan provinces to the east; Guizhou and Yunnan provinces to the south; and Tibet (Xizang) Autonomous Region (TAR) to the west. For centuries it has played a key role in China’s economy and in relations with Tibet and other western regions. Sichuan also plays an important role in China’s plans to develop the interior of the country.

Archaeological evidence at Sanxingdui just north of the provincial capital of Chengdu (with an estimated 2007 population of 11.12 million) suggests that Sichuan was inhabited as early as the eleventh century BCE by a technologically advanced people whose culture was distinct from that of the north China heartland. By 311 BCE the kingdoms of Ba (in eastern Sichuan) and Shu (in western Sichuan) had fully developed. In that year the armies of the Qin state from northern China incorporated the territories of Ba and Shu into the Qin empire, although the names of the two kingdoms are still used to refer to the Chongqing area (part of Sichuan until a 1997 administrative reorganization) and the Chengdu area, respectively.

Governors of Qin established a regional capital at Chengdu, and Qin engineers built the Dujiangyan waterworks on the Min River west of the city, making the Chengdu Plain a productive agricultural center. However, Sichuan’s geography—surrounded by mountain ranges and the Yangzi (Chang) River gorges—kept it relatively isolated from the rest of China. The Qin constructed a highway from their capital near the Huang (Yellow) River southwest into Sichuan, carving ledges into the steep mountain slopes. During the Tang dynasty (618–907 CE) Buddhism flourished, and many monasteries were established in Sichuan. The Great Buddha at Leshan, the world’s largest stone statue of Buddha, was carved into a cliff along the Min River south of Chengdu. During the last thousand years Sichuan has been a center of the horse and tea trade with Tibet. Sichuan also supplies rice, silk, sugar, and medicinal products to eastern China. Salt wells drilled as deep as 1,460 meters produce brine, which is boiled down using local deposits of natural gas.

Resettlement and Reassignment

The word Sichuan (four rivers) was applied to the area during the Yuan dynasty (1279–1368). At the end of the
Ming dynasty (1368–1644) the Sichuan population was devastated by a rebellion. The Qing dynasty (1644–1912) promoted resettlement of the area by emigrants from eastern China. Many settlers from Hunan and Hubei brought their spicy culinary culture which, combined with influences from other parts of China and local innovation, produced the world-famous Sichuan cuisine. After the Qing dynasty fell in 1912 Sichuan remained isolated from national politics until 1937, when it became the base of anti-Japanese resistance. In 1939 the Chinese Nationalist Party government created a new province, Xikang, out of parts of western Sichuan and eastern Tibet. In 1955 the People’s Republic of China government dismantled Xikang and reassigned its territory to Sichuan, with the result that the population of western Sichuan today includes many Tibetans and other national minority groups. Although they only represent about 5 percent of Sichuan’s population, the Tibetans (Zang), Qiang, Yi, Moso, and other
minority peoples are spread widely over the vast moun-
tainous regions of western Sichuan.

Deng Xiaoping, who became China’s leader after the
death of Mao Zedong in 1976, was a native of Guang’an
in eastern Sichuan. The province played a key role in
the early years of Deng’s reform program to decentralize the
economy. Deng’s close ally Zhao Ziyang, as provincial
Chinese Communist Party secretary in Sichuan during
the late 1970s, launched what came to be called the “house-
hold responsibility system,” dismantling communes and
giving farmers more freedom to manage their fields and
to market their surplus crops as they chose. Policies first
adopted in Sichuan Province soon spread across the coun-
try, leading to dramatic increases in agricultural output.

Sichuan Province is home to the Xichang satellite-
launching center and many scientific research institutes.
Large government investments in transportation and
energy networks have been made to promote the eco-
nomic development of Sichuan. The new dam in the
Yangzi River’s Three Gorges area, for example, is being
built to provide electricity for much of western China.
It is hoped that the dam will meet 10 percent of China’s
energy needs, but the environmental and societal costs
are great; an estimated 1.3 million people have been dis-
placed by the dam’s construction. The dam is projected
to be completed in 2009.

Sichuan Province and Chongqing (a province-level
municipal area with a population of over 28 million) are
the focal regions of the central government’s “Develop
the West” campaign. The campaign, begun in 2000, is
designed both to tap the resources of western China and
to reduce the cultural and economic disparities between
interior and coastal China. Many of eastern China’s mi-
grant laborers are Sichuan natives. By developing infra-
structure and luring foreign capital to Sichuan and other
western provinces, the government hopes to stem the flow
of migrants, thus alleviating social problems caused by
the division of families and political problems caused by
disadvantaged migrant communities in the coastal cities.
Provincial and local governments have promoted tourism
around many cultural and scenic sites, including the hot
springs at Jiuzhaigou in the northwest and the National
Nature Reserve at Wolong, home of the largest popula-
tion of giant pandas in captivity. China’s largest private
museum, the Jianchuan Museum Cluster, opened west
of Chengdu in 2005. The museum has the world’s most
extensive collection of artifacts from the War of Resis-
tance against Japan (1937–1945, known outside China as
the Second Sino-Japanese War) as well as from the Cul-

2008 Earthquake

On 12 May 2008 an earthquake measuring 7.9 on the
Richter scale and centered at Wenchuan in the Himala-
yan foothills west of Chengdu destroyed many Sichuan
communities and killed more than seventy thousand
people. Although aid from the government and private
donors quickly reached the stricken areas, the earthquake
may have long-term effects on Sichuan’s economy. Many
cultural sites, including the temple next to the ancient
Duijiangyan waterworks, were damaged. The collapse of
many school buildings, even as nearby government offices

© 2009 by Berkshire Publishing Group LLC
and residential complexes withstood the earthquake, has laid Sichuan officials open to charges of corruption. Many parents lost children in school buildings that may not have been constructed to comply with building codes. It is uncertain whether the earthquake will stimulate reform in Chinese administration and construction practices. The Chinese government’s three-year redevelopment plan is estimated to cost $150 billion and will include the complete relocation of Beichuan, one of the hardest hit Sichuan towns. In October 2008, the World Bank announced that loans amounting to $510 million would be allocated to Sichuan to support earthquake recovery efforts.

Silk

Silk production in China has evolved for thousands of years but remains tied to the life cycle of the silkworm and its sole diet of mulberry leaves. Silk was such an important product during ancient times that the major trade route between East Asia, West Asia, and Europe was called the “Silk Roads.” Its status as a luxury item remains the same today, and China continues to be the world’s largest silk producer.

Although the exact origins of sericulture (the production of raw silk from silkworms) are not known, experts agree that it began in China about 2500 BCE. Chinese mythology supports this date. In one popular myth the empress of a legendary emperor is credited with intensifying mulberry tree cultivation, breeding and raising silkworms, and inventing the loom in 2640 BCE. This myth also is important because it acknowledges the major role that women played in silk production and processing.

Production of silk was a vital part of the rural economy, and through the centuries many technical advances speeded up the production of silk thread. However, weaving remained difficult and time consuming until the invention of mechanized looms in the twentieth century. Although silk was produced mostly in rural areas, it was usually woven in urban centers for the imperial court or for well-to-do city dwellers, and people often paid raw silk cloth as taxes to the central government.

In about 140 BCE, during the Han dynasty (206 BCE–220 CE) silk production spread from China to India and to Japan a few centuries later. It spread to Europe in about 550 CE (during China’s Southern and Northern Dynasties period, 220–589 CE) when the Byzantine Emperor Justinian I asked two Persian monks to smuggle silkworms from China. In fact, silk was such an important product during ancient times that the major trade route between East Asia, West Asia, and Europe was called the “Silk Roads.” The Chinese traded silk for gold, silver, and wool.

China at the beginning of the twenty-first century remains the world’s major producer of silk, accounting for about 80 percent of the world’s silk. However, the development of synthetic fibers such as rayon (beginning in 1910) and nylon (beginning in the late 1930s) has decreased the demand for silk clothing. As it was in ancient
times, silk continues to be a luxury item but is no longer a major export for China.

**Silkworm Life Cycle**

The life cycle of the silkworm (*Bombyx mori*) largely determines silk production. Silkworm caterpillars hatch from eggs and need large amounts of mulberry leaves for food. Their growth period lasts from thirty-four to thirty-five days and is interrupted by several periods of dormancy. At the end of this period of growth, the caterpillars spin cocoons of a single strand of silk thread that can be from 600 to 900 meters long.

The adult moths, under natural conditions and uncontrolled by humans, would then emerge from the cocoons and reproduce. However, for silk production the emergence of the moth from the cocoon would be a disaster: The emerging moth breaks the silk strand and renders it virtually useless for cloth production. Thus, most moths are killed while still in the cocoon, although a few are allowed to reach maturity for breeding purposes.

**Mulberry Tree Cultivation**

Most phases of the life cycle of the silkworm are controlled by careful regulation of mulberry leaves (the
A woman inspects the completed cocoons. PHOTO BY PAUL AND BERNICE NOLL.

silkworm’s sole food) and temperature. In early times mulberry trees were planted in orchards, and new varieties were developed. The most crucial development had occurred by the twelfth century, with perfection of a method of grafting a leafy variety of tree onto the trunk of a hardier variety. Agricultural treatises of the twelfth century describe the method and suggest that silk producers everywhere adopt it. Use of such grafts permitted two crops of leaves a year in the central region of China and three in the southern regions.

**Controlling the Process**

Providing the silkworms with leaves was always of great importance, and in the fifth century a method was invented to regulate the hatching time of silkworm eggs to coincide with maximum leaf production. The eggs were bathed in cold water to lower their temperature and to delay hatching, often for as long as twenty-one days. The addition of periods of warming and cooling during the thirteenth century improved the method and had the extra advantage that eggs that contained malformed or weak worms could not survive the changes in temperature. After the eggs hatched growers found it best to have the worms grow as quickly as possible, and thus various techniques for warming the growing sheds were devised. During the sixth century fires of burning manure were generally used, although such fires sometimes produced unwelcome smoke. By the twelfth century small portable stoves had been invented. They warmed the sheds without producing smoke and could be removed if necessary. Large-scale silkworm operations often had large fire pits in the growing sheds. Such fires would be lit five to seven days before the eggs hatched and were left to warm the sheds during the growth phase of the worms. With these methods the growth phase of the silkworms could be reduced to just twenty-nine to thirty days.

**Reeling the Thread**

Reeling the silk fibers of the cocoons into thread was preferable while the moths were still alive in the cocoons because doing so produced a higher quality of silk, but this technique was impracticable because it was so labor intensive. Because most silk thread was produced by small rural operations that lacked large workforces, the moths were killed before they could damage their cocoons. Three methods commonly used to kill the moths were leaving the cocoons out in the sun, salting them, and steaming them in ovens. By the nineteenth and twentieth centuries, when mass production began, steaming became the most common method.

Reeling the thread involves unraveling the cocoons and twisting several fibers together to form a thread and then winding the thread onto a reel. This process can be done by hand, but by the late eleventh century a treadle-operated reeling frame had been devised. It allowed one person to reel large amounts of yarn relatively quickly. The design of the frame took into account the qualities of silk. The cocoons were placed into a basin of heated
water because water loosened the fiber in the cocoons. The heat caused the fibers to move and twist of their own accord. The motion of the water caused the threads to be more rounded. However, despite this technical advance, silk reeling required constant labor after it was begun and was difficult and time consuming.

**Weaving Technology**

Weaving lent itself less readily to improvements. The reeled yarn had to be made into the warp (a series of yarns extended lengthwise in a loom and crossed by the weft) and weft (a filling thread or yarn in weaving) by a spindle wheel. Preparation could take days. Two people were needed to operate the loom to weave just plain silk, and if elaborate designs were to be added, the production of even small quantities of cloth could take weeks. Early silk-weaving operations were run by weaving families who worked from their own homes, and many of the practices were passed down for hundreds and hundreds of years with little change. Technological innovation in silk production reached its zenith during the Song dynasty (960–1279), but not until the founding of the first modern silk-weaving factory in 1905 in Hangzhou was the silk industry further transformed.

The silk cloth, after it was woven, could be left raw, or it could be “finished” by being boiled in a solution of ash, steeped in soap overnight, and rinsed to render it softer. Many peasants produced silk to pay taxes and thus left the cloth raw.

**Silk in Society**

Much production of silk took place in rural areas, but complicated designs were usually woven in urban workshops or imperial factories that produced elaborate luxury goods for aristocrats, the imperial court, or wealthy city dwellers. Silk was a luxury, and it was jealously guarded by the imperial court, which often stockpiled bolts of silk instead of precious metals. During the Song dynasty, when foreign invasion threatened the imperial government, silk was an important diplomatic tool, with millions of bolts of cloth paid in tribute during the eleventh and twelfth centuries. Rulers also used silk to reward outstanding acts, to pay government officials, and to give relief to victims of disasters.

Use of silk in everyday dress was strictly regulated by sumptuary (relating to personal expenditures and especially extravagance and luxury) law. Laws were also enacted against the use of gold thread, garments of certain colors, “foreign” styles of dress, and embellished silk. Certain patterns were reserved for the imperial court. Although penalties such as caning and jail sentences were meted out, these laws seem to have been largely ignored by people who were wealthy enough to afford luxury items. Enemies of the Chinese were also aware of the prestige attached to clothing because they often asked for certain grades of silk cloth with decorations reserved for the imperial family as tribute.

**Further Reading**

Silver, originally used solely as ornamentation, was the most important currency of late imperial China, although it came mainly from abroad. A global silver shortage in the early nineteenth century almost overturned the Qing dynasty, which was temporarily rescued by an increased supply of silver due to the sale of silk and tea abroad. It was not until 1935 that the Chinese government controlled the monetary system by putting China onto the paper currency system.

Silver has been important in Chinese history, particularly for its use as money during the late imperial period. Before the fifteenth century, when silver became more important as money, people used silver mostly for ornamentation.

China’s main form of money during the imperial period was copper coins, which had been cast by the state since the late Warring States period (475–221 BCE). Around 1800 China’s copper coins were worth only about one hundredth the value of silver, with silver’s value relative to that of gold being between 1:14.5 and 1:15.1. The long-standing use of copper coins in Chinese history indicates that China engaged in small-scale commercial exchanges. On the other hand, China’s vast territory and diverse products in various regions necessitated money for large-scale exchanges. Gold or bronze of higher quality was used for storage of greater wealth and for exchange of larger scale from the Warring States period to the Han dynasty (206 BCE–220 CE). During the Han dynasty silver and deerskin also were used for storage of wealth. During the chaotic Southern and Northern Dynasties period (220–589 CE, known as China’s Dark Age), and Tang dynasty (618–907 CE) a barter economy based on woven products dominated because of the lack of trust entailed by the invasion of the northern intruders; the weak central government of Eastern Han, the Cao-Wei and the Jin Dynasty allowed many Non-Chinese tribes (referred to as the Sixteen Kingdoms of the Five Barbarians) to intrude on Chinese territory in the northwest. During wartime, production and exchange could not be engaged normally, because the money lent might not be returned. From the Song dynasty (960–1279) to the early Ming dynasty (1368–1644) convertible paper notes were mainly used for large-scale exchange. From the middle Ming dynasty until 1935 silver replaced paper notes for large-scale exchange. Silver was weighed and not coined by the state before 1910.

China began using silver cast into ingots during the Yuan dynasty (1279–1368). Qing dynasty (1644–1912) evidence shows that the government stipulated in what shape silver could be cast. Bank shops, which are different from banks in that they are privately owned and do not accept non-security loans, cast silver into ingots. The name of the bank shop or of the craftsman who cast the ingot, rather than the likeness of a king or queen, was cast on the ingot. Because Chinese people referred to silver coins from abroad as “Buddha head” to denote a king’s likeness or “Two pillars” to refer to the “II” in the words “Charles II” or “Philip II” on a coin, we can see that Chinese people had a vague concept that silver coins symbolized...
sovereignty. Not until Republican China (1912–1949), though, were silver coins cast by the state and bore the likeness of national leaders, as Western coins do.

Foreign Dependence

Furthermore, silver during late imperial China came mostly from abroad through merchants. Other than in Yunnan Province, China had few silver mines. From 1550 to 1700 silver used in China came mainly from Japan and partly from Latin America. About 1700, when Japan’s silver mines were depleted and Japan began keeping the remaining silver for its own use, Latin America provided more silver for China than did Japan. After 1775 almost all silver for China came from Latin America. During the sixteenth and seventeenth centuries the Spanish and Portuguese governments established companies to operate silver mines in Latin America and to bring back silver, mainly under the state’s custody. The Japanese shoguns

(military governors ruling Japan until the revolution of 1867–1868) opened the silver mines in Japan and controlled silver themselves. China acquired silver through merchants’ private international trade, and the government taxed a small part of it.

Paradoxically, from the fifteenth century onward the Chinese government designated silver as the means to pay taxes, and silver was much used for long-distance trade or large-scale transactions, particularly after the late eighteenth century. The supply of silver was crucial to China’s economy. Both the bottleneck period caused by the dominance of Japan silver over Latin American silver for China’s supply in the mid-eighteenth century and the decrease of the Latin American silver supply in the early nineteenth century threatened the Chinese economy. The early nineteenth century crisis almost caused the overthrow of the Qing Empire as its revenues were decreasing because the copper coins earners could not earn enough to pay taxes, or commodities from afar were charged in the more and more expensive silver. Social conflicts between the people and the government, between tenants and landlords, between craftsmen and merchants all partly contributed to the outbreak of the Taiping Rebellion (1851–1864), the largest rebellion in China’s history. The Qing dynasty could not pay its soldiers and officials for three years after this civil war broke out. The backflow of silver from international sales of China’s silk and tea between 1850 and 1887 was crucial to easing this Qing dynasty crisis.

Transition to Paper

Because this silver backflow took place when more opium was being imported from India by China, the fluctuation of the global silver supply was more important than opium importation for the early nineteenth-century silver outflow. This situation triggered the First Opium War (1839–1842) between Britain and China. During the late nineteenth and early twentieth centuries paper notes issued by foreign banks in China or by China’s own banks shared more silver for China’s money supply. Against this background the silver outflow, due to the American Silver Purchasing Act of 1934, did not damage the Chinese economy as seriously as the one during the early nineteenth century. Nonetheless, the outflow of the 1930s hastened China’s transition from the merchant-controlled silver economy to the state-controlled inconvertible paper notes system in 1935.

Sima Xiangru was the greatest writer of *fu* (rhapsody) in Chinese literary history. His *fu* became a model for emulation but also a target of criticism. His critics included Confucians who feared that the “healthy” content in his literature is overshadowed by excessively ornate depiction of scenes and objects.

Sima Xiangru (byname Zhangqing) was the greatest writer of *fu* (rhapsody), a poetic genre that thrived during the Han dynasty (206 BCE–220 CE). A native of Shu (modern Sichuan Province), he took a junior post during Emperor Jing’s reign (157–141 BCE). But because the emperor did not like *fu*, Sima left the post and became a member of the salon of King Xiao of Liang (d. 144 BCE). This salon played a pivotal role in the *fu* genre’s development, sustaining many famous *fu* writers such as Zou Yang (mid-second century BCE) and Mei Cheng (d. 140 BCE). Under the patronage of King Xiao, Sima composed the famous “Fu on Sir Vacuous.” Upon the king’s death Sima returned to Shu.

Sima was fond of swordsmanship. He was also famous for his romance with Zhuo Wenjun, whom he met on his homeward journey to Shu. When passing by Linqiong, he won the heart of the new widow Zhuo with his literary talents and seductive zither music. But Zhuo’s father refused the marriage; the lovers thus eloped to Sima’s hometown, Chengdu. Poverty pressed them to return to Linqiong, where they ran a wine shop. Zhuo’s father finally accepted their marriage and subsidized their livelihood. Adaptations of this story appeared in many works of literature in later ages.

Han emperor Wu (reigned 141–87 BCE) was an admirer and patron of Sima. Enraptured by Sima’s “Fu on Sir Vacuous,” the young emperor resolved to track down the author, who subsequently composed the “Fu on the Imperial Park.” This work earned him the post of gentleman.
He was later commissioned to a diplomatic posting in southwest China but lost favor after being charged with bribery. Soon thereafter Sima died of diabetes.

Sima brought the *fu* genre to a historical zenith. The word *grandiose* best defines his style. This style is achieved by the extensive use of descriptive phrases, hyperbole, and panoramic perspectives. Himself a lexicographer, Sima strove to find the most fitting word in the juxtaposition of spectra of colors, fauna, flora, buildings, plants, as well as in objective and emotional depictions of various objects. Carrying on the dialogue structure characteristic of the genre, Sima’s *fu* typically begins with a debate between two interlocutors, one of whom finally wins the debate. Sima also wrote in the Sao style of *fu*, which more closely adheres in form to the “Lisao” (Encountering Sorrows) by Qu Yuan (early third century BCE). Some of Sima’s famous Sao-style pieces are his *fu* on the abdicated empress Chen, one on the Great Man, and a lament for the second Qin emperor (reigned 210–207 BCE).

Sima’s *fu* became a model for emulation but also a target of criticism. His critics included Confucians who feared that the “healthy” content in his literature is overshadowed by excessively ornate depiction of scenes and objects.

Sino-American Commercial Treaty

Zhong-Mei Jingji Tiayue 中美经济条约

The Sino-American Commercial Treaty of 1946 was a controversial agreement aimed at providing the Nationalists with much needed wartime aid during their Civil War with the Communists. The Chinese Communists condemned the treaty as imperialist while segments of the American population criticized the commercial rights granted Chinese in the United States.

The Treaty of Friendship, Commerce, and Navigation (Sino-American Commercial Treaty of 1946), signed in Nanjing on 4 November 1946, was a comprehensive commercial treaty between the United States and China, the first such treaty concluded by either nation after World War II. Chief U.S. negotiators were U.S. Ambassador John Leighton Stuart (1876–1962) and U.S. Consul-General at Tianjin Robert Lacy Smyth. Chief Chinese negotiators were Wang Shih-ch'ieh, foreign minister, and Wang Hua-chang, director of the Treaty Department of China's Ministry of Foreign Affairs.

The purposes of the treaty included updating the January 1943 commercial treaty by which the United States had relinquished extraterritorial rights enjoyed in China since 1844 and developing a new framework for commercial ties between the two allies following the conclusion of the war. According to the U.S. Department of State announcement, the ten thousand-word treaty “is somewhat broader in scope than existing United States commercial treaties with respect to the rights for corporations, and includes... commercial articles similar in principle to the general provisions of recent trade agreements...” (Fox, 1947, p. 138). While the treaty may have been intended as a routine protocol, it was signed at a time when China was in the midst of a civil war between the Nationalist (Guomindang) government of General Chiang Kai-shek (1887–1975) and the Chinese Communists headed by Mao Zedong (1893–1976). The treaty was to serve as a mechanism for inducing an influx of U.S. capital for China's wartime recovery and economic development but ultimately proved ineffective. Although China's Legislative Yuan ratified the treaty on 11 November 1946, one week after the signing, the final ratifications were not exchanged in Nanjing until 30 November 1948. The treaty was put into force too late to affect positively the Nationalist war against the Communists. On the contrary, its provisions created a storm of controversy both in China and the United States.

Chinese Communist Party Chairman Mao Zedong used the treaty to bolster his campaign against the Nationalists, accusing his enemies of being the puppets of U.S. imperialism. Having declared 4 November 1946 “National Humiliation Day,” Communist leaders at Yanan ordered Chinese flags flown at half staff for three days after the treaty's signing. Mao vehemently denounced the original terms of the treaty, referring to it as “a commercial treaty of enslavement” in his October 1947 Manifesto of the Chinese People's Liberation Army (October 10th Manifesto). He proclaimed, “[T]o maintain his dictatorship and carry on civil war, Chiang Kai-shek has not hesitated to sell out our country's sovereign rights to foreign imperialism.”
Communist radio broadcasts announced: “The harshness and scope of the treaty far surpass the Twenty-One Demands that Yuan Shikai signed with the Japanese. The country will be subjugated and the nation exterminated if this treaty is carried out” (Orlean, 1948, 354). The Chinese Communists’ sentiments were echoed by the Soviets, who accused the United States of attempting to wrest control of China’s economy and return the country to a semicolonial state.

The inflammatory rhetoric was targeted at several articles in the treaty that encouraged U.S. investment in Chinese industry. China would benefit from capital, modern technology, and other resources, and, in a restatement of portions of the 1943 wartime commercial treaty, U.S. interests could eventually take control of much of China’s commercial development. While the provisions incurred the wrath of Chiang Kai-shek’s enemies, they were consistent with Nationalist appeals for U.S. aid at the time.

The treaty also ran into difficulty in the United States. After U.S. president Harry Truman (1884–1972) submitted the original version to the Senate for ratification, nearly two years passed before the Senate Foreign Relations Committee completed debate and put forward revisions. On 2 June 1948 the Senate consented to ratification “with a reservation and understandings.” The final ratification by the United States took place on 8 November 1948.

Among the problematic issues was language in the treaty that guaranteed equality, mutuality, and reciprocity for citizens of both countries, a significant change over earlier commercial treaties with China by which the United States and other foreign nations benefited from extraterritorial rights. As a result, provisions for “alien land ownership” became a concern for those states that regulated land ownership by foreigners or, as in the cases of Nevada and Oregon, specifically prohibited the ownership of property by Chinese. Debate in the Senate reflected the history of poor relations between Chinese and white U.S. citizens, particularly in the western states, that had resulted in a series of “exclusion laws” passed by the U.S. Congress in the late nineteenth century. Not until December 1943 did Congress pass the Act to Repeal the Chinese Exclusion Acts, an act that paved the way for naturalization and property ownership in the United States by Chinese. The 1946 commercial treaty would override discriminatory provisions still in effect. Several states, including Nevada and Oregon, revised outdated state laws soon after the signing of the Sino-American Commercial Treaty of 1946.

The final version of the treaty was proclaimed by President Truman on 12 January 1949, just months before the Chinese Communists’ victory and the establishment of the People’s Republic of China on 1 October. In 1951 the treaty was modified with acknowledgments by the Chinese Nationalist government on Taiwan that certain provisions were no longer applicable because of the Communist victory over the Nationalists. In March 1965 the U.S. Department of State notified Taiwan that portions of the treaty “were considered suspended with respect to areas of China not under control of the National Government of the Republic of China” (U.S. Department of State, 2008).

Sino-Japanese War, First ▶
The First Sino-Japanese War was a turning point in the modern history of East Asia: The victory of a smaller but more modernized Japan shocked the much larger, traditional Chinese empire. The war propelled Japan into the ranks of power and plunged China into political upheaval that continued into the twentieth century.

The First Sino-Japanese War was fought between August 1894 and April 1895. (The Second Sino-Japanese war, known to the Chinese as the War of Resistance against Japan, took place from 1937–1945; after 1939 the conflict joined with the worldwide struggle known as World War II.) It was started by Japan, which sought to take over China’s position of hegemony in Korea. Japan’s aggression was not motivated principally by China, but instead by fear of the West. Since the 1870s, Japan, unlike China and Korea, had adopted full-scale Western-style modernization, and this left them militarily exposed in an era of accelerating Western colonialism. Japan’s particular fear was that Russia would expand through northeast China and, by seizing Korea, could be in a position to destroy Japan. Historically, China had been the protector of Korea, and following a Japanese-backed attempted coup d’état in Seoul in 1884, Beijing had stationed troops in the peninsula to maintain order. An internal uprising in 1893–94 gave Japan an excuse to send its own troops to Korea. These were ostensibly to assist in restoring order but in reality they were meant to provoke conflict with China and create a pretext for war.

A series of prints by artist Hashimoto Chikanobu (1838–1912) showing Japanese troops surprising Chinese soldiers at Weihaiwei, and the death of a Chinese officer who had led his troops into battle during a snowstorm in 1895.
Battles on the mainland were concentrated initially in the north of Korea, but by late 1894 they reached across the border into China’s northeastern region of Manchuria; in January 1895, Japan opened a second front by attacking China’s Shandong Province. The war expanded further in March 1895 as Japanese forces invaded the Pescadores and Taiwan in search of a colonial base to their south. The single major naval battle occurred in the Huang (Yellow) Sea in September 1894. The decisive engagement of the land war arguably was in November 1894 at Lushun, known to the West as Port Arthur. This was China’s strongest naval base, however, it fell to the Japanese in one day. Despite this, or because of it, Japanese soldiers then engaged in a massacre of Chinese civilians in the town; this is proven by Japanese eyewitness accounts that speak of the heaped corpses of men, women, and children.

The longest period of fighting was in Taiwan. There the Japanese claimed to have pacified the island by November 1895, but in fact, guerrilla resistance continued well into 1896. The Japanese army responded by razing villages and, according to some observers, killing as many as 17,000 Taiwanese (mainly Chinese immigrants from the eastern provinces) in this part of the war.

During the war, the Chinese army mobilized about one million men, and the Japanese about 240,000. But

---

Itoh Sukeyuki, admiral of the Japanese naval forces.
China was never able to utilize this numerical advantage. Beijing neither wanted nor was prepared for war, and the Chinese sought to negotiate peace at the earliest opportunity. In addition, well over half the Chinese soldiers were untrained conscripts. The Chinese military also suffered from incompetent generals, a lack of any kind of uniformity in equipment or weapons, and shortages of ammunition. Furthermore, the men received no medical support, which greatly increased the risk of dying from illness or injury and naturally reduced their appetite for combat. For these reasons, Japan won every battle on land and sea with very few losses of life, although the Chinese resistance was sometimes fiercer than later historians have suggested.

A wider problem for China in this (and in its earlier wars in the nineteenth century) was disunity. At the official level, the South China fleet refused to fight Japan, just as the northern fleet had refused to assist the south in the war against France in the mid-1880s. This means
that it is actually misleading to speak of a war between China and Japan; Japan fought as a nation, China fought as regions. At the popular level, China had none of Japan’s modern technologies for organizing mass support; a politically engaged Chinese-owned press emerged only after (and as a consequence of) the war, while a system of national schooling for mass literacy was still decades away. Instead, the relative localization and brevity of the war on the mainland benefited Japan, and Japanese forces there encountered little or no public opposition. Indeed, Chinese businessmen and farmers in Manchuria profited by supplying the Japanese army.

At the peace conference in Shimonoseki, Japanese demands included a massive indemnity for its war expenses, China’s acknowledgement of the formal independence of Korea, and the cession to Japan both of Taiwan and the Liaodong peninsula in southern Manchuria. But in what is known as the Triple Intervention, the governments of Russia, France, and Germany combined to pressure Japan into relinquishing any territorial claim in Manchuria. In return for this concession, China was forced to increase the indemnity, bringing the total to $21 million, said to be about one-third of the government’s total revenue.

Among the long-term consequences of the war, four stand out. First, the independence of Taiwan from mainland control began with Japan’s colonization in 1895. In the twenty-first century, this remains a final lost territory and reminder of perhaps the greatest period of national weakness in Chinese history. Second, Japan had always been a marginal and despised presence in Asia: Its defeat of China was an unparalleled shock to the educated Chinese elite. This persuaded intellectuals to advocate radical social, political, and military reforms (some of these being attempted in the 1898 One Hundred Days’ Reform); it also encouraged the nascent revolutionary movement ultimately to be organized under Sun Yat-sen.

Third, in November 1897, the German navy seized part of Shandong Province as a belated reward for its part in the Triple Intervention. Other powers quickly followed with their own demands for territorial and economic concessions. This scramble to exploit China’s postwar weakness led many observers to predict the imminent collapse of China as an entity; the humiliation and assault on China’s territorial integrity also served as a major catalyst to the reform and revolutionary movements. Fourth, within weeks of Germany’s action, the Japanese government began repairing Sino-Japanese relations by approaching China’s most powerful provincial leaders with an offer to educate Chinese military students in Japan. The first of these students arrived in Tokyo in 1898; they would exert an important Japanese influence on the modern Chinese army, which was to last at least until the 1920s. These military students, however, were also soon followed by many civilian compatriots, and by 1904, Tokyo had become the center of the Chinese student revolutionary movement which helped bring about the collapse of the monarchical system in 1911–1912. Thereafter, and up to the present, Chinese nationalism largely refused to tolerate further insult at the hands of any foreign power.

Further Reading
The Sino-Swedish Expedition conducted scientific surveys of China's northwestern provinces from 1927 to 1935. The expedition research program covered many disciplines, including cartography, geography, geology, hydrology, and archaeology, as it made a topographical survey for future roads and railway construction in the region.

The Sino-Swedish expedition (SSE), which lasted from 1927 to 1935, was a major scientific joint undertaking of Republican China (1912–1949) and Sweden. It surveyed most of Gansu Province, Inner Mongolia, and Xinjiang, as well as areas in Tibet and Qinghai, Yunnan, and Hebei provinces. The two leaders were the geographer Sven Hedin (斯文·赫定, 1865–1952) and the archaeologist Xu Bingchang (徐炳昶, 1888–1976).

Their scientific and technical staff was truly international, with sixteen Chinese, fifteen Swedes, twelve Germans, two Danes, one Estonian, and one Russian. Geography, geology, geodesy, hydrology, paleontology, palaeobotany, botany, zoology, meteorology, archaeology, and ethnology were among the disciplines involved. The participants called the expedition a "travelling university" because it was so interdisciplinary. It was the first scientific collaboration between China and Europe of its kind and scale. According to the agreement on the joint research program, paleontological, palaeobotanical, and archaeological items found in the field would be examined in Europe before their return to China, a promise that was fulfilled in the 1950s.

On 20 May 1927 the expedition left Baotou in Inner Mongolia with a caravan of 289 camels to survey China's northwestern provinces, locate possible landing sites, and establish weather stations. One of the initial goals was to establish a network of airfields that would link Shanghai to Berlin via Kabul. Air connections were later made, but the project sponsor, the German airline Lufthansa, soon withdrew its support when the local authorities forbade flying by foreigners. The expeditions other scientific undertakings continued with additional support from the Swedish government and Vincent Bendix, a Swedish-U.S. industrialist from Chicago. During this second phase from late 1928 to 1933, the area covered by interdisciplinary fieldwork expanded greatly. In 1933 Sven Hedin proposed to the Nationalist (Guomindang) government in Nanjing the building of motor roads to Xinjiang to help restore in the then-province the rule of the central administration—which eventually happened in 1950. The government agreed to fund the third phase of the expedition. After preparations in Beijing, Sven Hedin, with a team of four Swedish and three Chinese academics and technicians, left the city by car in October 1933, entered Xinjiang in February 1934, and returned to give their report to Nanjing twelve months later. Apart from the topographical survey for future motor roads and railways, they did extensive research in the geography, geology, hydrology, and archaeology of the region.

The work on the collected scientific data began in 1937 and still continues. The results have been published in fifty-six volumes in the series Reports from the Scientific Expedition to the Northwestern Provinces of China, under the Leadership of Dr. Sven Hedin—The Sino-Swedish Expedition.
Expedition. The archaeological and geographical survey of the Edsina 额济纳 area resulted in the discovery by the Swedish archaeologist Folke Bergman (贝格曼, 1902–1946) of more than ten thousand wooden strips, mostly in Chinese, dating between 102 BCE and 95 CE. One of the Chinese archaeologists, Huang Wenbi (黄文弼, 1893–1966), published books on the archaeological work done in the Lop Nor 罗布泊 area and the ancient city of Gaochang 高昌. The expedition has had a significant influence on the development of science in China because the students who joined the expedition later occupied high positions in the Chinese scientific community. Researchers today are, among other things, interested in the meteorological and climatic data that the expedition collected in the desert because the data provide information on desertification and climate change.

Sino-Tibetan Languages

Hàn-Zàng yǔxì de yǔyán 汉藏语系的语言

Sino-Tibetan languages, by some measurements, are the largest language family in the world, and are divided into two groups. The Sinitic group includes variants of Chinese; the Tibeto-Burman group includes several hundred languages and language groups.

In terms of the number of people who speak one of its components as their first language, Sino-Tibetan is the largest language family in the world. Sino-Tibetan includes Chinese and its variants, Tibetan, most of the indigenous languages of the Himalayan region, and some of the more important languages of Southeast Asia.

The Sino-Tibetan family is divided into two groups. Whereas the sole constituents of Sinitic are the variants of Chinese (which are mostly—but mistakenly—referred to as the “dialects” of Chinese), the Tibeto-Burman branch totals several hundred often little-known languages and language groups, the proper linguistic classification of which is still largely unfinished.

The Bodic (bod, Tibetan for Tibet) languages are subdivided into Bodish and East Himalayan. The former include Tibetan proper and its variants, Kanauri in northern India and Newari and the Tamangic languages in Nepal (Tamang, Gurung, and Thakali). East Himalayan is formed by, among others, the Kiranti (or Rai) languages, the Kham-Magar group, and Bahing (Vayu). These are spoken in central and eastern Nepal. Baric is a conventional term used for the Kamarupan languages (named after the medieval state of Kamarupa in northeastern India), which are made up of a large number of lesser language groups, which are subdivided into the Abor-Miri-Dafi, Kuki-Chin-Naga, and Mikir-Meithei groups.

Burmic includes the Lolo-Burmese group, the most important language of which is literary Burmese, the national language of Myanmar (Burma); Burmic also includes sizable groups of languages in Thailand, such as Lisu and Lahu.

Karenic, sometimes regarded as a higher-level subgroup of Sino-Tibetan, taxonomically (in terms of its scientific classification) coordinates with Tibeto-Burman rather than being one of its branches and consists of the Karen languages Pwo and Sgaw, spoken in Myanmar and Thailand.

Kachinic (for example, Jinghpo, or Kachin proper, in northern Myanmar) is sometimes classified as a subbranch of Baric, but some scholars group it with Burmic or treat it as a separate Tibeto-Burman branch.

Qiangic, a small language family in south China, recently has been added to Tibeto-Burman; scholars sometimes view it as a separate branch of the family, sometimes included in Burmic. Some linguists establish a distinct Rung branch, composed of Qiangic, Gyarong and Pumi of southwestern China, and the Nung languages of northern Myanmar. The extinct language of the Tangut (the language of the Xi Xia empire, which flourished in Shaanxi and Gansu provinces between the eleventh and thirteenth centuries), written in a unique and complicated script, is mostly viewed as Tibeto-Burman.

© 2009 by Berkshire Publishing Group LLC
Scholars still debate its place in the family, but most opt for its inclusion in either the Rung subgroup or Lolo-Burmese.

The Bai (or Minjia) language of northern Yunnan Province in China may constitute a separate Tibeto-Burman group. This classification of Sino-Tibetan or Tibeto-Burman, as well as any other, can be viewed as only preliminary, and many details of it are still debated.

Another division of the Tibeto-Burman language—into indospheric and sinospheric languages—is based on cultural rather than linguistic criteria. Indospheric languages (the most typical of which are the Bodic and Baric languages) are spoken in the cultural realm of greater India, whereas sinospheric languages are spoken in the cultural realm of China. The millennia-long influences of these two dominant cultural areas are reflected in many loanwords (words taken from another language and at least partly naturalized) from Chinese and Indo-Aryan languages, respectively, found in the languages as well as in some real linguistic traits. Indospheric languages thus generally display more complicated morphological (relating to word formation) systems than languages of the sinosphere (with the Kiranti languages in eastern Nepal being morphologically the most elaborate of the Sino-Tibetan languages), whereas the latter, which are generally poorer in morphological devices, tend to use monosyllabic lexemes (units of vocabulary in a language), display intricate tone systems, and so forth. However, this division is far from being unequivocal, and it does not imply that direct influence of the eponymous languages is solely responsible for these differences.

Writing Systems

Some Sino-Tibetan languages are among those with the longest continuous written record in history.

Tibetans writing began in the seventh century CE; the script was an offshoot of the Indian family of scripts and continues to be used today. Newari, the language of the original inhabitants of the Katmandu valley, has been written in Devanagari script since the seventeenth century (with at least one manuscript dated as early as the fourteenth century). Lepcha, the state language of Sikkim, has a script of its own that has been in use since the eighteenth century, although it is little used today. Burmese has been written since the twelfth century in a script that is likewise an offshoot of an Indic predecessor.

A different kind of script, which some scholars have called possibly the most complicated writing system humanity has ever used, is the Tangut script, which rendered the language of the Xi Xia empire. Although progress was made in Tangut philology (the study of the meaning and use of words) and linguistics during the last decades of the twentieth century, it is not fully deciphered.

The Naxi (or Moso) language of Yunnan Province in China is known for an interesting kind of writing system that mainly consists of iconic, but nonetheless conventionalized, pictographs.

Questions Remain

Although the genetic relationship of the Sino-Tibetan languages is no longer in doubt, details of the relationship have not been worked out. Understandably, one of the reasons for this uncertainty is the great number of languages in the Tibeto-Burman branch, only a small number of which have been adequately described. Moreover, an alarming number of these languages are endangered, rendering the collection of reliable data for them the most important task of Sino-Tibetan linguistics. On the Sinitic side the last decades of the twentieth century brought much progress in our understanding of the phonological (relating to speech sounds) prehistory of Chinese, although scholars still debate too many details to be able to speak of a consensus on the sound-shape of early Chinese.

Besides subclassification, the most debated topics of Sino-Tibetan linguistics include such questions as whether the complicated verbal concord (agreement) system of, for example, the Kiranti languages is to be taken as original for Tibeto-Burman or the more isolating typology (the fact that words show only a minimal amount of morphological elements) of the Southeast Asian members of the family—and if a more isolating and tonal parent language has to be reconstructed, how many distinctive tones should be reconstructed for the parent language, and so on.
Characteristics

The Sino-Tibetan family shows perhaps more internal typological (categorized) diversity than any other established group of related languages. Most languages show systematic tonal contrasts, some do not. The basic word order in most Tibeto-Burman languages is subject-object-verb, but Karenic and Sinitic languages have subject-verb-object syntax (and prepositions as opposed to the postpositions common in the rest of the family). The morphological techniques used range from mostly isolating (in Southeast Asia and Sinitic), to agglutinative (relating to compound words), to high levels of polysynthesis (in Kiranti).

Sixteen Kingdoms

Shíliù Guó 十六国

The Sixteen Kingdoms was a violent era during the third and early fourth centuries CE when five tribes alternated with each other in establishing brief kingdoms in northern China. (See table 1.) Historians list the kingdoms as the sixteen nations of the five “barbarian” tribes. The time is often referred to as “Wuhu Shíliù Guó” (Period of Five Barbarian Tribes and Sixteen Nations). The five tribes were the Xianbei, Di, Hun, Jiehu, and Qiang, originating from Tibetan, Tangut, Mongol, Proto-Turkic, and Tungus tribes. Eventually the Xianbei tribe reunified northern China in 440.

The entire Huang (Yellow) River valley during this period became a battlefield for tribal kingdoms and some remnant military chieftains. As the nations fought among

themselves, blood flowed freely. Although the period is often considered China’s “Dark Age” because of the chaos and foreign occupation of its territories, the period was also a time of great change as China was transformed by the Indian religion of Buddhism.

Unryu SUGANUMA

Further Reading

The work of Edgar Parks Snow helped promote normalization of the U.S.-China relationship. As a journalist, Snow is known as the first and last foreign journalist to interview Chinese leader Mao Zedong. As an author, Snow is recognized for his book *Red Star over China*, which gave insight into the Chinese Communist Party and Red Army leaders.

Edgar Snow was an American journalist who authored eleven books and worked as a highly successful foreign correspondent during World War II. His most famous publication, *Red Star over China* (1937), provided the West with its first glimpse of the revolutionary Chinese Communist Party (CCP) and its Red Army leaders. Many Chinese were inspired to join the Communists after reading the Chinese-language edition. Snow was the first (and the last) foreign journalist to privately interview Mao Zedong. He helped promote understanding between America and China and the normalization of U.S.-China relations.

The Early Days

Edgar Snow was born 19 July 1905. He grew up in Kansas City, Missouri, graduating from West Port High School and attending Junior College of Kansas City. He transferred to the University of Missouri in Columbia but left after one year; he moved to New York City and began a career in advertising. He also studied journalism briefly at Columbia University. After making eight hundred dollars from a modest stock investment, Snow decided to see the world. In 1928 he arrived in Shanghai and met his destiny: China, which became his home for the next twelve years. His travels took him throughout Asia, including the Philippines (where he lived for two years), Indochina, Burma, and India. He also lived just less than two years in Russia.

In Shanghai, Snow took a job at the *China Weekly Review*. Given an assignment to write about tourist attractions of towns and cities along the Chinese railways, Snow was able to travel outside the foreign concessions of Shanghai and to see things other Westerners could not see. He was appalled by China’s poverty: Westerners received special privileges, as did Chinese city dwellers, but the vast majority of rural Chinese were trapped in dire poverty with little hope of escape.

In 1929, at the beginning of China’s great famine of 1929–1931, Snow visited the ravaged northwestern countryside. On the way he met Rewi Alley, an expatriate from New Zealand who spent his life working for the Chinese government and was to become Snow’s lifelong friend. In Saratsi, located in Inner Mongolia south of the Gobi Desert, Snow witnessed mass starvation and other horrors he would never forget. These experiences helped formulate his sociopolitical perspective. He remained sympathetic to the Communist Party’s emphasis on agrarian poverty in promoting a successful revolution. Unlike Russia’s Communist revolution, which emphasized class struggle based in the cities, with the proletariat (working class) overthrowing the bourgeoisie (wealthy upper class), over
eighty per cent of China’s people lived in the countryside. Agrarian reform in China was the method employed by the CCP to gain control and unite the country.

First Marriage and Life in Beijing

Snow married Helen “Peg” Foster (who wrote under the name Nym Wales), a private secretary to the American consul general in Shanghai, on Christmas Day, 1932. They moved to Beijing the following year and spent five years there. Snow took the helm of Consolidated Press for all of China and he also taught part-time at Yenching University, which connected him with liberals and the resurgent student nationalism. He learned basic Chinese and compiled *Living China: Modern Chinese Short Stories* (1936), a translated collection of short stories written by Chinese authors.

Red Star over China

In 1936, after the conclusion of the Communists’ Long March, Snow visited the territory held by the Communists, including the caves of Yan’an and the town of Bao’an in northwestern China. He was the first Western journalist to interview various Red Army leaders, including Zhou Enlai (1898–1976) and Mao Zedong (1893–1976), who was rumored to have died while escaping Nationalist Guomin dang (GMD) forces during the 9,600 kilometer (6,000 mile) Long March. At the time, the Chinese Communists were believed to be merely bandits, a ragtag, unorganized group. Snow, however, found dedicated revolutionaries, organized and confident they would prevail.

Snow spent many weeks with the Red Army and countless hours recording the first and only authorized biography of Mao Zedong, published in *Red Star over China*. The book is considered of prime historical significance because it was translated into Chinese and helped educate the entire nation about the CCP movement. It is still regarded a classic by scholars for many reasons, including the extensive and exclusive biographical interviews with Mao Zedong. According to Snow’s account, after thousands of years of imperial rule and servitude in China, Mao saw peasant-led revolution as the only path that would unite the people and be capable of expelling foreign imperialists—both Japanese and Western. Snow also brought back Mao’s proposal to the GMD: an end to civil war and a joint united front to resist the Japanese.

Snow found Mao to be an accomplished scholar of classical Chinese, educated in both history and philosophy, and a genius in both military and political strategy. The two men developed a mutual trust and respect, and a lasting friendship. It was the story of a lifetime, and Snow captured it in both words and photographs; this included his iconic photo of Mao wearing Snow’s red-star cap.

Chinese Industrial Cooperative Organization (Gung Ho)

In 1938, Snow, his wife Helen, and Rewi Alley founded the Chinese Industrial Cooperative Organization (known as Indusco, or in Chinese as gung ho). The Work-Together movement was sponsored by Soong Qing-ling (political leader and wife of Sun Yat-sen) and Sir Archibald Clark-Kerr (British ambassador in China). Snow had been moved by the devastation of Shanghai homes and businesses by the occupying Japanese military and wanted to help rebuild cooperatives to offer education and work opportunities to the destitute Chinese. They also enlisted Soong Qing-ling’s brother-in-law, Finance Minister H. H. Kung. Lack of support from the Nationalist GMD government limited the venture’s success, however.

World War II and the 1940s

Snow returned to the United States in 1941. The same year, he published *The Battle for Asia*. For ten years he had claimed that World War II actually began with Japan’s 1931 invasion of Manchuria, and in his book he claimed that the destruction of Japan’s Pacific fleet was imperative. (This was written before Japan’s attack on Pearl Harbor in December of 1941.) In 1942, Snow became associate editor at *The Saturday Evening Post*. As a distinguished war correspondent, he worked in India, Russia, Africa, and Europe. Three extended tours in the Soviet Union
yielded two books on the USSR. His Far East reportage included Indochina, the Philippines, Japan, and Korea. He wrote for many other publications, as well, including the Chicago Tribune, New York Herald Tribune, London Daily Herald, and Foreign Affairs.

During the 1940s Snow made two brief return visits to China, but in 1945 he was denied a visa by Chiang Kai-shek due to his ongoing criticism of the Nationalist government’s unwillingness to engage the Japanese and Chiang’s seeming inability to unite the country. When the GMD fell to the Communists in 1949, Generalissimo Chiang moved its government to Taiwan. The U.S. government banned all travel to the new People’s Republic of China (PRC). Snow would not return to China until 1960.

The Cold War Years and McCarthyism

Edgar Snow’s career as a journalist tailed off during the 1950s. He had supported China’s peasant-led Communist movement and often criticized the U.S.-backed Nationalist Party, now located in Taiwan. In 1949, Snow and his first wife divorced. He married the actress Lois Wheeler. Both their careers suffered greatly from the repression and innuendo of McCarthyism and the Cold War. They had two children and lived a quiet life in a semirural setting near the Hudson River, not far from New York City; Snow taught and did some lecturing. The family moved to Switzerland in 1959. Snow published two books during the 1950s, including Journey to the Beginning, which helped pave the way for his 1960 return to China. This and later visits would play a role in breaking isolationist policy between the United States and China.

Return to China (1960 and 1964)

Travel between America and China was off-limits due to the political mood (and State Department policy) throughout the decade following World War II. In 1960, Snow finally obtained a visa and flew to Beijing on 28 June for a five-month visit. He was reunited with friends Rewi Alley, George Hatem, and Huang Hua (one of his translators in 1936 and the future first Chinese ambassador to Canada). He visited fourteen of China’s twenty-two provinces, nineteen major cities, and numerous communes.

Snow spent several days with Zhou Enlai and had an extended dinner visit with Chairman Mao Zedong at his home adjacent to the Forbidden City. Mao claimed success for the Great Leap Forward (1958–1959) program, but his claim has been sharply disputed in other accounts. Mao did concede that China was still extremely poor and would remain so in the foreseeable future. The struggle to survive brought hardship, yet this “challenge” was capable of strengthening the people. Mao refused to talk about Sino-Soviet relations. He would, however, discuss Taiwan: Taiwan remained a domestic issue, and the United States needed to withdraw its troops from the region before talks with China could begin.

Although his travel in China was carefully choreographed, Snow felt he came away with a better understanding of modern China’s people. He saw vast improvements compared to his arrival in 1928. Snow was impressed, although skeptical of some government claims. He felt inspired to write a book that stood in sharp contrast to the usual Cold War portrayals of the PRC.

The Other Side of the River: Red China Today (1962) was acknowledged as a sign of Snow’s continuing goodwill towards China. On 9 January 1965, Mao and Snow met for dinner and four hours of conversation. This represented the most direct U.S.-China link during the entire Johnson administration (1963–1969). Mao spoke about a number of subjects. On U.S.-China relations, Mao felt deep regret that the forces of history had divided the two nations, but he also felt these forces would inevitably bring them together. War could come only if the United States invaded China; that would not be tolerated. Also, Mao declared no Chinese troops were stationed anywhere in Asia, including Vietnam. He sincerely hoped Sino-U.S. relations would improve.

Final Trip to China (1970)

On his last trip, Snow again had an extended private meeting with Mao; he had questions to ask. What about Mao's
personality cult? Although Mao was not very happy with it, he felt that after three thousand years of emperor worship in China, old habits were hard to break. But he did not want to be remembered as a glorious, all-powerful leader. He had begun as a primary school teacher in Changsha in Hunan Province, which was how he wanted to be remembered: as a teacher.

Regarding the Soviet Union, there was indeed ongoing tension. According to Mao, the Soviets considered China inferior, and advised them to move away from being so dogmatic. In turn, the Chinese saw the Russians as revisionists who were turning their backs from pure Marxism. Contentious criticism of both Mao and Edgar Snow from Russian scholars continues to this day.

Concerning the Cultural Revolution, Mao admitted it was a case of unintentional consequences. Mao condemned the mistreatment of captives—party members removed from power and subjected to reeducation. This created bad blood and made it difficult to rebuild and change the Party. In the years to follow, many books and articles detailed the horror unleashed by Mao’s movement to remove Party-chosen successor Liu Shao-ch’i and prevent other Party members from taking the capitalist road. Snow would not read them. He did, however, tell the story from Mao’s perspective, along with details from his final look at China, and presented it in his last book, titled The Long Revolution (1972).

Perhaps most importantly, Mao told Snow he was open to a visit from President Richard Nixon, whether as an official or simply a tourist. The continuing war in Vietnam—the Chinese felt America was prepared to withdraw—and the ongoing problem of Taiwan should not preclude opening a dialog between the nations. Unfortunately, Snow would not live to see the historic moment.

**Farewell, Friend of China**

Edgar Snow conducted many extensive interviews with key Asian leaders during his lifetime, ranging from Mao Zedong to Mahatma Gandhi. Snow always sought the truth but along the way learned that the truth depends on one’s point of view. He believed in America’s democratic ideals and hoped they might be implemented in China. However, he increasingly saw the U.S.—backed GMD as incapable of warding off Japanese imperialism and unifying the Chinese people under a common government able to address the abject poverty in China.

Edgar Snow died of pancreatic cancer on 15 February 1972 at age sixty-seven, three days before President Nixon’s historic visit to China; he was to have accompanied Nixon as a member of the President’s party. On 16 February 1972, Mao Zedong sent Lois Snow his personal condolences and heartfelt sympathy at Edgar Snow’s untimely death. He called him a true friend of the Chinese people who worked tirelessly throughout his life to promote mutual understanding and friendship between the people of China and United States. The Chinese people would remember him.

Zhou Enlai also wrote a warm eulogy, noting that Snow’s writings were widely appreciated in China. Zhou had often said Snow was not a journalist but rather a historian. He lamented the passing of a true friend of China’s.

Madame Sun Yat-sen (Soong Qing-ling) also offered her condolences in a personal message. She wanted Mrs. Snow to know that her husband’s unyielding support for China’s struggle against native fascism and the Japanese invasion and occupation would never be forgotten. Edgar Snow’s memory would remain forever alive and vibrant in the hearts of the Chinese people.

Red Star over China

In the journalist Edgar Snow’s book *Red Star over China*, first published in 1937, he wrote:

As early as Chingkangshan [a base held by the Red Army in the winter of 1927] the Red Army had imposed three simple rules of discipline on its fighters, and these were: prompt obedience to orders; no confiscation whatsoever from the poor peasantry; and the prompt delivery directly to the government, for its immediate disposal, of all goods confiscated from the landlords. After the 1928 conference, emphatic efforts to enlist the support of the peasantry were made and eight rules were added to the three listed above. These were as follows:

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Replace all doors when you leave a house.</td>
</tr>
<tr>
<td>2</td>
<td>Return and roll up the straw matting on which you sleep.</td>
</tr>
<tr>
<td>3</td>
<td>Be courteous and polite to people and help them when you can.</td>
</tr>
<tr>
<td>4</td>
<td>Return all borrowed articles.</td>
</tr>
<tr>
<td>5</td>
<td>Replace all damaged articles.</td>
</tr>
<tr>
<td>6</td>
<td>Be honest in all your transactions with the peasants.</td>
</tr>
<tr>
<td>7</td>
<td>Pay for all articles purchased.</td>
</tr>
<tr>
<td>8</td>
<td>Be sanitary, and especially establish latrines at a safe distance from people’s houses.</td>
</tr>
</tbody>
</table>

Official social organizations in China are subject to the supervision of the state, but they may exhibit considerable independence as long as they do not present a challenge to the state. In addition, many non-governmental organizations monitor the environment, the treatment of ethnic minorities, and the protection of cultural relics. Even illegal trade unions have been formed in recent years.

In the People’s Republic of China (PRC), associations of people with similar interests can be broken down into four basic types: state controlled (such as the so-called mass organizations), state supervised (such as professional and entrepreneurs’ associations or hobby-based organizations), informal (organizations of fellow townspeople and clan members), and illegal (secret societies, underground groups, opposition groups, and criminal organizations). While the state-controlled organizations have existed for almost the entire history of the PRC, the other three types have begun to reemerge only in the course of the reform process. The reasons for this reemergence have been the development of new social classes and an increasing division of labor and specialization in the process of economic reform.

Emerging Special Interest Groups
Since the 1980s, new groups with special interests have been forming professional organizations and interest associations. Along with formal groups, there are now informal ones, and to the traditional organizations have been added modern ones (women’s and environmental groups, for example). This development started in rural areas, where it was encouraged by the return to family-based economic structures and the withdrawal of the state from the running of villages. Often traditional organizations (such as clans, religious and temple organizations, or secret societies) reemerged. Farmers began to form traditional unofficial organizations and interest groups, most often regional groupings, and gangs of beggars emerged.

Illegal trade unions of migrant workers have developed, organizing strikes and demonstrations. In addition, business associations, hobby associations, and sport clubs have developed in urban areas. Although the non-state organizations are, to an extent, based on traditional structures, their emergence demonstrates a growing need on the part of the population for independent organizations.

According to the Ministry of Civil Affairs, which is responsible for the registration of associations, at the end of 2005, some 320,000 non-state organizations from the county level upward had been registered, including federations, non-government organizations (NGOs), and government-organized NGOs (GONGOs). These figures do not include associations at the township and village level, as they are not required to register. However, the term association is imprecise in China, as it encompasses organizations founded by the party/state as well as those set up by citizens. Organizations set up by citizens must register and adhere to the Regulations.
Concerning Registration and Administration of Social Organizations.

According to official Chinese data in 2005, more than 2,000 NGOs existed, all emerging since 1990. They are involved with environmental protection, endangered animal species, fringe groups, AIDS sufferers, ethnic minorities, protection of cultural relics, consumer issues, or nature and landscape preservation. Some NGOs are involved in the extension and enhancement of grassroots elections, participation in urban neighborhood communities, or the improvement of the labor conditions of rural migrant workers.

Although most associations are concerned with sports, health, recreation, professional, cultural, scientific-technical, and other activities, in recent years social organizations and foundations have emerged that are active in a broad range of more politically sensitive fields. Most notable is the environmental domain, where an increasing number of student groups have come forward to watch and monitor events. They originate in mainly larger cities and areas affected by evident ecological crises. According to reports in 2006, such groups existed at 176 universities in twenty-six provinces.

Beyond official associations are informal organizations like underground NGOs or informal networks. Some are traditional clans, hometown associations, secret societies, or beggar’s guilds. Hometown associations are active in China’s larger cities. They gather people from the same township, county, or province and act as interest organizations. They partly control entire markets, live
together in common living quarters, and provide mutual support. They function as self-protecting organizations of worker migrants and sometimes even as prototrade union organizations.

Religion is a contested field. The officially recognized religious communities are strictly controlled by the state. More traditional ones, such as temple associations and the sects and underground churches that have spread in recent years, may function as social pockets of resistance. But they are not tolerated by the party/state and, therefore, unable to affect the development of civil society.

Chinese associations and NGOs clearly differ from their counterparts in Western societies. To begin with, as long as such associations do not pursue political or politically sensitive objectives, the party/state takes a benevolent attitude since they address issues at the local level that the central state is unable to solve. Associations generally have a rather ambiguous character in China. On the one hand, they are subject to the supervision and control of the party/state. On the other, they may exhibit certain elements of independence as long as they do not challenge the party/state. In a society like China’s, interconnectedness between social associations and the party/state are helpful, as they contribute to problem solving through informal channels and by informal bargaining. The Chinese “bargaining society,” in which interests of social groups are bargain in an indirect way, requires such interconnectedness to enforce interests more easily.

Social Associations as Mediators

The role of social associations as mediators between state and society is nothing new in China. Traditional organizations were based on shared occupations, intellectual fellowship, family ties, or common regional origin. Particularly in rural areas, secret societies or farmers’ interest groups were important. Most secret organizations promised their members a heavenly state of happiness and tried to establish an egalitarian society built on the principles of morality and higher justice.

The guilds, for example, which had existed for centuries, were mostly structured like families and stood for particular interests, but they never had an impact on China’s political history. They adapted themselves to the requirements of the government bureaucracy, which controlled towns and markets, and sought to negotiate and petition their way rather than seek confrontation. They offered their members material advantages, supporting them in times of need, and represented their interests in dealings with the authorities. Through a strict code of rules, the guilds obliged their members to fulfill their duties to the state, especially since the guilds were held responsible by the authorities for their members’ behavior. The guilds financed themselves primarily through self-imposed goods taxes. Every guild was headed by a paid state official who could negotiate with senior officials and was officially recognized as a representative of the organization. This structure, which was easily adaptable to the supervision and control structures of the Communist Party, is in some ways similar to the structure now used by private social organizations in the PRC.

Rise and Fall

Toward the end of the Qing era (1912), numerous modern groups formed in towns. These included professional organizations, groups of intellectuals, chambers of commerce, trade unions, and students’, farmers’, and women’s groups. The weakness of the state in the late Qing era and at the beginning of the republic made these organizations increasingly independent. The chambers of commerce were thus able to work actively toward the creation of parliaments and the drafting of a constitution. Students’, workers’, and professional interest groups played an important part in the May Fourth Movement (1915–1923).

As the central government again took control and became more stabilized after 1927, the ruling Guomindang Party enforced a policy that limited the groups’ powers. In 1941 a law was passed that tied associations directly to state institutions and put them under state control. With the foundation of the PRC, most organizations were disbanded or changed into party-controlled or party-supervised institutions.

Legalization of Associations

The foundation of academic, professional, social, arts-, sports-, or hobby-based associations has been legal since the end of the 1980s. Hundreds of thousands of associations...
and organizations, covering a wide range of social interests, have been created across the country. The 1989 provisional decree offering Directions for the Registration and Administration of Social Associations subjected this rapidly growing trend to stronger state regulation, a move that is similar to the policy previously set by the Guomindang. A revised version of this law was passed in 1998. The rules require an official body (authority, state or party institution, or public enterprise) to make a formal application on behalf of the association and to act as the formal sponsor of the association. Because sponsorship includes a supervisory function—the heads of the sponsoring institution can be held responsible for misconduct by the association—insti tutions are often prepared to take on this responsibility only in return for material or in-kind advantages or because of personal connections.

**Association-State Link**

It would be wrong to assume that the connection with state or party institutions means that clubs and associations function as merely quasi-state organizations and represent only the interests of party and state. Social pressure that developed following the extension of a free market, political liberalization, and growing autonomy in society made the authorization of associations acceptable to the party and the state. The connection with sponsoring institutions has resulted, however, in multiple links between associations and the state. Usually associations attempt to articulate and implement their interests through their sponsors. This can be achieved through the common practice of *guanxi* (creating and using connections) or by having well-known and respected officials as honorary members or “consultants” to help the association gain political protection and recognition. In authoritarian societies there is hardly any other way to assert one’s interests. The close connections with state or party institutions also show that independent organizations are not yet possible. In present-day China, it is not the pressure group but the *guanxi* group that solves problems and conflicts and does so by means of patronage. A continuation of this trend is the need to seek help from a powerful sponsoring institution because the connection with an authority or public institution functions as protection and enhances the association’s status.

In a society in which independent parallel structures are not permitted, interest representation and participation in negotiations between the state and interest groups would be impossible without organizations being interlinked in this way. In China a social association’s interests are not so much asserted as indirectly negotiated, and they require such interconnections. On the one hand, only in this way can social groups attain a certain degree of participation in negotiations. On the other hand, associations can influence politics through their sponsor institution. Such semiautonomous organizations can be seen as the forerunners of autonomous economic and political associations. They are two-sided in character because they have elements of both state dominance and autonomy.

**A Future for Social Associations**

As economic reforms and social change have moved forward, special interest groups have sprung up. The party/state is attempting, however, to bind the newly developing interest groups into existing formal structures. On the one hand, increasing economic liberalization has meant that the state is no longer able to control all social activities, but on the other hand, it does not see the necessity for this as long as the newly developing interest groups do not evolve into parallel political structures.

Unlike in democratic societies, in authoritarian societies the state is the only body with decision-making power. Although such a structure might allow various associations and interest groups to have a voice in discussion processes, state supervision prevents the emergence of parallel organizations acting independently of the state. The continuing reduction of the role of the state in economic matters and further changes in Chinese society will probably mean that social associations will have an increasingly important role in the social and political processes of change.

Religious Activities as Social Associations

In China as in all parts of the world, the village community has been the primary source of social and economic interaction. An excerpt from the scholar Chang Liu’s 2007 book Peasants and Revolution in Rural China describes how religion works in the village context:

Religious activities were another major category of the village’s social activities. Many organizations were set up in the village for this purpose ... Of these religious organizations, it was the village-wide ascriptive religious association that organized the village as a whole. It was ascriptive because all members of the village were automatically included in the association. Before the twentieth century, this association was usually the only village-wide organization found in North China villages.

Organizing village-wide religious activities—such as collective prayers, maintenance of village temples, temple fairs and opera performances, and so forth—was of course the main function of the village-wide religious association. But it was never limited solely to this aspect. Since it was the only village-wide organization, it also served as an ad hoc body to handle secular public affairs of the village. Because of this, it actually took on the role of the village’s governing organ. Village public affairs involved the villagers’ common interests. These affairs might be generated by matters within or without the village community. Regardless of the source, they had one thing in common: they aroused public concern and necessitated collected choices and responses. Managing these public affairs was therefore a typical political process, carried out within the arena of the village and handled by the villagers themselves.

Harmony as a philosophical objective has been part of Chinese thought for more than 2,000 years. It has remained important in Chinese culture, whether applied to human relationships, religion, nature, or politics, both ancient and contemporary.

The concept of *harmony* has been an integral part of Chinese philosophical thinking for two and a half millennia. Expressed sometimes in the language of social relationships and at other times in the grander ideal of order in nature, it has been at the heart of various forms of Confucianism that have appeared, disappeared, and then reappeared since the Han dynasty (206 BCE–220 CE). In classical Confucianism, harmony was seen as most fully expressed in Confucius’s (551–479 BCE) concept of the five principle relationships: ruler and subject, father and son, older and younger brother, friends, and husband and wife. Social order was based on individuals clearly knowing their positions, and understanding their obligations to those above, and below them. This concept has been criticized not only for placing women in subservient positions, but also as the justification for highly conservative political and social policies, and as rationale for centralized forms of power. Since 2000, Confucius’s thinking has become fashionable in mainland China, and his statement (or the statement imputed to him)—that there should be “harmony without uniformity” guided by the moral principles of a righteous and clear-thinking person reasserted and reintroduced with approval by the government—among influential mainland intellectuals.

There are more esoteric forms of thought promoting harmony in classical Chinese philosophy. Mencius (372–289 BCE), the great near-contemporary of Confucius, spoke at length on the Mandate of Heaven (*Tianming*) and the responsibilities of rulers to those ruled, and vice versa. Daoism, dating back over two millennia, is one of the most famous, more esoteric expressions of the need for harmony. This has served as a more spiritual form in contrast to the highly practical moral philosophy contained in Confucianism. Daoism exercised influence over some of the rulers of China during the long dynastic period until the end of the Qing in 1912. Even so, its otherworldly nature meant it has not been associated with good governance. Promotion of harmonious relations has also been encapsulated in the need to seek balance—between the feminine and the masculine, light and cold, dark and light—that was most famously articulated in the West by the Swiss psychiatrist Carl Gustav Jung (1875–1961) when he adopted the yin–yang theory in his philosophical and psychological theories. In his work, both Western and Chinese forms of seeking harmony were used by individuals as they sought to come to terms with the archetypes in the collective unconscious. Jung prescribed the use of philosophies of contemplative practice for patients seeking to overcome mental or psychic problems. His thinking would have a big impact on later practitioners of psychotherapy.

Harmony has therefore managed to encompass the abstract religious practices of some belief systems, like Daoism, but it has also been important in practical
governance. Fear of the dissolution of stable political entities in Chinese history has left a deep historic stain. Dislike of chaos (luan), taken as the opposite of stability and harmony, was the excuse used by the Chinese leadership in 1989 when they ended the student demonstrations that year. It was also the worst criticism made of Mao Zedong’s Cultural Revolution (1966–1976), which, after 1978, was judged to be a willful encouragement of turbulence and disruption. Since that time, there has been an increasing emphasis placed on stability, the need for a well ordered society, and peacefulness.

This objective lies behind the concept of a “harmonious society” promoted (since 2003) by the Chinese government under President Hu Jintao and Wen Jiabao. Prior to this (1989–2002), President Jiang Zemin promoted a system in which inequality ran rife; there were increasing disparities between the coastal regions of China and the massive inward regions, and corruption had come back stronger than ever, after being slapped down in 1989 because it was viewed as responsible for the Tiananmen Square uprising on 4 June that year. The liberalization of the economy had released many of the controls that had been in place until then, meaning that many of the restraints on greed, personal gain, and exploitation were, in effect, lifted. In 1984, according to the Gini coefficient, an internationally recognized measure of social inequality recognized by the United Nations, China was one of the world’s most equal societies. By 2004 it had become one of the most unequal.

Wen and Hu wished to show that the ruling Communist Party understood this problem and wanted to continue to look after the interests of the weak and the
underprivileged. They improved educational provision in the rural areas, lifted many of the taxes placed on farmers that had been a major cause of contention, and undertook high-profile sackings of party officials who were viewed as corrupt. The most prominent of these was the Party Secretary of Shanghai, Chen Liangyu, whose involvement in the embezzlement of social security money for use in property investment lead to his arrest in 2006, and subsequent conviction and eighteen-year prison sentence.

Talking of a harmonious society was more an aspiration than an actuality. One of the greatest challenges facing China after decades of Communist rule was the very inharmonious relationship between humans and nature. Mao had personified this in his almost aggressive attitude to the natural world, as something that needed to be tamed. Modern China’s abuse of its own natural environment and its flora and fauna has been exhaustively catalogued. Of all the challenges facing modern China, the battle to clean up its own environment has become the most urgent—meaning that in many places sustainability has become a more resonant keyword in political discourse than harmony.

Harmony is also found in China’s international presentation of its own aspirations. In 1954 Premier Zhou Enlai proclaimed that the foundations of the newly established People’s Republic of China’s international policy were based on “Five Principles of Peaceful Coexistence”; one of these principles included respect for the integrity of other sovereign nations and noninterference in their domestic affairs. More recently, China has talked of being
a country that, despite its burgeoning economic power, should not be seen as a threat to the rest of the world. Party ideologue Zheng Bijian expressed this in his concept of “the peaceful rise of China” (Zhongguo heping jueqi). Even so, China’s protestations of pure intent and desire for harmonious international relations were viewed with some skepticism by other countries, many of which (the United States in particular) pointed to the double-digit increases in Chinese military expenditure over the last decade.

For the Communist Party inside China, talk of harmony stands in stark contrast to the imprecations of one of its key founders, Mao Zedong, who during his most radical period at the height of the Cultural Revolution in the late 1960s, demanded that there be “great disharmony under heaven” and ordered that young activists create disharmony. His embrace of dialectics in Marxism was seen as fundamentally contrary to the general desire in traditional Chinese philosophy to seek balance. More recent attempts to use so-called practices cultivating inner harmony by sects like Falun Gong (where controlled breathing is used to create calmness and self-awareness) have been quickly outlawed because of the perceived social disruption they cause.

China has a traumatic history of disharmony: The Muslim, Nien, and Taiping rebellions in the nineteenth century caused more than 50 million deaths, and there were the devastating Second Sino-Japanese War (called by Chinese the War of Resistance against Japan) and civil war in the twentieth century. It is no wonder that the current Chinese government, and many Chinese intellectuals, promote the need for balance, and for internal and external harmony. Perhaps it is awareness by Chinese leaders of the extraordinary complexity of forces within their country, and the need to keep these under control. As such, harmony might have had at times exotic routes, but in contemporary China it is a good expression of the county’s pragmatic nature, and its desire for self control.

Social Networking, Online
Zài xiàn shèhuì wǎngluò 在线社会网络

While being careful not to cross certain lines, China’s fast-growing online population of 298 million people (as of 2009), led by China’s “Generation Y” born in the 1980s, is experiencing the liberation of virtual community.

As China becomes increasingly networked, both terrestrially and by mobile technologies, online social networking is transforming many people’s lives with online news, entertainment, education, and shopping. It is also affecting the political landscape as more technically advanced policymakers turn to blogs and bulletin board systems for information about what people are saying and thinking.

Generation Y
Generation Y of China (balinghou), those who were born in the 1980s, grew up in the 1990s as single children without the traditional extended family network, owing to China’s one-child policy. Members of this group are the most enthusiastic users of online social networking. For these young Chinese, a personal and career path is no longer clearly laid out. There are more choices, more opportunities, and more uncertainty. The combination of three main factors makes them ideal users for online social networking: they tend to be highly computer literate, they tend to be the only child in the household, and they tend to be highly mobile. Online networking is the primary way for this generation to get in touch and stay in touch with friends, classmates, relatives, and co-workers. They use blogs, forums, and bulletin board systems (BBS), Web 2.0 social-networking sites, instant messaging, and microblogging, often through mobile devices.

Online Communities
China’s online youth are finding friendship and solace, as well as information and entertainment, in cyberspace. They are searching for others who can relate to their experiences and who may share their mind-set. Online social networking is also becoming functional and a way to adjust to real-world relationships. Online dating sites, such as lotus.com and love21cn.com (or Jiayuan.com), are increasingly chosen for meeting potential marriage partners. Web portals, such as MSN, Skype, and QQ (which boasts more than 220 million users), are accessed by many merchants as customer-service and marketing tools to reach out to real-world customers. Job seekers use online tools, which include searching and social networking, and young, mobile professionals use social-networking sites to find new friends before moving to another city.

For many Chinese, online communities offer an alternative to traditional sources of information, an alternative that is often viewed as more trustworthy than corporate or government sources and more relevant than received wisdom handed down from elders with assurances that it is true because they say so.

Social and entertainment infrastructures in China are more limited than they are in the West. The Internet,
however, provides easy access to entertainment. Its interactive nature seems to fit particularly well with Chinese culture.

Educational opportunities are still uneven in China, with most major universities and information centers still clustered in and around Beijing and Shanghai, but the Internet allows students anywhere to make use of online databases and other global information sources. Online initiatives are seen as crucial to solving the East–West educational divide.

Internet users in China already outnumber those in the United States. According to China Internet Network Information Center, the state network information center, as of June 2008, there were 253 million Internet users in China, a 19 percent penetration. (The United States, by contrast, had 220 million active Internet users in June 2008, about 73 percent of the population; the number of Internet users in China reached 298 million in January 2009). According to the International Telecommunication Union—the organization that sets and monitors communication standards—as of December 2007 there were 66 million broadband Internet connections in China. Chinese Internet users spend nearly 2 billion hours online each week; people in the United States, 129 million hours.

It is difficult to be precise about the figures because of the cell phone factor: Cell phones are ubiquitous in China, and an unknown number of Chinese cell phone users are using their phones to access websites, chat programs, and even to download and listen to music. As mobile technology expands, so do accessibility and the numbers of users.

China is also home to a number of “Net stars,” personalities who are famous online, such as Mu Zimei and Fu Rong Jie (Sister Fu Rong). The world’s top blogger is Chinese actress Xu Jinglei, who is now better known for her blogging than for her acting. She shot to the top of Technorati’s list of bloggers as soon as Technorati was prodded into internationalizing. Unlike in the West, Internet stars in China tend to become genuine stars who enjoy fame both online and offline.

Social Media

The online interfaces that make possible this brave new world are known collectively as “social media.” Blogs are an example of a social medium in which an individual addresses and receives feedback from a large audience—from
the one to the many. BBS, relationship management media (sites such as MySpace or Cyworld), massively multiplayer role-playing games (MMORPGs), file-sharing systems, and wikis are examples of social media in which many people interact with many other people—from the many to the many. Cyworld is an interesting example. Originating in South Korea, it currently has some 17 million users. It combines the features of MySpace, Flickr, and virtual worlds; its many users upload approximately 6.2 million photos daily. (Flickr, by contrast, uploads approximately 500,000 photos daily.) Finally, and of particular interest to businesses, there are corporate feedback forums that let people respond to their experiences with the company’s products—from the many to the one.

BBSs were among the earliest online community tools and are, for now at least, the most important social medium in China, with an estimated 53 million people in China making use of them. They are easy to use and allow for anonymous communication, which, in a restrictive society such as China’s, gives people a feeling of liberation. The Chinese enjoy the social, community-oriented (as opposed to individualistic) nature of BBSs. In general, Chinese people are not so eager to stand out. Blogs are extremely popular, too, but unlike in the United States, they tend to be personal, generally written just for friends and family.

BBSs are a vital center of information exchange for Chinese young people, who, like their peers in the West, find the comments of their contemporaries online more personal, immediate, and relevant than an old-fashioned viewpoint from a traditional source of authority. A typical post might recount a problem—sometimes word-by-word—and tens to hundreds of follow-up posts will help analyze the problem. Other typical posts are questions. Almost any question receives enthusiastic follow-up posts in which people offer analyses, experiences, and tips.

Postings are anonymous, but people seem to cherish the help they obtain and routinely come back to help answer questions themselves. The authors of the most helpful BBS postings are honored by their fellow posters and often given honorary positions in the BBS world. Participants adhere to a sophisticated code of online etiquettes and use a specific jargon. People who follow these rules tend to get more responses and are respected more. For example, people reading the postings on BBSs are encouraged to make a response entry, even if it’s an innocuous “Hi, I like your post.” This kind of behavior is considered polite and helps to build up a participant’s reputation.

Another interesting phenomenon is the race to be the first to respond to a post. Being the first to respond demonstrates respect; therefore, it has special importance. The first-response slot is given a special name: the “sofa.” People routinely compete to “grab the sofa” 抢沙发, that is, to try to be the first reader to respond. Different areas of a large BBS will have its own forum administrator (ban zhu 班主, page owner), who enforces rules and remove the postings that do not follow the rules. Forum administrators are site enthusiasts who have built a reputation for being reliable and trustworthy in enforcing the rules.

**Mob Mentality**

In the United States, Internet hunting is actual hunting: A webcam shows the landscape at an actual location, and a hunter at a computer sends a message to fire, triggering a remote-controlled gun. In China, however, Internet hunting is something completely different: It is the tracking down, by the online community at large, of someone who has committed some act or engaged in some behavior that outrages the community.

The best-known case involved a wronged husband, his wife, and the student with whom the wife had an affair. The husband posted a 5,000-word letter about his wife’s affair with the student, whom she had met through the popular game World of Warcraft (a game so popular in China that its characters appear in television ads). The online community identified the student and tracked him to his parents’ home, making vehement attacks online and putting him at risk of personal injury in the real world. This kind of behavior, a form of communal morality enforcement, is still a potent aspect of Chinese communal culture.

The Chinese government and established organizations are increasingly responsive to the opinions of the vocal online community. Tsinghua University, one of China’s leading higher education institutions, was alerted to a professor who had lied on his résumé by an Internet campaign started by Fang Zhouzi, a famous blogger who is known for identifying and publicizing the rampant
academic cheating among elite Chinese university professors. The professor was fired as a result. Similarly, an Internet campaign launched by environmentalists put pressure on the film director Chen Kaige and eventually caught the attention of the central government. The environmentalists were outraged over the damage that the film crew for Chen’s *The Promise* (2005) had done to the area surrounding Bigu Lake in Yunnan Province—a location so strikingly like Shangri-la, the mountain paradise of James Hilton’s *Lost Horizon*, that in 2002 it adopted that name. Eventually Qiu Baoxin, the vice minister of China’s Department of Development, publicly criticized the production team. Officials in the county of Shangri-la were fired, and the production team was fined.

**Government Monitoring**

The government responds to Internet social media in three important ways: by regulating it, investing in it, and monitoring online activity. This monitoring is done in various ways. One is keyword analysis. Posts that mention Falun Gong or Tibet, for example, might trigger investigation. In the face of government scrutiny, the online public in China protects the freedom of their online interactions by engaging in voluntary self-censorship. Perhaps for that reason, online media has not been used for political activity in China in the way it has in the United States.

**Commercial Monitoring**

Online activity is also monitored by marketers, and it seems that more businesses are allocating more funds to marketing online. One of the leaders in this area is CIC Data, a China-based Internet word-of-mouth and competitive intelligence research company. Sam Flemming, CIC Data’s director in Shanghai, blogs about social media. He thinks social media has greater reach and greater impact in China than it does in the United States because it has more impact on offline life than is true in the United States. He points to the case of the two university students who became an Internet sensation by lip-syncing to the songs of the Back Street Boys. Pepsi picked them up for its Pepsi Creative Challenge campaign and its MyDaDa campaign, and now they are television celebrities, called the Back Dorm Boys 后舍男生.

The most popular interactive sites, according to a 2008 study by CIC Data in Shanghai, are forums where consumers discuss automobiles and sports. Sites for parenting and childcare information are also popular, followed by discussion forums related to cosmetics and consumer electronics. The more personal and explicit sites, such as Senei.com.cn, are latecomers to the crowded Web as are Facebook clones such as Kaixinwang, Zhanzuo, and Xiaonei. The name Xiaomei is a pun, meaning something along the lines of “lustbook.”

**Worldwide Community**

While online life is similar in most countries, online life in China is somewhat unique because it is growing out of a culture with a deeply rooted tradition of social exchange based on feelings, respect, and reciprocity. But at a time when that culture’s economy is rapidly modernizing and globalizing, it seems possible that Chinese innovations in the realm of social media will come to the West and that China is certain to benefit from its connection to the rest of the world.

Social Stratification
Shèhùi jiēcèng fènhuà 社会阶层分化

After the Communist Party came to power in 1949 it attempted to narrow the gaps in income and wealth between men and women and between urban and rural residents. As a result, the standard of living for most Chinese was raised. Some gains were only temporary, however, and the socialist system has introduced new inequalities.

In 1949, when the socialist government of Mao Zedong (1893–1976) came to power, one of its main goals was to reduce the glaring inequalities of income and wealth. To this end the government appropriated most private property, abolished labor markets, expanded public education, and instituted wage controls. By the early 1960s inequalities of income and wealth in rural and urban areas were sharply reduced, and living standards for most Chinese were vastly improved. Ironically, however, socialism introduced new inequalities—both among people who did and did not have network ties to government officials and Communist Party members and among people who did and did not work in state-owned firms.

Furthermore, one of the most serious inequalities in pre-1949 China—the disparity in income and living conditions between urban and rural areas—was never eradicated under Mao. Just two years after his death in 1976, many of the policies designed to abolish economic inequalities were incrementally removed in an effort to marketize the Chinese economy. Post-Mao market socialism would reverse many of the equalizing trends of the Maoist era.

Haves and Have-Nots

In the decades before 1949 China was continuously buffeted by war, acts of imperialism, and domestic turmoil. By the time Mao’s government came to power, China had become a society in which a small proportion of well-to-do people lived alongside countless impoverished people. In rural areas, where about 80 percent of the population lived, 70 percent of farmers were landless and worked for subsistence wages for a small number of landowners. In cities unemployment was high, and begging and prostitution were rampant. Thus the government faced the immediate problem of raising living standards for a mostly destitute population.

Urban Economic Inequalities

The government sought to reduce economic inequalities in urban areas by appropriating wealth and abolishing labor markets. Privately owned housing was seized and subdivided into much smaller living spaces. Families could rent these apartments but never purchase them, thus eliminating a key means through which inequalities of wealth can be perpetuated from generation to generation.

By 1958 virtually all privately owned urban businesses had been appropriated and socialized as well. Furthermore, in an effort to ensure full employment, market competition for jobs in these businesses was eliminated. People leaving school were assigned to jobs bureaucratically. The masses of urban unemployed were
either assigned to jobs in factories or businesses or were sent to rural areas to work in agriculture. After they were matched to a job, employees could not quit voluntarily. But employees could not be fired either and thus essentially had a guarantee of lifelong employment.

Urban inequalities were reduced still more by salary compression in firms. Differences between the salaries paid for high-skill, high-prestige occupations such as doctors and other professionals and low-prestige jobs such as unskilled factory worker were much smaller than is typical in capitalist economies. Efforts were also made to increase the social prestige attached to manual labor and to downplay the social importance of white-collar work.

As a result of these economic policies, income inequalities during the Maoist era plummeted. For example, the richest 10 percent of the urban population took in only 21 percent of total urban income, a figure about ten percentage points lower than the average for other developing countries at that time. Living standards for the average urban resident improved substantially.

Furthermore, the determinants of socioeconomic status were different from those in capitalist economies. In capitalist economies socioeconomic position is largely dictated by income and therefore by one’s educational level. The highest-paying jobs require a long period of education, and a big difference in pay exists between jobs that do and do not require extensive education. Mao’s government expanded public education a great deal. But salary compression in urban firms meant that the payoff in income for a lengthy education was not great.

Instead, nonmonetary employment benefits became a much more important source of stratification in urban areas, and these benefits were determined not by what a person did on the job but rather by the type of work organization in which he or she did that job. Although nearly all urban work organizations were government owned, they were not all administered by the same government offices. About three-fourths of urban residents were employed in state-owned work organizations, which were controlled by the central government. The rest worked in collectively owned organizations that were controlled and operated at the municipal level. State-owned firms could not provide such benefits and could pay employees a salary only about three-fourths of what they would have received in state-owned firms. Because housing, health insurance, and pension plans could not be acquired through markets or other government channels, job placement in a state-owned firm became the goal among urban Chinese.

Important inequalities also developed among people who did and did not have personal ties to government officials and Communist Party members. In the absence of markets government officials and party members had monopoly control over the allocation of economic rewards. Persons with ties to government officials or party members could use those ties to maximize career opportunities or nonwage work benefits.

Rural Economic Inequalities

The socialists also attempted to reduce rural economic inequalities by confiscating resources from the wealthy. In rural China these resources consisted primarily of agricultural land. Many well-to-do landlords were killed in retribution for their exploitation of tenant farmers. Starting in 1951 confiscated land was redistributed equally to all rural households for members to farm privately. But in 1953 the government began taking back this land, designating it as community property. Families were required to work larger plots of land collectively, in groups of twenty to forty households, and the harvest was split between government and the collective. People were paid for their work in points, which were periodically traded in for money and grain. Although average household incomes in rural areas remained low, this collective system of farming did raise living standards for poor families and produced communities with much less economic stratification than before.

Gender Inequalities

One subjugated social group especially targeted by rural and urban economic policies was women. Prior to 1949 Chinese women had little social status or political and economic power. Their low social position was underpinned by a family structure that was patriarchal and
patrilineal. Male heads of household had near-absolute power in the household and held legal right to all family property. Women—especially new brides joining the family—were powerless, marginal family members who were often treated as servants. Fathers and brothers could provide no protection from abusive treatment by in-laws because a woman lost most ties to her natal family after marriage.

One key way by which Mao’s government tried to counter this family structure was by pulling women into the paid labor force. In urban areas women were incorporated into a growing industrial sector, and in rural areas women were put to work in agriculture. The idea was that women would be able to wield more power within their families if they had an independent income.

Such efforts to reduce gender inequalities were somewhat successful. It became routine in both rural and urban areas for women to work, and as a result of their being employed their status in the family improved. But a great deal of gender segregation in the workforce existed and continues to exist, with women usually assigned to lower-paying jobs and given lowest priority for nonmonetary benefits such as housing. Especially in rural areas Chinese families remained strongly patriarchal because the government never challenged the tradition of patrilineal marriage.

Urban-Rural Gap Remains

Although Maoist economic policies reduced inequalities within urban and rural communities, a substantial gap remained in income and living standards between urban and rural areas. As in all developing countries, urban residents in China before 1949 enjoyed much higher living standards than rural residents because of better access to education and well-paying jobs. After both rural and urban economies were socialized, this gap began to shrink. In 1957, for example, urban residents took in three times the income of rural residents. By 1978 urban incomes were 2.36 times greater than rural incomes. Thus the rural-urban gap was smaller, but still substantial, under Mao. Urban residents continued to have much better access to schools, medical care, and pensions. Generous government investment in urban industries and low state-set prices for agricultural goods kept the rural-urban gap from completely closing. Migration laws that prevented rural residents from moving to urban areas also kept urban incomes high by limiting the supply of labor for urban industries.

Post-Mao Policies

Just two years after Mao’s death in 1976, the new Communist Party leader, Deng Xiaoping (1904–1997), began to implement economic policies designed to marketize China’s economy. In urban areas private businesses were legalized, and foreign investment was encouraged. A private sector grew quickly, so that by 1999, according to government estimates, nearly 35 million urban residents were employed in privately owned firms. In July 2001 it became legal for private business owners to join the Chinese Communist Party (CCP), a further indication of the growing acceptance of private enterprise. Likewise, reforms were instituted in publicly owned firms, requiring them to operate more like private firms. Managers were given greater autonomy in setting wages for workers and also came under greater pressure to show a profit. Post-Mao economic policies also sought incrementally to institute labor markets in urban areas in both public and private firms. By the late 1990s residents of large cities were no longer assigned to jobs by the government and, after they were employed, could quit or be laid off from their jobs.

However, post-Mao economic reforms have reintroduced substantial economic inequalities in urban communities, in part because some residents now earn high salaries in foreign-invested firms. An equally important contributing factor is the growing unemployment problem. Pressure on public firms to be more profitable after Mao’s death gave managers incentives to cut labor costs. Layoffs are becoming more and more common as a result, especially among middle-aged women. Some employers lay off employees to solve overstaffing. Others wish to replace their urban employees with cheaper recruits from rural areas who have been allowed to migrate to urban areas and work in urban firms since 1983. By 1988 about 2 percent of the urban population was unemployed, a figure that is large compared with the Maoist era and increasing every year. Urban unemployment is publicly acknowledged as a serious and growing social problem.
Post-Mao market reforms in rural areas have also been extensive. Beginning in the late 1970s collective farming groups were disbanded, and rural families were again assigned land for use at their discretion. Rural families also became free to allocate household labor to nonagricultural work. Rural families now routinely have one or more members working in industrial jobs, which bring much better pay than does agriculture. Encouragement of private enterprise in rural areas has resulted in a mushrooming of industrial work opportunities in rural villages and towns.

Because of these burgeoning industrial job opportunities for rural residents and because household agricultural production gives rural families greater profit incentives than does collective agriculture, rural residents have become much more affluent, on average, than they were during the Maoist era. At the same time economic inequalities within communities have increased as some rural residents benefit more than others from these new opportunities.

That post-Mao economic reforms have increased inequalities in both rural and urban communities is not controversial. But scholars do disagree about whether upward economic mobility is still most advantageously pursued through personal ties to political actors. Some sociologists have argued that as a socialist economy marketsizes, political actors such as Communist Party members or government officials lose their monopoly control over economic resources. Opportunities for upward economic mobility open up among people who are not political actors or who lack ties to political actors, and the relative economic advantage of people with political capital declines. People with education or work experience start to see greater returns for those attributes. Thus,
for example, in a private, profit-driven business, someone with a college education but no political ties will be a more attractive job candidate than will someone who has political ties but no college education.

Others sociologists have argued that political actors still maintain privileged access to economic resources or are able to convert their political power into market resources easily. For example, a Communist Party member who wishes to become an entrepreneur can cut through the red tape required to establish a private business much faster than can someone who is not a party member.

**Losses and Gains**

Contemporary China is a fascinating case study for social stratification. Since a socialist government was established in 1949, China has undergone an enormous amount of purposive social change in a short time. Maoist efforts to change the stratification system demonstrate that economic policies can be an effective tool in reducing economic inequalities. In two decades or so China went from a country with a large impoverished population in both rural and urban areas to a country in which most citizens enjoyed a decent standard of living and in which the distribution of economic rewards was much more equal. After the post-Mao government began to dismantle these economic policies, however, many of the equalizing trends of the Maoist era began to reverse.

Mao’s China also demonstrated that although reductions in inequalities can be made, it is difficult to eradicate those inequalities altogether. The concerted efforts to eliminate gender inequalities were only somewhat successful, and the rural-urban income gap never completely closed. Socialism also introduced new sources of stratification: among people who did and did not have personal ties to political actors and among people assigned to different types of work units.

A sense of the social values of propriety, justice, honesty, and honor is a perennial and universal concern, and given China’s historical sweep and contemporary complexity, the country is clearly no exception. Indeed, consideration of such values has occupied many of China’s most prominent thinkers throughout its long history.

In some societies, propriety, justice, honesty, and honor must be extracted from behavior. In others well-developed textual canons exist. China has both explicit intellectual considerations of these values and the actual behavior of both ordinary people and leaders. Further, these values have figured prominently in many of China’s collective, imperial, and national projects. That is, they operate in two dual arenas: intellectual/behavioral and individual/collective.

All societies profess a variety of moral ideals, and all struggle to contain breaches of these ideals. In some cases evidence of the sense of ideal behavior can be found in the responses to perceived breaches. They are connected to the ways each society views human beings.

Propriety
A sense of propriety is a sense of acting properly, fittingly, in accordance with social expectations and decorum.

China has a long, passionate, and subtle history of consideration of propriety. Early in China’s historic civilizations, lì (rites) emerged as a preeminent concern. Cultural precursors saw their role as involved in shaping the workings of the universe and affecting the outcome of both human and natural events. What emerged from this principle was the idea of model emulation, in which certain idealized figures provided exemplars of behavior.

The Chinese philosopher Confucius (Kongzi, 551–479 BCE) and other Ruist (Confucian) philosophers wrote (spoke) at length of the proper rituals. The lì include guidelines for how people are to act with regard to other people and to the rituals handed down from the past. Confucius, in the Analects, wrote “I follow the Zhou” (Analects 3.14); this has been taken to indicate that in a situation of alternative rituals, he pursued those established by the Duke of Zhou.

The late Warring States period (475–221 BCE) text, the Zhou Li (Rites of Zhou), codified some rituals. A Han dynasty (206 BCE-220 CE) text, the Li ji (Book of Rites), specified ways of acting, recipes, manners, and a miscellany of detailed instructions regarding propriety. From the Warring States period on, debates in China centered on whether it is preferable to follow the example of a charismatic authority, such as Confucius, or the law.

Propriety includes relations among the sexes, sexual behavior, and many other aspects of social interaction. All these were governed by public orders as well as private guidelines. During imperial China laws governing behavior and extolling virtue were read aloud in villages. Those who maintained exemplary behavior—such as
widows who remained unmarried for decades—were honored through gateways and pillars pointing out their impressive accomplishments. The Kangxi emperor’s “Sacred Edict” of 1670, promulgating sixteen principles of moral behavior, was read in villages. One principle explicitly called for “propriety.” The Qing dynasty (1644–1912) government attempted to combine the legal and moral or charismatic aspects of leadership.

When Westerners first encountered Chinese, they found them to be governed by specific and detailed guidelines about behavior (notably different from their own) and often remarked on the Chinese focus on propriety (ritual, politeness, social status).

From the founding of the People’s Republic of China (1949) until the end of the Cultural Revolution (1966–1976) questions of propriety, whether individual or collective, were the subject of prominent public activity: Don’t use titles; don’t pay attention to status differences; treat people as equal; don’t be polite; be blunt; don’t be deferential; sacrifice yourself for the greater good, like the model worker, Lei Feng; tell the truth at all times; be selfless; be self-deprecating; don’t flatter others; don’t give honor to others.

Essentially a war on propriety was waged. The campaign to criticize Confucius (pi-Lin pi-Kong) was intended in part to criticize the traditional focus on manners; the Cultural Revolution clearly targeted proper roles, mores, niceties, and everything that had been part of earlier prescriptions for behavior.

Since the end of the rule of Chinese Communist Party

A propaganda poster from the “Learn from Lei Feng” campaign, titled; “Uncle Lei Feng tells Revolutionary stories” (1965). The image of Lei Feng has served as the model worker/martyr/saint of the Communist party for over 40 years.

COLLECTION STEFAN LANDSBERGER.
leader Mao Zedong, a reversion to norms of polite behavior has taken place in private, with attention paid to relative status, relationships, and decorum.

During the 1980s and 1990s campaigns such as that for “socialist spiritual civilization” (shehui zhuyi wenming jingshen) focused on behaving properly, as was evident in campaigns against spitting and unruly public behavior. In the 1990s people emphasized suzhi (quality). Sometimes sexual morality has been the focus, with pornography the target. Sometimes the focus has been on limao (politeness).

A national campaign to advance a “socialist harmonious society” was launched in spring 2005 by Hu Jintao, general secretary of the Chinese Communist Party, advocating a society in which human relations are honest, just, fair, and harmonious. In 2006 he proposed “Eight Do’s and Eight Don’ts” (honors and disgraces) of proper behavior.

In the years leading up to the 2008 Olympics, struggles about propriety were renewed. Some focused on boasting, corruption, inequality, spitting, and waiting in line. Taxi drivers, as hosts, were trained to speak correct English as an example of proper behavior. It is safe to predict that debate over propriety will remain part of Chinese public discourse in coming years.

**Justice**

Justice has to do with what is just, fair (gongping), and right (zheng). In some places some of these terms conflict with one another; what is right may not universally be impartial. People’s sense of justice guides the way they regard merit, reward, and punishment. Justice may be sought through law and the workings of the state, through the operations of a moral universe, or through individuals’ and groups’ interactions with one another. It can be substantive in individual relations or formal in law.

For millennia relationships have been regarded as inherently unequal and bring with them expectations about power, responsibility, and justice. We can see traces of China’s earliest sense of justice in its detailed codification of laws and punishments.

Not all punishments or convictions were regarded as just, but people often held the idea that in the divine realm, the truth of people’s innocence would be known because the universe operates according to principles of justice, reciprocity, and exchange.

The Chinese philosopher Mencius wrote of how natural it is to harbor different feelings for relatives and strangers. It would be proper and correct to treat individuals as nonequivalent. The law codified this social value.

In the three entities called “gods, ghosts, and ancestors” the idea of exchange—which involves just turn-taking—rules interactions. Exchange, as the anthropologist Marcel Mauss described, governs these interactions. Human beings provide for the spiritual needs of ancestors. People burn incense and bow to gods. Gods and ancestors, in turn, make sure devotees pass examinations, get well, get promotions, and so forth. The term for filiality, xiao, comes from “feeding the dead.” Misfortune is often explained by healers as stemming from people’s failure to reciprocate. Ghosts are especially threatening because they do not recognize the obligations that govern other relationships. Further, the universe operates according to impersonal powers, such as operations of the underworld. The Buddhist idea of a karmic balance, held by most Chinese in imperial times, reinforces the idea of just rewards for righteous actions—eventually.

In terms of the legal system, in imperial times people turned to the courts and the legal system only when personal intervention and what would now be called “mediation” failed to yield acceptable results. The state attempted to counter the prevailing sense that it is right to favor one’s relatives and associates through its system of assigning magistrates to districts away from home and of rotating their posts every three years.

The twentieth-century revolutions revolved in part around the notion of economic justice. It was seen as unjust that a small proportion of the society owned most of the resources. The redistribution of land and other goods in the 1950s reflected a changed notion of what a just society would look like.

From the 1950s to the late 1970s the law was suspended on the grounds that it was bourgeois. Mediation was encouraged in the case of disputes. The legal system was restored in the 1980s and especially the 1990s. The penal and carceral sense of justice in recent years has been tempered by an emerging civil code, with the shift from “rule by law” to “rule of law.” Many people look hopefully at the legal system as a way of combating widespread corruption and favoritism. The legal assumption has been
that a criminal is guilty unless proven innocent. The vast majority of all trials end in conviction.

Films such as Zhang Yimou’s *The Story of Qiu Ju* (1992) reflect citizens’ sense that securing justice from local officials is difficult and that somewhere in the center a dispenser of justice exists.

Many of the most fraught events in twentieth- and twenty-first-century China are connected with the sense of justice: human rights (both societal and individual rights), environmental justice, and economic justice.

## Honesty

A sense of honesty must be part of the morality of every human society, along with the recognition that human beings are skilled at manipulating truth. Chinese society is no different; it places a premium on honesty while recognizing that honesty may not always be possible or even desirable in every context.

One commonly told story of an honest person is that of Qu Yuan (332–296 BCE). He was a loyal official of the state of Chu, one of the Warring States (475–221 BCE), who criticized his ruler, King Huai. Despite being exiled, Qu Yuan persisted in stating his views. He eventually committed suicide in the Miluo River out of despair. To honor his memory, the Dragon Boat Festival is held every year. People throw triangular, rice- and meat-filled bamboo leaves to feed the spirit of Qu Yuan. His poems include “Li Sao” (Lament) and “Tian Wen” (Questions Addressed to Heaven), collected in the *Chuci*. His name is synonymous with that of any spurned advisor; the danger of stating the truth is always warned against.

Confucius similarly roamed from state to state offering his version of the truth about how to act. His teaching was not always desired; many rulers were reluctant to listen to someone who did not tell them flattering and pleasant things. But Confucius had the integrity to persist in his message, rarely being honored for it.

The *Sunzi Bingfa* (*Sunzi’s Art of War*), one of many war manuals, advocated the use of deception in order to bring about a greater good, which was the avoidance of physical warfare. When one cleverly manipulates appearances and anticipates one’s enemies’ responses to one’s own actions, the good can triumph. In this sense, views of truthfulness are shaded by pragmatic concerns.

In contemporary China many ordinary citizens wholeheartedly desire honesty. They often feel, however, that the government manipulates the truth in order to preserve its power and to manipulate people into acting a certain way. Censorship and the blocking of information (the Internet especially, but in prior decades the blocking of books and other media) are seen as necessary for preserving public morality, for preserving the honor of the nation, and for preventing undesirable information from circulating. The fact that citizens and the government are involved in a continuous struggle to gain or restrict information suggests an individual hunger for honesty alongside a political fear of it.

In ordinary day-to-day life many individuals feel that they cannot be completely honest, especially in financial or political affairs. People fear corruption or manipulation of information, and to protect themselves individuals may not be entirely forthright.

Honesty has to do with saying what is true. The whole truth is rarely urged by any society. So the question revolves around constraints on the full truth.

## Honor

Honor (*guang*) is related to face (reputation), which is in turn related to politeness. Honor requires keeping one’s reputation intact in others’ eyes, a guiding value in China for millennia. A metaphor of light and shining, of visibility, of being seen, is connected with honor. Its opposite is being shamed and losing face. Honor can be gained by individuals or by collectivities, from the family to the nation-state.

Greetings provide an opportunity to bolster someone’s honor: “Jiu yang” (“I have long heard of your illustrious reputation”). Banquets permit public display of honor among peers and comrades as people are toasted with honorific expressions (“Wo jing ni,” “I honor you”). The roles played give a framework for honor. Relationships (*guanxi*) similarly have the potential for increasing or threatening someone’s honor.

During late imperial times China lost its sense of national honor and was shamed through the experience of semicolonialism as Western powers carved up China’s territory among themselves in the form of treaty ports and extraterritoriality. This period is recalled as China’s
“century of humiliation.” China suffered as the “sick man of Asia” because of its opium addiction and loss of currency to Western powers.

In gaining World Trade Organization (WTO) status in 2001 and in hosting the 2008 Olympics, China sees itself as gaining honor in the eyes of the world as it regains its rightful place as a nation of superlatives. China has attempted to build the tallest buildings, the longest bridges, and the highest railway line (in Tibet). Each of these accomplishments adds honor to China; people believe that the twenty-first century surely will tell the tale of China’s recognition as worthy of admiration.

China’s revolutions—political, cultural, social, and economic—have revolved in part around the sense of propriety, justice, honesty, and honor. In the early twenty-first century resolution has not yet been achieved. But much debate has occurred in private and public, in explicit examination of principles, and in implicit concern about the proper moral directions to take.

“Building a socialist spiritual civilization” is an official goal of the ruling Chinese Communist Party that was first proclaimed in 1986. The commitment to establish such an objective officially was triggered by deep concerns that as China advanced economically, it would regress spiritually.

After the Chinese Communist Party (CCP) adopted economic reform and opening policies in the late 1970s, many party members began to worry that if China pursued only the goals of economic development, society might advance in material terms but regress morally and ethically. The Cultural Revolution (1966–1976) had already done irrevocable harm to the Chinese moral universe. Within this context, unbridled pursuit of economic development under reform and opening could lead to a society whose citizens were materially wealthy but selfish, grasping, and base. They could become psychologically alienated: mistrustful of others and unable to cooperate for the public good or for their own good. Eventually material advancement itself might grind to a halt.

Concern mounted as Western television programs, films, and popular music flooded into China starting in the early 1980s. For many, this kind of popular culture was not seen as seriously challenging to the Chinese way of life. But older comrades, in particular, feared that in the spiritual vacuum prevailing after the Cultural Revolution, even seemingly innocuous concepts and cultural products from abroad could do great harm. They decided to launch a “campaign against spiritual pollution” in 1983 but had to cut it short after only a few months when it started slowing economic growth. Clearly, in any contest between material and spiritual civilization, the CCP would favor the material. But it did formally adopt “building a socialist spiritual civilization” as a fundamental goal for all of society to pursue at a high-level Party meeting in September 1986.

Has the CCP achieved this goal or even made substantial progress toward it? Most would say no. The problem is twofold.

First, the Party has still not articulated a clear and distinct image of what a socialist spiritual civilization would look like. What should people think and do to build one? How should they change their behavior? Usually the answers given were that people should “have lofty ideals,” “proceed from a scientific spirit,” “love genuinely beautiful things,” and other vague banalities. They should also strive to do the opposite of anything currently defined as bad. For example, if corruption is defined as bad, they should not be corrupt; if spitting on the sidewalk is defined as bad, they should not spit. Beyond such homilies little in the way of concrete guidance was offered, nor practical policies introduced. The only significant exception would be the massive campaign to make Beijing more “civilized” in the months leading up to the August 2008 Summer Olympics.

A second problem is that the incentive structures necessary to build material civilization frequently reward behaviors opposite to those believed necessary to build spiritual civilization. Too many “lofty ideals” and too
Building Socialist Spiritual Civilization

In December 1980 Li Chang, Vice President of the Chinese Academy of Sciences, sent a letter to a member of the party Central Committee discussing the concept of socialist spiritual civilizations, in the hope of combating what the academy called “Western bourgeois material civilization.”

Since the Fifth Plenary Session of the Eleventh Party Central Committee, inspired by the idea of “improving and strengthening the Party leadership,” I have felt all along that, after the ten disastrous years of the “Cultural Revolution,” there still exists within the Party the pernicious influence of the ultra-left line of the Gang of Four, remnants of the factional ideology of feudalism, selfish individualism of the bourgeoisie, anarchism of the petty bourgeoisie, and colonial ideas that worship things foreign. Under these influences, ideological demands inside and outside the Party have grown somewhat slack…. I feel that, along with the general goal of realizing the Four Modernizations, we should also consider putting forward a goal of “building socialist spiritual civilization.” The phrase itself first appeared in Vice Chairmen Ye’s 1979 speech at the meeting in celebration of the thirtieth anniversary of the founding of the People’s Republic of China.

I consider that the socialist spiritual civilization includes a concrete aspect (such as well-developed education and thriving science, literature and art) as well as an ideological aspect (such as social ethics, traditions, and customs) . . . It was wrong of Lin Biao and the Gang of Four to emphasize the primacy of the spiritual role. However, we should not overlook the fact that spirit can play a definite role.

Society of Jesus

Yēsūhui 耶稣会

More commonly known as Jesuits, the Society of Jesus sent many missionaries to China between the sixteenth and eighteenth centuries. In addition to Christianity they introduced Western science, technology, and art to China, and returned to Europe with Chinese philosophies and aesthetics, which in turn influenced Western thought.

The Society of Jesus, a Catholic order whose missionaries worked in China between 1582 and 1773, was critically important to the global exchange of knowledge and ideas during this time. As renowned scientists and artists, Jesuit missionaries introduced contemporary Western science and technology to China during the late Ming (1368–1644) and early Qing (1644–1912) dynasties. As cartographers, they provided both China and the West with an image of their place in the world. As missionaries, they reintroduced China to Christianity and sparked a fascination with Confucianism in Europe that fueled Enlightenment thought and led to Chinese studies as a field of interest.

The Society of Jesus was founded by Ignatius of Loyola in 1540 to help revitalize the Catholic Church after the crises and loss of influence brought about by the Protestant Reformation in Europe. The society’s dual focus on quality education and overseas missions produced scores of outstanding scholar-missionaries.

Jesuit Mission Methods

Two Jesuits who were not themselves missionaries in China (although one of them spent time in Macao, on China’s coast) created a unique framework for the mission that fully acknowledged and sometimes incorporated China’s own cultural achievements. Francis Xavier (1506–1552), the first Jesuit missionary to Japan, called for outstanding scientists to serve as missionaries to the civilized countries of Japan and China. He suggested converting China “from the top down,” beginning with the emperor, and using China’s intellectual leadership in Asia to further the mission within the entire region. Alessandro Valignano (1539–1606), who spent time in Japan and in the Portuguese-controlled territories of Goa in India and Macao on China’s coast in his official capacity as Visitor to the East, refined Xavier’s model. His accommodation method demanded that missionaries respect and adjust to native cultures. Matteo Ricci (1552–1610), the foremost Jesuit missionary to China, further developed the Jesuit mission approach. He integrated what he considered an authentic Confucianism with Catholic beliefs. Ricci promoted a very careful introduction of Christian dogmas and expected only a gradual transformation of his converts. The Jesuits also received permission from the Vatican to train Chinese priests using Chinese in place of Latin and celebrating the mass in Chinese.

Within the first decades of their presence in China, Jesuits established residences and congregations in cities throughout the empire, among them Nanjing, Nanxiang,
Beijing, Shanghai, Hangzhou, Xi’an, Kaifeng and Jinan, often using a small network of Chinese scholar supporters, among them Xu Guangqi (1562–1633), to help them gain entry into local society. The limited number of foreign missionaries serving in China fostered independence among Chinese congregations and Chinese clergy, evident in the founding of societies focusing on mutual support, welfare, and charity.

The almost continuous presence of Jesuit scientists at the Ming and Qing imperial courts from 1630 to 1773 is generally considered the most remarkable achievement of Jesuit mission work. It provided some imperial protection, starting with baiban letters of approval and culminating in the Kangxi Emperor’s edict of toleration (1692). The Jesuit mission, however, was repeatedly threatened, and Jesuits often had to leave their residences and live in obscurity. The first period of anti-Jesuit agitation occurred in Nanjing from 1616 to 1621 under the vice president of the Board of Rites (one of the six government ministries, responsible for ritual, the calendar, and the administration of the Civil Service Examination), Shen Que (1592). Two scholar-officials who were among the first generation of converts, Li Zhizao (1565–1630) and Yang Tingyun (1557–1627), offered housing to several missionaries in Hangzhou. Other missionaries were asked to leave China. Another crisis occurred in 1664 when the anti-Christian activist Yang Guangxian (1597–1669) accused Johann Adam Schall von Bell (1591–1666), a German Jesuit, of causing the Shunzhi Emperor’s death. At this time, most missionaries in Beijing had to leave for Canton (Guangzhou). In both cases, the Jesuits soon regained their previous strength and positions.
The Rites Controversy

Ricci’s accommodation to Chinese culture sparked almost a century of controversy both within and beyond the Jesuit order. The most critical issue was the evaluation of ancestral rites and the rites celebrated in ceremonies at the Confucius temple as either civic or sacred ritual. Ricci, and most other Jesuits, considered them essentially civic in nature and therefore compatible with Christianity if slightly modified. Some Jesuits, including Ricci’s successor Langobardi and all missionaries from the mendicant orders (Franciscans and Dominicans) who were present in China since 1634, considered them sacred and expected converts to stop participating in these rituals. The Vatican, asked to clarify the issue, ruled against the Jesuit approach in 1645. This ruling was reversed in 1656. As the controversy continued, the Jesuits eventually asked the Kangxi Emperor (reigned 1662–1722) for clarification. In a handwritten note dated 30 November 1700, the emperor sided with the Jesuit view. This, however, did not prevent Pope Clement XI (reigned 1700–1721) from ultimately deciding against the Jesuits in 1715. The Kangxi Emperor, who heard of this decision in 1720, responded by asking all missionaries who followed the Pope’s decision to leave China. His successor, the Yongzheng Emperor (reigned 1722–1736) subsequently evicted all missionaries except for those who worked as foreign experts at the court, thus effectively ending Catholic missionary activity in 1724. Jesuits continued their mission at the court until the Jesuit order was temporarily suppressed in 1773.

Jesuit Contributions in China and Europe

Jesuits like Matteo Ricci, Johannes Schreck (1576–1630), Johann Adam Schall von Bell, Ferdinand Verbiest (1623–1699), and Joachim Bouvet (1656–1730) provided a direct link between the intellectual elites of China and Europe through their personal connections with eminent Europeans such as Kepler, Clavius, Galileo, and Leibniz and with Chinese academics and administrators throughout the empire. The results of this exchange benefited both China and Europe. To China, Jesuits brought Western mathematics, including a revision of the imperial calendar; Western-style painting and architecture; and great advances in astronomy, horology (the study of time measurement), and cartography. In Europe, Chinese aesthetics influenced landscaping and interior design, and among technical advances were the waterproofing of vessels, silk making, and porcelain production. More importantly, Jesuit missionary work and publications allowed both sides to consider alternatives to the status quo. They offered a Catholic-Christian world view to China, and they lead to the critical revision of feudal church and state institutions in contemporary Europe that sparked Enlightenment thought.

Sociology
Shèhuìxué 社会学

The discipline of sociology emerged in China in the early twentieth century, but was officially banned from classroom instruction and scholarly research shortly after 1949. In the post-Mao era the Chinese government recognized sociology for its role in China’s modernization and globalization, and it has re-emerged as a respected field of study over the past thirty years.

Sociology is known in Chinese as “the study of society” (she huì xue 社会学). Being introduced into China from the West around the end of the nineteenth century, sociology’s broad implications for building a better society inspired pioneer social-thinkers of modern China. Under Mao Zedong’s (1893–1976) regime that began in 1949, however, sociology was considered a stream of knowledge for the bourgeoisie and was banned from classroom instruction and scholarly research for nearly thirty years. In the post-Mao era, the rebirth of sociology was part of the nation’s new reform-and-openness policy to modernize China. For the most recent thirty years, Chinese sociologists have laid the foundation of the discipline in their country, upgraded their teaching and research to international standards, and made sociology a social science discipline of growing scholarly significance and national impact.

Birth and Early Development

Sociology emerged as a new subject of social science in France and England, through the contributions of Auguste Comte (1798–1857) and Herbert Spencer (1820–1903), in the mid-1800s, a century that witnessed rapid industrialization, great social changes, and the flowering of social thoughts throughout the European continent. Meanwhile, China was an agricultural society under a corrupted Qing dynasty (1644–1912); it lost wars to Britain, France, Japan, and an eight-country joint-military force within a sixty-year span on Chinese waters and lands and was forced to open its port cities along the Pacific coast to international trade under unequal treaties. A sense of urgency elevated Chinese intellectuals who, for the first time in a 2,000-year Confucian tradition of great self-respect and self-preservation, voiced out loud a fresh message that China must learn from the West. Introducing sociology into China was a result of the learning-from-the-West movement.

Yan Fu (1854–1921), while sent to study in England’s Navy Academy from 1877 to 1879, became much more interested in social-political thoughts than naval ones. Returning home, he began translating some of the great Western books of the time, including Thomas Huxley’s Evolution and Ethics, Adam Smith’s The Wealth of Nations, and John Stuart Mill’s On Liberty, into Chinese. Yan’s sociology favorite was The Study of Sociology by Herbert Spencer; after two chapters appeared in the State News Letter (Guo wen bao 国文报) in 1898, the whole book’s translation was published, with the Chinese title "The Study of Sociology".
of群学肄言 (Qun xue yi yan), by the Shanghai Civilization Publishing House in 1903. This translated work, combined with Yan’s own interpretations of Spencer’s social Darwinism, marked the birth of sociology in China.

While Chinese translations of other works by American, European, and Japanese sociologists followed Yan’s pioneering effort, sociological teaching and research grew quickly in the first half of the twentieth century. The first sociology course was taught in 1908 at St. John’s University in Shanghai; the first department of sociology was set up in 1921 at Xiamen University; and in 1934 China had forty-one universities that offered sociology courses, seventeen departments of sociology, and nearly 500 registered sociology students. This period witnessed a good number of foreign sociologists arriving to teach in China and a much greater number of Chinese students going abroad to learn sociology. Built on an expanding sociology faculty and students, the All-China Sociological Association was funded in 1930, and continued to function as a public forum even during the period of China’s War of Resistance Against Japan (1937–1945, known outside China as the Second Sino-Japanese War, fought in the context of World War II). Meanwhile, theoretical and empirical research flourished. In the spirit of “making sociology Chinese,” scholars and students were oriented toward offering ingenious explanations of social problems, as exemplified in Fei Xiaotong’s (1910–2005) series of original research of peasant life, the family, and social structure. By 1949, sociology had been a lively and rigorous degree program in more than twenty leading universities, and teaching and research activities had contributed greatly to the spread of sociological knowledge throughout China.

Banishment and Political Tortures

Sociology met an unprecedented challenge under the new People’s Republic of China in 1949. Influenced by Vladimir Lenin’s characterization of Auguste Comte’s sociology as bourgeois, Mao Zedong’s new government terminated all sociology programs during the 1952–1953 educational reform, and sociological teaching and research were banned officially. At the time, these brutal actions against sociology followed the model of the former Soviet Union, which abolished the discipline. To Chinese leadership, Karl Marx’s historical materialism should and must take the place of sociology as the only theoretical guidance for building a new society, and, secondarily, there was no need for a discipline that dealt primarily with social problems that would never occur in a socialist China. As a consequence, sociologists were brainwashed and reallocated to the teaching or research of other subjects under the guidance of orthodox Marxism, Leninism, and Maoism.

The termination of sociology was extremely unpopular among Chinese sociologists, whose resistance was, after all, confined only to their minds. Their hope to legitimize and resume the discipline to normalcy was sparked (yet limited to a matter of months between 1956 and 1957, as it turned out), by Mao’s April 1956 speech of “letting one hundred flowers blossom and one hundred schools of thought contend.” The implication of this speech was to permit any form of culture, art, and thought to exist in their own rights, including the possibility of reviving sociology. Such an implication was taken seriously by leading Chinese sociologists, who cheerfully voiced their wishes of making sociology a legitimate and useful social science discipline for a socialist China. But these voices were mixed with other voices that demanded political democracy, a signal Mao considered a rightist attack on the Communist rule. When Mao reacted politically, the atmosphere turned around 180 degrees, and sociologists, joined by 300,000 other so-called rightists, became targets of the political torture of intellectuals during the anti-rightist movement of 1957 and 1958. Subsequently, many sociologists were removed from academic or leadership positions and sent to labor camps; during the Cultural Revolution of 1966–1976, many were physically attacked by the Red Guards. Fei Xiaotong, China’s most influential and respectable sociologist, for instance, lost his personal freedom, was forced to clean toilets, and contemplated suicide.

Rebirth and Rebuilding

The death of Mao Zedong in September 1976 was followed, after more than a year’s power struggles within top leadership, by a series of new directives made to
rectify the ultraleft forces within the Communist Party that were also responsible for the banishment of sociology. Deng Xiaoping and his new leadership began to re-recognize sociology, along with other social sciences, for the role it could play in education during the country’s modernization under a reform-and-openness policy. The re-establishment of the Chinese Sociological Association in March 1979 marked the rebirth of sociology in China.

The association assembled a good score of living Chinese sociologists, who elected a board of fifty distinguished members and Fei their first president, to lead a collective effort of rebuilding Chinese sociology. Having survived political torture and personal persecution since 1957, Fei, at the age of sixty-nine, still had the scholarly spirit to seek truth through science and was determined to devote his life to the revival and reconstruction of Chinese sociology. In the short term, Fei’s urgent task was to train a new generation of sociologists; with twenty-seven years of inactivity, China did not have sociologists to resume classroom instruction or scholarly research of professional quality. Fei and his colleagues invited established professors from America and elsewhere to teach short-term training programs in China during the 1980s. Two of these programs were of historical significance and had lasting impacts on sociological reconstruction.

The first of these was a two-year summer program in Beijing in 1980 and 1981. Students included nearly 100 middle-aged social scientists from China’s major universities and research academies. This program trained the first post-Mao cohort of sociology lecturers, who subsequently helped set up sociology departments and sociology institutes throughout the country. The instructors of this program were invited from the University of Pittsburgh, where C. K. Yang (1911–1999), Fei’s college classmate and lifetime friend, was a professor of sociology. Yang also mobilized, through his former students, a handful of sociologists of Chinese origin from the Chinese University of Hong Kong to join the teaching faculty in the Beijing summer program. Lecture notes from this program were considered valuable and were quickly circulated among colleagues.

The second was a year-long program, set up at Nankai University in 1981, and offered to a group of forty-three college seniors selected from China’s leading universities. Among other instructors, Peter Blau and Nan Lin, both then on the faculty of the State University of New York at Albany, were invited to teach the summer section of the program. With their first-class instruction in theory and methodology, Blau and Lin together laid a solid sociological foundation within this group, the first cohort of post-Mao sociology students. A significant number of career sociologists emerged from this program, many of whom eventually assumed department-chair positions in sociology programs within the country. Others went abroad for doctoral studies and are currently active in research and teaching around the globe.

**Chinese Sociology Today**

After a nearly thirty-year rebuilding effort, Chinese sociology now has gained new stature. As of 2008, seventy-four universities are authorized by the Ministry of Education, an organ of China’s central government, to offer bachelor’s degrees in sociology, and eighty-seven offer master’s degrees in sociology. Under tight scrutiny, PhD programs are so far limited to only eleven top institutions whose faculty quality and academic caliber meet a higher standard; in a sequential order of receiving state approval, these are: Peking, Renmin, Nankai, Nanjing, Zhongshan, and Shanghai universities; the Chinese Academy of Social Sciences; Tsinghua, Wuhan, Jilin, Huazhong Normal, and Fudan universities. Graduates from these and other sociology programs have taken a wide range of job positions, but most career sociologists work in universities or research academies.

The central government allocates significant funding to programs of academic excellence and national recognition. The “211 Project” identifies 100 national top academic programs, which included the sociology programs of Peking and Renmin universities. The “985 Project” identifies the best universities nationally to which funds are allocated to finance programs of national and international standing; all sociology departments with PhD programs are viable competitors for funds allocated through this directive. Finally, a competitive social science funding scheme has been established to sponsor social science research on an annual basis.

Living in an era of reform, Chinese sociologists have focused on empirical studies of emerging social problems.
One research direction of national impact is about China’s path to modernization. Fei led a group of sociologists in studying developmental patterns, and their research findings have had a direct impact on the directives behind the growth of China’s township-village and private enterprises and the population migration from rural to urban areas. A more contested area of research is about the changing system of social stratification; based on a national survey, Lu Xueyi and his colleagues observed a ten-stratum hierarchy in today’s China, which is significantly different from the image of a working-class led hierarchy under Mao’s regime. The research of state-society relations has been developed largely in the area of rural sociology; Sun Liping pioneered a “practical sociology” approach by looking into village communities in which state laws and power are limited by local social structures. Finally, a new area of national attention is economic sociology; creative scholarship in this area has focused on issues of trust, social capital, and social networks in China’s transition economy.

Influenced by a Confucian tradition, older generations of Chinese sociologists have always had the vision of using sociological knowledge to help construct a better society. This is exemplified in Fei’s work on townships and migration. Following this tradition, the reform-era generation has stressed the notion of “problem consciousness” in teaching and research, which has generated a significant number of problem-solving and policy-evaluation studies. Chinese sociologists have made policy and legislative contributions to birth control, social security system, rural taxation reforms, unemployment problems, community building, environmental protection, and sustainable development. The role of critical sociology is, however, significantly underdeveloped, as China’s public space has effectively been under the control of a Communist party-state. Only recently has public sociology had a role in creating environmental movements.

**Sociology Publications**

China has two sociology journals, *Journal of Sociological Research* (Shehuixue Yanjiu 社会学研究, since 1986) and *Society* (Shehui 社会, since 1982), and eight first-rate social science journals (consult Zhou and Pei [1997] and Bian and Zhang [2008] for names of these journals), which make the top-ten outlets for nearly 200 article-length publications on sociological topics each year. A review of these publications suggests that sociological research quality, measured by authors’ using theoretical frameworks, methodological justifications, and extended references, significantly increased around 1995. Since then, a trend toward adopting peer review and tightening scholarly standards in the screening of submissions has been observed. This trend was consistent with a central directive that scholarly research must meet international standards. Chinese researchers who received rigorous training, domestic or overseas, and gained research experiences in collaboration with international scholars have been the driving force behind improvements in scholarly publications.

Another significant improvement is in public-data archiving. Bucking the tradition of not sharing data, sociologists from the Hong Kong University of Science and Technology and the Renmin University of China collaborated to start the Chinese General Social Survey in 2003. Its datasets, along with related documents, have since been disseminated internationally through the Internet (www.chinagss.org). This development has earned China membership in the East Asian and International Social Survey programs. Another project of similar nature is the Chinese version of American Family Income Dynamics project, a collaboration of the University of Michigan and Peking University. Still in preparation in 2009, this project has a panel design to establish a public data archive to satisfy domestic and international users.

International exchanges have been instrumental to the rebuilding of Chinese sociology from the very start, but more still needs to be done. Wider and deeper scholarly dialogues with the world are expected to be mutually beneficial. On the one hand, there is a growing interest in China, and more and more foreign sociologists from around the world want to do research in the country. Chinese sociologists, on the other hand, still have much to learn from their foreign counterparts about how to enhance and institutionalize sociology as a discipline of theoretical and methodological rigor in their homeland. While they share sociological terminologies, methodological principles, and theoretical goals, the Chinese and their foreign colleagues have worked rather separately in areas of common interest, such as economic sociology, social networks, social stratification, and institutional change. Together they can
develop joint research projects through which to achieve new sociological explanations of issues and problems in a world of increasing globalization.

Soil Erosion
Shuǐtǔ liúshí 水土流失

Practices such as deforestation for farming, overgrazing, and poor construction techniques have resulted in a rate of soil erosion in China that is among the worst in the world. Climate factors, such as wind and increasing temperatures that increase the rate of glacial shrinkage, also adversely affect soil erosion. Government efforts to control soil erosion have focused on rehabilitation of small river valleys.

Soil erosion occurs when soil is detached and moved by water, wind, or tillage. Scientists estimate that 15 percent of the Earth’s ice-free land surface suffers from soil erosion. Although the area eroded by tillage is not known, of that 15 percent, erosion by water is responsible for about 56 percent, and erosion by wind is responsible for about 28 percent. China, with 3.66 million square kilometers (37 percent) of its land surface eroded to some degree, has one of the worst cases of soil erosion in the world. Soil erosion has been identified as the primary environmental problem in the country. It causes desertification, silts up rivers, lakes, and reservoirs, and aggravates droughts and sandstorms.

Causes
China has every type of soil erosion in the world, including water erosion, wind erosion or desertification, freeze-thaw erosion, landslide, mud rock flow, and hill avalanche. The two prevalent types are water and wind erosion, which occur in all the provinces and autonomous regions in China’s mainland. The most severe soil erosion in China occurs in the Loess Plateau on the middle and upper reaches of the Huang (Yellow) River, where 490,000 square kilometers out of a total area of 640,000 square kilometers are subject to erosion. The soil loss from the Loess Plateau is more than 2.1 billion tons annually.

A vulnerable ecosystem and unfavorable climate changes have been identified as two of the causes of China’s soil erosion. As the least-industrialized region with the lowest population density in China at barely two persons per square kilometer, the Qinghai-Tibetan Plateau, the “roof of the world” at an average elevation of 4,500 meters above sea level, experienced a sudden rise of temperature beginning in the 1970s. As of February 2007, the average winter temperature had gone up by 1.4°C from the historical average of minus 4.4°C, while the winter temperature in the regional capital Lhasa rose by 6°C. Along with records showing the temperature rise are records showing shrinkage of glaciers at an annual average rate of 131.4 square kilometers over the past three decades. Some scientists predict that the glacial areas on the plateau, which equal five times the area of France, will dwindle by nearly one-third by 2050. Elsewhere, a research station of the Chinese Academy of Sciences at Xilingol League in Inner Mongolia documented that in the twenty-four years up to the year 2000, 12 centimeters of topsoil were lost to wind erosion.

But human activity is believed to be the main culprit in soil erosion. Historical records indicate that most of the eroded areas once were covered with lush woods but were
denuded through the centuries because of wars and mis-
calculated development, such as deforestation for farming, 
discriminate logging, overgrazing, mining, and road con-
struction without consideration of water and soil conserva-
tion. An investigation of the Three Gorges Reservoir area 
indicates that farming on mountain slopes accounts for 60 
percent of the total soil erosion in the area. Most eroded 
areas are caught in a vicious cycle in which soil erosion has 
destroyed the land’s natural productivity, but because of 
the pressures to sustain an ever-growing population, poor 
land use practices are continued, resulting in further dam-
age to the ecosystem. No wonder the areas that are subject 
to severe soil erosion are commonly poverty-stricken.

Rehabilitation

China began its efforts to control soil erosion in the 1950s 
when the State Council established under it the Water 
and Soil Conservation Committee. Now the Ministry of 
Water Resources is responsible for steering the work of 
water and soil conservation and coordinating comprehen-
sive utilization of water resources. Under the Law on Wa-
ter and Soil Conversation and other water-related laws, 
programs have been planned to carry out water and soil 
conservation and eco-environmental improvement in key 
areas, including the middle reaches of the Huang River, 
the upper reaches of the Yangzi (Chang) River, sandstorm 
areas, and grassland areas.

Although government officials openly admit that the 
trend of worsening soil erosion has not been fundamen-
tally checked, control efforts have never stopped, with 
some local achievements witnessed, especially in the 
rehabilitation of small watersheds or river valleys. Such 
rehabilitation efforts feature integrated planning, which 
takes into account the land and resources capacity with 
regard to population size, and the pursuit of a sustainable 
mode of development that is appropriate to local reality 
while allowing the ecosystem to restore its function ef-
fectively. The comprehensive rehabilitation of small river 
valleys, which normally takes five years to accomplish, 
emphasizes the equal importance of economic, ecologi-
cal, and social benefits. It has been regarded as the best 
way to control soil erosion in China.

In Qinghai Province a sapling of dragon spruce takes 
four years to grow barely 5 centimeters tall, assuming that 
the sapling survives hostile conditions such as a frost-free 
period of only seventy days a year, extreme aridity, strong 
wind, and severe cold in winter plus an altitude of well 
over 2,000 meters above sea level. Nevertheless, the vil-
lagers of Xiaogaoling in Huangyuan County have built, 
in the fifty-one years since 1958, a green shelter on the 
mountains surrounding the village of 450 households. The 
400,000 trees covering 513 terraced fields have in-
creased the village’s forest coverage from 0 to 40 percent, 
checked soil erosion, and increased land productivity, 
with grain yields raising from 1,125 kilograms per hect-
are to 5,250–6,000 kilograms per hectare (2001). This 
conservation work has also enabled the village to better 
withstand natural disasters.

Throughout Qinghai, which occupies one-eighth of 
China’s land area, the extension rate of deserts has slowed 
from 13,000 hectares annually in the late 1990s to 2,000 
hectares in 2007, thanks to conservation efforts such as 
Xiaogaoling’s. Nationwide, according to the Ministry of 
Water Resources, forty thousand small river valleys have 
been rehabilitated from soil erosion, bringing a total of 
900,000 square kilometers of soil erosion under control.

Song Dynasty

The Song dynasty (960–1279) defined a new and enduring phase of China’s premodern civilization, including southward economic shift, flourishing of urban culture, revival of the classical heritage over medieval Buddhism, and a new class of civil administrators who served the enhanced imperial autocracy.

The Song dynasty’s duration of 320 years ranks second only to the Han dynasty’s four centuries (206 BCE–220 CE) during the two millennia of China’s imperial age (221 BCE–1912 CE). Like the Han, the Song dynastic court was reestablished in a distant locale after its earlier capital had been occupied by enemies. But unlike the Han, which regained control over all of China proper, the Song lost the ancient northern heartland to nomadic invaders for the second half of its dynastic era. So historians refer to the Northern (960–1126) and Southern (1127–1279) phases of the whole Song dynastic period.

Even the Northern Song never succeeded in fully reconstituting the entire territory of China proper, much less in projecting power beyond the Great Wall, as the Han and Tang (618–907 CE) dynasties had done. Two powerful non-Chinese nations, formerly allied with China’s great medieval Tang dynasty, had survived its fall and established their own independent states, occupying territories that straddled the borders of China proper. To the northwest was the Xia state (1032–1227, also known as Xi Xia), established by a nation with Tibetan ethnic affiliations. To the northeast lay the Liao state (916–1125), founded by a seminomadic tribal federation, the Qidan, from which come the Russian name for China (Khitai) and the medieval European name (Cathay). Song was forced to secure peace with Liao and Xia by paying annual tribute while submitting to unprecedented terms of diplomatic equality. In the far south, Vietnam’s national independence from China commenced in the early tenth century, and the Song dynasty’s attempted suppression failed to reassert the dominance that the Han and Tang dynasties previously held over northern Vietnam.

How then, being so weak, did the Song dynasty manage to survive for so long, and why is it worthy of our regard today? Patriotic and nationalist Chinese since Song times have often expressed regret, or even humiliation, at the Northern Song’s unprecedented acknowledgment of equal diplomatic status with its predatory neighbors and at the Southern Song’s extended failure to recover north China. Even so, uncomfortable reservations about the Song’s diminished geostategic posture, compared to the expansive glory of the preceding Tang dynasty, are strongly offset by characteristic Chinese pride in the Song’s outstanding economic and cultural achievements, for which it is often regarded as the acme of Chinese civilization.

Considered in global context, the Song period shows marked features of modern societies: a fundamentally rational, non-mystical worldview; transformation of society by growth of technology, commerce, and population; and development of strong state institutions with increasing influence in society.
The creative reformulation of Chinese culture, which came to fruition in Song times, made the preceding age of the Tang dynasty seem almost unrecognizably alien to historically aware people of the Song. The Song times generated mature intellectual, social, and political models that remained definitive in China until the twentieth century. If the Song was weak in its own East Asian region, its world-leading scientific and commercial strengths were nevertheless greatly admired in faraway lands to the south and west. Three world-changing inventions—printing, gunpowder, and the maritime compass—first exerted powerfully transforming effects in Song China before these technologies were transmitted as far west as Europe.

**Transformation of China**

The Song period marks a distinctive phase in two major trends that had gradually transformed China during the preceding millennium since the Han dynasty. The first trend was a strenuous effort to gain direct access to the cultural and material riches of the ancient Persian and Indian civilizations by state-sponsored expansion from the Huang (Yellow) River valley westward into Central Asia. The second was the conquest, colonization, and integration of the Yangzi (Chang) River valley and points south by successive regimes based in the Huang valley, leading also to fruitful contacts with Indian civilization through Southeast Asia.

A turning point in the unfolding of these two trends occurred in the mid-Tang period, in the decade of the 750s, and may be suggestively summarized by three events. First, in 751 an Arab army, aided by Turkish forces formerly allied with the Tang dynasty, defeated a multinational Tang army at Talas River in modern Kyrgyzstan, in the context of keen strategic competition for control of the profitable trans-Eurasian trade route. Second, in 752, in the wake of that defeat, a Tang general of Iranian cultural origin instigated a massive civil war in north China that destroyed the Tang state’s central power. The dynasty survived in name for another 150 years while the weakening of its control over land tenure and markets greatly stimulated economic growth in the semiautonomous southern provinces. Third, in 758 Baghdad was founded in Mesopotamia as the capital of the new Abbasid dynasty. At that time non-Chinese infidel powers in Central Asia restricted direct overland access to north China. Thus trade between Islamic centers and the Far East increasingly flowed by the southern maritime route from Baghdad through Basra and the Persian Gulf to distant ports in India, Southeast Asia, and the southern coast of China.

In the late ninth century, when the Chinese rebel Huang Chao 黄巢 sacked Guangzhou 广州 (Canton), many thousands of resident Islamic traders were massacred. The violence of that event is but one dimension of a multifaceted yet pervasive nativist reaction against the early Tang period’s cosmopolitan openness through which China had gained and given much in cultural exchange and commercial intercourse with other ancient civilizations. Buddhism, which had thoroughly pervaded Chinese culture during the previous five hundred years, came under attack for being of foreign origin and thus allegedly at odds with characteristic Chinese commitments to family and the sociopolitical hierarchy. The revival of Confucian ideas in Song times was associated with heightened sensitivity to distinctions between Chinese and foreign.

In the early tenth century, five brief regimes successively ruled ancient China’s political heartland in the Huang River valley, most of them based at Kaifeng 开封. Contesting for the imperial legacy after the Tang’s fall, the increasingly intense wars of this transitional era exhausted the hereditary clans, whose military power had dominated medieval society for nearly a millennium, opening the way to a new governing elite of civil administrators and to unprecedented elevation of the emperor above his chief counselors.

Kaifeng’s emergence as an imperial capital signifies fundamental economic change. At the start of the imperial era, prosperity in the capital cities of the Qin 秦 (221–206 BCE) and former Han dynasties had depended on irrigation and transport by canals built in the secure zone at the juncture of the Huang and Wei 满 rivers. But by Tang times reliable local food supply was inadequate for that northwestern capital area’s enlarged population, which became dependent on rice shipped by the Grand Canal from the remote southeastern Yangzi River delta, a naturally well-watered “land of fish and rice,” as the colloquial saying puts it. The Grand Canal greatly promoted links between these two major river valleys during the
long Tang dynasty, as China’s economic and demographic center shifted southward. Kaifeng’s advantageous location, near the juncture of the Huang River and the Grand Canal, guaranteed the security of regular food supply to the court there.

Kaifeng was a new kind of capital city, with a thriving urban life based on commerce. Before the mid-Tang period, China’s few large cities had principally served administrative functions, largely related to taxation and conscription of the large peasant population and to regional military control. Private commerce was relatively undeveloped, and state monopolies controlled production of strategic commodities essential to maintaining a balanced peasant economy, such as salt and iron tools, as well as luxuries like silks, some of which were exported overland to western Asia at great profit. Accordingly, in early imperial capitals, such as Chang’an 长安, for example, residents typically lived in closed courtyards, and night curfews were enforced.

But from the late Tang through the Northern Song, over three and a half centuries, the number of urban prefectures with populations of more than 100,000 doubled, from twenty-six to fifty-two. Dramatic growth of domestic trade, stimulated by use of the world’s first paper money, significantly reduced interregional differences within China proper. Economic and cultural integration was further supported by the rapid spread of book publishing. When Kaifeng became the Song capital, it was already a well-developed commercial city, and its flourishing economic and social life continued unabated. The brilliance, elegance, and raw human energy of scenes in and near the Northern Song capital are vividly portrayed with realistic
and colorful detail in a famous horizontal handscroll more than 5 meters long, known as *Peace Reigns over the River* (*Qingming shanghe tu* 清明上河图).

**Northern Song**

In 960, facing a threat from the Khitan, an educated professional military officer named Zhao Kuangyin 赵匡胤 usurped the reigning child emperor in a bloodless coup and founded the Song dynasty, a name that commemorates a classical feudal state of that region. Facing imminent invasion by the Khitan, Zhao judged that the urgent need for competent leadership outweighed the normative demands of loyalty to an immature sovereign. This instance of a classic ethical conundrum in dynastic politics has been generally, if not universally, approved by historians, a verdict that accords with the generally elevated character of the Zhao family’s ruling style through eighteen reigns.

Concerned with forestalling any further coup against himself, the Song founder immediately persuaded his own commanders to accept lavish retirement under his close surveillance, thus centralizing military power, which remained a characteristic feature of Song rule. This opened the way to a century and a half of internal peace in China proper and to one of its most glorious phases of cultural and economic growth.

Powerful non-Chinese states, formerly allied with the Tang dynasty, faced the newly established Song state on its northern frontier. Northern Song never controlled the far northwestern Gansu 甘肃 corridor, which had been crucial for access to Central Asia during the Han and early Tang. Rather, the early Song’s chief external concern was with the northeastern threat emanating from the environs of modern Beijing 北京, where the Liao dynasty had established its southern capital (then called Yan 燕), the first instance of that city’s later continuing role as the capital of successive regimes with Chinese-style imperial pretensions. In response to this major geostrategic shift, the Song founder followed recent precedents that placed the administrative center at Kaifeng, in the eastern part of modern Henan 河南 Province. This move marked a decisive break with dynastic traditions of the previous millennium.

During the whole Song period, China’s population is estimated to have doubled, from some 50 million to more than 100 million, amounting to around one quarter of the presumed global total. Agriculture became increasingly commercialized as its growing productivity was driven by the spread of innovative technologies. Many landlords left their country estates to take up residence in towns and cities. The consequent changes in elite lifestyle contributed to a new, commercially oriented urban culture with a decidedly more open, mobile, and competitive society. A new and lasting style of painting emerged among cultivated literati, which featured exquisitely articulated views of man in balanced harmony with impressive natural settings. Household amenities such as venetian blinds and playing cards, among many others, were well known in Song China before being transmitted to the West.

Membership in the new type of social elite, which formed in the Northern Song and persisted until the twentieth century, could be gained only through success

in the highly competitive civil examinations. This institution’s dominant social role over a millennium exerted a Darwinian effect favoring demographic propagation of aptitudes for book learning, which have remained a major asset for China’s modernization.

Underlying this remarkable quantitative growth and qualitative change were the long internal peace, gained by centralizing control over military forces, and the qualitative enhancement of bureaucratic administration, particularly through expanded use of civil examinations for recruiting officials. Song emperors were distinctively humane in applying their autocratic powers, habitually respecting their civil officials. New tensions, between the anticommercial bias of revived classical Confucian ethics and the unprecedented contemporary realities of a thriving national economy, were played out in court politics of the Song period, establishing negative precedents that have exerted effects into recent times. But the overall system of regional and local administration was rationalized to an unprecedented degree, enhancing efficiency of population registration, tax collection and transport, and disaster relief, thus facilitating widespread improvements in the popular livelihood. The rise of schools throughout the some fifteen hundred counties greatly promoted education and stimulated social mobility, which brought extraordinary creative vitality to eleventh-century Song China.

The Song dynasty’s chief defects were two. The first was a relatively weak military position toward powerful and predatory nomads in the north because of excessive military centralization intended as a guard against civil war; thus the unheroic policy of utilizing China’s wealth to buy peace was arguably a rational and humane choice intended to avoid the devastation of war and maintain political stability. The second defect was a tendency to administrative paralysis caused by intense factional disputes among bureaucrats, arising from the Confucian stress on principled search for truth by individuals and a heightened emphasis on personal loyalty to the ruler, which allowed no place for a loyal opposition.

Song China’s burgeoning emporia attracted resident merchants from distant points in the Islamic trade networks which then spanned Eurasia. A Jewish community, which Chinese did not distinguish clearly from Muslims, is known to have existed by the eleventh century in Kaifeng, where it remained well established for eight centuries until being dispersed during civil disturbances in the nineteenth century. Thus, although in recent years some Chinese citizens have affirmed personal Jewish ancestry, Jews have not been officially recognized as one of the fifty-six ethnic communities or five religions of contemporary China. On the other hand, Quanzhou, a port city on the southeast coast, during the Southern Song hosted a large population of Islamic traders whose descendants remain today a conspicuous and distinctive presence in that area.

Iron production in Song China reached levels unmatched anywhere until the nineteenth century. Chinese utilized coal, a fuel unknown to Europeans like Marco Polo, who wondered at the black rock that burned when he visited China in the generation following the Song dynasty’s fall. Song period advances in the application of agricultural technology, such as a pedal-driven waterwheel for irrigation, in combination with the sophisticated use of multiple cropping, dramatically increased agricultural output, especially in the long Yangzi River valley from Nanjing to Sichuan and further south. Intense use of water transport in the many canals, rivers, and lakes of south China underlay development of marine technology employed in building the contemporary world’s largest and best designed ocean-going vessels. Such ships, constructed with sternpost rudders and watertight compartments, and carrying several hundred men, often sailed to ports of the western Indian Ocean.

Heavy expenses for northern military defense burdened the treasury by the middle of the eleventh century, provoking efforts at institutional reform and rationalization implicitly aimed to “enrich the state in order to strengthen the military,” as the classical maxim puts it. Reformers, such as Wang Anshi 王安石 (1021–1085), were also sincerely motivated by Confucian principles of benefiting the people. They were opposed by conservatives, such as Sima Guang 司马光 (1019–1086), who were equally devoted to different understandings of the shared Confucian teachings and of the common good. The creative optimism of early Northern Song scholar-officials, such as Fan Zhongyan 范仲淹 (989–1052) and Ouyang Xiu 欧阳修 (1007–1072), who sought innovative and practical solutions to contemporary problems in accord
with Confucian values, yielded to a political stalemate in which preemptive accusations of moral deviation stymied policymaking at the court. The failure of eleventh-century reforms left lasting effects on imperial government in later dynasties. Wealth gained from commerce was typically invested in farmland, which brought social prestige according to Confucian standards, while stunting the possibilities of independent capitalist development.

In the early twelfth century, a new power rose in northern Manchuria, the Jin 金 dynasty of the Jurchen 汴珍 nation (Jurchen Jin dynasty, 1125–1234), with whom the Song court made an alliance against their common enemy the Liao state. But in 1126 the Jin armies, after occupying Liao, continued southward and seized the Song capital at Kaifeng, carrying off the two last two Song emperors to Manchuria, along with thousands of their clan members. None of them ever returned to China.

SOUTHERN SONG

Following this shocking disaster, a younger brother of the last Northern Song emperor reestablished the Song court in a temporary capital south of the Yangzi River at Hangzhou 杭州 in modern Zhejiang 浙江 Province, where it persisted for another century and a half until it was destroyed by the Mongol 蒙古 invasion in 1279. Even after losing all territories north of the Huai 淮 River basin, the Southern Song continued to grow economically and to thrive culturally, whereas the north lagged under alien rule. Southern export trade was expanded from one port,
Guangzhou (Canton), during the Northern Song to several other ports along the coast: Hangzhou, Quanzhou, and Ningbo, for example. State revenues from maritime trade outgrew income from agriculture, indicating a pragmatic attitude toward the anticommercial ethos of neo-Confucian moral teachings that were concurrently being energetically promoted.

Chinese demographic presence in Southeast Asia can be traced to early communities of resident sojourners in this period. Rapidly ripening rice, allowing two crops to be harvested per year, was introduced to China from Southeast Asia, as was cotton. Chinese craftwares, such as the widely desired porcelains that we call china, and preserved foods were traded for luxury goods such as rare minerals or exotic fauna and flora. As wealthier Chinese consumed more meat, pepper from Java and Sumatra became a necessary import to China, as to Europe. Remains of Song period export products have been found as far away as Arabia and East Africa. A Chinese maritime record of the early thirteenth century indicates knowledge of western locales such as Baghdad, Cairo, and even Sicily.

In the Southern Song period, the Jiangnan region (southeast of the Yangzi River) for the first time became economically and culturally dominant in China, foreshadowing the rise of Nanjing as the founding capital of the Ming dynasty (1368–1644) and later of the unified Republic of China from 1927 to 1949.

The Southern Song philosopher Zhu Xi (1130–1200) has been called the single most influential person in the last millennium of Chinese history. Zhu creatively integrated pre-imperial Confucian teachings with Buddhist and Daoist perspectives, which had enlarged Chinese thought and enjoyed popular favor in the medieval period. Through Zhu’s reformulation neo-Confucian thought transcended elite circles and became effectively competitive with Buddhism and Daoism for influence in society.

Zhu Xi’s system, which was orthodox in China until the twentieth century, offered its followers a comforting sense of living in organic harmony with moral principles that were both universal and historically Chinese. Zhu’s thought was rational, as opposed to mystic, but its emphasis on ethical learning diminished later Chinese thinkers’ interest in natural science, which had advanced impressively during the Northern Song, as in the thought of Shen Guan 沈括 (1031–1095). Thus personal commitment to core humanistic disciplines of the Confucian way, such as normative family relations and the prestige of classical and historical models, pervaded Chinese society at all levels during the last millennium.

Southern Song government was often dominated by powerful chief ministers who monopolized power by concurrently holding two or more offices originally meant to be separately staffed. Arbitrary governance paralyzed policymaking and administration, and demoralized officials, intensifying factional disputes.

**End of an Age**

World history was changed forever in the middle of the thirteenth century with the rise of Chinggis (Genghis) Khan’s militantly aggressive Mongol empire, which destroyed the Jurchen Jin dynasty in north China in 1234 before invading Russia, Poland, and Hungary in 1240 and 1241. Western Europe was saved only because the advancing Mongol horde returned to Mongolia on the death of their “Great Khan.” In the Middle East, they destroyed the secret Isma’ili Order of the Assassins and conquered Persia, sacking Baghdad in 1258 and taking Damascus and the Levant in 1260 before a planned attack on Egypt was blunted.

Still, Southern Song valiantly resisted until finally overcome in 1279 by the Mongols’ Yuan dynasty (1271–1368) under Khubilai Khan, during whose reign (1260–1294) Marco Polo was in China. The Mongols’ typically violent and suspicious ruling style, and their imposition of overbearing and exploitative top-down controls on local administration, introduced a shocking new despotism to Chinese government, with lasting reverberations through the centuries to modern times. Many Chinese scholars who had matured in the late Southern Song withheld their support of the new Yuan dynasty and so gained the honored name of principled loyalists to the glorious memory of the fallen Song, China’s most civilized and enlightened age.

By Song times China had fully integrated the influences of the Indian Buddhist worldview and emerged with a renewed and strengthened Chinese identity. That historical experience prefigures China’s struggle in the twentieth century to balance the universal claims of
Marxism and Western science with pride in its own native traditions, and suggests possibilities for China’s role in the world of the present century.

Song Lyrics (Ci)

Words set to music, or song lyrics, were a major poetic form in China between the seventh and thirteenth centuries. Words held sway over melodies. Often the music served as a sort of template to which the poet fit the words. Song lyrics covered the whole range of the poet’s experience and were often quite personal.

The song lyric (ci) is one of the major poetic genres in China that had a close connection with musical performance throughout its development. One of the earliest terms used to identify the genre was words set to music (quzi ci). This term points to the song lyric’s origins in the new music from central Asia that began entering China during the Tang dynasty (618–907 CE) and soon became all the rage at the cosmopolitan Tang court and in urban culture. Lyrics were set to this so-called banquet music (yanyue). The earliest extant song lyrics are folk compositions preserved in manuscripts discovered in the Buddhist caves of Dunhuang in Gansu Province. The later history of the song lyric genre, however, is largely a product of literati authors and their interaction with popular culture.

The first literati experiments occurred during the ninth century during the late Tang dynasty; the form evolved in the hands of different literati authors into a major form of written poetic literature from the tenth to the thirteenth century during the Song dynasty (960–1279) and gradually declined after the conquest of China by the Mongol Yuan dynasty (1279–1368).

Two other phrases used to refer to the song lyric highlight formal features and the problem of the genre’s status. A second phrase used to designate the song lyric was long and short lines (changduan ju). This phrase points out a defining formal feature of song lyrics: its frequent use of uneven line lengths and strictly determined rhyme and tone schemes. Although the song lyric frequently had lines of varying length, it was far from free verse. Song lyrics were identified by their tune titles, which referred to a common tune matrix to which different poets would fill in the words (tanci). These tune patterns determined the number of characters per line, the placement of rhymes, and the tonal pattern. Uneven lines of song lyrics accommodated a large number of colloquial elements and empty, or function, words (xuci) and tended to employ more continuous syntax than shi poetry did.

The long and short lines must have reflected the structure of the new music. They were also thought to be more suitable for narrating the twists and turns of subtle emotional states with which the genre was often preoccupied. Finally, song lyrics were also often referred to by a third phrase, the remains of shi or the unspent energy of shi (shiyu). In generic terms song lyrics were often defined against the established genre of shi poetry as the “other” of shi. Shi was the serious poetic genre long thought to be the proper vehicle for conveying one’s intent, to reveal the poet’s character and even to demonstrate one’s fitness for public office in the civil service. By contrast, early song lyrics were associated with women and the entertainment quarters, where courtesans sang the popular new music. The writer of ci could borrow the voices of the singing girl and her allied personae. Song lyrics also allowed
more room for a poet to describe his or her private life, separate and independent from the more public aspects of identity that were the proper domain of shi. This feminine connection would play an important role in setting the ci’s thematic range and would make problematic its legitimacy as a genre for serious literary pursuit during its early development. At the same time, the predominance of the female voice also led to a complex poetics of voice, impersonation, and performance.

Five Dynasties Writers: Courts of Shu and the Southern Tang

The earliest substantial corpus of song lyrics by literati authors comes from the Five Dynasties period (907–960 CE). During this time of political division the song lyric was largely a tale of two southern kingdoms, with a prominent collection known as Collection among the Flowers (Huajian ji) compiled in the court of the southwestern kingdom of Shu and important works written by the rulers of the southeastern kingdom of Southern Tang. This collection came largely to define the generic identity of the song lyric as delicate and subtle in tone, linked with the boudoir setting and closely associated with the female poetic voice. The collection contains some song lyrics in which male writers wrote objective descriptions of female figures, epitomized by the song lyrics of Wen Tingyun (812–866) and others in which writers borrowed the female voice in a kind of literary ventriloquism. At the same time in the Southern Tang court, the second and last ruler, Li Yu (961–975), crafted concise song lyrics that harnessed the power of immense natural images to convey the intensity of his sorrow when his kingdom was conquered by the Song dynasty. Although Song literati criticized this failed ruler in official statements, his song lyric’s departure from the boudoir setting, use of a male autobiographical voice, and introduction of vast natural imagery as correlates to feelings associated with the state and country created a precedent for later writers of similar disposition. Literati song lyrics of this period were composed predominantly in the shorter xiaoling form, which bore a closer resemblance in structure and length to shorter forms of shi poetry with which literati writers were well acquainted.

Northern Song Writers

After the Song dynasty unification of the empire in 960, song lyrics began to be composed by members of the newly risen scholar-official class. Some prominent figures, such as Yan Shu (991–1055) and Ouyang Xiu (1007–1072), continued to write banquet songs almost exclusively in the xiaoling form. The main dynamic behind changes in the song lyric was the interaction between popular and literati elite cultures and the effort to employ popular styles, adapt them, or to create a refined style. The form at the heart of this cultural intersection was the manci, a longer form of the song lyric formerly eschewed by literati writers because of its technical challenges and association with popular culture. The appeal of the manci lay in its capacity for more expansive and continuous narration of thoughts and feelings.

Three important writers exemplify these trends in the manci. Liu Yong (c. 987–1055) was the first literati writer to take up the manci form. His manci revolved around two overlapping themes: romances with singing girls in the city and the sorrows of the official traveler on the road. His use of colloquial diction and direct treatment of the theme of love, although incredibly popular in urban entertainment quarters, drew much criticism from contemporary literati. The great renaissance man, Su Shi (1037–1101), is credited with elevating the form by using song lyrics as shi poetry, that is, by using the song lyric to address a broad range of topics associated with the poet’s public persona and incorporating diction and allusions from shi poetry. The short prefaces that he appended to more than 43 percent of his song lyrics also firmly grounded the reading of his manci about his personal sense of displacement in official travel and political exile.

Zhou Bangyan (1056–1121), director of the Music Bureau at the court of Emperor Huizong (reigned 1100–1126), also incorporated diction and allusions from shi poetry into his manci but achieved a different effect. The heavy use of citation and allusion in his song lyrics created an ambiguous and unstable focus in which the poet
becomes a disembodied presence. In his manci we see the shift of the organizing core of his song lyrics away from the persona of the poet and toward the creation of a highly refined mood often centered on an object.

Southern Song Writers

After the collapse of the Northern Song dynasty and the relocation of the capital to Hangzhou in 1127, the song lyric developed along two distinct, although often overlapping, directions following the innovations of Su Shi and Zhou Bangyan. Each of these innovators’ styles was shaped by two different groups, the first by a group of activist scholar-official writers and the second by a new class of professional musicians. During the early Southern Song dynasty a group of scholar-official writers confronting the collapse of the central government and mass migration to the south began to consciously write song lyrics in the manner of Su Shi. Su Shi’s precedent, which had transformed the song lyric into a vehicle for confronting the sense of displacement in travel through a strong, personal voice, responded exactly to the needs of writers, such as Ye Mengde (1077–1159), who were forced to flee south while defending the reestablished state. In the next generation, Xin Qiji (1140–1207) exemplified the trend toward expressing a personal voice and mourning the tragedy of the communal past among scholar-official writers. During the second half of the Southern Song dynasty, however, the mainstream of song lyric writing was defined by an emphasis on musical craft, as seen in the manci of Jiang Kui (1155–1221) and Wu Wenying (1200–1260). These works were written by a class of professional musician-poets whose members were unable or uninterested in obtaining scholar official status and instead relied on the patronage relationships, often within the political elite of the flourishing commercial center and capital of Hangzhou. The opulence and refinement of the material culture of Hangzhou are reflected in their song lyrics on objects, which focused on small and delicate objects, often located within one of the famed gardens of Hangzhou, that evoked a stream of memories and associations.

Although the song lyric declined during the Yuan dynasty, the Qing dynasty (1644–1912) experienced renewed interest in the song lyric by a number of maverick writers, such as the female revolutionary Qiu Jin (1877–1907) and the world traveler Lu Bicheng (1883–1943), who drew on the full range of styles and voices developed during the heyday of the genre from the ninth to the thirteenth century.

Soong Mei-ling, whose life spanned three centuries, was one of the most influential women in twentieth-century China, becoming an indispensable advisor to her husband, Chiang Kai-shek, on foreign affairs. Serving as a de facto liaison between Chiang’s wartime government and the United States during World War II, Madame Chiang Kai-shek, as she was known, was the first Chinese person ever to address both houses of the U.S. Congress.

Soong Mei-ling was born into a wealthy Cantonese family in Shanghai in 1898. Her father, businessman Charlie Soong (Song Jiashu, 1866–1918), made his fortune publishing and selling Chinese-language bibles. He insisted all his children be educated in America, so Soong Mei-ling left for America in 1907 to attend a private school. She graduated from Wellesley College in Massachusetts in 1917. Her fluency in English and profound understanding of American society and politics would enable her to play an essential role in China-U.S. relations after her marriage to rising political star Chiang Kai-shek in 1927.

In China, Soong held numerous political posts. From 1929–1932, she served as a member of the Legislative Yuan. From 1938–39, she was Secretary-General of the Chinese Aeronautical Affairs Commission. In this capacity, she recruited retired U.S. airman Claire Lee Chennault to head the so-called Flying Tigers air force, made up largely of volunteer pilots from the U.S., to help China fight Japan’s air forces. After the Japanese attack on Pearl Harbor in 1941 caused the U.S. to enter World War II, Chennault was officially appointed as a General by President Roosevelt.

During World War II, Soong served as Chiang’s interpreter and confidante as America sent many military advisors to his war-time capital in Chungking (Chongqing). While Chiang knew little about the West, Soong felt that the Republic of China’s fate would depend on good relations with America. In 1942–1943, Soong toured the U.S. extensively to drum up support and funding for the Nationalist government’s war effort as an ally against the Japanese. She formally addressed both houses of Congress, becoming the first Chinese and only the second woman ever to do so.

At the same time, with the help of her long-time friend, Henry Luce, founder of Time magazine, she organized the now infamous China Lobby as the Nationalist’s support base in the U.S. Time magazine published many glowing reports of Soong and her husband. (They had appeared jointly on the January 1938 cover of Time as “Man and Wife of the Year.”)

However, by the late 1940s, reports of gross corruption under Chiang sullied their reputations in America. Members of Soong’s family, including her brother T. V. Soong, and her brother-in-law, H. H. Kung, were both members of Chiang’s government and were reportedly embezzling great sums of money that America had sent for the war effort. When Soong Mei-ling embarked on another trip to the U.S. in November 1948, she was not invited to speak before Congress. And President Truman
pointedly refused to allow her to stay at Blair House, as she had under Roosevelt.

After the Communists won the Civil War in 1949, Soong fled with her husband to Taiwan. After his death in 1975, she moved to New York, where she lived until her death in 2003 at the age of 105. She was buried at Ferncliff Cemetery in Hartsdale, New York, where her oldest sister, Ai-ling was also interred. (Her middle sister, Qing-ling, was the widow of Sun Yat-sen and had been buried in China.)

Soong’s will stated her intention to be re-buried, along with husband, on the Chinese mainland once the political differences between the People’s Republic and the Republic of China on Taiwan were resolved.

A member of a wealthy Shanghai Christian family prominent in the Chinese Nationalist Party, Soong Ziwen served in major financial and diplomatic posts under the two pre-1949 leaders of the Nationalist Party. The two men, President Sun Yat-sen and Generalissimo Chiang Kai-shek, each married sisters of Soong Ziwen. Soong and his family were key figures in U.S.-Chinese relations before 1949.

Soong Ziwen was the eldest son of Charlie Soong (Song Jiashu, 1866–1918), a Chinese Christian minister who rose from obscurity to head a wealthy Shanghai family. Like his father, Soong Ziwen was educated in the United States, and his career was closely tied to support for the leader of the Nationalist Movement, Sun Yat-sen (Sun Zhongshan, 1866–1925). Equally important were the marriages of his three elder sisters. The eldest, Soong Ai-ling (1889/1890–1973), married Kong Xiangxi (usually called “H. H. Kung,” 1881–1967), a financier who also served in the top echelon of the Chinese Nationalist Party (Guomindang, GMD) administrations. His second-elder sister, Soong Qing-ling (1893–1981), married Sun Yat-sen in 1915, and his third-elder sister, Soong Mei-ling (1898–2003), married the Nationalist leader Chiang Kai-shek (1887–1975) in 1927.

After graduating from Harvard in 1915 Soong Ziwen worked in international banking in New York before returning to China as a financial manager. In 1923 his brother-in-law Sun Yat-sen called him to Guangzhou.
(Canton) to reform the Nationalist movement’s finances. Soong Ziwen remained after Sun’s death in 1925, and when his other brother-in-law Chiang Kai-shek established a Nationalist government in Nanjing in 1928, Soong became minister of finance.

Soong Ziwen and his third brother-in-law, Kong Xiangxi, emerged as decisive figures in Chiang Kai-shek’s efforts to centralize economic and financial power in the 1930s. Their efforts threatened the interests of many Chinese and foreign capitalists who resented their statist, dirigist (relating to economic planning and control by the state) policies. Chiang Kai-shek, however, needed their skills to provide a stable currency, taxes, and loans on which to expand Nationalist power.

In 1928 Soong Ziwen’s career became dependent on his close ties to his sister Soong Mei-ling and her husband, Chiang Kai-shek. In the 1930s Soong achieved the first successes in the recovery of Chinese sovereign rights from the nineteenth-century unequal treaties. Soong Ziwen also established a number of state-owned modern factories that were intended to produce revenue for the Nationalist government and improve its defense capacity. These factories became key elements in the Nationalist government’s program of state-controlled capitalism and were condemned later as “bureaucratic capitalism.”

After the War of Resistance against Japan (1937–1945, referred to as the Second Sino-Japanese War outside of China) broke out Chiang Kai-shek called on Soong Ziwen’s connections with the United States to help secure U.S. loans and support. He and his sister Soong Mei-ling played critical roles in this effort. From 1942 to 1945 Soong held the post of foreign minister. Accusations circulated widely, both in China and the United States, that members of the Soong family, including Soong Ziwen, enriched themselves personally from U.S. aid.

At the end of World War II Soong Ziwen became head of the Executive Yuan, which managed civil government. He also continued performing important diplomatic tasks. Chinese critics, including many Chinese Nationalist leaders, disliked Soong Ziwen for his close identification with U.S. interests.

When the Nationalist government fell in 1949 and fled to Taiwan, Soong was serving as governor of Guangdong Province. Subsequently he moved with his wife and three daughters to an estate on Long Island in New York but continued to serve as an advisor to Chiang Kai-shek. He died after suffering a stroke in 1971.

China has profoundly affected the states of Southeast Asia throughout history, losing its dominance only during a period of Western colonialism in the region. Chinese influence in Southeast Asia is again on the rise and is evident in the spheres of economics, religion, and political ideologies.

The opening decade of the twenty-first century saw China reestablishing itself as Asia’s dominant power and redefining China–Southeast Asian relations. In effect, the Southeast Asian states have been returning to an earlier phase in their history, when they had accepted a subordinate role in their relationships with China. Only between the seventeenth and twentieth centuries, when Western imperialism held sway in the region, did China lose its dominance vis-à-vis the Southeast Asian countries.

Chinese Migration in Southeast Asia

Chinese influence in the eleven countries of Southeast Asia (Brunei, Cambodia, East Timor, Indonesia, Laos, Malaysia, Myanmar (Burma), Philippines, Singapore, Thailand, and Vietnam) is relatively proportional to the number of Chinese in each country. Vietnam, for example, was historically the Southeast Asian state most influenced by China because of the steady stream of Chinese migration into northern Vietnam. This influx of Chinese soldiers, officials, and peasants into Vietnam came about through geographical and political conditions. Geographically connected to southern China, Vietnam was an attractive alternative for Chinese fleeing from local bullies, civil wars, dead-end bureaucratic positions, and limited land. Chinese immigration to Vietnam was rather seamless during the first millennium of the common era with Vietnam actually China’s southernmost province between 111 BCE and 939 CE. While this political reality was based on military subjugation, the very fact that it lasted for a millennium is significant. No other Southeast Asian country experienced such profound Chinese influence on its history and society for such a length of time.

Chinese migration to other areas of Southeast Asia involved establishing enclaves only on the coasts of those countries. During the first centuries of the common era, merchants from China’s southern and eastern provinces used small boats, known as junks, to venture into Southeast Asian waters, facilitating trade. This trade dramatically increased during periods when the Silk Roads were impassable due to civil wars along the overland route, which connected China with Western empires. Over time, Chinese traders set up communities in Southeast Asia at established ports. In places such as the Indonesian and Philippine archipelagos, Chinese settlements took root where the land met the sea. In short, the Chinese migration into the islands of Southeast Asia was limited to the periphery of the states and did not reach into the interior. The geographical margins of these Chinese communities matched the social isolation the early migrant Chinese sought. Overseas Chinese did not always integrate into
the native population because the Chinese believed in the superiority of Chinese culture and society.

Western industrialization and the concomitant imperialism (Western powers colonized every part of Southeast Asia except Thailand) changed the nature of Chinese influence in Southeast Asia. The Chinese actually became more important in Southeast Asian financial systems as Chinese merchants were the personnel that Western colonial powers used to plug Southeast Asia into the world’s economy. In places such as the Malay Peninsula in the mid-nineteenth century, the British established tin mines, which produced the vast majority of the world’s tin. Anglo officials in Malay preferred to employ Chinese laborers rather than the indigenous population, for the former were less likely to create strife and had no ties to local Malay chieftains or the ubiquitous mosques. The importation of Chinese labor was on such a scale that in 2008—a century and a half after the mass arrival of Chinese laborers—26 percent of Malaysia was ethnically Chinese; in neighboring Singapore 76 percent of the island’s residents was Chinese.

While Chinese people constitute only a minor portion of the Philippines’ population, they possess disproportionate economic control, which can be traced to their partnership with the colonial Spanish officials of the region. The Philippines proved to be a losing economic proposition for Spain, which ruled the archipelago from 1571 to 1898. But the Spanish did use the city of Manila as an area for exchanging international goods. Chinese porcelain, finished silk textiles, and other material from southern China were sent to Manila. The Manila-based Chinese merchants partnered with Chinese in southeast China to make this trade possible. From Manila, Chinese wares were placed on a galleon and shipped across the Pacific to Acapulco, Mexico, in exchange for Peruvian silver, which was sent back to Manila and China.

**China’s Philosophical Influence in Southeast Asia**

More powerful and profound than economic influences has been China’s ideological impact on Southeast Asia.
Varied in time and nature, Chinese philosophies have affected the cultures of its southern neighbors.

The geographical and political connections between Vietnam and China also affected the Vietnamese worldview. Assimilating Vietnam into the Chinese bureaucracy meant the imposition of China’s political paradigm on its southern province. Embedded in this system was an implicit moral value system. In other Southeast Asian states these values were spread through intermarriage and the establishment of Chinese schools.

Some of the Confucian ideas that were transmitted to Southeast Asian states include a high regard for education, an emphasis on affable relations, and filial piety. In Vietnam as in China, there emerged an elite educated class that ran the political system. Mastery of the Confucian classics was the means to a more secure, economically viable existence in Vietnam. The Confucian notion of the superiority of learned men was integrated into Vietnamese culture, and a good number of Vietnam’s most influential twentieth-century figures—such as Ngo Dinh Diem, Vo Nguyen Giap, and Ho Chi Minh—spent much of their early careers acquiring an education.

In more recent times the thoughts, policies, and writings of Mao Zedong have spawned revolutions in Southeast Asian states. One example of a group that Mao influenced was the Khmer Rouge. This somewhat marginalized Communist group in Cambodia borrowed many of its ideas and practices from Mao’s formulations. During the 1970s, when the popular Cambodian king, Norodom Sihanouk, was ousted by pro-American elements in his army, China facilitated an uneasy alliance between the ousted monarch and the Khmer Rouge. Led by Saloth Sar, also known as Pol Pot, the Khmer Rouge capitalized on this China-negotiated alliance and staged a civil war that allowed the Khmer Rouge to run the country from April 1975 to December 1978. The leaders of the Khmer Rouge envisioned an agrarian-based utopia that valued ideological correctness more than education in the humanities and sciences. Their policies resulted in the systematic elimination of people based on their high educational attainment, ethnicity, and ties to the old regime. It is estimated that 2 million out of Cambodia’s population of 6 million died during the Khmer Rouge rule. The Cambodian Communists’ policies and atrocities were not unprecedented. Taking their cue from Mao’s Great Leap Forward (1958–1961), the Khmer Rouge leaders tried to emulate Mao’s vision for a society where people’s lives, energies, and productivity would all be for the state. And, just as in China, vast numbers of Cambodians lost their lives for this ideology.

As in Cambodia, post–World War II Communist movements in Malaysia, Indonesia, and the Philippines borrowed heavily from Mao’s teachings, continuing a more than two-thousand-year-long pattern of Chinese philosophers affecting the worldview of Southeast Asian peoples.

Current and Future Relations

“The Chinese people have stood up.” Mao’s memorable words at the 1 October 1949 founding of the People’s Republic of China (PRC) were more prophetic than real. In fact, it was only after Mao’s death in 1976 that China’s rise shifted the balance of power in the region and in the world. The country’s recent, rapid economic growth is unparalleled in human history. For example, since 1979 China’s economy has doubled every eight years. In that same time period the U.S. economy had doubled once.

It is apparently not in China’s destiny to cross oceans and colonize other countries. Identifying their country around 1000 BCE as the Middle Kingdom, surrounded they then thought only by barbarians, the Chinese to this day have not sought overseas colonies because they see themselves as the source of culture: “Let nations come to us and discover our greatness” is the historic Chinese attitude. Some observers question whether this hands-off policy will remain, given China’s economic and military growth. All signs point to the continuation of the peaceful relationship between Southeast Asia and China, though there does seem to be a shift in China’s hegemonic role in Southeast Asia. China’s relations with the Association of Southeast Asian Nations (ASEAN) and its claim on potentially oil-rich regions around Southeast Asia point to new developments between China and Southeast Asian states.

Two recent examples of increased tension between China and Southeast Asian nations are the disputes over the Spratly and Paracel islands in the South China Sea and the establishment of a Chinese base on Mischief Reef, situated 250 kilometers off the southern Philippine island of Palawan. In these cases Southeast Asian countries claim
that China is moving into territory that does not belong to it. China contends that it is not interested in colonizing these islands, but it does seek to explore potential oil reserves in the area. Various ASEAN diplomats remark that when they seek to negotiate with China on these matters, the Chinese are more likely to cite past dynasties and old maps than they are to talk about present realities.

Since the break-up of the Soviet Union and the withdrawal of the U.S. military presence from Southeast Asia, particularly from its two large bases in the Philippines (Clark Air Base and Subic Bay Naval Base), there has been a superpower vacuum in the region. While China has not yet stepped into a hegemonic role in Southeast Asia, there is an opportunity for it to do so. Its future in the region will depend on how it maintains relations with each country rather than with the entire region as a whole because ASEAN is too ideologically and ethnically disparate to provide a united front against any type of Chinese dominance in the region. Furthermore, the 20 million overseas Chinese in Southeast Asia are treated differently from country to country. For example, Chinese have adjusted quite well in Thailand and the Philippines, but they have not experienced the same amiable integration in Vietnam, Malaysia, or Indonesia. During 1978 and 1979 the mistreatment of Chinese in Vietnam was considered so intense that the Chinese government sent ships to Vietnam to evacuate its overseas constituents.

Compared with Vietnam, hostility between Malays and overseas Chinese in Indonesia and Malaysia is relatively recent. During the nineteenth century thousands of Chinese emigrated to Malaya to the point that in 1931 Chinese made up 41 percent of the Malay Peninsula’s population. The Chinese eventually dominated the economy of Malaysia. In the last quarter of the twentieth century, however, bloody riots against the Chinese on the Malay Peninsula have caused tension between China and Malaysia. During the first decade of the twenty-first century, the Chinese community in Malaysia still has an inordinate amount of influence on the Malaysian economy.

In neighboring Indonesia the Malay population holds some animosity toward their Chinese neighbors because of their economic wealth in the archipelago. The Indonesian Chinese were also accused of supplying 1960s Communist revolutionaries with weapons, bringing the country to the brink of civil war and leading to President Sukarno’s eventual downfall.

Given the historic precedent of Chinese dominance in Southeast Asian relations and China’s recent rise to superpower status, it appears natural that China will view itself as a guardian over its southern neighbors. But given the diverse historic and current relationships that each Southeast Asian country has with China, it is unlikely that there will be one universal policy that governs Sino-Southeast Asian relations. Rather, the nature of these relations will be predicated on China’s economic/military interests in a particular region and the strength of the bonds between a particular Southeast Asian country and China.

Southeast Asian Financial Crisis of 1997 ▶
The Southeast Asian Financial Crisis that began in Thailand and quickly spread to neighboring countries was an example of the cyclical nature of capitalism. This crisis caused massive political and economic fluctuations and competitive currency devaluations. Within this context China showed itself to be an economically stabilizing influence and a regional leader, the benefits of which it is continuing to enjoy today.

The Southeast Asian Financial Storm, or Asian Financial Crisis as it is more commonly known, was the result of a decade of rapid economic growth in Asia (the Asian economic miracle) where fundamental economic realities became skewed, leading to a period of adjustment following the boom. In this respect it was simply another part of the boom-and-bust cycle of capitalism. The usual starting point is the run on the Thai baht that began in July 1997.

Boom-and-Bust Cycles of Capitalism

It was this boom-and-bust cycle that the economic planners tried to stop at the end of the Second World War. The Bretton Woods agreement is the most famous, where the International Bank for Reconstruction and Development (later the World Bank) and the International Monetary Fund (IMF) were created. The purpose of the IMF was to make emergency loans to economies that found themselves in dire straits. The IMF would restore public confidence through loans and prevent an economy from sliding further into recession. At the same time, it would provide financial advice to get an economy back on track. It has played an important role in the world economy since its creation (though it is not without its critics).

A final initiative of the Bretton Woods agreement was the stabilization of currency exchange. The prewar gold standard system did not survive the Great Depression and Second World War II. The U.S. idea after the war was to peg gold to the U.S. dollar and then, in turn, link all Western currencies to the U.S. dollar ("as good as gold"). This had the effect of stabilizing both international trade and currency exchange. Under this system it was impossible to have a run on a country's currency by speculators. Unfortunately, this system did not last. The U.S. government overspent on both the Vietnam War and President Johnson's Great Society initiative. The result was a massive oversupply of U.S. dollars on the world market to pay for both. When European bankers, in particular, became alarmed about this dollar glut, they began to pressure the United States to pay them in gold at the level agreed upon in 1945. The United States was unable to do this, and President Nixon removed the dollar from the gold standard in 1971, leading to a sharp depreciation in the dollar and the subsequent loss of billions to European banks. The creation of the euro, incidentally, is in large measure a result of this event, so the Europeans do not have to depend on the U.S. dollar as a world currency.
Since this time, the world has moved to a system of floating exchange rates, and hence a high level of instability in the global financial system. For example, how can exporters plan ahead when they do not know how much their products are going to cost in the long term in different markets? What prevents speculators from creating a run on a particular currency to make short-term profits?

**Underlying Causes of the Crisis**

In Asia the financial crisis had both long-term and short-term beginnings. Through the 1970s until the mid-1980s, Japan had been running a huge surplus with the world in general and the United States in particular. In 1985 the Japanese agreed to increase the value of the yen. However, the yen rose far faster than anyone expected, from about 230 yen to the U.S. dollar in 1985 to eventually 80 yen to the U.S. dollar ten years later. The Japanese government, therefore, became worried about endaka, or high yen recession, where their exported products would cost too much on world markets. One result was that they kept interest rates low (eventually 2.5 percent and today just over 0 percent), and banks were encouraged to lend on easy terms to compensate. Japanese companies also massively invested offshore, especially in Southeast Asia, to make products with lower labor costs and, therefore, be less expensive in global markets.

With low interest rates and easy lending by banks, the Japanese massively overinvested in both the Japanese stock market and real estate, creating an artificially large economy (a “bubble”). After Japan’s financial meltdown beginning in 1991 (the end of the “bubble economy”) Japanese companies continued to invest in Southeast Asia, this time to produce low-cost products for the Japanese market as well, and remain competitive there.

Unfortunately, not all of this investment was used wisely in Southeast Asia. Japanese money was typically channeled through local banks, and their lending criteria were not always rigorous. It was also often put into real estate, and this created inflated real estate prices in the region. Other countries followed the Japanese lead and money poured into the region. The result was a number of economic bubbles created by the inflow of foreign investment.

**Short Term Causes of the Crisis**

In terms of short-term causes of the crisis, in 1997 it became clear to some currency speculators that local currencies were overvalued, and they attacked them. The idea was to short sell the currencies (to make a contract buying the currency in the future at a low price and then selling that currency to drive it down). The first attack occurred in Thailand in that year. The result was a panic. Everyone holding reserves of Thai baht sold them, which drove down the price. Then speculators began looking around the region and attacked other currencies. At the same time, panicked investors withdrew their funds, and this added to the fall in local economies. Some $80 billion to $100 billion of investment was withdrawn from the region.

**Impacts of the Crisis**

The result was economic chaos in a number of countries in Asia. Eventually Thailand and Indonesia accepted rescue packages from the IMF (as well as South Korea in Northeast Asia). Massive currency devaluation took place. The worst affected (exacerbated by political turmoil in the country) was the Indonesia rupiah, which dropped from about 2,500 rupiah to the U.S. dollar in mid-1997 to about 18,000 by the time the slide stopped. The Malaysian government took the unprecedented step of introducing currency controls (not allowing its currency, the ringgit, to be freely traded) and the currency’s exchange rate is still managed today though its value is linked to a basket of major currencies. Real estate values plummeted, banks collapsed, unemployment soared, and political turmoil resulted (the authoritarian government of Indonesia, in place for more than thirty years, fell after a period of bloody rioting).

There were a few bright spots. China refused to devalue its currency, to compete with the lower currencies of Southeast Asia, and supported the Hong Kong dollar. It came out of the crisis with substantial political collateral, and became something akin to the savior of Southeast Asia. China’s response showed leadership, where the government put regional above domestic interests. It could...
have devalued its currency and ameliorated the impact of the crisis on China's economy but chose instead to support neighboring countries. By doing so China gained substantial political capital in the region that is continuing to pay dividends today. Singapore, where bank lending was more rigorous, also survived with only a minor recession. The very poor countries of Southeast Asia—Vietnam, Laos, Cambodia, and Myanmar (Burma)—were not overly affected because their economies were already at such low levels. But those economies that had grown substantially because of foreign investment—Thailand and Indonesia in particular—suffered enormously.

The real pain lasted for about two years before there were early signs of recovery, though Thailand and Indonesia had yet to recover fully more than a decade later. The idea of Asia's "miracle economies" had been shown to be no miracle at all.

The crisis is best placed within the context of the boom-and-bust cycles of capitalism. The Great Depression is the best known of these, followed by the recession in the early 1970s in the United States caused by the dollar default and the dramatic rise in the cost of oil by OPEC. This was followed by the Latin American debt crisis of the early 1980s where Mexico, Brazil, and Argentina, in particular, defaulted on their international loans and had to be rescued by the International Monetary Fund (IMF). Then, after the Asian Financial Crisis, came the collapse of the American hedge fund, Long Term Capital Management, in 1998, and Russia's loan default and the collapse of the ruble. Finally, in 2008 there was the mortgage crisis in the United States that dragged the U.S. economy into a recession, followed by a banking crisis that spread to financial systems and has affected economies worldwide into 2009.

In this respect the Southeast Asian financial crisis of 1997 and the 2008 global crisis are similar. When public sentiment for buying goods and investment is strong, business does very well, but this broad-based economic excitement tends to make both borrowers and lenders less prudent. People borrow too much and banks lend on overly easy terms. Prices become inflated, and when the downturn begins, the herd mentality means that everyone rushes to shed their investments (typically either in real estate or the stock market) at the same time. Prices plummet and a recession threatens. The major difference between the crisis of 1997 and the one beginning in 2008 is that the latter downturn, having started in the world's largest economy and consumer market, necessarily has global repercussions.

Southern and Northern Dynasties

Nán-Běi Cháo 南北朝
220–589 CE (years debated by scholars)

The Southern and Northern dynasties (220–589 CE, although scholars debate the exact dates) were periods of civil unrest and warfare, but they also brought the spread of non-indigenous Mahayana Buddhism and native Daoism, the emergence of Chinese Buddhism, and advancement in the arts and sciences.

The highly complex period of the Southern and Northern dynasties has engendered lively scholarly debate about official and unofficial and regional/local dynasties whose names appear in the Chinese chronologies but are not always recognized as valid by Western scholars. This era is generally bracketed by the Three Kingdoms period (220–265 CE) and followed by the Sui dynasty (581–618 CE). China scholars acknowledge that there is disagreement on the dates for this era. The dynastic subgroups referred to in this article may be best characterized as unofficial local dynastic units whose names appear in unofficial or altered official histories.

During the Southern and Northern dynasties internal strife divided the north and south, and two dynastic successions were formed. Many northern Chinese migrated to southern China, whereas non-Chinese immigrants (primarily Xianbei steppe nomadic tribes) migrated to northern China and to some tribal areas in the south. Among these new migrants the process of sinicization accelerated. The two regions—roughly divided at the Yangzi (Chang) River—had significant ecological distinctions, with the level northern steppes conducive to livestock and horse breeding and large-scale cavalry warfare with heavily armored, fast-moving, and well-organized horsemen. The stirrup, which gave an advantage to armed riders, was developed during the earlier Western Jin dynasty and was adopted by the horse nomads of northern China and central Asia. The mountainous south was crosscut by major rivers, and warfare included the use of ships and riverine naval tactics as well as armies of foot soldiers. Naval fleets on the Yangzi River formed the line of defense against the non-Chinese from the north. The construction of irrigation works (dams, canals, and terraces) facilitated rice production to feed a population that was increasing as a result of a high birth rate and Chinese immigration from the north. Small communities grew in size, and major urban centers arose.

Buddhism, introduced into northern and southern China during the first century CE, spread and flourished in the north in part because the aristocrats who had been the main followers of Confucianism migrated to the south, and the north was then controlled by immigrant non-Chinese who were not committed to either local shamanism or Confucianism. In addition, Buddhist religious tenets and scriptures appealed to the northern farmers and craftsmen who had been oppressed by the previous nobility, especially because of the promise of an afterlife, which is not found in Confucianism.

Daoism also had its adherents. The two sects were the Supreme Purity Sect and the Numinous Treasure Sect. (The preferred way to translate into English or romanize the name Daoism, a native Chinese religion and
philosophy, has been the subject of controversy.) Buddhism in southern China was influenced by the teachings of monks such as Hui Yüan (334–416).

Cultural Advances

During this era the Southern dynasties especially enjoyed major cultural achievements in technology and manufacturing and a proliferation in arts and crafts, literature, and the sciences. Important advances occurred in astronomy, mathematics, cartography, medicine, and porcelain production; gunpowder was invented for use in fireworks. The arts, including the composition and recitation of poetry, the composition of music and the playing of instruments, and calligraphy and painting, prospered mainly under the emperors in the south, and members of the Chinese nobility were expected to master these endeavors to gain prestige among their fellow aristocrats. Among them were the influential poet Tao Qian (365–427), the calligrapher Wang Xizhi (307–365), and landscape artists such as Gu Kaizhi (344–406). Knowledge and the application of the sciences were also held in high regard; for example, a noted mathematician and astronomer, Zu Chongzhi (429–500), was esteemed in the south at the capital of Nanjing, where he calculated the length of the solar year, predicted eclipses, and worked out the value of pi. Institutions of higher learning were established, including the Zongmingguan (Imperial Nanjing University). The Southern dynasties were in commercial contact with the Indian subcontinent by sea and with the kingdoms of Funan and Champa in Southeast Asia (the latter are situated in contemporary Cambodia and Vietnam).

Southern Dynasties

The Jin dynasty was succeeded by four Southern dynasties, each led by military commanders who seized power for brief periods but were unable to establish hereditary succession; these dynasties were the Liu Song (420–479 CE), Southern Qi (479–502 CE), Liang (502–557 CE), and Chen (557–588 CE). In spite of naval strength, building and maintaining land armies were difficult. There were shortages of conscripts; troop desertsions caused shifting political alliances and social statuses because specific households had been designated for military service to the exclusion of others. The sovereigns of the Liu Song dynasty included Wu Di (420–422), Shao Di (423–424), Wen Di (424–453), Xiao Wu Di (454–464), Qian Fe Di (465), Ming Di (465–472), Hou Fei Di (473–477), and Shun Di (477–479). The Southern Qi had seven emperors: Gao Di (479–482), Wu Di (483–493), Yu Lin Wang (494), Hai Ling Wang (494), Ming Di (494–498), Dong Hun Hou (499–501), and He Di (501–502). The subsequent Liang dynasty had six sovereigns: Wu Di (502–549), Jan Wen Di (549–551), Yu Zhang Wang (551–552), Yuan Di (552–555), Zhen Yang Hou (555), and Jing Di (555–557). The Chen dynasty had five emperors: Wu Di (557–559), Wei Di (560–566), Fei Di (566–568), Xuan Di (569–582), and Hou Zhu (583–589). Emperor Wen Sui (581–604), the first emperor of the Sui dynasty, constructed a fleet in Sichuan and was able to conquer the south and reunify China.

Northern Dynasties

The proto-Mongol Xianbei nomadic tribes dominated northern China and established the Northern dynasties, which included the Northern Wei (386–535), Eastern Wei (534–550), Western Wei (535–556), Northern Qi (550–577), and Northern Zhou (557–588). The Xianbei maintained a polity (political organization) of social stratification between them and their Chinese dependents but employed Chinese as low- and mid-level bureaucrats for political administration.

The Northern Wei had fourteen sovereigns: Dao Wu Di (386–409), Ming Yuan Di (409–423), Tai Wu Di (424–452), Nan An Wang (452), Wen Cheng Di (452–465), Xian Wen Di (466–471), Xiao Wen Di (471–499), Xuan Wu Di (500–515), Xiao Ming Di (516–528), Xiao Zhuang Wang (528–530), Chang Guang Wang (530–531), Jue Min Di (531–532), An Ding Wang (531–532), and Xiao Wu Di (532–535). The Northern Wei emperor, Xiao Wen, had mixed ancestry—a Toubi clan Xianbei father and a Chinese mother—and renamed his clan “Yuan” (Chinese for “first” or “primal”). He relocated the capital city from Pingcheng to the old Eastern Han and Western Jin dynasties’ imperial site at Luoyang (which had a population of one-half million by 510) and constructed a series of Buddhist temples.
Ultimately more than twelve thousand Buddhist temples and monasteries were built. The temples were used for worshipping and for storing scriptures, and the form of the buildings derived from Buddhist stupas (dome-shaped structures serving as Buddhist shrines) but assumed the appearance of Chinese pagodas.

In addition, Xiao Wen Di instituted a major sinicization program in 493 that required that the Xianbei elite conform to certain Chinese standards, which included wearing Chinese garments rather than Xianbei clothing at the royal court. He encouraged intermarriage among the higher-ranked clans of Xianbei and Chinese, and required the Xianbei who were under thirty years of age to learn the Chinese language. As another form of acculturation, tea, commonly drunk in south China, began to replace yogurt drinks as the beverage of choice among the northerners. Prince Donyang of the Northern Wei served as governor of Dunhuang from 523 to 538 and with the wealth of local families devised a monumental project to honor Buddhism with the modification and mural paintings in the Mogao Caves. Other Buddhist murals were painted in the Yungang, Longmen, and Maijishan grottoes.

Food shortages among troops garrisoned in the north led to several insurrections in 523 and from 526 to 527, and led to rebellions in the Northern Wei court. Xiao Jing Di assumed control of the Eastern Wei and the capital at Luoyang, while a rival took control of the west and the older capital at Chang’an in 535. After Xiao Wen Di’s death his successors gradually abolished the Xianbei-Chinese assimilation policy.

**Emperors**

The Eastern Wei’s sole emperor was Xiaojing (534–550), whereas the Western Wei dynasty had three: Wen Di (535–551), Fei Di (552–554), and Gong Di (554–556). The Northern Qi emperors were Wen Xuan Di (550–559), Fei Di (560), Xiao Zhao Di (560–561), Wu Cheng Di (561–565), Hou Zhu (565–577), You Zhu (577), and Fan Yang Wang (577). Lastly, the Northern Zhou dynasty had five sovereigns: Xiao Min Di (557), Xiao Ming Di (557–560), Wu Di (561–578), Xuan Di (579), and Jing Di (579–581).

The Eastern Wei monarch was forced to abdicate, and the Northern Qi dynasty was established under Wen Xuan Di. Emperor Gong Di of the Western Wei was deposed, and the Northern Zhou dynasty was created under Xiao Min Di. In 577 the north was reunified when the Northern Zhou conquered the Northern Qi, but Yang Jian (who became Emperor Wen Sui) overthrew the Northern Zhou in 581, and the Sui were able to conquer the south and reunify China for the brief period ending in 618, when the Tang dynasty (618–907 CE) succeeded in maintaining this unity.

Southern Three and Northern Four Banks

The Southern Three and Northern Four Banks were the two leading private commercial banking groups during the 1920s and 1930s, the golden age of modern Chinese banking. Both groups adopted a Western banking-management style and helped support China’s modern industrial development until their decline at the outbreak of war with Japan in 1937.

The rise of the Southern Three and Northern Four Banks reflected the change of Chinese banking style from traditional qianzhuang (native bank) and piaohao (native draft bank) to modern corporate governance. The loose political environment after the collapse of the Qing dynasty in 1912 created a situation prime for the development of private banking. A group of foreign-educated professionals combined the knowledge of Western management styles with the realities of the Chinese financial system to establish these seven banks, whose support contributed to China’s modern industrial development.

Southern Three

The Southern Three Banks 南三行 were the National Commercial Bank, the Zhejiang Industrial Bank, and the Shanghai Commercial and Savings Bank. The term Southern Three refers to the origins of the capital of these banks, which came from the southern Yangzi (Chang) River regions such as Zhejiang and Jiangsu provinces.

The Zhejiang Provincial Railway Company founded the National Commercial Bank 浙江兴业银行 in May 1907 with the intent to develop industry in Hangzhou. Initially it was a joint state and private shareholding bank. After the Zhejiang railway was nationalized, however, the bank sold all of the Zhejiang railway shares to the mercantile community and individuals; therefore, it became a completely private banking company with limited liability. Ye Kuichu (1874–1949), a president of the National Commercial Bank, moved the headquarters to Shanghai in 1915. The bank became a fully functional commercial bank with the ability to grant loans for industrial development, accept savings and industrial deposits, and conduct trust business. The National Commercial Bank was ranked first in ability to attract deposits among Chinese commercial banks by Banker’s Weekly from 1918 to 1926. Its business gradually declined after the Guomindang (Chinese Nationalist Party) government took power in 1927.

The Zhejiang Industrial Bank 浙江实业银行 was founded in 1909 by the Zhejiang provincial government and local merchants. The bank was privatized after the Chinese Republican Revolution of 1911–1912. Li Ming (1887–1966), a native of Shaoxing in Zhejiang Province who graduated from Yamaguchi College of Business in Japan, favored liberal enterprise and developed this bank into an efficient operation with relatively small facilities. Li built diverse business connections with foreign companies and provided opportunities for the bank to operate in foreign exchange. Subsequently the bank was listed
as the second-largest private bank specializing in foreign exchange in the 1930s.

The Shanghai Commercial and Savings Bank was founded by a group of Shanghai bankers under the leadership of Chen Guangfu (1880–1976) in June 1915. Chen Guangfu, a native of Dantu in Jiangsu Province who graduated from the Wharton School of Finance at the University of Pennsylvania, adopted U.S. banking practices and emphasized efficiency and innovation. Chen believed that if a bank lacked pioneering spirit, it would not be able to compete in China’s modern society. Consequently he tended to deviate from conventional wisdom in Shanghai banking. Whereas others often sought short-term returns, he emphasized long-term returns; whereas others were often unable to deal with small accounts, he made them some of the bank’s major depositors. Chen created the one-dollar savings plan, travel agent offices, warehouse mortgages, railway transportation remittance, and foreign exchange business. Chen was the key figure in Shanghai bank growth. Compared with that of other private banks, the initial capital of the Shanghai Commercial and Savings Bank was miniscule, earning it the nickname “the little Shanghai bank.” Nevertheless, it operated with a distinctive style by offering the one-dollar savings plan, which encouraged people to open a savings account in the bank with a one-dollar deposit. Through the accumulation of various savings resources, the bank developed into the number one private bank in China.

## Northern Four

The Northern Four Banks were the Yien Yieh Commercial Bank, the Kincheng Banking Corporation, the Continental Bank, and the China & South Sea Bank. These banks were founded mostly north of the Yangzi River, in contrast to the Southern Three Banks.

The Yien Yieh Commercial Bank was founded in March 1915 to assist the Chinese Salt Administration in tax collection. The bank was originally designated to specialize in the salt industry with official funding under government supervision. But because of a shortage of government funds, the Yien Yieh Commercial Bank was transformed into a private bank. Wu Dingchang (1884–1950), a native of Wuxing in Zhejiang Province and former superintendent of the Bank of China, was elected general manager. Because the majority of the bank shareholders were warlords, Wu’s administration was limited in selling and buying government and foreign bonds. Despite Wu’s limitations, he organized the first Chinese banking syndicate and founded the joint business office of the Northern Four Banks in 1922.

The Kincheng Banking Corporation was founded in May 1917 with a distinguished Chinese business name meaning the “golden city.” Zhou Zuomin (1884–1955), a native of Huai’an in Jiangsu Province, was founder of the bank. Initially the Kincheng bank set up a savings department to absorb floating capital from various channels and granted loans to Chinese industrial projects, such as cotton and flour mills, match manufacturers, coal mines, and chemical industries. Zhou tried to pattern the Kincheng bank on a Japanese model by joining banking capital with industrial syndicates. The bank also handled remittances from transportation, especially railways. In an effort to expand its business domain, the bank established the Pacific Insurance Company to handle shipping, automobiles, and fire insurance.

The Continental Bank was established in April 1919 with private funding by Tan Lisun (1880–1933), a native of Wuxi in Jiangsu Province who graduated from Tokyo Commercial College. The Continental Bank specialized in savings, warehouses, trusts, and real estate business. The bank set up savings services stations in universities, hospitals, and commercial areas. It built many warehouses and railways and engaged in foreign trade and trust businesses by opening the Continental Trade Company. The Continental Bank financed China’s northwest wool industry and northeast oil manufactures. Although initially its involvement in real estate had generated tremendous profits, the outbreak of the War of Resistance against Japan in 1937 destroyed the bank’s real estate development plans and created a significant amount of bad loans. This experience taught all private banks a huge lesson in the risks of engaging in real estate development.

The China & South Sea Bank was an overseas bank founded in 1921 by Huang Yizhu (1868–1945), a wealthy worldwide importer and exporter of sugar, and Hu Bijiang (1881–1938), a former branch manager of the Bank of Communications. The bank specialized in overseas Chinese business and foreign currency exchange
and remittances. Because the bank was an overseas Chinese investment bank, the Chinese Beiyang government granted the bank special rights to issue banknotes abroad. In 1922 the China & South Sea Bank joined other three northern banks to form the Joint Four Bank Business Office. The other three banks transferred interbanking funds to support the China & South Sea Bank in issuing banknotes and instituted the Four Banks Reserve Fund, with 60 percent cash reserve and 40 percent reserve in securities or bonds. Although the Four Banks Reserve Fund guaranteed all notes issued, each bank had its own logo on the notes, acknowledging its own responsibility. The joint efforts to issue banknotes were unique in the banking history of China.

In 1923 the Four Northern Banks organized the Joint Savings Society of the Four Banks in Shanghai to absorb floating capital in the market. This society shared profits with its customers by distributing annual dividends to them. To promote its image, the society built the twenty-four-story Shanghai Park Hotel in 1934. The hotel was the first skyscraper in Asia and became a landmark in Shanghai in the following half century.

Compared with the Southern Three Banks, the Northern Four Banks had stronger capital components, with financial resources derived from former Qing dynasty (1644–1912) officials, warlords, and overseas Chinese. Similar to the Southern Three Banks, the Northern Four Banks also had an excellent team of managers. These bankers were all friends who met weekly to discuss political and economic issues. They organized the Chinese Bankers Association and published Banking Weekly magazine.

The rise of the Southern Three and Northern Four Banks reflected the change of Chinese banking style from traditional qianzhuang (native bank) and piaohao (native draft bank) to modern corporate governance. The collapse of the Qing dynasty created a loose political environment for private banking development. A group of foreign-educated professionals applied its Western management knowledge to the system of the Chinese banking already in operation to create these seven banks. These private banks supported China’s modern industrial development.

The golden age of the Southern Three and Northern Four Banks was short-lived—from 1907 to 1937. China’s modern banking development was interrupted by the outbreak of the War of Resistance against Japan. With the government wartime banking and financial control, which continued during the civil war period, little room was left for private banks’ development.

The Southern Three and Northern Four Banks became part of history after the political and financial system changes that came with establishment of the People’s Republic of China in 1949. In 1951 all private banks were progressively reorganized into a few groups with joint state-private ownership, a principal form of state capitalism adopted during the socialist transformation. The Northern Four Banks became a joint state-private ownership banking group on 1 September 1951. The Shanghai Commercial and Savings Bank, however, moved its capital to its Hong Kong branch, then to Taiwan. The other two southern banks also joined the state-private ownership enterprises in China. At the end of 1952 all private banks in China were nationalized.

Southern Weekend
Nánfāngh Zhouruí 南方周末

Southern Weekend’s editorial liberalism and the free-market orientation of its business reporting often contrast with the positions of its parent, Southern Daily, the official publication of the Communist party in Guangzhou. Southern Weekend is internationally known for its investigative reporting on topics such as health, environment, and corruption.

Appearing first in 1984 as a weekly culture supplement to Southern Daily, the Communist Party’s official daily paper in Guangdong Province, Southern Weekend developed into a free-wheeling, commercially-oriented subsidiary with a nationwide circulation and an international reputation as a pacesetter in investigative reporting.

Also called Southern Weekly—the English translation added to the nameplate after a redesign in 2006—this broadsheet paper is one of more than a dozen publications of the Southern Daily Press Group that has a history of ups and downs that exemplify both the opportunities and pitfalls of operating under the umbrella of an official party organ. While the parent Southern Daily retained the role of authoritative propaganda mouthpiece, Southern Weekend emphasized a market-driven business philosophy along with a professional approach to journalism that allowed for aggressive reporting on controversial subjects.

With savvy editorial leadership sustained by networks of influence in the relatively open atmosphere of Guangdong and further buoyed by outstanding commercial returns, Southern Weekly tended to avoid direct criticism of officials in its home base of Guangzhou by focusing its toughest reporting elsewhere. Through the 1990s, it gained acclaim for investigations of public health problems such as AIDS and SARS, stories about environmental degradation, and exposés of corruption and police brutality. Foreign media accounts described the paper as “outspoken,” “semi-independent,” and China’s “most probing major newspaper.”

After the late 1990s, increased government interference and dismissal of several cohorts of senior editors—with several imprisoned on flimsy corruption charges themselves—put a damper on critical reports and commentaries, even as sports, business, entertainment, and lifestyle coverage remained vigorous and the paper’s editorial philosophy remained adamantly liberal and free-market oriented.

Southern Weekend continued to survive in China’s competitive media mix and to draw attention for its reporting contributions to major stories, including the 2007 discovery of forced labor at Shanxi Province brick kilns and revelations about shoddy construction of schools that collapsed during the 2008 Sichuan earthquake. Through blogs and leaks to foreign media, its editors and reporters periodically have divulged political pressures to suppress stories, including information about tainted milk and suspicions about corruption in a government-backed charity. The paper’s popular website also sometimes provides previews of stories that fail to make it into print.

As of 2005, Southern Weekend claimed a national
circulation of 1.3 million, although periodical circulation figures in China are notoriously unreliable. In 2008, during a period of declining ad revenues after a two-decade boom, it still was a desirable venue for national and multinational advertisers, with a listed rate of RMB500,000 (US$73,000) for a quarter-page color ad. The paper drew criticism in late 2008 for running two pages of content about the producer of Maotai, China’s most famous brand of grain alcohol, that appeared to be a corporate “advertorial,” or advertisement in news format.

More so than perhaps any other periodical, Southern Weekend embodies and reflects the real and active trends of modernism and capitalism in Chinese society today.

Space Program

China's space program had its start in 1956 with the development of ballistic missile technology. In recent years, China has made important progress across a broad range of space technologies—including launchers, satellites, and human space flight—and has taken a leading role in regional space cooperation. In 2003, China launched its first astronaut into space on the Shenzhou-5. The human space flight program ultimately plans to create a permanent manned space station.

China is widely regarded as a rising space power. While China's progress in space technology was slow from its inception until 2001, China has since made marked progress in nearly all areas of space flight technology, including launchers, satellites, and human space flight. China's space program is designed to assist the country in achieving its military, economic, and political goals. Militarily, the People's Liberation Army (PLA) is transforming itself into a military reliant on using information to win wars in which space may play a major role in developing an advanced C4ISR (command, control, communications, computers, intelligence, surveillance, and reconnaissance) system as well as developing antisatellite (ASAT) technologies to deny the use of space to potential adversaries. Economically, China's support for its space program lies in its potential as a driver for economic and technological advancement.

Politically, China's expanding international cooperation on space activities establishes it as a leader in the field with growing influence to shape events. In addition, by participating in a robust space program with high-profile activities, such as human space flight, the Chinese Communist Party demonstrates to the Chinese people that under its leadership China can achieve a more respected world position.

History

China's space program was established on October 8, 1956 with a focus on the developing of ballistic missiles to support China's nuclear weapons program. The first China-built ballistic missile was launched on November 5, 1960 and by 1966 China's first operational ballistic missile, the Dongfang-2 (DF-2), was entered into service. China's first satellite, the Dongfang Hong-1 (DFH-1), was launched on April 24, 1970 and broadcast the song, The East is Red, for 6 days. Shortly thereafter, Mao Zedong (1893–1976) approved a human space flight program, which was given the name Shuguang (or “Dawn”) and also codenamed the 714 Project. The program's goal was to launch a human into space by 1973. The project suffered setbacks due to lack of funding and the political upheaval caused by the Cultural Revolution (1966–1976) and was cancelled in 1975 due to more pressing economic concerns. On the other hand, China successfully launched its first recoverable satellite in the same year, a satellite model that remains in use today performing photo-reconnaissance missions.
China’s space program from the mid-1970s to the late 1980s suffered from a low level of activity with no more than four launches per year. Most launches were of the Shijian (SJ) space experimental satellite or the recoverable satellite. In 1988, China launched its first communications satellite. In 1992 the Chinese government approved a human space-flight program, and research and development continued throughout the 1990s on the capsule and the launcher, with one unmanned test flight occurring in 1999.

Also in the 1990s China established itself as a low-cost provider of launch services and though the total number of annual launches per year did not increase, the number of satellites launched were increasingly made up of foreign satellites. At one point China was approaching a 9 percent share of the global launch service market. Its success as an international launch provider was put to an end in 1996, though, after the failed launches of a Long March-2E (LM-2E) in 1995 and a LM-3 and LM-3B in 1996. Chinese rockets were deemed to be too unreliable by the international launch insurance market to insure. In addition, satellites containing U.S. components were forbidden to be launched on Chinese rockets after it was determined that a U.S. company had illegally provided the Chinese space industry with export controlled information that was used to correct the launch malfunctions. This ruling effectively shut down China’s commercial space launch efforts.

China’s progress in space technology accelerated in the early twenty-first century with increased funding and a higher profile. During this time, China launched a variety of new satellites, improved its launcher reliability to international standards, initiated a lunar exploration program, and conducted three human space flight missions. During the period from 2001–2005, for example, China launched more satellites than in the previous 31 years combined. China at this time also began to receive international recognition as a leading space power, sparking speculation that a new international space race could result.

Elements of China’s Space Program

China’s space program can be broken down into four main elements: launchers, without which no space program would be possible; satellites, in several varieties; human space flight, centered around the seven (to date) Shenzhou missions, the last three of which were manned; and the lunar program, which hopes to land an unmanned rover on the moon in the near future for exploration purposes.

Launchers

The Long March series of launchers, named for the Chinese Communists’ 9,600 kilometer march across China from 1934–1935, is China’s main launch vehicle. China has thirteen versions of the Long March, each designed to launch different payloads into different orbits, including Low Earth Orbit (LEO), Sun Synchronous Orbit (SSO), and Geosynchronous Earth Orbit (GEO) (See Table 1). The LM-2F is dedicated for human space flight missions and includes an escape tower to separate the space capsule from the rocket in event of mishap. The Long March booster has reached a reliability of 94 percent success rate based on 115 launches at the end of 2008, a figure on a par with international standards. The success rates of the

*Marketed to international customers
**Dedicated for Shenzhou missions

NOTE: LEO: Low Earth Orbit; GEO: Geosynchronous Earth Orbit; SSO: Sun Synchronous Orbit
Long March family vary widely depending on launcher, however. The LM-2C continues to be a solid work horse with no failures and thirty launches by mainly launching China’s recoverable satellites. The LM-3, on the other hand, has just a 79 percent success rate.

China is developing a new family of launch vehicles that offer increased reliability and adaptability. These new launchers will, in part, support China’s human space flight and lunar exploration programs by launching a space station into Earth orbit and satellites to the moon. The new generation of rockets will be divided into light, medium, and heavy-lift versions and will be able to send a 1.5- to 25-ton payload into low-Earth orbit (LEO) and a 1.5- to 14-ton payload into geosynchronous orbit (GEO). The first launch of the new rocket is scheduled to occur by 2013.

**SATELLITES**

China has made steady progress in satellite development since 2001. China now has four different types of remote sensing satellites—meteorological, ocean, ground, and radar—in orbit on a continuous basis. These systems are able to provide different types of information to monitor weather and disasters, as well as providing information for national security applications. In addition, in 2000 China also established its first satellite navigation and positioning system, Beidou.

**Recoverable Satellites**

The recoverable satellites are China’s most frequently launched satellites. These satellites are used for reconnaissance missions and remain in orbit for no more than 30 days. At the end of their mission, the satellites return to earth via a ground landing with the aid of a parachute, at which point the imagery is removed for analysis. Recoverable satellite technologies, such as heat shielding, were the basis for China’s human space flight capsule.

**Yaogan**

China launched a total of five Yaogan remote sensing satellites by the end of 2008. Their exact nature is unknown and the China government has only stated that they are intended for scientific experiments, land survey, crop yield assessment, and disaster monitoring. There is speculation that this series of satellites is composed of optical imagery and synthetic aperture radar satellites, however.

**Fengyun**

Fengyun class meteorological satellites provide data such as cloud cover and precipitation to China’s National Weather Bureau. By 2015, China plans to build a stable observation satellite system and achieve directable three-dimensional observation of the Earth’s land masses, oceans, and atmosphere. The first Fengyun satellite, the FY-1A, was launched on 7 September 1988 and was equipped with four visible channels, three near infrared channels, one short wave infrared channel, and two long wave infrared channels. Subsequent versions of the satellite have been improved. The FY-2C was launched on 19 October 2004 and was China’s first non-experimental meteorological satellite. It was officially put into operation on 1 June 2005.

**Ziyuan**

The first Ziyuan satellite was launched on 14 October 1999 and is a joint project with Brazil, in which China has a 70 percent stake. It was equipped with sensors to conduct photo-reconnaissance of the earth, including a three-meter optical imagery resolution, and 80-meter and 160-meter resolution infrared sensors. It also has two wide band imagers with a resolution of 256 meters. By March 2002, Ziyuan satellites had already imaged China more than 23,000 times and covered 96 percent of Chinese territory. In 2004, a network of three Ziyuan satellites was established to provide timely coverage of the Earth. China has also established a database of satellite imagery with an archive of 800,000 images using the Ziyuan satellites.

**Haiyang**

Haiyang ocean observation satellites conduct environmental observation of the oceans by collecting data on the characteristics of seawater, including chlorophyll density, sea surface temperature, suspended sand content, and maritime contamination. The first Haiyang was launched on 15 May 2002 while the second was launched in April 2007. They use visible light and infrared spectral coverage to collect data on water and are equipped with remote sensors that can transfer digital images back to earth.

**Beidou**

The Beidou satellite system is a regional navigation and positioning system. The first two Beidou satellites were launched on 31 October and 21 December 2000.
After the launch of these two satellites, China was said to have established its own satellite navigation and positioning system to be used primarily for road, rail, and ocean traffic. The third Beidou satellite was launched on 25 May 2003. Beidou is based on a system called radio determination satellite service (RDSS) involving at least two satellites in geostationary orbit, at least one ground station, and customer receiver/transmitters. This system can achieve accuracies up to 20 meters with the use of multiple ground stations. The Beidou system can also provide communication between user terminals and ground stations. It will eventually be replaced by a system similar to the U.S. global positioning system (GPS) that will be free of charge.

**Communication Satellites**

Chinese communication satellites are based on the satellite bus of the Dongfanghong-3 (DFH-3) and DFH-4, but when launched are given the designation of Chinasat or Sinosat. Chinese communication satellites are used to broadcast television programming to the entire nation and to bring telephone service to the rural areas of China. By the end of 2005, the Chinese government reported that 98 percent of administrative villages now have
phone service. China for the first time exported satellites by building and launching communication satellites for Nigeria (Nigcomsat-1) and Venezuela (Venesat-1) in 2007 and 2008, respectively.

**Double Star**
The Double Star 區星 satellite project is the result of an agreement signed on 9 July 2001 between the China National Space Agency and the European Space Agency (ESA) to research the effects of the sun on the Earth’s environment. China’s two satellites have joined four ESA satellites of the Cluster project to form a monitoring network. The first launch occurred on 30 December 2003 and the second satellite was launched on 25 July 2004.

**Human Space Flight**
China’s human space flight program is its space industry’s most difficult and largest mission. China has conducted seven launches, the last three of which were manned. On 15 October 2003, China launched its first astronaut into space on the Shenzhou-5. This mission lasted less than 24 hours but proved that China was technologically capable of sending a human into orbit and returning him to Earth safely. China’s second manned space flight occurred on 12 October 2005 and lasted five days with a crew of two. China’s third manned mission was launched on September 25, 2008 and lasted three days. The mission of Shenzhou-7 was to conduct an extravehicular activity. China’s human space flight program is planned to eventually result in a permanent manned space station.

**Lunar Program**
China’s lunar exploration program, known as Chang’e, was officially announced in January 2003. The program is composed of three stages. The first stage began in 2007 and involved sending a satellite to take three-dimensional images of the moon and ended on March 1, 2009 when the satellite was purposefully crashed onto the lunar service for scientific reasons. The second phase will begin before the end of 2011 and will involve landing an unmanned space vehicle on the moon that will carry a lunar-rover, a seismograph for detection of “moon-quakes,” and a telescope. The final stage is to be completed before 2020 and will involve sending an unmanned space vehicle to the moon to take samples of the lunar soil that will then be sent back to the earth via a return vehicle.

**Launch Centers**
China has three launch centers to serve different types of orbits. China has also announced that it will build a fourth launch center on the island province of Hainan, off China’s south coast.

**Jiuquan Satellite Launch Center**
The Jiuquan Satellite Launch Center, located in Gansu Province in northwestern China, was founded in 1958 and is China’s first and most widely used launch center. The launch center is used to launch satellites into low and
medium earth orbits. Most notably, Jiuquan is used for China’s human space flight missions.

**TAIYUAN SATELLITE LAUNCH CENTER**

The Taiyuan Satellite Launch Center, located in Shanxi Province, was founded in 1966. The launch center is used to launch satellites into sun synchronous orbits.

**XICHANG SATELLITE LAUNCH CENTER**

The Xichang Satellite Launch Center, located in Sichuan Province, began operation in 1984 and is used to launch satellites into geostationary orbits.

**WENCHANG SATELLITE LAUNCH CENTER**

The Wenchang Satellite Launch Center, located in Hainan Province, was approved in 2008. It is scheduled to be completed in 2012 with the first launch to be conducted in 2013. Due to its closer proximity to the equator, rockets will require less energy to reach orbit. Consequently, Wenchang will be used to launch heavier payloads, such as a space station and lunar lander, into orbit.

Special Economic Zones
Jīngjì tèqū 经济特区

During the 1980s, China established the first of its Special Economic Zones with the intention of attracting and accommodating foreign businesses and investments to China. Their development and expansion—and more liberal systems and regulations—played an important part in China’s global economic transition.

China’s late-twentieth-century process of economic transition began with the establishment of what are known as special economic zones (SEZs). SEZs are geographically insulated areas opened economically to the outside world. They are regulated by the government, with preferential policies in their favor, so that special and flexible economic policies and measures are adopted primarily to promote foreign investment, technology transfer, and exports. In 1979 China designated the first four SEZs—Shenzhen, Zhuhai, Shantou, and Xiamen—as part of its domestic economic reform. By limiting its experiment to those four SEZs, China sought to minimize the unnecessary economic, social, and political costs often associated with a drastic policy switch and to gain the necessary experience in carrying out the transition.

Serving both as windows to the outside world and as laboratories to test and refine various reform policies, the SEZs played a pivotal role in China’s overall economic transition during the last two decades of the twentieth century. Numerous measures aimed at reforming the existing economic system and reaching a higher degree of economic openness were developed in and spread from the SEZs. In many regards the effect of the SEZs has far exceeded their limited geographical boundaries. It is safe to say that without the successful operation of the SEZs, China’s reforms would not have gone as far, and the transitional process would not have been as smooth.

China’s Approach to SEZs

At the outset of economic reform and an open door policy, the Chinese central government realized that development could not happen in all places at once (that would have been too costly), and that certain policies needed to be tested within limited areas before being implemented nationwide. The government planned to take advantage of the global trend of industrial relocation to attract foreign investment to its capital-starved economy. Foreign investment would allow China to make full use of its large reserve of inexpensive surplus labor to produce labor-intensive goods for export and, ultimately, to create foreign-exchange earnings. The government also recognized the importance of advanced foreign technology for stimulating growth and for making possible technology transfer. It was hoped that inland enterprises could later learn from the experience of the SEZs.

Supported by growing local enthusiasm for such policies, particularly from Guangdong Province, the SEZs functioned as a laboratory where various methods aimed
at overcoming the drawbacks associated with a central-planning system could be developed. Market mechanisms were foreign to the Chinese reformers, and economic efficiency was hard to achieve. Fourteen more cities were designated as coastal open cities in 1984. Here, the entire city adopted policies similar to those implemented in the SEZs, such as promoting foreign investment. In 1985 the Yangzi (Chang) River, Pearl River, and southern Fujian deltas were declared open economic zones. In April 1988 a fifth SEZ was established in Hainan, after Hainan was newly designated as a province, so that the entire province functioned as a zone. In the same year, a coastal development strategy, officially called the weixiang xing fajian zhanlue (Outward-Oriented Development strategy), was launched in the coastal areas. This policy had a much larger scale and wider range, embracing twelve provinces and cities under the direct control of the central government. In April 1990 the Pudong New Area was formally established—with policies favorable for inducing rapid construction, large investments, and other economic development—for building a center of finance, commerce, and high technology. In the eighth five-year plan (1991–1995), the focus was placed more on the development of particular industries than of regions. Through the special economic zones, China's reform spread from region to region by expanding the geographic areas where preferential reform policies could apply.

Economic Incentives and Political Considerations

In the Chinese SEZs, flexible and innovative packages were assembled that offered incentives for foreign investors. These included preferential tax rates; concessions; and exemptions from certain taxes, administrative fees, and the need for high-level or mid-level approval. Most exported and imported items were exempted from custom duties and the industrial and commercial consolidated tax. The SEZs also introduced reform measures dealing with labor-related issues. Employment contracts with specified term limits and dismissal of unqualified employees were permitted for the first time.

There were certain political considerations in establishing the early SEZs. The zones were not selected on the basis of whether there was a strong industrial base, an adequate urban infrastructure, or a technologically innovative capacity. The SEZs had to be easily separated from the vast inland areas because drastically different policies were to be tested in the zones, and no one could be certain that the policies would succeed. In the early stages, fences were built around them, and checkpoints were stationed to inspect traffic. Administrative procedures were also used to control population inflow to the zones. The SEZs were not built into major industrial centers at first to avoid significant losses if the experiment should fail. Moreover, the central government intended to use these zones as intermediary or buffer zones for the future reunification of Hong Kong, Macao, and Taiwan with the mainland, and so they were chosen partially for their proximity to those places. Finally, the overseas Chinese community was targeted as a potential source for productive capital. The southeast coast in Guangdong and Fujian, where the SEZs were set up, were the places of origin of many overseas Chinese.

As an integral and critical component of China's gradualist approach toward economic reform and opening up, the SEZs have developed into self-contained mini-economies along the lines of “one country, two systems.” In these SEZs, nonsocialist measures could be adopted. The SEZs have moved China much further down the path to economic transition than would have been possible with export-processing zones because these zones may not reform the traditional socialist system but mainly processes products for export. The measures that proved to be effective and successful in the SEZs have been extended, whenever feasible, to the rest of the country. This, in turn, has helped the entire economy gradually to become more open and efficient. As the country moves further into the twenty-first century, the policy differences between the original SEZs and the rest of China are being minimized.

Assessment

Judged by most social and economic indicators, the performance of the SEZs has, for the most part, been extraordinary. Despite the unfavorable initial conditions—such as a lack of industrial, infrastructure, and technological
support—the pace of development of the zones has not only exceeded the national average but also narrowed the gap with some major industrial centers, such as Shanghai, that have long been considered to be the backbone of growth and trade in the Chinese economy. This happened within a short time.

无事不登三宝殿

Wú shì bù dēng sān bǎo diàn
Chinese sports have been influenced by the more harmonious physical disciplines of Chinese tradition, as well as the need for military preparedness, but in the modern post-opening era Chinese athletics are starting to more closely resemble western sports in their practice.

Chinese physical culture has always oscillated between two poles: at one extreme, violent competition; at the other, the peaceful quest for physical and spiritual harmony. Boxers, wrestlers, and other athletes embody the first extreme; devotees of tai chi (taijiquan), a kind of graceful gymnastic exercise, represent the second. Chinese sports, which fall by definition into the first category, have often been modified by influences from the second. For millennia, Chinese culture has had gentle sports as well as rough ones. Good form has often been prized above competitive success.

Traditional China

In ancient China, as in European antiquity, most sports were rough. Extant references to sports frequently refer to them in conjunction with military preparation. During the Zhou dynasty (1045–256 BCE), for instance, soldiers ran, jumped, threw objects of various sorts, wrestled, and practiced their skills as archers, swordsmen, and charioteers. They seem also to have demonstrated their prowess as weight lifters. Kangding (tripod lifting) was popular as early as the Qin dynasty (221–206 BCE).

Wushu and Archery

By the time of the Han dynasty (206 BCE–220 CE), foot soldiers and mounted knights had replaced charioteers as the mainstay of the army, and the practice of *wushu* (military skills, also translated as martial arts) was highly developed. Although the unarmed techniques of *wushu* were especially prized, archery too had numerous devotees, and the sport was immensely popular during the Song dynasty (960–1279). An eleventh-century district survey found 588 archery societies enrolling 31,411 members, nearly 15 percent of the local population. During the Qing dynasty (1644–1912), China’s Manchu rulers preferred that their subjects not practice the martial arts. *Wushu* nonetheless experienced a surge in popularity during the nationalistic reaction to Chinese defeat in the First Opium War in 1842.

Ball Games

Ball games, played with carefully sewn stuffed skins, with animal bladders, or with found objects as simple as gourds, chunks of wood, or rounded stones, are universal. Ball games of all sorts were quite popular among the Chinese. When they began is unknown, but stone balls have been dated to the sixth millennium BCE. *Cuju*, which resembled modern soccer football, is mentioned in the *Shiji*, one of the oldest extant Chinese texts. The famed Han dynasty poet Li Yu (50–130 CE) also wrote of football.
A silk fan painting from the Song dynasty shows a gathering of ballplayers and spectators. The different and colorful costumes, which were strictly regulated by occupation during the Song dynasty, shows a total disregard for social status in the sporting world. Attributed to Su Hanchen, twelfth century.

Games similar to modern badminton and shuttlecock were played in the first century CE.

**Racket Games**

Through most of China’s recorded history, racket games were popular among women. A Ming-dynasty (1368–1644) scroll painting, “Grove of Violets,” depicts elegantly attired ladies playing *chuiwan*, a game combining elements of modern billiards and golf. According to the *Wanjing* (1282), the players took turns striking a wooden ball and sending it into holes marked with colored flags. The ethos of the game stressed fairness and harmony among the players.

**The Mongols**

Harmony seems not to have been foremost among the values of China’s Mongol rulers. The martial arts flourished, and mounted archers were the backbone of the army. If the Venetian traveler Marco Polo (1254–1324) can be believed, the Mongol rulers produced a royal heroine comparable to the Greek girl Atalanta, who raced against and defeated a number of suitors. Princess Aiyaruk was said to have owned more than ten thousand horses, winning one hundred at a time as she outwrestled a long line of doomed suitors.

Mongol emperors like Khubilai Khan (1215–1294) were passionate about the hunt, but the golden age for that sport seems to have been during the Manchu Qing dynasty. Emperor Kangxi (1654–1722, ruled from 1662) was said to have hunted with a retinue of seventy thousand horsemen and three thousand archers, which suggests that his prey had very little chance of survival.

**Aristocratic Disdain and Archery**

Throughout Chinese history, aristocrats obsessed with the quest for harmony tended to disdain sports, a tendency strengthened by the arrival of Buddhism during the Han dynasty. In the moralistic eyes of Confucian sages, playing ball games was little better than drinking, gambling, and womanizing. Yet even Confucian scholars succumbed to the seduction of archery and granted the sport a half-hearted endorsement. “There is no contention among gentlemen,” wrote Confucius (551–479 BCE). “The nearest to it is perhaps archery.” It was not, however, the warrior’s grimly competitive archery. “Even the way
they [the archers] contend is gentlemanly” (Riordan/Jones 1999: 28).

Archery was also a sport for women. It was practiced by a number of court ladies, including the Dowager Empress Chonga. For men and women who found archery too bellicose a pastime, there was touhou, which required the player to toss an arrow into a vase. In time, the game was refined to the point where nine officials were required for a two-person match.

**Kite Flying and Dragon Boat Racing**

Adults as well as children flew kites, some of which were fanciful works of art in paper and wood. This form of amusement was known as early as the Warring States period (475–221 BCE) but became a national obsession during the Tang dynasty (618–907 CE). In its competitive version, contestants sought to maneuver their kites so that they cut the strings of their opponents’ kites. A much older sport, dragon boat racing, elicited the same aesthetic impulse. This sport evolved from impromptu races among boats decorated with images of dragons that protected the crews from storms. Eventually, races were held to commemorate the drowned. The most famous of these races was in memory of the poet Qu Yuan, who perished in 278 BCE. By the Tang dynasty, there were fixed dates and strict rules for the races, which had become major events. Some of the boats were “manned” by female crews. The Dragon Boat Festival (Duanwujie) is today one of China’s most important traditional Chinese festivals, falling on the fifth day of the fifth month in the lunar calendar.

**Polo**

Polo, which probably had its origins on the plains of Central Asia, reached China in 627 CE. It became a passion among those wealthy enough to own horses. All sixteen emperors of the Tang Dynasty were polo players. One of them, Xizong (reigned 874–888), remarked that he would take top honors if civil-service examinations were based on polo. The army used the attractions of the game as a way to improve its men’s equestrian skills. This may not have been a good idea. When the Mongols invaded, several Chinese generals were said to have been more competent at polo than at warfare. If numerous terracotta figures can be trusted as evidence, polo was also played by aristocratic Chinese women. The sport lost favor during the Song dynasty.

**Introduction of Western Sports**

Western sports came to China toward the end of the Qing dynasty. Europeans resident in China established the Canton Regatta Club in 1837. The first modern track meet was held at St. John’s University, a Christian school, in 1890. Six years later, American missionaries introduced basketball at the Tianjin YMCA. YMCA workers were responsible for the first national sports festival, held in Nanjing in 1910, and for the quadrennial Far Eastern Games (1913–1934), at which Chinese athletes competed against those from Japan and the Philippines. Other Americans

Liu Changchun, China’s first Olympic athlete, competed as a sprinter in the 1932 Olympics in Los Angeles.
founded and directed educational institutions such as the Chinese Physical Training School (Shanghai, 1914).

As the Confucian scholar’s disdain for the merely physical waned, Western sports increasingly influenced the behavior of Chinese men, especially those of the urban middle and upper classes. In time, modern sports revolutionized the lives of middle-class and upper-class women. In the course of the twentieth century, images of the ideal female gradually changed from the delicately immobile court lady barely able to hobble on her deformed feet to the robustly active young girl racing up and down a basketball court. Female athletes became “icons of desirable sexuality” (Hong 1997: 275). From a feminist perspective, modern sports have been emancipatory.

From 1912 to 1949, modern sports were mainly an urban phenomenon. Although national sports festivals were an increasingly salient aspect of Chinese culture, the nation’s athletic elite did poorly in international competition. China’s National Olympic Committee was not officially recognized until 1931. At the 1932 Olympic Games, where Japanese swimmers astonished the world by winning eleven of the sixteen medals in the men’s competition, sprinter Liu Changchun was the lone Chinese representative. He was eliminated in the heats.

The low level of elite sports (and the generally unhappy state of Chinese physical education) from the 1920s to the 1950s can be explained by the trauma of civil war and foreign invasion. Communist victory in the Civil War over the Nationalists in 1949 heralded the transformation of Chinese sports as well as the rest of Chinese culture. Mao Zedong (1893–1976) had written in 1917 that physical education is “more important than intellectual and moral education” (Hong 1997: 131), but resources were scarce in 1949, and progress was slow. In 1951, the government inaugurated an inexpensive way to enhance the nation’s fitness. China’s masses began to perform early-morning out-of-doors gymnastic exercises in accordance with commands broadcast by state radio. The sequence of national sports festivals was resumed in 1959.

In this first decade of Communist rule, the emphasis was on national defense. The government’s physical culture program included not only tai chi and conventional sports like track and field but also paramilitary training with bayonets, hand grenades, and other weapons.

Although the regime’s avowed aim was to promote fitness and sports for the masses, the state-run All-China Athletic Federation recognized that athletes who broke world records and won international championships contributed to their country’s prestige. Limited government support for elite sports bore early fruit in the 1950s. Chen Jingkai set a world’s record in bantamweight weight lifting; Zeng Fengrong and Rong Guotuan won world championships in high jumping and table tennis. Quarrels with the International Olympic Committee (IOC) over the

A poster advertising baseball, with a racist image of a Chinese man missing a catch. China has had to overcome a stereotypical reputation for having a physically unfit populace.
status of Taiwan culminated in 1958 with Chinese resignation from the committee. At the same time and for the same reason, the People’s Republic of China (PRC) withdrew from the international federations for soccer and other sports. The PRC did not make its debut at the Olympic Games until 1984.

The Republic of China (Taiwan) continued to send teams to the Olympics. In the 1960 games, held in Rome, Yang Chuan-kwang barely lost the decathlon to his close friend, the American Rafer Johnson.

Unfortunately for those who dreamed of international supremacy, the Cultural Revolution (1966–1976) drastically altered the regime’s approach to sports. Mao’s motto was “Friendship first, competition second.” Sports contacts were, however, limited to friendly nations like the People’s Republic of Korea. Athletes and coaches who had had international experience were suspect: Were they truly committed to Maoism? Some of them, like Zhuang Zedong, the world champion in table tennis (1961–1966), were sent to prison. Others, like table tennis stars Rong Guotuan and Fu Jifang, committed suicide. At the elite level, Chinese sports were devastated.

During the PRC’s ten years of turmoil, athletes representing Taiwan continued to compete internationally. One of the island’s most successful sprinters, Chi Cheng, was third in the 80-meter hurdles at the 1968 Olympics in Mexico City. Two years later, competing in the United States, she set world records in the 100-yard and 200-yard sprints (10.0 and 22.7 seconds) and in the 100-meter hurdles (13.2 seconds).

The policy of the PRC veered again in the 1980s. The new motto was “Break out of Asia and advance on the world.” To achieve this goal, the government invested heavily in sports infrastructure. Although physical education was required in all schools, gifted athletes received special attention. Borrowing from the model developed by the Soviet Union, the government established a network of special schools to train an athletic elite. By 1990 there were 150 such schools (while the Soviet Union had a mere 46). Large sums went to build sports facilities. Research into sports physiology and sports psychology was strongly supported at Beijing University. To maximize performance in Olympic sports, the government decided in 1997 to eliminate all traditional Chinese sports (except wushu) from the annual national sports festival.

Current Emphasis on International Sports

The system worked. The achievements of Chinese athletes have been spectacular. Thanks in part to substantial government investment in sports infrastructure and relatively generous subsidies to athletes, the Chinese began to win international championships. At the 1982 Asian Games in New Delhi, Chinese athletes won sixty-one events and ended thirty-one years of Japanese domination. Two years later, Chinese Olympians returned from Los Angeles with fifteen gold, eight silver, and nine bronze medals.

To ensure Olympic success at Seoul in 1988, the PRC spent over a quarter of a billion dollars, more than fifty million dollars for each gold medal earned. Generous rewards for individual athletes were a part of the regime’s
program; diver Fu Mingxia’s victory brought her a bonus that was three hundred times a teacher’s annual salary.

In the 1990s, female runners like Wang Junxia set new world records by astonishing margins. Wang Junxia’s time over 3,000 meters was 8:06.11 minutes, an unprecedented improvement of 3.28 percent over the old record. (No previous track record had ever been lowered by more than 2.51 percent.) At the 1994 world swimming championships, Chinese women won twelve of a possible sixteen gold medals. In response to the suspicion that such performances were drug enhanced, Chinese coaches referred to hard training and the ability of peasant women to “eat bitterness.” It was true that Chinese athletes trained harder than their Western counterparts, but it was also true that Chinese men had failed to achieve such stellar performances and that a large number of female athletes tested positive for anabolic steroids. Between 1972 and 1994, ten of the world’s elite swimmers had failed drug tests; in 1994 alone, eleven Chinese swimmers failed.

In 1993, the desire to “break out of Asia and advance on the world” motivated the government to modify its ban on openly professional sports and launch a twenty-four-team soccer league (followed by leagues for basketball and volleyball). In keeping with the regime’s new openness to capitalist development, soccer teams pay their players ten times the salary of the average Chinese worker. Transfer payments are allowed and foreign players are lured with bonuses. The money comes not only from ticket sales but also from corporate sponsors such as Hyundai, Samsung, Panasonic, and Pepsi-Cola. The sports of the People’s Republic seem more and more like the sports of Europe and North America, a tendency that was accelerated in 2008, when Beijing hosted the summer Olympic Games.

The 2008 Olympics were an athletic success for China, and were also an economic success and a political success. China had, for the first time, more Olympic champions than any other nation. They also experienced a huge boom in tourism and advertising revenue, and short of several small incidents, the Olympics were also a political success, avoiding any major pitfalls. The chief accomplishment of the Beijing Olympics to history will probably be as a symbol of China’s rise as an athletic superpower and the increasing presence of sports in China as a westernized, commercial activity.

Sports Sponsorship

Corporate sponsorship is an essential aspect of modern sports. At the 2008 Beijing Olympics companies spent millions of dollars to get their names before a worldwide audience. Foreign companies found that they had to weigh the advantages of the publicity that sponsorship brings against potential backlash from activists and politicians who used the Olympic spotlight as a chance to criticize the Chinese government.

China has hosted several big sporting events recently, including the Nanshan Open (a snowboarding event), the Shanghai Showdown (China’s first Gravity Games, an extreme-sports competition), and the 720 China Surf Open. The X Games Asia, which have been hosted by South Korea, Thailand, and Malaysia, were hosted for the first time by China (in Shanghai) in May 2007.

2008, though, marked the first time that China hosted the world’s most prestigious sporting event: the Olympics. Along with the sports competition came the competition (and controversy) of sports sponsorship.

The big sporting events leading up to the Olympics provided China with practice for the main event. Kia Motors, the South Korean automaker, was just one sponsor of the 2007 X Games Asia, which were also sponsored by ESPN, ESPN STAR Sports, and the Chinese Extreme Sports Association. Kia Motors, a secondary sponsor of the X Games Asia since 2005, renewed its sponsorship with a three-year primary sponsorship both to develop the games in China and to gain product exposure. In 2005 alone, according to Kia Motors, exposure from the X Games Asia was worth $12 million.

Given such successes and the enormity of the Chinese market, the Beijing Organizing Committee for the Games of the XXIX Olympiad (BOCOG) had little trouble finding sponsors and partners to finance and coordinate the 2008 games. The Beijing 2008 sponsorship program consisted of three tiers of support: partners (who paid approximately $40 million), sponsors (who paid $20–30 million), and suppliers (who provided services and goods).

The Johnson & Johnson company, one of the Beijing Olympics’ U.S. sponsors, was glad to take advantage of the billions of viewers who, in the words of Brian Perkins, Johnson & Johnson vice president of corporate affairs, looked at Beijing and China “with amazement.” Herbert Heiner, CEO of Adidas, the German sportswear manufacturer, whose sponsorship was reportedly $80–100 million in cash and services, was similarly enthusiastic: “The Beijing 2008 Olympic Games will once again be a worldwide visible proof of our dedication to athletes, products, innovation, and leadership. At the same time the Beijing 2008 Olympic Games provides us with a unique platform to build the Adidas brand image and business in China, as well as the whole of Asia,” Heiner said in an official statement to the BOCOG when Adidas sponsorship was announced in 2005.
Olympic Sponsors

The Bank of China (BOC), the most international of China’s commercial banks and the country’s second-largest bank, is another institution that benefited from the first Olympics to be held in China. In July 2004 BOC became the sole banking partner of the Beijing Olympics. As such, BOC was the exclusive provider of both investment and commercial bank services and products. It was also a major player in the BOCOG licensure and ticketing programs.

BOC, in partnership with the Visa credit card company, improved the financial infrastructure necessary for ticketing, automatic teller machines (ATMs), and other point-of-sale services. Multinational partnerships such as this one also provided Chinese companies with a chance to learn from the experience of longtime Olympic sponsors (Visa has been an Olympic sponsor for more than twenty years).

Chinese manufacturers such as Haier, which makes home appliances, mobile phones, televisions, and theater systems, welcomed the increased global brand

Sponsors are eager to get a foothold in Chinese sports. During the Beijing Olympics in 2008 the deals signed brought multimillions in revenue. PHOTO BY TOM CHRISTENSEN.
recognition that sponsoring the Olympics brought. As a sponsor, Haier provided funds, home appliances, and other services to the Beijing 2008 Olympics, the Beijing 2008 Paralympic Games, BOCOG, and the Chinese Olympic Committee. Haier is headquartered in Qingdao, the sister city host of the Olympics, where the sailing events were held.

The chances are good that most viewers of the Olympics did not see the home appliances that Haier provided, but the advantage of Haier’s sponsorship came from the company’s being able to label itself an official sponsor and being able to market globally on that label.

“Haier becoming an official sponsor of the Beijing 2008 Olympic Games will greatly boost the preparations for the Beijing 2008 Olympic Games, especially the Olympic sailing events,” BOCOG Executive Vice President and Secretary-General Wang Wei said when the Haier sponsorship was announced in August 2005. “Sponsoring the world’s greatest sporting event also provides Haier with an unparalleled platform to build up its prestige on a global basis.”

Other Chinese companies that were sponsors and partners of the Beijing Olympics included the computer manufacturer Lenovo, China Petroleum & Chemical Corporation (SINOPEC), Air China, and Tsingtao Brewery Company.

Challenges for Foreign Sponsors

With the Olympics being hosted by Beijing, foreign companies found that they had to weigh the advantages of the publicity that sponsorship brings against potential backlash from protestors, activists, and politicians who used the spotlight of the Olympics as a chance to criticize the Chinese government.

The 2008 Olympics were not the first Olympics to meet with opposition—the 1980 Moscow Olympics are another example. Indeed, any country that has hosted the Olympics in the past twenty-four years has had detractors who have protested the host country and called for boycotts of sponsoring companies. Longtime Olympic sponsors such as Eastman Kodak, Coca-Cola, and General Electric, with their worldwide influence, have often been the targets of such protests. The difference is that with so much media, Internet, and global connectivity in 2008, the Beijing Olympics were the first Olympics for which grassroots activism could have as large an impact on the image of the games as could the sports competition itself.

Interest groups such as Reporters Sans Frontières (Reporters without Borders), Play Fair, and OlympicWatch.org were at the forefront of efforts to persuade countries, athletes, and sponsoring companies to boycott or at least withdraw their sponsorship from the Beijing games. These groups were concerned about censorship, unfair working conditions, China’s role in Sudan, and other human rights issues.

Such activism was an additional challenge and distraction for the Beijing Olympics’ international sponsors, which included Eastman Kodak, Adidas, Coca-Cola, General Electric, Johnson & Johnson, McDonalds, and Visa. These companies, despite their deep pockets and global clout, jealously guard their corporate image and the reputations of their brands and thus had to take into account opposition to Beijing’s hosting of the Olympics.

Such companies faced two choices, both of which had negative ramifications: acknowledge the activists and their criticism and risk alienating the Beijing government or ignore the activists and risk alienating the consumers whom those activists might rally to their cause. Public relations firms and organizations such as Future 500, a nonprofit liaison service between corporations and stakeholders, tried to walk the line. Future 500’s China initiative was designed to generate constructive interaction between corporations and nongovernmental organizations and other activist groups. As Future 500 reminded companies in The China Stakeholder Initiative on its website, “For industries that operate on the global stage, anything said by anyone anywhere—true or not—can impact your brands everywhere . . . That [fact] will be increasingly important between now and August 2008 when three billion people tune in to television and the Internet to watch the Olympic Games in Beijing. There, center stage will be not only the athletes, but corporations as well.”

Future 500 reminded companies that they needed to approach the Olympics with a measured amount of support for both the activist causes and their Chinese hosts. One issue that was problematic for the Beijing Olympics
was genocide in the Darfur region of Sudan. China’s continuing investment in Sudan and support of Sudan’s government led some protestors to refer to the Beijing Olympics as the “Genocide Olympics.”

When Adidas was confronted by activists about another issue—labor conditions in China—Adidas said it would pressure its suppliers in China, with whom the company had direct influence, but that Adidas would not try to pressure the Chinese government. To most companies that approach—addressing poor labor conditions, human rights abuses, or other issues without directly challenging the Chinese government—was the least damaging and therefore most palatable approach.

Corporate logos and messages were much in evidence during the Beijing Olympics as foreign companies advertised to an audience in the billions, hoping to increase their brand recognition and future profits in China. Likewise, Chinese companies used the platform of the Olympics to introduce their brands to the rest of the world.

Sports Training System

Xùnliàn tīzhì 训练体制

China has used the success of its economic reforms to create an elite sports training system that finds and develops athletes from the country’s vast population. The effectiveness of this system was shown in the 2008 Olympics, when China won fifty-one gold medals—more than any other country.

In 1932 Liu Changchun 刘长春 became the first Chinese athlete to participate in the Olympic Games and was the lone representative of Republican China (1912–1949) at the Olympics in Los Angeles.

Seconds later—11.1 seconds, to be precise—the first chapter of Chinese Olympic history was over as Liu Changchun was eliminated in the first preliminary heat of the 100-meter race, finishing well behind most of his competitors.

Liu’s defeat became yet another in the long history of defeats that China had suffered at the hands of foreign powers. For almost a century humiliation had been a constant of Chinese history, beginning with the losses of the Opium Wars during the mid-1800s at the hands of the technologically superior Western powers. The First Sino-Japanese War of 1895, lost to an until-then inconsequential neighbor, was even more damaging to China’s self-image. Finally, just a month before the Olympics in Los Angeles, Japan had overrun a helpless Chinese army in Manchuria. Sprinter Liu Changchun’s failure in the preliminary heat seemed to be yet another sign of Chinese weakness.

More than seventy years later another young Chinese athlete, again named “Liu,” crouched into his starting position for an Olympic race, the 110-meter hurdles. The expectations of a whole nation again weighed on a young man’s shoulders. However, this time the expectations of a nation did not drag down the young man. Indeed, Liu Xiang 刘翔 seemed buoyed by those expectations. He fairly flew over the hurdles, and 12.91 seconds later, equaling the world record time, Liu had won China’s first Olympic gold medal in track and field and was about to become one of China’s greatest athletic heroes.

Liu’s gold medal was China’s crowning glory at the 2004 Olympics in Athens, placing China second only to the United States in the gold medal total. However, the real significance of Liu’s victory was the fact that he won in a sport in which the Chinese were traditionally not seen as strong competitors because of their smaller and less-muscular physique. Liu Xiang’s gold medal marked the beginning of the end of the presumption that Chinese athletes can excel in only a narrow range of sports. Interviewed after his victory, Liu said before he burst into tears: “I proved that Chinese people, Asian people, and yellow-skinned people are able to do well in track events” (Armitage 2004).

His sentiment expressed not only his pride in his victory but also the frustration that past generations of Chinese had suffered. His words echoed a sentiment that remains important today: the joy—and relief—that the Chinese feel at finally having overcome an era of weakness and isolation. During a short time China has risen from being, in athletic terms, a developing country to being one of the world superpowers. This rise, reflecting
China’s overall rise to political and economic power, has baffled many experts and begs this question: How did China do it?

**Keys to Success**

The foundation of athletic success in China is, as in every other country, athletic talent residing within the population. China, being the most populous country in the world, has the obvious advantage of a vast number of people from which to draw sports talent. This extraction of talent, however, requires a highly organized sports system that identifies and develops talent. The development of China’s elite sports system, which made an unprecedented “great leap forward” during the last two decades, required the interplay of two ingredients: organizational infrastructure to find and accommodate athletic talent and the financial and human resources to provide sports facilities and training technology.

To provide these two ingredients, China developed an elite sports system that combines characteristics of the Western approach with the old Soviet approach.

**Elite Sports System**

China’s elite sports system, adopted during the period of reform and opening up starting in the 1980s, is based on the **Juguo tizhi** 举国体制 approach—the support of the whole country for the elite sports system. This approach, which gives priority to elite sports development, assures that all available sports resources are channeled into elite sports.

The organizational infrastructure of the system follows many of the principles of the old Soviet sports system. It features a tightly controlled, highly centralized, strictly hierarchical, state-led system that almost entirely relies on state funding. Efforts to transform the system that was established during the 1950s into a more decentralized system that promotes self-supporting (and less-government-dependent) sports development have so far largely failed.

A key aspect of the organizational infrastructure of China’s elite sports system is the far-reaching system of talent scouting and advancement, often called the “pagoda system.” The foundation of the pagoda system is mandatory physical education in regular schools and in spare-time sports schools.

Only by a thorough scouting system on this fundamental level can the potential of China’s vast gene pool be tapped and athletic talent found. Sports scouts canvass the country, visiting regular schools in their search for students with sports potential. They find athletes who are as young as five or six years of age. If young athletes show enough talent, they might be invited into the multilevel elite sports education system, which consists of a network of specialized sports schools. Such children, depending on their age, are sent to one of almost five hundred elite sports primary schools or more than two hundred elite sports middle schools and high schools.

About 400,000 young athletes are being trained in these schools. Their potential for different sports is examined, and their training is individualized accordingly. If they excel during competitions against their peers, they are promoted to the upper levels of the pagoda system at the municipal- and provincial-level sports schools, where they have full residency and are trained extensively. From there they have the chance of being promoted to the national teams and to compete in international competition. On the national level China trains approximately three thousand world-class athletes—almost three times as many as the United States.

**Financial and Human Dimensions**

Organizational infrastructure alone, however, cannot explain the rise of Chinese sports. The Chinese sports system for decades suffered from a lack of material resources—which is not surprising in a developing country. That lack of resources translated into inadequate training facilities and backward training technology. The organizational system to find and accommodate talent might have been in place, but China lacked the monetary means to transform talented children into world-class athletes.

China’s impressive economic strides after the reform of its economy during the 1980s provided the necessary second key to athletic success: financial and human resources. After the initiation of economic reform, sports facilities and equipment for elite sports education received a massive upgrade. Since then more funding has been directed into the improvement of sports facilities and
into the introduction of foreign, state-of-the-art training technology.

Training methodology also has become more scientific. The traditional training methodology is based on the “three unafraids” (unafraid of hardship, difficulty, and injury) and the “five toughnesses” (toughness of spirit, body, skill, training, and competition). That methodology still plays an important role in Chinese training, but it is now being complemented by more scientific coaching, sports psychology, and sports medicine techniques. To achieve this transformation, China has imported foreign expertise in training methodology by hiring successful sports coaches from all over the world.

For example, legendary Yugoslavian soccer coach Bora Milutinovic led the Chinese national team into the 2002 World Cup finals and enjoyed great popularity in China. With such a flow of material resources into its sports system, China possesses the most potent features of two worlds: the meticulousness and strictness of the Soviet-style sports system and the innovation and sophistication of Western-style training, methodology, and technology. All the ingredients for China’s rise as a world sports power were present by the mid-1980s.

Political Will of the Party
An organizational infrastructure and financial and human resources, important as they are, do not by themselves produce successful sports system. Also necessary is an intense interest in sports accomplishments by people who have the power to direct resources into elite sports. In China’s case the prerequisite is the political will of the Chinese Communist Party (CCP). The determination and enthusiasm that the CCP shows for the advancement of Chinese sports suggest that the political hay to be made from athletic success is particularly appealing to China’s political leadership. Athletic success yields three forms of political dividends in particular: intensification of national unity, strengthening of international esteem, and demonstration of systemic strength.

An important element in China’s unparalleled economic development, which is based on foreign direct
investment to an extent, is the Western image of China as a land of limitless opportunity and economic growth. Most investors, however, are nervous by nature, and capital, even in China, is increasingly mobile. The narrative of China’s rise, therefore, must constantly be fed with new successes. Winning Olympic gold medals is one way to provide new successes. Victories by China’s athletes in international competition, especially in events that are the focus of public attention, are one good way of asserting China’s power and winning international esteem. Likewise, international esteem is necessary for earning a more influential position in international politics. The success of Chinese athletes, therefore, indeed has a big political payoff on the international stage.

Today’s athletic arenas are the crucibles of today’s national heroes. The ascent of China’s sports has created many national heroes, such as Liu Xiang in track and field, Guo Jingjing 郭晶晶 in Olympic women’s diving, and Yao Ming 姚明 in basketball. Such heroes have become a focus of national sentiment that bridges the ethnic, socioeconomic, and cultural gaps that divide China today. In a nation as vulnerable to fragmentation as China is, in a nation whose national cohesiveness is always threatened by deep divisions running through society, all-encompassing icons of national unity have great political value. When Chinese watch a Chinese athlete win, it does not matter if those spectators are poor farmers from Guizhou or rich businessmen from Guangdong, Uygurs from Hohhot or Han Chinese from Beijing.

When such spectators watch Chinese athletes outperform their opponents, deep cultural divisions are forgotten, and all of these spectators are, at least for the moment, one thing: Chinese. Sports can create a feeling of national connectedness that trumps the divisions of class, age, and ethnicity. For China’s political leaders, whose power is directly tied to China’s susceptible unity and coherence, this power of sports pays an enormous political dividend, creating a political incentive to channel resources to the elite sports system.

A third vital political dividend is the power of association. Success in international sports is the privilege of nations that are rich and powerful. China’s ascent in athletics thus can be used as a symbol of the strength of China’s political system and its leadership, as a symbol of the competence of the Chinese Communist Party. The gleam of the medals around the necks of Chinese athletes also reflects positively on the performance of China’s political elite. And indeed most Chinese athletes are versed in reiterating that they owe their success to the Chinese state and the party. At a time when the Chinese Communist Party faces great political challenges to its power, when its legitimacy is measured not by revolutionary heritage but rather by tangible political success, the CCP looks for new ways to show its vitality. Creating great athletes is one way for the CCP to show that vitality and to strengthen its claims that the current political leadership can lead the country into a future filled with challenges.

The political dividends of success in sports have been high since the beginning of the period of reform in the 1980s. The organizational structure needed to create a superlative sports power was already in place, and the material means began to be available. China was ready for the world. And that is why its flag was seen many times as the national flags were raised at the medal ceremonies of the 2008 Beijing Olympics. China won fifty-one gold medals—more than any other country—and one hundred medals in all, second only to the United States.

Spratly Islands Dispute

Nánshāqúndào zhēngduān 南沙群岛争端

Although the Spratly Islands in the South China Sea cover barely 5 square kilometers of dry land, they are a focus of international boundary disputes due to their strategic location. China, Taiwan, Malaysia, Vietnam, and the Philippines all lay claim to all or part of the archipelago; Brunei claims fishing rights to part of the area, as well.

The Spratly Islands (Nansha qundao in Chinese) include about one hundred reefs and islets totaling less than 5 square kilometers spread over 410,000 square kilometers in the South China Sea (Nanhai). Today these tiny specks of land are important as symbols of national pride, as military outposts astride vital shipping lanes, as fishing grounds, and as sources of oil or natural gas. The People’s Republic of China (PRC), the Republic of China (Taiwan), Vietnam, Malaysia, and the Philippines have made claims to all or part of this archipelago. Brunei also claims a fishing zone that overlaps the southern portion of the Spratlys.

Chinese texts dating from the Han dynasty (206 BCE–220 CE) appear to describe the islands, and Chinese would later claim that sovereignty was established by a Yuan dynasty (1279–1368) naval expedition. Certainly for centuries Chinese traders and fishermen were aware of the Spratlys (probably named for nineteenth-century British captain Richard Spratly). The PRC emphasizes that Qing dynasty (1644–1912) maps include the Spratlys as part of the empire.

Claims to sovereignty were bolstered when Generalissimo Chiang Kai-shek’s Nationalist government accepted the Japanese surrender in the South China Sea, including both the Spratlys and the Paracel Islands (Xisha qundao), in late 1945. While Chinese Communist Party leader Mao Zedong and Chiang Kai-shek were Cold War adversaries, both sought to burnish their nationalist credentials by making strong territorial claims in the South China Sea as well as in islands at the southern edge of the Ryukyu Islands.

China’s adamancy and presence in the Spratlys have been a function of its growing military power and economic needs. In the 1960s and 1970s China and the Philippines announced the discovery of oil around the Spratly Islands, thus adding urgency to contending claims. The Chinese navy began regular patrols in the area in the mid-1980s. In 1988 Beijing highlighted the Spratlys’ ties to China when the island of Hainan was promoted to full-fledged provincial status (the PRC considers the Spratly Islands to be part of the new province, which was split off from Guangdong Province in 1988). That year marked the last serious military conflict concerning the islands, a clash between China and Vietnam during which seventy Vietnamese sailors lost their lives. This followed close to a decade after the PRC’s invasion of Vietnam in February of 1979 (which China says was in response to attacks by Vietnam), during which China claimed to have captured several cities and counties before announcing a withdrawal on 5 March. The Chinese gradually increased their presence in the South China Sea through small military outposts and markers.

Tensions grew in the 1990s with the increase of oil and...
gas exploration among the islands. In particular, China and Vietnam granted overlapping drilling rights and began to cooperate with foreign oil firms. One focus of regional concern has been a Chinese military installation on Mischief Reef on the eastern edge of the Spratlys. The Chinese Ministry of Foreign Affairs released a statement in 2000 reiterating China’s historical claims in the context of modern international law.

Over the past half decade the PRC has taken a more cooperative approach as part of its overall diplomatic strategy toward Southeast Asia. The Declaration on the Conduct of Parties in the South China Sea, signed by Association of Southeast Asian Nations (ASEAN) members and China in 2002, called for mutual consultation and confidence-building measures by all parties to the dispute. Further, the PRC has begun to cooperate on oil exploration ventures with Southeast Asian nations. The dispute over the islands has become a test case of a rising China’s claims of peaceful intentions in the region.

St. John’s University, known as “St. John’s College” until 1905, was one of Shanghai’s first Christian colleges. Founded in 1879 as a secondary school for boys, by the 1920s St. John’s (shèng yuēhàn dàxué) was regarded as one of China’s most prestigious universities and enjoyed the reputation of being the “Harvard of the East.” It has been the site of East China University of Political Science and Law since 1952.

St. John’s University (1879–1952), was one of China’s most prestigious universities prior to the Communist revolution of 1949. St. John’s became China’s first institution to grant the bachelor’s degree in 1907, and exerted great influence on the history of modern China through its educational programs and alumni leaders in the fields of diplomacy, politics, business, education, and medicine. It was divided into several specialized public colleges with the Communist organization of the education system in 1952.

St. John’s founder, Samuel Isaac Joseph Schereschewsky (1831–1906), was sent to China by the American Episcopal Church as a missionary in 1859 and was elected bishop of Shanghai Parish in 1876. Bishop Schereschewsky launched a financial campaign for the college in 1877 and raised $26,000 of his $100,000 goal, with a three-year promise of an additional annual $6,000 appropriation from the Board of Missions of the Episcopal Church. The cornerstone of St. John’s first building was laid in 1879.

Bishop Samuel Isaac Joseph Schereschewsky, the founder of St. John’s University in Shanghai in his study in 1902. On his left is his Chinese secretary, Lien; on his right, his Japanese scribe, Bun.
laid in the Jessfield suburb of Shanghai on 14 April 1879. St. John’s first pupils, thirty-nine boys transferred from Baird Hall and Duane Hall, two small Episcopal schools, arrived in September.

St. John’s education, guided by the aim of educating outstanding Chinese ministers, was for a decade directed at the secondary level. The majority of students were Christians who were provided with food, clothing, housing, books, and supplies. In October 1881 St. John’s admitted students for the study of English. This move, along with a subsequent decision to teach Western subjects in English, proved of great importance to the development of the institution as well as to the history of China’s Christian colleges. St. John’s became a center for English language study and a lightning rod for arguments about the negative impact of English on the secularization of Christian education, the dilution of missionary educational goals, and the denationalization of Chinese students.

A key turning point in St. John’s history was the arrival in 1886 of Francis Lister Hawks Pott (1864–1947), who would guide the school for fifty-two years and become a leading advocate of Christian higher education in China. Pott was born into a New York Anglican family and graduated from Columbia University in 1883. Pott raised St. John’s standards by establishing entrance examinations in Chinese and English, adding a three-year collegiate course, and securing funds for infrastructure expansion. In 1905, patterned on the structure of Columbia University, St. John’s became a four-year college.
comprehensive university with schools of theology, medicine, and arts and sciences. St. John’s became China’s first institution to grant the bachelor’s degree in 1907 and gradually became known as the school of choice among Shanghai’s affluent merchant families, whose brightest sons could enroll directly into premier U.S. graduate programs.

In 1952 China’s institutions of higher learning were fundamentally reorganized for the Communist era, and St. John’s schools were incorporated or transferred into several specialized public colleges. The campus, designed to harmonize Chinese and Western architectural aesthetics, is now the site of East China University of Political Science and Law. St. John’s is recognized as an institution that exerted great influence on the history of modern China through its educational programs and its many alumni who became leaders in diplomacy, politics, business, education, and medicine.

St. John’s University. (1929). St. John’s University, 1879–1929. Shanghai: Kelley & Walsh.
General Joseph Stilwell, known as “Vinegar Joe” to his soldiers, spent much of his Army career in Asia. As a young officer he briefly visited Shanghai and Hong Kong in 1911. After World War I he requested to be assigned to China. Because of his language skills he was accepted by the Nationalist Chinese, and was made Chief of Staff to Chiang Kai-shek. He became the senior U.S. military officer in China during World War II.

General Joseph Stilwell was the senior U.S. military officer operating in the China-Burma-India (CBI) theater during World War II. He is best remembered for extending the Burma Road, a 1,800-kilometer supply route, which originated in Ledo, India, went through Burma (now Myanmar), and ended in Kunming in Yunnan Province.

Joseph Warren Stilwell was born in 1883 in Palatka, Florida, and was accepted into the United States Military Academy at West Point in 1900. He was commissioned as an infantry officer in 1904 and sent to the Philippines, recently acquired from Spain during the Spanish-American War, for a short tour of duty. While on this assignment Stilwell travelled to Japan and China. When he returned to the United States, he taught English, Spanish, French, and history at West Point.

By 1917 the United States had become involved in World War I, and Stilwell was sent to France as a liaison officer. After World War I, Stilwell briefly returned to the United States before being sent to China from 1920 to 1923. He went back to China in 1926 and stayed for three more years. When he returned to the United States in 1929, he was stationed in Fort Benning, Georgia, where he was given his nickname “Vinegar Joe” because of his tendency to let a soldier know that he had done something wrong.

In 1935 Stilwell returned to China for his third tour of duty. As the military commander at the U.S. embassy in Peking (now Beijing) from 1935 to 1939, he became fluent in the Chinese language and very knowledgeable about Chinese customs and culture. He was in China in 1937, when Japan first invaded the country. Despite his expertise on China, he had lagged behind his fellow officers and expected to be retired from the Army upon his return to the U.S. However, during his return he learned that he had been selected for promotion to the rank of brigadier general and assigned a brigade command at Fort Sam Houston, Texas. Stilwell’s use of the 3rd Brigade of the 2nd Infantry Division in military exercises, in which he used tactics he had seen by the Japanese in China and which Germany would use in Europe, embarrassed senior generals. He was rewarded with promotion to the rank of major general and given command of the Seventh Infantry Division at Camp (later Fort) Ord, California.

Stilwell demonstrated his excellent command of troop movements during the training of his division, and particularly of new recruits and reserve officers at Fort Ord, leading to his appointment as commanding general.
of the III Army Corps (later changed to the IIIrd Armored Corps headquartered at the Presidio of Monterey, California.

When the United States entered the war in the Pacific in 1941, General Stilwell went to Asia, but instead of commanding troops, he was sent to the CBI theater to establish an American military force and to assist Generalissimo Chiang Kai-shek, head of China’s Nationalist (Guomindang) forces, as his chief of staff. Stilwell had been selected by Army Chief of Staff General George Marshall and Secretary of War Henry Stimson because of his expertise on China. Chiang respected Stilwell because of his ability to speak Chinese, and Stilwell’s expertise in China was a major asset that allowed him to get involved quickly with operations in the CBI, when he arrived in February 1942.

11 October 1944. General Joseph W. Stilwell talking with Major General Curtis E. LeMay of the 20th Bomber command, at a B-29 base. LIBRARY OF CONGRESS.

Generalissimo and Madame Chiang Kai-shek with Lieutenant General Joseph W. Stilwell, Commanding General, China Expeditionary Forces, on the day following a Japanese bombing attack [the Doolittle Raid]. Maymyo, Burma (Myanmar) 1942. US NATIONAL ARCHIVES.
Retreat and a New Road

By that time Japanese forces were making huge strides in taking over China. Singapore and Burma had already been invaded by Japanese forces. General Stilwell was able to persuade Chiang to give him control of some Chinese forces to help push back the Japanese. Stilwell was not the highest Allied officer in the CBI theater; British General Harold Alexander, Allied commander in Burma, was the superior ranking officer. From March to May of 1942, Stilwell tried to help Allied forces in Burma, but Allied command problems and strategic moves by the Japanese caused Allied forces to retreat. Most British forces retreated to India, while some Chinese forces went back to China. Rather than evacuating by aircraft, General Stilwell retreated on foot with his men. Chiang was irritated by the Chinese losses and blamed Stilwell for these, causing a rift in their relationship that would only worsen as the war went on.

As soon as Stilwell arrived in India, his main focus was on how to retake Burma from the Japanese forces. His plan was to connect the Burma Road with China so that more supplies could be moved into China from Rangoon, Burma (now Yangon, Myanmar). When the Japanese took control of southern Burma, a new proposal was made. General Stilwell’s operations officer, Lieutenant Colonel Frank D. Merrill, recommended building a road from Ledo, India, to Burma, connecting with the old Burma Road, which had been built in 1937–1938, to provide a land supply route from India to China and Burma for support of the Allied soldiers who were fighting in the north Burma region. The connection of the road from Ledo, India, through northern Burma, would permit shipment of supplies to Kunming, China.

In late 1944, barely two years after Stilwell accepted responsibility for building the Ledo Road (which later came to be known as the Stilwell Road), the route was connected to the Burma Road. The first convoy reached Kunming on 4 February 1945.

Air and Ground Fighting

To establish air superiority to protect the Burma Road and to drive Japanese forces out of Burma, a plan for capturing the Japanese-controlled city of Myitkyina in Burma was developed. This win would allow Allied airplanes under the command of Claire Chennault, the commander of an American volunteer group, the Flying Tigers, to use the runway there to attack the Japanese and provide a strategic area from which to launch new offenses.

The ground offensive against the Japanese also continued. Frank Merrill, now brigadier general, took command of the 5307th Composite Regiment, a group that came to be known as Merrill’s Marauders. This group attacked the Japanese Eighteenth Division in February 1944, enabling Stilwell to gain control of Burma’s Hukawng Valley.

Before and during the ground and air offensives against the Japanese, General Stilwell had to deal with the political battles with Chiang Kai-shek, who was fighting Mao Zedong’s Communist forces as well as the Japanese, in addition to contending with disagreements among the Allied forces, especially the British, who had issues other than Burma as priorities.

Although the completion of the road from Ledo to Kunming and the success of the air route pushed the Japanese occupation of China to the east, the war came to an end with the atomic bombing of Hiroshima and Nagasaki in August 1945. General Stilwell was present at the signing of the Japanese surrender aboard the USS Missouri in Tokyo Bay on 2 September 1945.

Postwar geopolitics kept General Stilwell from full recognition. His animosity toward Chiang Kai-shek led to statements that were seen as pro-Communist, and he returned to the United States after the Japanese surrender, in charge of the Western Defense Command in San Francisco, the same post he had held at the outbreak of the war. Just over a year later, on 12 October 1946, General Stilwell died from stomach cancer.

Stock Markets

Gǔpiào shichǎng 股票市场

Shanghai is the largest, both in number of companies listed and in market capitalization, of the three stock exchanges most important to Chinese companies. Hong Kong is the oldest but now second to Shanghai in size. Shenzhen, the newest and smallest of the three exchanges, focuses on small- to medium-tier companies that are often state-owned. All three exchanges have suffered declines in market capitalization from their 2007 peak.

Mainland China has two stock markets, the Shanghai and Shenzhen exchanges, and the Hong Kong Exchange also plays a major role in China. Before the establishment of the mainland exchanges, the Hong Kong Stock Exchange served as the principal exchange in which Chinese companies could raise capital. The maturing of the Shenzhen and Shanghai exchanges has given Chinese companies the alternative to raise capital within China in its local currency (renminbi).

The Three Exchanges

Japan’s Tokyo Stock Exchange is the Asian leader in terms of market capitalization (US$1.32 trillion in 2008). But today, the Shanghai and Shenzhen exchanges together list more than 1,500 companies with a combined market capitalization of US$1.78 trillion (2008). With the Hong Kong Stock Exchange (US$1.33 trillion in market capitalization in 2008), China can truly claim to rival Japan.

The Shanghai Stock Exchange

Located on the eastern coast, Shanghai is China’s largest city. As a center of commerce since the nineteenth century, it has been a hub of international commerce since the 1930s. Foreign investment was halted in 1949 with the Communist party takeover, but with economic reforms of the 1990s, it has regained its place as the center of finance and trade in mainland China.

Closed during the first years of the People’s Republic of China, the Shanghai Stock Exchange (SSE, 上海证券交易所) reopened in 1990. A non-profit, membership institution, it is directly governed by the China Securities Regulatory Commission. As mainland China’s largest exchange, its listed companies include Chinese gas and oil companies, banks, insurance companies, and high-tech sectors. The SSE treasury bond market is the most active of its kind in China. Trades in A shares are restricted to domestic investors, while B shares are open to all investors.

The SSE is the sixth largest exchange in the world and second only to Tokyo in Asia, with 861 companies listed. At its peak in 2007, its market capitalization was US$4.04 trillion. Reflecting the losses of 2008, the January 2009 market capitalization was US$1.557 trillion.
THE HONG KONG STOCK EXCHANGE

The Association of Stockbrokers in Hong Kong was established in 1891, although there are reports of securities trading going back to the mid-nineteenth century. Economic reforms in 1999 led to the merger of the Stock Exchange with Hong Kong Futures Exchange to form the Hong Kong Stock Exchange (HKEx 香港交易所). At the end of 2007, Hong Kong Stock Exchange had 1,241 listed companies with a market capitalization of almost US$2.7 trillion, making it Asia’s third largest. In January 2009, its market capitalization was US$1.24 trillion.

HKEx’s listed companies include property development and strategic investment holdings companies (Cheung Kong Holdings), banks (HSBC, Industrial and Commercial Bank of China), and utilities (Hong Kong and China Gas). The principal regulator of Hong Kong’s securities and futures markets is the Securities and Futures Commission, which is responsible for administering laws governing securities and facilitating development of these markets.

SHENZHEN STOCK EXCHANGE

Shenzhen, a city in Guangdong Province less than 50 kilometers from Hong Kong, was established in 1980 as China’s first Special Economic Zone. It has become an important business and economic center and is home to the Shenzhen Stock Exchange (SZSE 深圳证券交易所). The smallest of the three China exchanges, it is the ninth largest stock exchange in Asia, based on a market capitalization of US$7.85 billion in 2007 and US$3.89 billion in January 2009.

Listings on the SZSE are mostly small- to medium-tier companies; many are state-owned enterprises in which the Chinese government, which views the stock market as a means of raising capital, has a controlling interest. Among the most actively traded stocks are Tang Steel, a large state-owned steel manufacturing enterprise; China Vanke company, the largest residential real estate developer in the People’s Republic; and Guangdong Electric Power Co. Like the Shanghai Stock Exchange, Shenzhen Stock Exchange is governed by the China Securities Regulatory Commission.

Chinese Companies Abroad

The Chinese exchanges are, in comparison to the New York Stock Exchange (NYSE), smaller and less active. But the role of Chinese companies on the international exchanges is growing. The NYSE celebrated the thirtieth anniversary of the establishment of diplomatic relations between the United States and China with the ringing of the opening bell by National Committee on United States–China Relations president Stephen Orlins on 5 January 2009. Accompanying Orlins were former secretary of state Henry Kissinger, China’s ambassador to the United Nations, China’s consul general in New York, and the Commissioner of the National Basketball Association—because the NBA is fast expanding its presence in the Chinese media market. The forty-five People’s Republic of China companies listed on the NYSE had a market capitalization of US$802 billion.

Growth and Contraction

The year 2007 could be called one of “market frenzy.” The Chinese rushed to invest savings in the Shanghai and Shenzhen markets; Shanghai grew more than 300 percent in market capitalization over 2006. China led the world in the number of new shares offered. The companies with initial public offerings were, in general, big state-owned enterprises in the oil and gas industries, mining, and banks. Alibaba, Asia’s number one business-to-business portal, drew international attention and acclaim with its initial public offering on the Hong Kong stock exchange, raising US$1.5 billion.

The decline in manufacturing caused by the global downturn of 2008 forward had drastic impact on Alibaba and on new Chinese companies hoping to follow in its success. In 2008, the Shanghai exchange lost over 60 percent of its market capitalization; Shenzhen exchange lost close to that. The Hong Kong exchange, which lost approximately 49 percent of its market capitalization in 2008, continues to play an important role as an exchange for Chinese companies.

Chinese officials have expressed optimism that economic stimulus efforts by the Chinese government in
2009, including investment in infrastructure, along with increased commercial lending will reverse the downward slide that stocks suffered in 2008.

Storytelling ▶

A man’s greed is like a snake that wants to swallow an elephant.

人心不足蛇吞象

Rén xīn bù zú shé tūn xiàng
A popular art form in China since the second century BCE, storytelling has many styles, often geographically based. It can utilize both narrative and song and sometimes verse and musical instruments as well. Over time, it has evolved to reflect cultural and societal changes, frequently mixing well-known traditional tales with modern political commentaries.

Storytelling styles in China have roots in the telling of anecdotes, tales, and jokes as far back as the Han dynasty (206 BCE–220 CE). By the Tang dynasty (618–907 CE), Buddhist monks told religious tales in a popular style. Narration and song, presented with rich description and a lively delivery, attracted many listeners; this use of both verse and prose became an important feature of storytelling in China. At times, Buddhist monks also used visuals (bianxiang, or pictures showing magic transformations) to help illustrate some stories.

During the Song dynasty (960–1279), storytellers emerged in more professional or semiprofessional roles. The luckiest ones told their tales in teahouses or in private houses, protected from the elements, while the less fortunate shared theirs in the streets, festivals, and markets, dependant on coins collected from listeners. Many had to travel through difficult terrain to reach rural audiences, often using fortune-telling and begging to supplement their incomes.

In the seventeenth century Liu Jingting, often called the father of Chinese storytelling, moved many people with his narratives, including true stories from the collapse of the Southern Ming dynasty (1368–1644). From this time, several important storytelling centers and styles flourished, with many storytelling venues offering pinghua/pingshu storytelling without music, and tanci storytelling with a blend of singing, speaking, and instrumental music. The garden city of Suzhou and busy Yangzhou were two cities known for storytelling; by the 1940s, there were sixty to seventy storytelling houses in Suzhou alone.

In nearby Shanghai, changes in storytelling reflected urban growth. In the late nineteenth century, storytelling beggars, often hungry and disabled, often were found in the Chinese part of the city. Fifty years later, the conditions of many storytellers there had improved, with the musical tanci style developing into a sophisticated, popular form. Modern areas of Shanghai, with electricity and improved building techniques, soon boasted entertainment centers up to ten stories high and storytelling theaters seating five hundred listeners. In the 1930s, more than twenty area radio stations had daily storytelling programs; by the early 1940s, Shanghai had over five hundred storytelling venues and two powerful storytelling guilds.

After 1949, storytelling was seen as an important means to spread ideas in the Communist revolution, since it was both a low-cost and well-received form of entertainment in much of China. Many intellectuals tried to teach traditional tellers from various backgrounds and styles to use more modern themes, including new stories praising governmental campaigns or glorifying the role of workers. Traditional storytelling guilds were disbanded and...
the government started training programs and institutes in order to have more control over content.

During the Cultural Revolution (1966–1976) many storytellers were put out of work and had to take up other jobs. Others were imprisoned, or retrained to tell stories about revolutionary heroes like the model soldier Lei Feng, or stories ridiculing superstitions and reactionary beliefs. Stories were sometimes cut in length, too, to accommodate work schedules. Most of the traditional stories were forbidden as reactionary or were censored and changed to reflect the political philosophy of the time.

In the late 1970s, storytelling returned in part to its former state, only to find great competition from both the media and a faster pace of life with more distractions, especially in urban areas. Some forms, like the xiangsheng comic style or tanci, still found many followers while other styles either disappeared or depended on the support of the government to continue. Audiences in the storytelling houses today are usually elderly males, although radio and television performances reach much larger audiences. Stories will always be shared in China for education and for entertainment, but the future of many traditional storytelling styles is in question, with too few younger storytellers emerging to take the place of today’s aging tellers.

**Style**

The narrative storytelling arts in China, covered by the word *quyi* since 1949, number over three hundred; the term *storytelling* covers a varied number of these, depending on the definitions used. In most of them, the teller’s voice is often a powerful instrument, accompanied at times by simple percussion instruments—bamboo clappers or drums—and at times with more elaborate stringed instruments. Even something as simple as a small wooden block, the *xingmu*, adds to the drama in many styles, capturing the audience’s attention and providing a dramatic emphasis or portraying effects: the slash of a sword, a hero’s moan, horses’ hooves, or the cries of a solitary bird.

The use of humor is also found in many styles, with the lively art of *xiengmiang* best known for its comic style. Description, too, is a basic tool of the Chinese storyteller, who often combines well-known descriptive formulas to create images of, for example, a hero: eight-feet tall, with a square mouth and full lips, tiger eyes, a face like the round moon, and two long ears.

Often adding to the storyteller’s attraction is the use of onomatopoeia: *ming, ming, ming* (wind), *hua, hua, hua* (rain), *gululu* (thunder), *danglanglang* (something shattering), *guang, guang, guang* (cannon shots), and many others. In some styles, sound effects—galloping, roaring, crying—were important as well. Although the use of visuals to tell stories, such as scrolls and paintings, is an important genre in nearby India, such props appear to be less popular in Chinese storytelling, according to the scholar Victor Mair. Other objects used at times include a folding fan and a handkerchief.

Several well-known storytelling genres, under a broad definition of storytelling, are introduced below; many other exciting varieties (for example, Beijing Clapper tales that use two types of bamboo clappers) as well as simple folk styles also exist.

**Xiangsheng**

Performers satirize both society and human foibles in the comic form *xiangsheng*, which has roots in the Qing dynasty (1644–1912). Its humor (with puns, double meanings, and impersonations), fast-paced delivery, and ability to quickly respond to societal changes and concerns have made this a popular variety. The *xiang* in *xiangsheng* refers to *xiang mao*, or facial expressions, while *sheng* refers to *sheng yin*, or voice. Xiangsheng performers combine facial and vocal expression to make the four basic skills of *xiangsheng*: singing, talking, joking, and imitating. This narrative style can be performed with one, two, or three performers, but the two-person type is the favorite.

The language of *xiangsheng* is Beijing Mandarin, thus the form is most popular in Beijing, Tianjin, and throughout northern China. Stories before 1949 tended to be risqué and full of stereotypes and insults, thus appealing to the lower-class males who made up the audience. After 1949, the stories and delivery were cleaned up to appeal to all classes, male and female. The popular *xiangsheng* star Hao Baolin helped to raise the art’s status and promoted the use of fine singing during the sessions. His skill at imitations, along with his other talents, even made him a favorite of Mao Zedong, a great fan of this form.
Traditionally, xiangsheng tellers, like many other storytellers and performers in the oral tradition, apprenticed with a master teller. Today’s tellers are expected to write and create their own material, and amateurs also embrace the art; in 2004, the first Internet xiangsheng competition was held. Recent story topics show a wide range, including housing problems, filial piety, corruption, the effects of government policies, eating dumplings, and even changing one’s job or trade. In the past, the stories might last for about an hour, but today many stories have a shorter format, around twenty minutes, to fit the needs of radio and television broadcasts.

Pinghsu and Pinghua

These two examples of storytelling, from the southern (pinghua) and the northern and central (pinghua) areas of China, feature well-known classics told with expression, but without music. In the past, storytellers in these styles apprenticed to master tellers and worked to perfect episodes that could stretch for months of daily two-hour sessions, with scenes carefully stopped at a dramatic moment to bring the crowd back again. Today’s tellers learn such techniques both in drama schools and from masters, but they tell their tales over a shorter time period.

The stories are often shared in storytelling houses where hanging scrolls welcome listeners with well-known couplets:

- Today again you have heard me tell of things long past.
- If you have time to spare, please come early tomorrow.

Inside, audience members, usually elder males, are given tea leaves, glasses, and plentiful hot water. They often munch on sunflower seeds and other snacks to help pass the time happily while listening. A large fan (symbol of the story arts), calligraphy, and or a painting might be found behind the storyteller. The stage is usually a raised platform, with a table, tea, a fan, and the xingmu block (known as the zhiyu, or “talk stopper,” in Yangzhou storytelling).

The stories recounted in these nonmusical forms are usually the great favorites that have been long told, and were also read as novels, including Xiyou ji (Journey to the West), which follows the adventures of pilgrims seeking Buddhist scriptures; Shuihu (Water Margin), about a bandit group in the twelfth century; and San guo (Three Kingdoms), which tells of battles and heroes during an unsettled time.

Intricate descriptions, dialogue, sound effects, facial expressions, and actions bring the stories to life. Today,
this style reaches beyond the traditional venues into homes for the aged, business and government functions, and over both radio and television broadcasts.

**Tanci**

Stringed instruments are popular in the sophisticated form of tanci (“plucking lyrics”) enjoyed especially in Suzhou and Shanghai. The *pipa* (a pear-shaped lute) and *sanxian* (the three-string banjo) are played by a pair of tellers, today usually a male and a female, although some solo performers are found. Most of the listeners in the storytelling houses are elderly and male. They come regularly to the programs, which usually start at 2 p.m. with an opening ballad. Audience members sip tea as they listen to the storyteller/s weave a tale for a two-hour period. In the past stories could stretch on for months, but most stories today continue for two-weeks worth of such daily sessions.

Traditional and new love stories of gifted scholars and talented beauties are popular in this elegant, refined tradition. New stories share political thought as well: stories of exploitation, corruption, crimes, or working-class heroes. Musical melodies support the various characters and scenes; besides basic melodies used by male and female roles, special melodies include the go-between tune for matchmaking, the wild-rooster-crowing tune for rapid descriptions, and a creepy tune for evil characters.

Traditional training for this type of storytelling, usually from master to student, covered the four basics of speech, humor, the music of stringed instruments, and song. The student performed various services for the master and began to learn pieces by listening and repeating, accompanying the master teller to his performances, and observing. In this art, as in others, oft-repeated and concise formulas helped to teach:

- Fast, but not confusing; slow, without pausing
- Pausing the sound, but not the spirit
- Loud but not noisy; soft but not inaudible
- Happy but not hysterical; sad but not morose

Today’s training is done in government institutes, with a short storytelling apprenticeship at the end. Students attracted today to the three-year course in Suzhou (which also leads to a junior-college diploma) frequently come from the rural areas, know little of the art, and are often drawn by the diploma and the chance for an urban residency permit. Grade sizes have dropped to approximately sixty to seventy students in recent years, while in Shanghai very few students study tanci at all.

Chinese oral storytelling is a rich and varied art, changing as it moves into the twenty-first century. It will indeed survive as an art, even though specific forms may weaken, change, or suddenly appear, for it answers a basic need to communicate and to share both heritage and humanity.

John Leighton Stuart was an American missionary born in China. He was the founder and first president of Yenching University in Beijing and also served as the U.S. ambassador to China just before the Communist takeover. He was famously derided by Mao Zedong as being the last representative of western imperialism.

John Leighton Stuart, born in Hangzhou, China, to American missionaries Mary Louisa and John Linton Stuart, was an important figure in twentieth century Chinese-American relations. He lived in China until the age of eleven, when he was sent to the United States to attend school in Mobile, Alabama; he later enrolled at Hampden-Sydney College in Virginia, where he received his BA as well as his LLB. As a young adult, he did not return to China because he felt that missionary work in the land of his birth was without merit. However, he changed his mind and, following in his father’s footsteps, became a minister, obtaining his theological degree from Union Theological Seminary in New York City. In 1904, he married Aline Hardy Rood, and the following year he was ordained as a Presbyterian minister and sent by the church as a missionary to China.

In his early years as a missionary, Stuart became an educator. From 1908 to 1919, he taught Greek at Nanking Theological Seminary (now Nanjing Union Theological Seminary) in Jiangsu Province, during which time he wrote an essential Greek-English-Chinese dictionary of the New Testament, as well as a handbook to New Testament Greek for Chinese speakers. He wrote several other books in Chinese, mostly exegetical works on the Scriptures.

In 1919, he began to work on establishing a new university in Beijing. He aggressively sought out benefactors
and found a prominent one in Charles Martin Hall, the inventor of tinfoil. With secured funds, Stuart purchased a royal garden that he turned into a campus. Yenching University opened in 1926, specializing in law, medicine, theology, and arts and science. Stuart was its first president; his objective was to make the institution the very best in Southeast Asia. To that end, he helped to create the Harvard-Yenching Institute in 1928, a joint effort by Harvard and Yenching universities that concentrated on furthering arts and science education in the region. As a result, by 1930 Yenching University was one of the very best in all of China, where scholars, both Chinese and non-Chinese, taught, studied, and researched.

At the start of the Second Sino-Japanese war (known in China as the War of Resistance against Japan) in 1937, Stuart remained in Beijing. While the Japanese occupied the city, he played an important role in maintaining a balance between the Japanese occupiers and his university students, who often led anti-Japanese protests. After 1941, however, with Japan’s attack on Pearl Harbor, he was imprisoned because he was a citizen of the United States. He remained there until the defeat of the Japanese in World War II in 1945.

Following the Second World War, Stuart served as the U.S. ambassador to China from 1946 to 1949; his mandate was to assist General George C. Marshall in finding a détente between the Nationalists and the emerging Communists. The efforts proved unsuccessful, and the Communists took control of mainland China, with Chiang Kai-shek and his Nationalists relegated to Taiwan. Stuart would be the last U.S. ambassador to China until 1979, when normal relations resumed between the United States and the People’s Republic of China.

Stuart returned to the United States and wrote extensively about his experiences; he did not visit China again. He died in Washington, D.C., in 1962. Stuart’s legacy in China rests upon his active involvement in furthering education in China, especially in the hope that it might serve to weaken age-old feudal traditions and usher in a new sensibility for Chinese youth whereby they might engage fruitfully and beneficially with the world at large.

Su Shi was perhaps the most renowned scholar-official of the Northern Song dynasty (960–1126), with pathbreaking accomplishments in several aesthetic fields, including all major genres of poetry (shi, ci, and fu), old-style prose (guwen), calligraphy, painting, and even cuisine.

Su Shi was the renaissance man of what was arguably the renaissance in Chinese intellectual and cultural history of the tenth and eleventh centuries. This period marked a threshold in Chinese history with the rise of the scholar-official class empowered by a merit-based examination system, new infrastructures of travel that made the new scholar-official elite a mobile and cosmopolitan class, and an intellectual revival of Confucianism that encouraged this new class to conceive of itself as “co-rulers” of the empire alongside the emperor. However, Su Shi’s most enduring impact on the Chinese literary tradition was the way he responded to the challenges of displacement in official travel and exile through his literary works.

Su Shi was born in the southwestern mountain town of Meishan (Sichuan Province). In 1057 at the age of twenty-one he traveled with his father, Su Xun (1009–1066), and younger brother, Su Che (1039–1112), to the capital, Kaifeng, in the north to take the official examination. Su Shi placed second in this highly competitive exam and thereby came to the attention of Ouyang Xiu (1007–1072), the chief examiner and a major political
reformer of the time. Many groups of scholar-officials sought to have their visions for “ordering the world” implemented by the court, but the day was won by Wang Anshi (1021–1086), who advocated a set of “New Policies,” a kind of state socialism that sought to build up the central government’s wealth and military strength vis-à-vis its nomadic neighbors to the north. Su Shi’s outspoken opposition to some of the inadvertent ill effects of these policies on the local populace caused him to be sidelined to a series of provincial appointments. In addition to directly criticizing the New Policies, Su wrote satirical poems addressed to his allies to voice his protest. He was arrested in 1079 on a trumped-up charge of high treason and was subjected to the “Crow Terrace Poetry Trial” in which his literary works were gathered and examined for treasonous passages. After one hundred days, a death sentence was commuted to an open-ended exile to the Huangzhou (Hubei Province) in the central Yangzi (Chang) River valley. This five-year period of exile (1080–1084) was a time of intense self-reflection and Buddhist practice for Su Shi during which many of his greatest literary works were written. Su Shi sustained himself during his exile by farming a plot of land known as the “Eastern Slope,” and it was from this plot of land that he took the name “Layman of the East Slope.” The death of Emperor Shenzong and the regency of the Grand Empress Dowager (Shenzong’s mother) brought the return of Su Shi and other opponents of the New Policies to the capital. During this brief period Su Shi wrote the greatest number of “poems on paintings” (tihuashī). These poems, along with his prose writings on the arts of the brush, crystallized the theories of literati painting, including the idea that painting possesses the same expressive capacity as poetry. The ascent of Shenzong’s son, Zhezong, to the throne in 1093 led to the restoration of the New Policies administration of his father, and Su Shi was exiled for a second time to the distant south, first to Huizhou (Guangzhou Province) from 1094 to 1096 and then to Qiongzhou (Hainan Island) from 1097 to 1100. Although he was allowed to return to the mainland in 1101 in order to take a post in his home province, he fell ill and died on the road home.

Shī poetry was a classical form of verse written in lines of five or seven characters, organized in couplets with rhyme falling on the even numbered lines, with roots stretching back to the Zhou dynasty (1100–256 BCE). By the Tang (618–907 CE) and Song (960–1279 CE) dynasties,
shi had become perhaps the highest ranking genre of poetry and the ability to compose shi became one of the criteria by which candidates for employment in public office were chosen. As such, shi poetry became associated with literati expressions of commitment to the affairs of the state. Su Shi’s shi poetry continued within this tradition, but his shi poems had a strong philosophical and discursive or prosaic flavor, as was characteristic of Song dynasty shi poetry. In his shi poetry, like his ancient-style prose, he developed a style that embodied both spontaneity and objectivity, emphasizing the images of flowing water and the moon that represent the continuity or pattern (li) that he discovered within change.

He also took up the song lyric (ci), a genre of poetry quite unlike shi poetry in both form and generic status. The song lyric was a form of verse of relatively low generic status written within the format of popular songs, often characterized by uneven line lengths and more colloquial language, and was associated with urban entertainment quarters, the female performers who sung them, and the themes of delicate emotions and romantic love. Su Shi elevated the status of this popular song lyric by expanding its topics to include aspects of public life that were formerly the domain of shi poetry. While he wrote song lyrics on romance and the more delicate emotions, he also expanded the thematic scope of the song lyric to focus on longing for place and for like-minded historical figures of the past.

Su Shi was a scholar-official of multifaceted accomplishments who drew the full range of poetic genres and art forms into the common repertoire of literati aesthetic pursuit while leaving the indelible imprint of his own signature style on each.

Military campaigns—against the Chen to reunify north and south China, against Turks north of the Great Wall, and against Koguryô in Korea—dominated much of the Sui dynasty (581–618 CE). Legal and administrative reform, infrastructure improvements, engineering marvels, and construction of cities and palaces were hallmarks of the period. The dynasty ended after only two emperors.

The Sui dynasty lasted only thirty-seven years, from 581 to 618 CE, and had only two emperors, Sui Wendi and Sui Yangdi. A hallmark of the dynasty was territorial expansion. The dynasty began with Wendi’s successful campaigns to reunite north and south China under his rule; the dynasty ended when the huge loss of life and wealth caused by Yangdi’s failed campaigns to expand into Korea incited rebellion and overthrow. Wendi began legal reforms and the building of a large imperial library that Yangdi continued. Both emperors built grand new capitals and improved and extended China’s infrastructure of canals, roads, and the Great Wall. Administrative reforms, such as the creation of civil service exams, strengthened imperial bureaucracy at the expense of the aristocracy and provincial officials.

Reunification of North and South China

The crowning achievement of the Sui dynasty was the reunification of China, ending nearly three centuries of division between Southern and Northern dynasties (220–589 CE). Sui Wendi acceded to the emperorship of north China by usurping his grandson. Almost immediately after his enthronement on 4 March 581, Sui Wendi turned his attention to the problem of “swallowing the region south of the Yangzi River,” that is, conquering the Southern Chen dynasty (557–589 CE) that ruled the region. On 28 March, he took the first step toward realizing his ambition by appointing two of his most successful generals to posts as Governor-Generals for regions on the Yangzi (Chang) River’s northern bank. But the emperor had to delay preparations for the campaign in order to deal with threats from his Turkish neighbors.

The preparations resumed in earnest during 585. The most urgent need for the Sui campaign was a navy. The Yangzi River was a formidable obstacle, forming a natural barrier that the Chen relied on for defense against attacks from the north. The southerners had established eight fleets along the river’s course to thwart Sui invasions. On 6 September 585, Wendi appointed Yang Su (c. 561–606), his most able commander, to the post of Governor-General for Xinzhou (on the Yangzi in southwestern Sichuan), with instructions to construct a fleet. The emperor supplied him with two million yuan in cash, one thousand lengths of silk, and two hundred horses to
accomplish the task. The most impressive craft that Yang built were large warships, each of which had castles of five stories that rose more than one hundred feet above their deck and could accommodate eight hundred men. On the prow, stern, starboard, and port, the general installed six spiked booms fifteen meters tall that pivoted down to strike enemy ships. During a battle the booms dropped vertically onto opposing vessels to damage or pin them. Yang Su also constructed a large number of troop transports with room for one hundred naval soldiers each.

On 22 November 586, Wendi appointed his third son Yang Jun (570–600) nominal head of a temporary government that had control over thirty-six districts on the Han River, a northern tributary of the Yangzi. The emperor charged him with building a second navy. The prince’s staff gathered a force of soldiers, sailors, and marines that exceeded 100,000 men. Wendi also had a third maritime fleet constructed and stationed in the Yellow Sea off modern Haizhou in Jiangsu Province. This fleet was under the command of Admiral Yan Rong (fl. 557–604), who earned an unenviable reputation for cruelty.

To solve the problem of supplying a large military force with provisions, Wendi undertook the construction of the Shangyangdu, a canal that linked the Huai River to the Yangzi. Its completion, on 15 October 587, enabled the Sui to ship materiel and provisions to the front faster.

Section from the painting *Portraits of the Emperors* by Yan Liben. (Ink and color on silk.) Emperor Sui Wendi is pictured in the right foreground and is followed by his son and successor Emperor Sui Yangdi. Wendi and Yangdi were the only emperors of the short-lived (thirty-seven-year-long) Sui dynasty.
and cheaper than over land. In the same year one of Wen- 
di’s commissioners procured 100,000 horses to serve as 
mounts for his cavalry and as teams for supply wagons.

Another prerequisite for launching the campaign 
against the Chen was the subjugation of the Liang dy-
nasty, a small state sandwiched between the Han and 
Yangzi rivers. Its ruler came to pay homage to the Sui 
court on 25 September 587. Wendi took advantage of the 
monarch’s absence from his state and ordered one of the 
Sui armies to attack the Liang capital. On 25 October, it 
camped outside the city’s walls, and the following day 
the Liang court along with 100,000 men and women fled 
into Chen territory.

The order of battle was fixed on 22 March 588, when 
Wendi issued a decree calling for an eight-pronged as-
sault on the south with three navies, the two armies the 
emperor had established in 581, and three additional 
forces—one under the command of his son Yang Guang 
(later emperor Yangdi)—that he created later. Altogether 
he had 518,000 men under arms who faced some 100,000 
Chen warriors. The main objective of the campaign was 
to seize Jiankang (modern Nanjing), the Chen capital.

The war began in late 588, when Yang Su’s navy of sev-
eral thousand ships sailed down the Yangzi through the 
Three Gorges and encountered a Chen fleet of one hun-
dred vessels at a set of rapids. During the night the general 
led his ships past the white water while his marines seized 
two strongholds on either side of the river. Yang Su pur-
sued the retreating Chen forces downstream, where he 
ran into three iron chains strung across the river to pre-
vent the passage of his fleet. Again Sui marines attacked 
Chen forts, carried them with the loss of five thousand 
troops, and removed the chains. In the next engagement 
Yang sent four of his huge warships against the enemy 
fleet. They destroyed a dozen or more of the Chen vessels 
with their spiked booms and scattered the remainder. Af-

terward the general sailed east, sweeping aside all opposi-
tion, and joined forces with Prince Yang Jun at the mouth 
of the Han River. By that time Jiankang had fallen, and 
the combined force took no further action. Meanwhile 
Admiral Yan sailed up the Yangzi where he captured a 
strategic city.

While the navies were maneuvering on the Yangzi, Sui 
armies invaded Chen. One of Wendi’s generals had sold 
old horses to purchase two sets of boats. He hid the set 
of new, fit boats in inlets along the northern bank of the 
Yangzi. He moored the set of broken-down craft on the 
river in full sight of the enemy as a ruse to convince them 
that his troops could not possibly make a crossing. Under 
the cover of darkness on the night of 22 January 589 (the 
lunar New Year), some contingents of the army landed on 
southern bank of the Yangzi and established a foothold. 
Sui forces then poured across the river and crushed Chen 
armies in several battles. On 2 February, they seized Ji-
ankang and overcame the Chen emperor.

Afterward Wendi had Jiankang razed to the ground 
and converted it into farmland so that it could not serve 
as a focus for resistance by Chen loyalists. Yang Su put 
down the last of the southern rebellion in 591. The con-
quest of Chen extended the borders of the Sui empires to 
the South China Sea, adding 130 districts and four hun-
dred counties to its territory.

Actions on the Frontiers

The Turks, nomadic tribes inhabiting the steppes north of 
China, posed the greatest threat to the Sui dynasty. Dur-
ing the Northern Zhou dynasty (557–581 CE), the Turk-

ish Empire, which controlled the region from modern 
Manchuria to the borders of Persia, was strong enough 
to exact tribute in the amount of 100,000 lengths of silk 
a year from the Chinese emperor. In the summer of 582, 
the Turks launched incursions into northwest China on 
such a massive scale that Wendi had to station an army 
across the Wei River from Daxing, his capital, to prevent 
them from sacking the seat of his government.

One of the Sui dynasty’s responses to the depredations 
of the alien nations on their frontier was to strengthen the 
Great Wall, the traditional barrier erected to protect the 
sedentary agricultural population of China proper from 
its nomadic pastoral neighbors. In 581, Wendi ordered 
fifty thousand laborers to construct or repair it. Wendi 
undertook larger projects in 586 and 587 when he assigned 
110,000 and 100,000 men respectively to work for twenty 
days on the Wall. In the summer of 607, Yangdi sent a 
host of one million to build a new section of the wall that 
was more than 540 kilometers long. Five or six out of ten 
laborers perished during the twenty days that it took to 
complete that part of the Great Wall.

The Great Wall often failed to thwart Turkish raids. 
Fortunately for the Sui, dissension broke out among the
Sometime between 582 and 584, the western tribes of the Turkish empire split from their eastern brethren. War frequently broke out between the two divisions of the empire. After a serious invasion that threatened Daxing in 601 and an attack in 602 on Qaghan Qimin (also called Khan Qimin, reigned 599–611 CE), the Sui’s puppet who occupied the steppes between the Huang (Yellow) River and the Great Wall, a revolt by one of its tribes forced the western Turks to withdraw. As for the eastern Turks, a split at court over the question of succession to the khanate arose in 582, and the Sui skillfully played one faction against the other thereafter. In 597, Wendi forged a marriage alliance with Qaghan Qimin by presenting him with a Chinese bride. The emperor also provided him with military support that enabled the khan to defeat his rivals. Thereafter the khan became a compliant servitor to the Sui throne. Further serious problems with the Turks did not arise until 615.

The Tuyuhun, a proto-Tibetan nation that occupied grazing lands around Lake Kokonor on the western frontier, also made periodic incursions into Chinese territory. In 608, they requested assistance in their struggles with the Turks, and Yangdi sent an army out to help them. Intimidated by the size of the Sui forces, the Tuyuhun fled. The Chinese commander captured their commander, took more than a thousand heads, and enslaved four thousand men and women. The Sui then took possession of Tuyuhun territory (some 2,200 kilometers from east to west and 1,000 kilometers from north to south), established local administrative districts, and populated the territory with criminals sentenced to exile for their offenses.

The Tuyuhun, a proto-Tibetan nation that occupied grazing lands around Lake Kokonor on the western frontier, also made periodic incursions into Chinese territory. In 608, they requested assistance in their struggles with the Turks, and Yangdi sent an army out to help them. Intimidated by the size of the Sui forces, the Tuyuhun fled. The Chinese commander captured their commander, took more than a thousand heads, and enslaved four thousand men and women. The Sui then took possession of Tuyuhun territory (some 2,200 kilometers from east to west and 1,000 kilometers from north to south), established local administrative districts, and populated the territory with criminals sentenced to exile for their offenses.

Centralization of Power

Wendi had only one political model to follow in reforming his government, that of the centralized autocratic monarchy that the Qin dynasty (221–206 BCE) first established in the third century BCE. Since the first century CE, however, power had gravitated to an aristocracy of great families who controlled local governments to the detriment of the emperor and his bureaucracy. Wendi set out to correct the problem by undermining the regional patricians. To that end, he forbade provincial officials from appointing subordinates (thereafter a prerogative of the Department of Personnel in the capital), from serving in their native districts lest they favor their relatives or partisans, from occupying a post in any district where they had served before so they could not build a base of power, and from taking their parents and adult sons with them when they assumed a new office. The emperor dealt a further blow to the aristocracy in 583, when he eliminated genealogy as a qualification for holding office.

Wendi also wanted to ensure the competency of the bureaucracy and root out corruption. To accomplish that end, he limited the tenure of local governors to three years and ordered them to send representatives to the capital three times per year to report on affairs in their districts. The emperor required the officials to undergo a yearly evaluation of their merits and faults by the Department of Personnel; the results of those appraisals were recorded in the men’s dossiers and were instrumental in determining their promotions or demotions, rewards, or penalties. Furthermore, he dispatched inspectors, the eyes and ears of the emperor, to local districts, where they scrutinized the performance of the governors and rated their conduct.

A competent bureaucracy also required a system for selecting talented men. An edict issued in 587 ordered governors of prefectures to recommend three men annually (a total of around nine hundred men per year after the conquest of Chen in 589). In addition, the Sui established three (later four) civil service examinations that evaluated the learning and literary skills of the candidates. Those apparently lost 80 to 90 percent of its officers and men. The final military interventions were three campaigns prosecuted against Koguryo between 612 and 614.
who passed the oral and written tests received entry-level appointments to posts in the bureaucratic hierarchy.

Substantial revenues were, of course, critical to the Sui’s centralization of government. In 583 the throne discovered that there was widespread tax evasion among its subjects living east of Luoyang. Household registers were the government’s instruments for determining the liability of families, and the easterners had been falsifying them by listing adult males as minors or seniors who were exempt from taxation. So Wendi sent out inspectors to make an accurate head count. As a result, the agents added 1,641,000 delinquent taxpayers to the tax rolls. Another round of inspections conducted in 609 added another 641,000 names to the registers.

Standardization of the currency was another important measure that Wendi adopted to centralize state control over the empire. When he assumed the throne, there were several forms of cash (round copper coins) in circulation. The emperor had new coins minted, a thousand of which weighed 2.75 kilograms. In 583, he sent specimens of them to customs barriers with orders that officers there were to confiscate any coins that did not conform to the samples and melt them into copper for the state’s use. By 585 the older coins disappeared. The new currency no doubt had a very salutary affect on trade. Unfortunately, during Yangdi’s reign the government lost control of minting of the coins, and it slipped into private hands. Not only did the weight of coins drop to half and then to a quarter of the original standard, but also manifold currencies appeared, such as iron, leather, and paper coins.

Legal Reforms

One facet of Wendi’s drive to reform the government was the revision of the legal code. Deliberations ordered in 581 resulted in the elimination of three forms of capital punishment (hanging, dismemberment, and exposure of the condemned’s head in the market), leaving throttling and decapitation as the only legitimate types of execution. The new code also substituted beating with a rod for flogging with a whip. Two years later, the emperor promulgated the Kaihuang Code, which reduced the number of articles (1,537) in the Zhou legal code of 563 to five hundred and arranged them under twelve headings. The Kaihuang Code is no longer extant, but it was the basis of the Tang Code that had the same number of headings and 501 articles. The Tang Code remained virtually unchanged until the Ming dynasty (1368–1644) and served as the basis for the legal codes of Korea, Japan, and Vietnam.

The limitation of capital punishments to throttling and decapitation did not apply to cases of treason. Twice Yangdi had men—a son of Yang Su along with ten of his party and a general who defected to Korea—“quintered.” That form of execution involved tying ropes to the condemned’s neck and limbs and attaching the ropes to chariots. At a signal the charioteers simultaneously spurred their teams of horses in five different directions, dismembering and beheading the man. The flesh of the defecting general’s body was also butchered, roasted, and given to court officials who ate it at Yangdi’s command.

Such acts were exceptional. Wendi took great care to ensure that mistakes were not made in imposing capital punishment. The emperor did not trust provincial officials to apply it justly, so in 592 he forbade them from executing criminals until the Court of Supreme Justices in the capital had reviewed their judgments. In 595 he also commanded the justices to report such sentences to him three times for his approval before they issued the authorizations for executions.

By and large the Sui Dynasty was a period of great leniency toward malefactors. From 581 to 615 Wendi and Yangdi issued sixteen Great Acts of Grace. Those proclamations nullified the sentences of all criminals and emptied all prisons throughout the empire.

Libraries and Literature

One aspect of the Sui’s reunification of China was the assembly of a great library to establish the cultural heritage of the dynasty. In 583, Wendi ordered commissioners to hunt for books that were missing from the imperial library. According to his stipulations, agents were to borrow the books and compensate their owners with one roll of silk for every scroll of text. When the works arrived at the capital scholars selected the best versions and collated them, weeding out forgeries in the process. Then imperial scribes made fair copies, and the originals were returned to their owners. After the conquest of the Northern Chen dynasty, the process continued and contributed to integrating northern and southern cultures.
Yangdi continued collecting manuscripts for the great library. Fascinated with things mechanical, he had a special library constructed in Luoyang for his books. When the emperor visited the library, a maidservant, who preceded him bearing incense, stepped on a trigger device set in the front of the library hall. The trigger activated machinery that raised curtains, swung the two leaves of the door back into the interior, and opened the doors of the bookcases. When he left, the process was repeated in reverse. By the end of the dynasty the capitals had huge libraries. A catalogue compiled early in the Tang dynasty (618–907 CE) listed 14,466 titles in 89,666 scrolls.

Korean Campaigns

In the latter part of his reign, Yangdi was obsessed with conducting three wars against Koguryo, a state in present-day Liaoning Province and northern Korea. The emperor wanted to accomplish what his father had failed to do in 598. In preparation for the campaign he ordered the construction of a maritime fleet on 24 April 611. One of his mandarins went to the northern coast of Shandong peninsula with orders to build three hundred war ships. Workers labored day and night, not daring to rest. Maggots infested them from the waist down, and three out of four perished. After Yangdi arrived at his palace in Zhuojun (near present-day Beijing) on 1 June, he set about marshalling his resources for the war. He called up thirty thousand crossbow men, thirty thousand javelin throwers and ten thousand seamen. To provide ample provisions for his armies, canal barges transported huge quantities of cereals from the granaries on the Huang River to his base in the north. The quantity provided by the barges was apparently insufficient, so the emperor ordered thousands (perhaps 300,000) of two-man wheelbarrows loaded with 180 liters of grain each to make their way up the roads from the south. But before they reached the base at Zhuojun the porters had consumed all of the cereals and fled. Yangdi ordered up fifty thousand carts to carry uniforms, armor, and tents to the front.

By 7 February 612, a host of some 600,000 troops and civilians had assembled at Zhuojun. On 3 March, the first of the armies advanced toward the west bank of the Liao River. On 19 April, the soldiers assaulted a bridge across the waterway, but failed to take it when they met fierce resistance from the Koreans. Yuwen Kai then constructed three pontoon bridges, but he seriously miscalculated the distance. They were 2.4 meters short of the eastern bank. Nevertheless, several contingents leapt into the water from the truncated span and assaulted the Koreans on 24 April. The enemy pushed them back, and three Chinese generals died in the battle. Two days later an engineer fixed the bridges, and the armies crossed the Liao River on them and defeated the Koreans.

Sui forces then laid siege to the stronghold at Ryotongsong (modern Liaodong city). When their repeated assaults failed, Yangdi changed his strategy. He sent nine corps south to attack P’yŏngyang, the capital of Koguryo. That expeditionary force marched to within sixteen kilometers of the city. Realizing that his men were too exhausted to proceed and short of provisions as well, their commander-in-chief withdrew. As the retreating Sui armies were fording a river, the Koreans attacked and inflicted staggering losses on them.

In the meantime Admiral Lai Huer (d. c. 617) sailed from Shandong with his warships. His navy landed on the Korean coast thirty-two kilometers from P’yŏngyang where Sui marines inflicted a crushing defeat on the enemy. Afterward forty thousand troops advanced and assaulted the city. They carried the outer wall, but a counterattack by the Koreans overwhelmed them, slaying or capturing all but several thousand of the marines. The admiral retreated to the coast and waited for the arrival of the northern army. When it retreated, he led his fleet back to Shangdong.

On 26 August, Yangdi’s disbanded his armies. Of the 305,000 troops that had crossed the Liao River, only 2,700 returned. Despite the enormous loss of life and military equipment, Yangdi immediately began preparations for a second campaign.

On 28 January 613, Yangdi called for the mobilization of more troops to invade Koguryo. That announcement immediately sparked disaffection throughout the empire. The first in a series of rebellions broke out five days later, and a further fifteen uprisings erupted before the end of the year. Nevertheless, the emperor doggedly persisted in prosecuting the war, and his forces crossed the Liao River again on 21 May. The army besieged Ryotongsŏng for the second time, but failed to capture it after a siege of more than twenty days. Yangdi then ordered one million hemp bags filled with earth to build a ramp 42 meters wide and
the height of the city wall so that his troops could ascend and overrun the ramparts. He also had his engineers build siege towers on eight wheels that were taller than the wall. When soldiers pushed them close to the city, archers could shoot into it.

All that effort was for naught. On 25 June, the son of Yang Su, Yang Xuangan, revolted. Xuangan was in charge of the giant granaries at the end of the canal on the Huang River, so his insurrection cut the supply line to the armies in Koguryo. On 6 July, the rebel forces encamped outside an eastern gate of Luoyang, defeated the army sent to oppose him, and breached the city’s outer wall. Making matters worse, one of Yangdi’s commanders defected to the Koreans on 18 July. Yangdi had no choice but to disband the expeditionary army in the north on 20 July. The emperor dispatched one of his generals south to suppress Yang’s rebellion. After the general destroyed the rebel forces, Xuangan ordered his own brother to kill him. On 21 August, Xuangan’s corpse was dismembered in the eastern market of Luoyang. Three days later his remains were butchered and burned. His father’s corpse was exhumed, and the raw bones were burned.

When Yangdi asked for opinions on the question of conducting a third campaign against Koguryo on 14 March 614, his advisors were dumbfounded and dared not offer counsel for several days. Undaunted, the emperor summoned more troops on 4 April, but many of the soldiers did not arrive in time due to rampant rebellions throughout the empire. The army in the north proved ineffectual again, but such was not the case for the navy. Admiral Lai made a third crossing to the Korean coast, and his marines defeated the Korean army. Lai’s men then besieged P’yŏngyang. Yŏngyang (reigned 590–618), the king of Koguryo, was in desperate straits. On 7 September, he pleaded for peace and begged to surrender. Yangdi accepted the capitulation on face value and disbanded his armies five days later.

The Korean king’s surrender was a ploy to buy time. He ceded little territory and no powers over his subjects to his powerful neighbor. When Yŏngyang refused to visit Luoyang to pay homage to the emperor, Yangdi contemplated a fourth invasion of Koguryo, but nothing came of it. The emperor harvested only bitter fruit from his adventures in Korea. Rebellions increased in intensity and ferocity year after year from the beginning of the campaigns until the end of his reign.

**Fall of Sui Dynasty**

On 19 June 615, Yangdi left for one last tour of the northern frontier. On 6 September, the Chinese wife of Qaghan Shibi, (reigned 611–619), successor to Khan Qimin, sent word that her husband planned to attack the emperor’s entourage with twenty thousand horsemen. Yangdi quickly repaired to Yanmen (north of Taiyuan inside the Great Wall) four days later. On 11 September, Shibi’s warriors surrounded the city. A month later, the Turks lifted the siege when Sui reinforcements arrived on the scene, and Yangdi returned to Luoyang, his capital. The humiliating confinement at Yanmen was the last blow to whatever prestige the emperor had salvaged from the colossal catastrophe of his Korean campaigns.

After his return to the capital, Yangdi obstinately refused to recognize the looming danger, and he became increasingly incapable of dealing with the numerous insurrections that proliferated within his realm. When rebel forces threatened Luoyang in 616, Yangdi decided to flee and to abandon the north. He executed two officials who objected to his flight and set sail on his dragon barge for Jiangdu on 27 August. He languished there for a year and seven months. In desperation he even toyed with the idea of establishing a new capital in the south, but it was too late.

In the morning of 11 April 618, a body of his troops, many of them northerners who ardently desired to return home, stormed the palace, entered its bathhouse, and forced Yangdi into a chair. Aware of his impending doom, the emperor requested permission to take poison wine in an effort to save his dignity, but his captors refused. So he undid his belt sash and handed it to one of the officers who throttled him. Yangdi’s death at the age of forty-nine effectively brought a close to the Sui dynasty, although a grandson reigned over the dynasty nominally as a puppet of the Tang in Daxing for another thirty-six days.

**Heritage**

At the height of the Sui dynasty in 609 the empire stretched 5,022 kilometers from the Pacific Ocean to the steppes north of Tibet and 8,000 kilometers from the Great Wall to Vietnam. Within its boundaries there were 190 prefectures, 1,242 counties, and 357,468 square
kilometers of arable land and pastures. The census of that year recorded a population of 46,019,956, the largest since the Han dynasty.

In that year the Sui dynasty was a success by any measure. It was at peace with its neighbors. No serious internal insurrections had erupted since 591. A relatively impartial and efficient bureaucracy governed the capitals and provinces. The justice system appears to have maintained order fairly according to a well-defined code of laws, and the country was prosperous. Had it not been for Yangdi’s catastrophic campaigns in Koguryo, the dynasty could well have endured for three centuries instead of three decades.

Further Reading

Wendi (family name Yang Jian) founded the Sui dynasty. His greatest achievement as emperor was the reunification of north and south China. An able administrator, he built a new capital city, reduced taxes, and created granaries to guard against famine. A devout Buddhist, he expanded the number of monasteries and monks throughout the country.

Yang Jian (541–604 ce), Wendi, was the founder of the Sui dynasty in 581 and the unifier of China in 589. He was born in a convent at Fengxiang west of modern Xi’an on 21 August 541. A nun told his mother that the child should not dwell among the laity because he was quite extraordinary, a sign that he would rise to a high position. The nun then took responsibility for raising the boy in a lodge set aside for him.

Jian was the son of a powerful general whom the first emperor of the Zhou period of the Northern dynasty (557–581 ce) ennobled as the Duke of Sui for his meritorious service in founding that dynasty. After his father’s death Jian succeeded to the dukedom and later adopted the title as the name for his dynasty.

After attending the imperial college for the sons of nobles and high-ranking officials in Chang’an, Yang Jian received his first official appointment by virtue of hereditary privilege at the age of fourteen. Subsequently he rose through the bureaucracy and held three posts as Grand General.

On 16 August 575 Emperor Wudi (543–578) ordered Yang Jian and another officer to lead a navy of thirty thousand men east as part of Wudi’s plan to conquer the neighboring Northern Qi Dynasty (550–578). This campaign failed, and the admirals were forced to burn their ships. Wudi renewed his campaign to subjugate the Qi in 576 and appointed Jian and seven other generals to take command of the Zhou armies and strike eastward. Those forces vanquished the Qi on 8 March 577. The victory united virtually all of China north of the Yangzi (Chang) River, and the emperor bestowed the title Pillar of State on Jian as a reward for his meritorious service during the war.

Fortune smiled on Yang Jian in 578 when Emperor Xuandi (669–580) elevated Yang’s eldest daughter Lihua (560–609) to the dignity of empress on 29 July. After the emperor’s death in 580, Jian was installed as regent for his grandson, the eight-year-old boy who succeeded to the throne. Yang soon acquired total control over the government and its military forces. He ruthlessly dealt with the threat to his growing power by the royal house. By the end of the year he had sixteen Zhou princes—one of whom actually attempted to assassinate him—as well as forty-one of their sons and brothers killed. After annihilating the entire royal family, he suppressed a number of rebellions instigated by Zhou loyalists in the provinces.

On 4 March 581 ce, Yang Jian assumed the throne and received the imperial seals. To commemorate the occasion he bestowed a Great Act of Grace granting amnesties to criminals throughout northern China. Two days later he raised his wife, Madam Dugu (552–602 ce), to the dignity of empress, and on 9 July he had the last Zhou emperor murdered.
The Empress

Madam Dugu, who possessed the independent character of northern steppe women from whom she was descended, controlled the dealings of her household and also exercised influence over affairs of state. When her husband conducted official business, she rode to the audience chamber in a litter next to his. After he entered she waited outside and sent a eunuch in to report on what was transpiring. When she discovered some fault in Wendi’s decisions, she sent in her counsel advising him to set a new course. The emperor usually yielded to her suggestions. Her clout was so great that palace attendants thought of her as a second emperor.

The empress was staunchly monogamous. When she married Yang Jian at the age of fourteen, she exacted a promise from him to have no children by any other woman. She was also extremely jealous, so much so that palace ladies dared not approach him. Among the children of Wendi and his empress were Yang Yong, the eldest, who was deposed as crown prince; Yang Guang, an army leader during battles against Chen who succeeded his father as emperor; and Yang Jun, a naval leader during battles against Chen who was removed from office for wastefulness.

Madam Dugu shared her husband’s concern for placing public interests over private. Once when an official suggested that she purchase a casket of pearls worth eight million yuan, she rejected the proposal. The empress argued that the money should be spent on rewarding the armies battling the Turks and Tuyuhun on the northern and western frontiers.

Conquest of South Dynasty and Unification of China

The victory against the Qi leaders of the North dynasty while Wendi was a general of the Northern Zhou rulers united all China north of the Yangzi River. Sui Wendi’s successful campaign against the Southern Chen, who ruled the area south of the Yangzi, achieved the reunification of all China after nearly three centuries of division.

The Chen relied on the natural barrier of the Yangzi and their fleets along the river for defense against attacks from the north. To overcome this obstacle, Wendi appointed Yang Su (c. 561–606 CE) to the post of Governor-General for Xinzhou (on the Yangzi in southwestern Sichuan Province) and gave him many resources to construct a fleet. Among the naval craft that Yang Su had constructed were large warships with spiked booms that dropped vertically onto opposing vessels and large numbers of troop transports. Two other fleets were created, one under the command of Wendi’s son Yang Jun. Other preparations for war included expansion of armies (one under the command of son Yang Guang), procurement of horses as mounts for cavalry, and teams for supply wagons, and construction of a canal linking the Huai River to the Yangzi for fast transportation of men and materiel to the front. By the time the war began in late 588 CE, the Sui forces numbered 518,000 men compared with 100,000 men under arms for the Chen forces.

Thanks in part to superior warships, Sui forces achieved naval victories, including the removal of three chains across the Yangzi that had prevented their progress down river. Sui army forces crossed the Yangzi on the night of 22 January 589, the lunar New Year, and established a foothold in Chen territory. Sui forces then poured across the river and crushed Chen armies in several battles. On 2 February they seized the Chen capital of Jiankang and overcame the Chen emperor. Wendi had Jiankang razed to the ground and converted into farmland so that it could not serve as a focus for resistance by Chen loyalists.

The conquest of Chen extended the borders of the Sui empires to the South China Sea. Wendi supported military victory with administrative moves: he forced Chen nobles to move to Daxing, bringing southern cultural traditions to the north; reduced taxes in the south; and used Buddhism as unifying religion.

Daxing

Among Wendi’s greatest accomplishments was the construction of a new capital, Daxing, to replace the seven-hundred-year-old Chang’an, which was too cramped, and its water was brackish. Work commenced in 582 at a site about 10 kilometers southeast of Chang’an. An outer wall enclosed an area that was 84 square kilometers. The
city, built in a grid pattern, included a palace compound at the center of the city, a compound for the offices of the central government, and two vast, self-contained markets. The remainder of the city, 89 percent of its area, consisted of 109 walled wards for the dwellings of its citizens. Broad streets, up to 152 meters wide, ran the length and breadth of the city. Daxing was the largest capital ever built in Chinese history: Beijing of the Ming and Qing dynasties (1368–1912) was 25 percent smaller at 62 square kilometers.

Emperor Wendi and his government moved into their new quarters on 15 April 583. The emperor then ordered the flooding of the palaces at Chang’ān so that, it was said, the ghosts of the men that he had murdered would have no place to return. After the Tang took Daxing over and renamed it Chang’ān, the city became the grandest metropolis in the world and served as a model for capitals built in Japan and elsewhere. Unhappily, a warlord razed it to the ground in 904, and Chang’ān never again served as the seat of China’s central government.
Statecraft

Wendi was a legalist at heart. He insisted on the rigid, strict, and uniform enforcement of the law, the imposition of harsh punishments on malefactors, and the bestowal of liberal rewards on the meritorious. In his view justice had to replace mercy, and all subjects were equal before the law, even his kin. When his third son built a flamboyant palace embellished with jade and jewels, the emperor stripped the prince of all his offices and confined him to a mansion in the capital. Despite appeals for clemency from several of his mandarins, he did not relent. But Wendi sometimes bent the law when a valued friend committed a crime. He once commuted the death sentence imposed on a provincial official who had sold cereals to reduce the price of grain during a famine.

The emperor could be harsh and cruel. He would not tolerate corruption among officials and had venal offenders beaten for as many as four days in his audience hall. Wendi once had a man flogged to death with a horse whip for complaining that his favor for a certain minister was excessive. He had an official beheaded for not beating an offender with enough force. The emperor himself often beat people on the palace grounds. Wendi also went to extremes in his legislation. In early 596 he imposed the death penalty on thieves who stole cereals from a granary and enslaved their families. On another occasion the emperor prescribed capital punishment for thieves in the capital who stole property that was worth as little as one yuan. He later had to rescind the decree because of widespread protests against it.

Wendi was essentially pragmatic and had little or no regard for the frivolous, the extravagant, or the exotic. In the summer of 581, he dismissed all the government’s entertainers—acrobats, jugglers, wrestlers, dwarf, magicians, and the like—and sent them back to the people. In the same year the emperor forbade tribute of choice dogs, horses, vessel, toys, and delectable foodstuffs that were customary gifts sent by the prefectures to the throne. Like his wife, he was parsimonious. Rather than have new carriages built for him, he had the old ones repaired. He also insisted that only one dish of meat be served at his banquets.

The emperor had little esteem for Confucianism. The only one of its texts that he favored was the Classic of Filial Devotion because it bolstered his authoritarianism by stressing absolute submission of inferior to superior. It is not surprising, then, that in the summer of 601 Wendi abolished all schools—the bastions of Confucianism—in the empire save a single college in the capital that had seats for only seventy students. He reasoned that there were too many students (nearly one thousand in Daxing at the time), that they were slothful, and that they had neither virtues nor talents that were useful to the state.

Wendi took the traditional paternalism of the monarchy very seriously: He was the father and his subjects were his children. Fourteen days after ascending the throne he distributed five thousand government cattle to the poor. In 585 Wendi ordered the civilians and soldiers in all prefectures to dig underground pits for the storage of grain. Annually farmers deposited a small portion of their harvests in them for relief in times of famine. After the completion of Daxing in 583, Wendi reduced the corvée—the annual labor obligation of adult males—from thirty to twenty days and reduced the tax paid in cloth by half. In 586 the emperor sent commissioners out to the provinces with orders to dispense relief to all families of warriors slain in battle. (In 593 he granted a year’s remission of taxes for the same.) After the conquest of Chen in 589, the emperor granted the south a tax remission for ten years and excused the other areas of his realm from paying their levy in grain for one year.

Buddhism

Wendi, his empress, and their sons were devout Buddhists, attending services held in the palace every evening. In 580, while he was regent, Yang Jian had a decree issued in the name of the emperor that rescinded the proscription of Buddhism. That act, promulgated in 574, had defrocked the clergy, destroyed monasteries along with their images, and confiscated monastic lands. As emperor, Wendi ordered the restoration of all cloisters destroyed during the proscription, donated silk for repair of damaged monasteries, and called for the reinstatement of images in the temples, making their destruction a capital offense. His promise of free charters to anyone who constructed a monastery in the new city of Daxing resulted in a total of 120 Buddhist cloisters in the capital (in contrast to the ten Daoist abbeys). Outside in the provinces the growth of Buddhism was equally spectacular. In 585
the emperor founded forty-five government monasteries in the prefectures of north China. Between 601 and 604 he had 111 stupas (mounded tombs) built throughout the empire to enshrine Buddha’s relics—hair, nail clippings, teeth, bones, and the like. Wendi also created Assemblies of Twenty-Five whose monks scattered throughout the empire to spread the Buddhist doctrine (dharma). By the end of the Sui dynasty, China had 3,792 Buddhist monasteries with a clergy of 230,000.

The emperor took the vows of a Buddhist layman in 585 and came to be known among the faithful as the bodhisattva Son of Heaven. In 586, in a very rare surrender of imperial prerogatives and dignity to a clergyman, Wendi invited a prelate to lecture on the dharma in order to dispel a drought. The monk ascended the throne and faced south while Wendi and his court sat on the ground facing him. Wendi cast himself in the role of the universal Buddhist monarch, claiming that he owed his rise to dharma, predestined fate. He employed Buddhism among his subjects as an ideology to unify China by spreading a single faith yoked to the state. His patronage laid the foundation for Buddhism’s golden age in the Tang dynasty.

Last Years

In the summer of 604 Wendi contracted an illness, reputedly brought on by his debauchery with two consorts who occupied his affections after the death of his wife. On 13 August, he died under suspicious circumstances at the age of sixty-four. There are strong indications that his son Yangdi committed patricide. When called to attend his father during his last days, he made sexual advances to one of the old man’s consorts. The woman informed Wendi, who decided to remove him as heir-apparent and to install his eldest son in his place. Fearing that he would lose his chances for the throne, Yangdi arranged the murder of Wendi before he could change the order of succession.

Wendi was ruthless, brutal, harsh, capricious, and autocratic. While those were not admirable traits in a man, they may have been exactly the qualities that the establishment of a new dynasty and the unification of China required. By and large the emperor was a diligent and effective ruler who was responsible for most of the Sui dynasty’s achievements.

The reign of Sui Yangdi was marked by the building of canals, the construction of grand palaces, and extravagant entertaining. The expense associated with these achievements, along with huge loss of life and burdensome taxation of the populace in wars against Koguryo in modern-day Korea, resulted in widespread rebellion, Yangdi’s ultimate death, and the downfall of the Sui dynasty.

Yang Guang (569–618 CE) was the second son of Sui Wendi and the second and last emperor of the Sui dynasty (569–618 CE). His father ennobled him as the Prince of Jin at the age of thirteen. In 588, the emperor placed him nominally in charge of the land forces that vanquished the Southern Chen dynasty the following year. In 590, Wendi appointed him Governor-General of the southern province of Yangzhou with headquarters at Jiangdu (modern Yangzhou). Except for a brief stint as a commander of an army sent against the Turks and yearly visits to pay court in Daxing, Wendi’s capital, Yang Guang spent ten years in the post. He became an ardent admirer of southern culture during that period, even learning the Wu dialect of the territory under his administration. Unlike his father, who was anti-intellectual and anti-Confucian, Yang Guang patronized hundreds of Confucian scholars and southern literary men, inviting them to Jiangdu where they taught and wrote.

When the crown prince, Wendi’s eldest son, incurred the extreme displeasure of Empress Dugu in 600, a cabal of officials including Yang Guang succeeded in unseating him. Wendi then installed Guang as his heir-apparent. On 21 August 604, Yang Guang ascended the throne in Daxing, eight days after the demise of his father, whose death he probably engineered. In November, Yangdi left for Luoyang, which became the real seat of his court. Although there were very important political and economic factors in the emperor’s decision to shift his capital to Luoyang, he had a real aversion to Daxing and spent little time there. A geomancer had informed him that Daxing was a threat to him because metal (the element of the west) governed it whereas wood (the element of the east) governed his personal destiny (axes hew trees).

Luoyang

Yangdi was not happy with the existing city of Luoyang, another capital built in the Han dynasty and rebuilt several times thereafter. In April 605, he ordered the construction of a new city to replace the older metropolis, assigning two million adult males to erect walls, grade roads, and raise buildings. On 11 April, Yangdi ordered over twenty thousand wealthy merchants and great traders to move their families into the capital in order to fill its markets. The city was completed in February 606, a mere 294 days after Yangdi issued the decree inaugurating the project.

The city, encompassing about 46 square kilometers and laid out in a grid pattern, included a palace, administrative compound, three markets, and 103 walled wards.
for dwellings. Luoyang straddled the Luo River, so it had a distinct advantage over Daxing because transportation by water was easy and inexpensive. But it also had a terrible disadvantage because the river periodically flooded, heavily damaging homes and other structures.

West Park was among the most extravagant of Yangdi’s expenditures at Luoyang. The wall of that pleasure garden was 70 kilometers in circumference. The palace was constructed of extraordinary timber and wonderful stones; rare flora and fauna filled its gardens. A large lake surrounded three man-made mountains, purportedly representing the fabled mountains of the immortals rumored to lie in the eastern ocean. Ingenious kiosks and observatories on the mountains, operated by hidden machinery, rose from and fell into the ground as if levitated by some divine magic.

Unlike his frugal father, Yangdi was profligate and spent large sums on building palaces, including the conversion of his former mansion at Jiangdu into an enormous and extravagant palace. The emperor raised at least seventy palaces at various sites in the provinces during his short reign of less than fourteen years.

The Grand Canal

Yangdi is probably best known to history as a builder of the Grand Canal. The first branch replaced an older canal that linked the Huang (Yellow) River to the Yangzi (Chang) River. On 14 April 605, he ordered some 500,000 soldiers and laborers from Henan (the region south of Luoyang) to build a segment from the Huang River to the Huai River and 100,000 from the south to repair his father’s canal from the Huai River to the Yangzi. Two broad roads, lined with elm and willow trees to provide shade, flanked the 119-meter-wide waterway, and twenty-six palaces erected along its course served as rest stops.

The second branch was a true innovation. On 23 January 608, Yangdi issued a command conscripting one million men from northern armies for the construction of a canal from the Huang River to a point between modern Beijing and Tianjin, a distance of about one thousand kilometers. When the number of adult males proved insufficient for the task, the emperor impressed women to fill the ranks. Completed in 609, its primary function was to provide transportation of provisions north for his campaign to conquer Koguryo, in modern-day Korea. Early in 611, he ordered the construction of a third branch, again a replacement for an older canal, from the Yangzi to Hangzhou. The total length of the system was approximately 2,357 kilometers.

The Imperial Flotilla

The renovation of the canals from the Huang River to the Yangzi served to improve the transportation of grain and silk revenues to the central government in the capitals, but the emperor also wanted an impressive waterway on which a flamboyant flotilla could carry him to Jiangdu. On 23 April 605, eight days after ordering the construction of the canals, he commissioned two of his mandarins to select timber for the construction of a fleet of twenty thousand vessels on the Yangzi. A quarter of the boats were built for the imperial flotilla. First and foremost among the vessels was the Dragon Barge: 13.5 meters high, 15 meters abeam, and 60 meters from stem to stern. It had a superstructure of four decks crowned by a main hall and two audience chambers. Eighteen hundred “hall legs” working in three shifts grasped six giant hawsers and towed the ship from the roadways on banks of the canal. The empress rode in the Circling Hornless Dragon barge, towed by nine hundred “hall legs.” The remainder of the boats carried an assortment of passengers and their regalia: consorts, palace women, princes, princesses, capital officials, clergymen, foreign emissaries, as well as imperial guard units. When Yangdi sailed on the canal, he took his entire court and much of the central government’s bureaucracy with him. The completed flotilla—5,245 vessels requiring a total of 45,930 haulers—arrived in Luoyang during September. It departed for its first voyage to Jiangdu on 2 October. In all, the flotilla sailed five times to and from Jiangdu during Yangdi’s reign.

Northern Tours

During the second phase of his reign Yangdi devoted the better part of his time to dealing with the Turks on China’s northern borders. His strategy called for overwhelming them with China’s cultural superiority by the display of clever contrivances. To that end, he personally conducted
tours in the north and northwest ostensibly to inspect the Great Wall. In 607, he ventured north of the Great Wall to Yulin, where the emperor feted the Turkish Qaghan Qimen (reigned 599–611) and his entourage in an enormous tent, large enough to accommodate the khan and 3,500 of his tribesmen. During the feast Chinese entertainers performed the hundred acts—acrobatics, wrestling, juggling, and the like—for the amusement of the guests. The Turks, who were duly startled but pleased, presented a huge number of cattle, sheep, horses, and camels to Yangdi. Yangdi reciprocated with gifts of silk and gold jars.

On his second tour in 608, Yangdi traveled north of the wall again and stopped at Wuyuan. The emperor brought with him a portable wooden fortress that was assembled on the spot. Its crenulated walls were 178 meters square and 12.46 meters high. When the imperial cortege encamped, spear chariots encircled the fort, and iron spikes were scattered on the ground inside the enclosed space to injure any horses that intruded. Rotating crossbows rigged with trip wires automatically fired at any trespassers. During his sojourn Yangdi ordered the construction of a city replete with dwellings, curtains, couches, and cushions for the Qaghan Qimin. The khan respected Chinese culture and was thinking of changing his barbarian customs, and Yangdi wanted to reward him.

Yangdi’s third tour in 609 took him to the region of Lake Kokonor in the far northwest to inspect the new territories that one of his commanders had acquired from the Tuyuhun the preceding year. For the occasion a large touring car was constructed, its roof large enough to accommodate a unit of imperial guards numbering several hundred who stood watch there.

On 27 July, Yangdi boarded the car. As a sign of special favor he invited the King of Turfan and the Chieftain of Hami—both oasis states on the northern silk route—to ascend the hall and dine with him. Other legates from more than twenty foreign nations sat in the courtyard outside to eat. Court entertainers performed foreign and Chinese music for the amusement of the guests. Afterward the emperor bestowed gifts on everyone.

**The Korean Campaigns**

During the third phase of his reign Yangdi was obsessed with defeating Koguryô, a state in present-day Liaoning Province and northern Korea, something his father had failed to achieve. Yangdi mounted a total of three campaigns against Koguryô. In preparation for the first campaign, he ordered the construction of a maritime fleet of three hundred warships, called up thirty thousand crossbow men, thirty thousand javelin throwers and ten thousand seamen. To provide ample provisions for his armies, canal barges, supplemented by thousands of two-man wheelbarrows on the roads, transported huge quantities of cereals from the granaries on the Huang River to his base in the north. In addition, Yangdi ordered fifty thousand carts to carry uniforms, armor, and tents to the front.

By 7 February 612, a host of some 600,000 troops and civilians had assembled at Zhuojun. Sui armies crossed
the Liao River on pontoon bridges and had initial success, but suffered staggering losses at P’yŏngyang, the capital of Koguryŏ. Naval and marine forces under Admiral Lai Huer also suffered huge losses after initial victories. On 26 August, Yangdi disbanded his armies. Of the 305,000 troops that had crossed the Liao River only 2,700 returned. Despite the enormous loss, including enormous amounts of military equipment, Yangdi immediately began preparations for a second campaign.

On 28 January 613, Yangdi called for the mobilization of more troops to invade Koguryŏ. That announcement immediately sparked disaffection throughout the empire. The first in a series of rebellions broke out five days later, and a further fifteen uprisings erupted before the end of the year. Nevertheless, the emperor doggedly persisted in prosecuting the war, and his forces crossed the Liao River again on 21 May and besieged Ryotongsŏng. They used siege towers on eight wheels to shoot arrows over the city wall, finally scaling the walls on a ramp of earth-filled hemp bags.

All that effort was for naught. A revolt by the man in charge of the giant granaries at the end of the canal on the Huang River cut the supply line to the armies in Koguryŏ. In July, the rebel forces encamped at Luoyang and defeated the army sent to oppose them. When one of Yangdi’s commanders defected to the Koreans, Yangdi had no choice but to disband the expeditionary army in the north. The rebellion was suppressed, the leader killed, and his corpse dismembered in the eastern market of Luoyang.

Undaunted by opposition to a third campaign against Koguryŏ, the emperor summoned more troops on 4 April 614, but many of the soldiers did not arrive in time due to rampant rebellions throughout the empire. The army in the north proved ineffectual again, but forces under Admiral Lai defeated the Korean army and besieged P’yŏngyang. On 7 September, Yŏngyang (reigned 590–618), the king of Koguryŏ, surrendered. Yangdi accepted the capitulation and disbanded his armies five days later.

The Korean king’s surrender was a ploy to buy time. He ceded little territory and no powers over his subjects to his powerful neighbor. When Yŏngyang refused to visit Luoyang to pay homage to the emperor, Yangdi contemplated a fourth invasion of Koguryŏ, but nothing came of it. The emperor harvested only bitter fruit from his adventures in Korea. Rebellions increased in intensity and ferocity year after year from the beginning of the campaigns until the end of his reign.

### Last Days

Rebellions by the Turks and the Chinese populace against Sui authority dominated the last days of Yangdi’s reign. While on a tour of the northern frontier in June 615, Yangdi received word that the Qaghan Shibi (reigned 611–619) planned an attack on the emperor’s entourage. Yangdi retreated to Yanmen, inside the Great Wall, but Shibi’s warriors surrounded that city and besieged it for a month, until Sui reinforcements arrived. Yangdi then returned to his capital at Luoyang.

The humiliating confinement at Yanmen was another blow to Yangdi’s prestige and authority over the populace. He refused to recognize the extent of the danger to him, however, and became increasingly incapable of dealing with the numerous insurrections proliferating within his realm. When rebel forces threatened Luoyang in 616, Yangdi decided to flee and abandon the north. He boarded his Dragon Barge and set sail for Jiangdu.

On the morning of 11 April 618, a body of his troops, many of them northerners who ardently desired to return home, stormed the Jiangdu palace and surrounded Yangdi. Aware of his impending doom, the emperor requested permission to take poison in an effort to save his dignity, but he was strangled with his own sash. Yangdi’s death at the age of forty-nine brought a close to the Sui dynasty.

### Heritage

Traditional historians classified Yangdi as a “bad last ruler”; the indictment lodged against him by the captors on the day of his death contained many of the criteria for making such a judgment. He had abandoned the dynasty’s ancestral shrines (the north), had pursued foreign wars that resulted in the death of many men (Koguryŏ), had spent too lavishly and extravagantly (Luoyang, palaces, the flotilla, and the northern tours), had destroyed the livelihood of his subjects (his enormous exaction of taxes and huge levies of corvée for public works), and had caused rebellions. While all of the charges were
true, they failed to acknowledge that some of his vast expenditures for projects (Luoyang and the Grand Canal) reaped great benefits for the empire. Furthermore, the hardships that he imposed on his people between 605 and 611 caused no serious disaffection among his subjects. In the end the colossal waste of men and resources on the Korean wars that yielded no tangible results brought him down and earned him the opprobrium of “bad last ruler.”

Further Reading

Just outside Beijing's Forbidden City, the Summer Palace of Yiheyuan was first built in the mid-eighteenth century during the reign of Emperor Qianlong. After being burnt down and subsequently damaged it was restored as a quintessential imperial compound, with spectacular gardens, imposing architecture, and panoramic views.

The Summer Palace or Yiheyuan (Garden of Nurtured Harmony) on the northwestern outskirt of the Forbidden City is noted for sophisticated landscaping that combines woods, a hillock, water, and architecture. Commissioned in 1750 as a villa during Emperor Qianlong’s reign, it was burnt down in 1886, and was subsequently rebuilt and given its current name. It again suffered partial damages in 1900, but was soon restored and has since remained the epitome of Chinese imperial gardens. It is now a United Nations Educational, Scientific, Cultural Organization (UNESCO) World Heritage site.

The park of 290 hectares is composed of a hillock in the north, lakes in the south, and a palatial compound at the northeastern corner. The principle palace (Hall of Benevolent Longevity) and its courtyard can be accessed through the main gate on the east. This exquisitely decorated building compound, arranged with axial symmetry, features architecture on a grand scale designed with intricate detail such as gabled and hipped roofs and other attributes appropriate for demonstrating imperial power.
Its stately halls once served as a functional administration center to hold court and receive dignitaries. The living quarters nearby consist of separate quadrangles and appear relatively modest and intimate. A multi-story, sophisticatedly equipped grand theater also is part of the architectural complex in this area.

West of these courtyards lies a covered painting-exhibition arcade (728 meter long) that traverses the heart of the park along the northern rim of the central lake. Rising up from the lakefront is the Longevity Hill (60 meters high), on which buildings cluster amidst a landscape designed with distinct features characteristic of Chinese classical gardens. Along a north-south axial line on the hill is the courtyard of a ceremonial hall (Cloud Dispelling Hall), followed by an imposing octagonal tower (Pavilion of Buddhist Incense) on a high platform, and a temple (Sea of Wisdom) wrapped in glazed ceramic tiles and miniature Buddhist images at the summit. Beyond these glittering architectural structures down the northern slope is a somewhat subdued and densely wooded area that also is the site of a temple complex and a few smaller buildings. The slope overlooks a narrow lake, which meanders along the secluded northern edge of the park to be integrated at the eastern foothill into a lotus pond within an elegant southern-style garden. The riverbanks near the northern gate are lined with houses that originally included commercial shops built exclusively for royal visits. The landscaping and building designs here replicate scenic spots in poetic marshy lands south of Yangzi (Chang) River, a region famous for private villas with fine gardens.

The lake area of the parkland offers impressive panoramic views projecting beyond the perimeter of the park. Here small islands and dikes in conjunction with differently shaped bridges divide the central Kunming Lake into sections that mimic picturesque areas south of the Yangzi. Major attractions, such as the Marble Boat, South Lake Island, Seventeen-Ache Bridge, Jade-Band Bridge, and a willow-tree-lined long avenue called Xiti, are among the hallmark features of the Summer Palace. The expansive vista over the unassuming water surfaces compliments the textured relief of woodlands inside and outside of the park, incorporating spontaneously true nature into an artificially molded setting.

Sun Daolin’s charismatic performances made him a mainstream cinema icon in the People’s Republic of China. Although a lifelong actor, his artistry included forays into literary criticism and poetry. During the post-Mao era, an abiding commitment to cultural internationalism further cemented Sun’s status among overseas and official arts patrons alike.

A prolific and popular screen actor after World War II, Sun Daolin entered Yanjing (Yenching) University in 1938, majoring in philosophy and writing his thesis on Aristotle’s *Poetics*. At the same time, this son of a wealthy, Belgian-educated engineer began devoting increasing amounts of time to stage acting. After first joining the university’s drama society, Sun performed with several troupes devoted to employing the theater as a mode of social transformation as well as entertainment. His early repertoire included works by the influential playwright Cao Yu and the novelist Ba Jin, as well as European authors Nicolai Gogol and Alexandre Dumas.

After graduating in 1947, Sun Daolin began his screen acting career the next year, first appearing in the Qinghua Film Company’s *The Big Reunion* (1948) before taking a lead role in the well-received *Crows and Sparrows* (1949). This event solidified Sun’s position within the Shanghai film industry, and drew the attention of those within the nascent state-run film industry of the People’s Republic, many of whom—like Sun himself—had ties to the world of pre-1949 commercial cinema. The fact that Sun appeared in numerous films throughout the early 1950s, at a time when domestic feature production had dipped precariously, attested to his popularity with crowds, filmmakers, and cultural officials alike. In 1957 Sun was awarded a “first-place” individual award by the Ministry of Culture for his work between 1949 and 1955, recognizing him for his service to the state.

Sun Daolin’s career was predicated upon his versatility. He played a politically irresolute intellectual in *March of the Democratic Youth* (1950), an engineer in *Female Driver* (1951), and a steely-willed Communist officer in *Reconnaissance across the Yangzi* (1954). While reprising many of these roles in early 1960s works of socialist cinema such as *A Revolutionary Family* (1960) and *Early Spring, February* (1962), Sun also lent his voice to numerous dubbed foreign features, and served as a council member during the fourth and fifth conferences of the China Film Workers Association.

Following the Cultural Revolution (1966–1976), Sun returned to filmmaking as an actor, while also writing and directing several of his own screenplays. The film *Zhan Tianyou* (2000), a biography of the eponymous early twentieth-century Chinese railroad engineer, won him China’s highest award for a feature. Sun also continued to work as an interpreter of foreign culture for Chinese audiences, both in his voiceover work and through translations and adaptations of Western plays. At the same time, he gave extensive interviews to foreign journalists and scholars interested in China’s state film industry. Sun’s most notable overseas appearance came in 1988, when he appeared as a special guest performer in an American...
Sun Daolin and family. Sun was the heartthrob of movie-going women from the 1950s through the 1970s.

Conservatory Theater production of Eugene O’Neill’s Marco’s Millions, playing the role of Khubilai Khan.

Married to the famous Yue Opera (the main regional opera style of Zhejiang Province and Shanghai) artist Wang Wenjuan, Sun Daolin spent the majority of his career as a performer for mass audiences within the Chinese-speaking community. Retiring only two years before his death, his lifetime as a mainstream cultural icon was recognized by China’s highest-ranking political leaders and the international press, along with countless admirers.

SUN Yat-sen
Sun Zhōngshān 孙中山
1866–1925 Revolutionary leader

Sun Yat-sen was a revolutionary leader and founder of Republican China (1912–1949). An uprising in 1911 resulted in his election as provisional president of the new republic and the abdication of the Qing dynasty emperor in 1912. He devised what he called the “Three People’s Principles” for the new republic: nationalism, democracy, and livelihood. Those principles are today the guiding ideology of the Republic of China on Taiwan.

Sun Yat-sen was born near Guangzhou (Canton) to a family of farmers. His personal name was “Wen,” his style or secondary name was “Yat-sen,” and his revolutionary name (for which he is better known in China) was “Zhongshan” (中山 Chung-shan). He first attended a village school, went to Honolulu at age thirteen with his older brother for his secondary education, then received a medical degree at the College for Medicine for Chinese in Hong Kong. Alienated by the ineffectiveness of the Manchu Qing dynasty (1644–1912), Sun became a revolutionary. Travels to Hawaii, Hong Kong, and later to England and the United States had a profound influence on him.

In 1894 Sun Yat-sen founded the Revive China Society (Xingzhonghui 開中會) among overseas Chinese with the goal of expelling the Manchus from China and establishing a republic. Later he devised a set of ideals for the republic that he called the “Three People’s Principles”: nationalism, democracy, and livelihood, which are roughly analogous to U.S. President Abraham Lincoln’s phrase “of
the people, by the people, and for the people.” Sun also en-
visioned a combination of the best government concepts
of the West with those of traditional China in a five-power
constitution that would consist of the executive, legisla-
tive, and judiciary branches plus a censorate (to check
abuses by officials) and an examination system to recruit a
bureaucracy. The Revive China Society was incorporated
in 1905 by the Tongmenghui (同盟会 United League)
with membership among military officers of the Qing
army, Chinese students abroad, and overseas Chinese.

After ten abortive uprisings between 1895 and 1911, the
eleventh— the Wuchang Uprising of 10 October 1911—
was successful, resulting in Sun’s election as provisional
president of Republican China (1912–1949), with his capi-
tal in Nanjing, and the abdication of the Qing emperor
on 12 February 1912. Sun resigned as president in favor
of General Yuan Shikai on condition that Yuan support
the republic.

However, Yuan betrayed the republic by abrogating
the elected parliament, which was dominated by the Na-
tionalist Party (in 1912 the Tongmenghui became the Na-
tionalist Party or Guomindang 国民党), culminating in
Yuan’s failed attempt to become emperor. After Yuan’s
attempt at usurpation politics in China degenerated to
civil wars among rival warlords.

Sun, frustrated in attempts to obtain help from
Western democracies, turned to the newly established
Communist government in Russia for military and or-
ganizational help in 1922. Sun agreed to the Russian
stipulation that the Nationalists accept members of the
new Chinese Communist Party into their ranks. Sun
then reorganized the Nationalist Party and assigned his

Bust of Sun Yat-sen. Sun devised a set of ideals for China’s new republic that he
called the “Three People’s Principles”: nationalism, democracy, and livelihood.
PHOTO BY JOAN LEBOLD COHEN.
lieutenant, Chiang Kai-shek (1887–1975), to assemble an army committed to Sun’s ideology. Sun died of cancer in Beijing while making a last attempt to negotiate a peaceful unification of China. Because he had expressed a desire to be buried in Nanjing, his body was temporarily kept in the Biyun Temple in Beijing until a mausoleum could be built in Nanjing.

Four years later, in May of 1929, the mausoleum was completed. A train carried Sun’s body from Beijing to Nanjing; the body was then moved along a newly built boulevard (named Sun Yat-sen Road) to the site of the new mausoleum, officially known as the Mausoleum of Dr. Sun Yat-sen. The mausoleum is engraved with the phrase “Nationalism, Democracy, and People’s Livelihood.” A public memorial service was held for three days before Sun was laid to rest on 1 June 1929.

China honors Sun Yat-sen as the father of the republic, and his Three People’s Principles are the guiding ideology of the Republic of China (1949– ) on Taiwan.

Sunzi

Sūnī 孙子

Said to have flourished early fourth century BCE  Military strategist

Sunzi, a military strategist said to have flourished during China’s chaotic Warring States period, is known for a work attributed to him usually translated as The Art of War. During a time when 600,000 men could participate in a single battle, strategy became paramount for a state’s survival; Sunzi reserved his highest praise for a strategist-general who could win a war without ever fighting a battle. Centuries later Mao Zedong would use his advice in his campaigns against the Nationalists.

Sunzi 孫子 was the most famous and successful of many Chinese strategists. In self-defense every one of the seven Warring States of his time (he was said to have flourished in the early fourth century BCE) identified someone to prepare strategies and counter-strategies. Little is known of his life, despite the historian Sima Qian’s (c. 145–87 BCE) having identified him as a strategist serving the state of Wu. What is certain is that the thinking assembled under his name reflects the cumulative wisdom of the Warring States period in Chinese history (475–221 BCE), which came to an end with the unification of China under the short-lived Qin dynasty (221–206 BCE). This period saw incessant warfare among the seven states which were gradually swallowed up by the state of Qin until in 221 BCE it succeeded in unifying all of China under the first emperor, Qin Shihuang.

Stratagems along similar lines were recommended in a number of widely distributed treatises during these warring centuries that led to China’s consolidation under the Qin.

The military thinking of these strategists paralleled the newly emerging ideas about governance developed by thinkers commonly known in the West as Legalists (fajia 法家), led by Han Fei Zi. The Legalists advocated strong central control as the surest way to enhance the power of the state. The Qin state, which was the successor state in the Zhou homeland around what is now known as Xi’an, had been led by Legalist ministers for many years. It succeeded in dominating all its neighbors, though this first empire disintegrated after only a few years with the death of Qin Shihuang. The Legalist philosophy of authoritarian control as a means of prosperity and social stability, however, far outlasted the Qin, and has had a persistent influence throughout Chinese history.

Before the Warring States period, warfare in China was conducted largely in an aristocratic mode that emphasized individual feats of valor. The armies typical of the Spring and Autumn period (770–476 BCE) were led by aristocrats driving chariots. The largest armies of the sixth century BCE assembled 50,000 men. Two centuries later the Warring States could muster up to 600,000 men in a single battle. Under these pressures, honor was no longer relevant as a motivation for soldiers. Instead they were to be strictly obedient within a top-down command structure. The orders were given by the king’s most trusted servants, the strategist-generals.

Sunzi seems to have been the earliest or at least the
most famous of the strategist-generals, outlining the models to be applied afresh to each particular situation. The text attributed to Sunzi, usually translated as The Art of War (or Warfare), seems to have been widely available, read by would-be strategists and ministers throughout China. In it the strategist recommends avoiding direct confrontations with an enemy. In fact, he reserves his highest praise for a strategist-general who can win a war without ever fighting a battle. The best means for doing so depend on outsmarting the enemy, but that in turn requires intimate knowledge of how the enemy has situated his assets. Sunzi recommends the liberal use of spies, false informers, simulated retreats, or indeed any technique that is likely to yield his side the upper hand.

**The Ambush at Maling, 342 BCE**

Twelve years after the state of Zhao was saved through the siege of Wei, the state of Wei in turn attacked the Han state. The Han ruler called on the state of Qi for help. Tian Ji and Sun Bin (the chief general and the chief strategist, respectively), commanding the Qi army, immediately led it in an attack against the Wei capital. As soon as Pang Juan, commander of the Wei troops, heard about this, he pulled his army back out of Han territory. Strategist Sun Bin (believed to be a direct descendent of Sunzi) knew of General Pang Juan’s arrogance and his low opinion of the Qi troops. Faced with an advancing Wei army, Sun Bin began an apparent retreat. On the first day, his troops left behind traces of 100,000 campfires; on the second day 50,000, and on the third day only 30,000. Pang Juan, eager for victory, concluded that the Qi army had been seriously weakened by mass desertions. So he left the bulk of his infantry behind and set out in pursuit with some lightly equipped troops.

He covered two days’ worth of ground in a single day’s march. Sun Bin had calculated that Pang Juan would reach Maling at dusk.

Sun Bin set an ambush there and waited. As planned, the Wei troops arrived exhausted from their forced march, and Sun Bin’s army demolished them. General Pang Juan committed suicide on the battlefield, much to the delight of Sun Bin, who had previously had his kneecaps cut off on Pang Juan’s orders after having been framed by the general as a traitor.

**Medieval Applications**

Centuries later the Chinese were still fascinated by wily strategists, as attested by the fourteenth century classic fiction called The Romance of the Three Kingdoms (sanguo yanyi). This work, written by Luo Guanzhong, is one of the four all-time classics of Chinese fiction. It was set during the turmoil of the third century CE associated with the fall of the Han Dynasty (206 BCE–220 CE) and weaves together the schemes and wars of an entire century into an orderly whole, analyzing the strategies...
used in great detail. The hero, Zhuge Liang, whose tomb is still preserved in Chengdu, is widely honored because his strategies outwitted those of all his adversaries.

**Modern Application of *The Art of War***

Sunzi’s approach to warfare has applications reaching into the modern era. In his essay “Strategic Problems of the Revolutionary War in China,” dated December 1936, Communist Party leader Mao Zedong (1893–1976) wrote, in reference to his fight against the Nationalists under Generalissimo Chiang Kai-shek (1887–1975):

If an attacking opponent is superior to our army in numbers and firepower, we can alter the balance of power only when the enemy has penetrated deep into the interior of our base territory and there has drained the cup of bitterness to the lees, so that “the fat grow lean and the lean exhaust themselves to death.”… At that point the enemy army, though still strong, has been substantially weakened; its soldiers are tired out and demoralized, and many of the enemy’s weaknesses are revealed. The Red Army is still weak, but it has been preserving its strength, storing its energies, and awaiting the exhausted enemy at its ease. At this point it is possible, as a rule, to strike a certain balance in the strength of the two sides or to transform the enemy’s absolute superiority into a merely relative superiority—sometimes it is even possible for us to gain the upper hand.

Mao, who had studied the Chinese classics as part of his schooling, has clearly learned from Sunzi, at one point even echoing Sunzi’s idea of an army awaiting the exhausted enemy at its ease.

In condensed form, Mao formulated the essence of the strategy in a sixteen-character poetic formula for guerrilla warfare, which translates as:

- When the enemy comes, we go.
- When the enemy rests, we disrupt.
- When the enemy is exhausted, we fight.
- When the enemy goes, we give chase.

As this passage indicates, the military tactics of Mao, fighting against the Nationalists, owed a substantial debt to the Chinese tradition of strategical thinking.

A clone of *Pop Idol* in the United Kingdom and *American Idol* in the United States, *Super Girl* was a reality program that was launched in 2004 by Hunan Satellite TV Station in China. The program has had an enormous impact on China’s television and media industry and on society, and has become highly controversial among the public.

*Super Girl* was a reality program launched in 2004 by Hunan Satellite TV Station of China. The program to some degree was a clone of overseas entertainment programs such as *Pop Idol* in the United Kingdom and *American Idol* in the United States. The *Super Girl* competition was open to any female contestant regardless of her origin, appearance, or singing ability. The program challenged some traditional rules and encouraged the audience to participate.

The program was divided into three parts: initial selection of contestants, preliminary regional rounds, and knockout competition. The first two parts were regional selections, held in five of China’s provinces. The weekly broadcast knockout competition was held in Changsha, Hunan Province. The singer with the fewest votes was then eliminated. Each year a grand finale of the show took place between the final three contestants. In a change from traditional judging rules, a few dozen “audience judges” were selected from different backgrounds in society in addition to several professional judges. Television viewers were able to watch each part of the contest, and beginning with the second part they could vote for their favorite singers. Voting was conducted by telephone and text messaging. Thus the outcome of the contest was to a large extent dependent on the preferences of the public.

### Impact of the Show

Mengniu Milk Group reportedly paid ¥14 million to Hunan Television for rights to sponsor the show’s broadcast outside Hunan Province beginning with the 2005 season. The 2005 contest was estimated to have generated a total of ¥766 million. The indirect business impact of the contest was estimated at several billion yuan.

Television advertisement slots cost an average of ¥33,400 for fifteen seconds in the 2006 season. During the finals of *Super Girl* the price went to more than ¥110,000 per fifteen seconds, with advertising sales reaching about ¥200 million for the season.

According to the TV survey institute CVSC-SOFRES Media, during the 2005 season the audience rating of Hunan Satellite TV Station ranked second in mainland China, exceeding 10 percent and surpassing the ranking of China Central Television’s New Year’s gala earlier that year; the audience rating of *Super Girl* was the highest among the programs presented in the same time frame. More than 100,000 candidates signed up during the 2005 season, and the total TV audience for all the finals was 400 million, with one final peaking at 280 million viewers. More than 2.8 million comments were posted at the *Super Girl* section of www.Sina.com, an influential website in China.
Significance of the Show

One of the main factors contributing to the show’s popularity was that viewers were able to participate in the judging process by sending text messages with their cell phones to vote for their favorite contestants. During the 2006 regional contest in Guangzhou alone, 612,713 text message votes were cast for the top three contestants. In the final contest the votes for the champion and runner-up were 5,196,975 and 4,818,125, respectively. This reaction was considered to be one of the largest “democratic” voting exercises in mainland China.

Super Girl was so popular that many provincial satellite TV stations have imitated it, an indication of how the Chinese TV industry has become increasingly competitive and that the TV industry, as well as all of China’s media, has become more focused on entertainment. But some elites in the Chinese intelligentsia, such as Dake Zhu, a Shanghai cultural scholar, criticize the broadcasting of talent shows such as Super Girl. Zhu thinks Super Girl was a victory in terms of audience rating and revenue earned from advertising but was a disappointing cultural phenomenon. On the other hand, many elite scholars supported Super Girl. Cui Weiping, a professor at Beijing Film Institute, pointed out that the real significance of Super Girl lies in examining the show as a realistic performance of democracy. That position has opened up a debate about whether the show’s appeal was the result of audience projection of the so-called reality program into the political realm by fantasizing about having a vote in an issue of “real” significance.

Since August 2007 the State Administration of Radio, Film and Television has placed some restrictions on some vulgar phenomena in talent shows. Super Girl, after three seasons, was replaced by Happy Boys in 2007. Nevertheless, talent shows will continue to play a prominent role in the development of Chinese TV program patterns.

Supervisory System, Ancient
Gǔdài de jiānchá zhìdù 古代的监察制度

A system developed in ancient China that primarily served as the means by which bureaucratic institutions and government officials were monitored, and which ensured that the growing empire was governed and functioning properly.

The Chinese traditional supervisory system could trace its origins back to the times when China created the first bureaucratic governing machine under a monarch. While being exploited to strengthen monarchical control over the extended executive branch of the state, the supervisory system witnessed its own expansion, formalization, and bureaucratization over the centuries. As the bureaucratic machine became indispensable for governing the growing Chinese empire, highly adaptable supervisory institutions governed under a different set of regulations played a crucial role in monitoring the Chinese bureaucratic machine’s function and in keeping it on a “correct” track.

The bureaucratic post of yushi (censor), which in later periods was commonly entrusted with the supervisory power over administrative officials, already existed in the Shang dynasty (1766–1045 BCE). In Zhouli, or Book of Rights—a collection of the Western Zhou dynasty (1045–771 BCE) institutes believed to have been compiled by scholars of the Spring and Autumn (770–476 BCE) and Warring States (475–221 BCE) periods—it was written that to keep a complex bureaucracy functioning properly under the Zhou kings, serious crimes committed by officials were targeted, and a post of chief judge (shishi) was established for prosecuting those who were involved. Two posts of grand steward (dazai) and his lieutenant (xiaozai) also were set up to be in charge of impeaching officials who violated government regulations and disciplines.

During the Eastern Zhou dynasty (770–221 BCE) a post of yushi was established in Qin, Zhao, Han, and Qi as these decentralized feudal domains were transformed to warring states governed through functionary officials and clerks.

Preliminary theories and practices regarding how to keep officials and bureaucratic offices in check were widely discussed and implemented by prominent statesmen and political advisors of the time, such as Guan Zhong (d. 645 BCE), Shang Yang (390–338 BCE), and Han Feizi (281–233 BCE). Shang Yang in particular firmly believed that in order to make the supervisory system work, the power of censorial officials ought to be separated institutionally from that of administrative officials being supervised.

Major Developments during the Qin and Han Dynasties

The centralized imperial system established by the Qin dynasty (221–206 BCE) and consolidated and perfected during the Han dynasty (206 BCE–220 CE) was a major institutional development in Chinese history. Although this political system, under which the vast Chinese empire was unified and governed, was centered
on an imperial house, it was maintained through a well-organized bureaucracy.

Under the first emperor (reigned 221–210 BCE) the Qin central government was divided into three branches controlled by, respectively, the counselor-in-chief (chengxiang), the military commander-in-chief (taiwei), and the censor-in-chief (yushi). These three paramount officials were ranked head to head as “three grand dukes” (sangong), with each deriving his power directly from the emperor. Although the censor-in-chief had an official duty to assist the counselor-in-chief and could succeed the latter when a vacancy was created, he also headed the Censorate (yushifu) and could impeach the counselor-in-chief. Since the censor-in-chief was also the chief secretary serving the emperor, the Censorate staffed by a number of censors (yushi) was mainly managed by the junior censor-in-chief (yushi zhongcheng). At the local level supervising censors (jian yushi) affiliated with the Censorate were periodically sent down to inspect activities of commanding governors (junshou) and other subordinate officials.

During the Han dynasty, while the supervisory system established under the Qin was further expanded, several important changes took place. First, the former censor-in-chief (rank: wanshi [ten thousand shi of grain—one shi of grains weigh about 110 pounds]) assumed more formal secretarial duties to serve the emperor and was eventually transferred from the Censorate to a purely administrative post. As a result, the junior censor-in-chief (rank: qianshi [one thousand shi]) became the highest official responsible for running the Censorate, while the institute itself became specialized exclusively in censorial services during the mid-Han. From the monarchical perspective it would be much easier to control imperial censors, who wielded a wide range of powers, if they were low-ranking officials.

Second, to monitor the ever-expanding officialdom, the supervisory organization itself grew to become a more complex body. It was expanded to include several related divisions that could check on each other, making the emperor less worried about the possibility that the supervisory system would spin out of control. Besides the junior censor-in-chief, who had forty-five professional censors working under him, an additional supervisory post of rectifier (chengxiang sizhi) was established under the counselor-in-chief to monitor different administrative divisions of the central government. Moreover, under Emperor Wu (reigned 140–87 BCE) a powerful independent censorial post of metropolitan commandant (sili xiaowei), together with twelve supporting clerks, was added to the supervisory operations. While personally controlled by the emperor, the metropolitan commandant had power to supervise, investigate, arrest, and impeach any suspicious officials in the imperial capital and its surrounding areas.

The local supervisory work was also enhanced during the Han dynasty. Under Emperor Wu thirteen regional censors (cishi) affiliated with the Censorate were appointed. Their duties were confined to six areas (liutiao) defined by the emperor, which made local magnates, commandery governors, and various marquis (nobles) their main targets. Each commandery governor also appointed five local inspectors (duyou) to tour counties in the jurisdiction.

**Supervisory Institutes after the Han and in the Tang Dynasty**

During the periods between the Han and Sui (581–618 CE) dynasties when the empire was in disunity, specific supervisory practices varied under different rulers, but they all retained the basic Qin and Han organizational structure and features. Key supervisory institutes remained under direct control of the emperor and were made flexible enough to meet different imperial needs. To break the monopoly of great families over governmental posts, low-ranking supervising officials, including clerks coming from poor families (dianqian), were asked to spy on local officials. Moreover, supervising inspectors could also report activities of officials to the emperor anonymously and were even allowed to impeach them based on unconfirmed hearsay (wenfeng zoushi). Therefore, it was not surprising that censors were often found abusing their power. High-ranking officials, particularly after the Jin dynasty (265–420 CE, one of the dynasties during the Southern and Northern dynasties [220–589 CE] period), were thus forbidden to take on the post of junior censor-in-chief. Regional standing censorial offices were regarded as unreliable by emperors, and censorial inspections instead were often assigned to ad hoc imperial censors.
Supervisory practices during the Tang dynasty (618–907 CE) were more institutionalized and formalized. Before, the Censorate had been located inside the imperial inner quarters and treated more like the emperor’s personalized tool of control. During the Tang dynasty the office of the Censorate was moved to the outer court, while the post of censor-in-chief was restored, lifting the Censorate from rank 4a to 3a. The Censorate was more bureaucratized as it was formally divided into three bureaus (sanyuan): Headquarters Bureau (responsible for handling daily affairs and impeachments), Palace Bureau (responsible for controlling high-ranking officials’ ritual conduct), and Investigation Bureau (responsible for touring prefectures and counties and investigating local officials). The expanded Tang Censorate, which had its own jail, had the power to review important judicial cases, supervise economic matters handled by both central and local officials, and investigate corruption cases of the military. Besides ad hoc tours and inspections of local prefectures and counties carried out by censors sent down from the Censorate, more regular supervising posts were established in ten and then in fifteen regions (Dao) to carry out censorial work confined to the six categories specified by the Tang emperors, which had a different focus compared with those six areas defined by Emperor Wu of the Han.

Another major development during this period was a series of appointments of formal remonstrance officials, particularly those who were affiliated with the Chancellery (menxia sheng). These remonstrance officials had the power to examine and rebut not only proposals coming from the Secretariat (zhongshu sheng) but also state policies formulated in imperial edicts. The most reputable Tang remonstrance official was Wei Zheng (580–643 CE), who often openly rebutted the edicts of the Taizong emperor (reigned 627–649 CE). According to Tang rules, without the approval of the Chancellery, even a Tang emperor could not get the concerned policies promulgated.

Supervisory Practices from the Song to the Qing Dynasty

During the Song (960–1279) and Yuan (1279–1368) dynasties the supervisory institutes were further centralized, while the rank of the censor-in-chief was promoted from 3a in the Tang to 2b in the Song dynasty and then to 1b in the Yuan dynasty. To increase the efficiency of the Censorate, the number of its formally appointed censors was reduced considerably, while the number of clerks was increased during the Song. Also, each of the six branches of the central government was put under a censor’s watch. Song emperors increased imperial control over the supervisory system, requiring each censor to submit at least one report per month. Censors were allowed, again, to impeach officials based on hearsay. At the same time, remonstrance officials were detached from policymaking institutes and increasingly worked as censors who targeted officials rather than as imperial advisors.

The Ming dynasty (1368–1644) supervisory system comprised several overlapping institutes, and its effective control over officialdom was enhanced through combined bureaucratic and monarchical efforts. To consolidate formalized bureaucratic supervisory institutions, the old Censorate (yushi tai), which had comprised several bureaus during the Tang dynasty and had been trying to coordinate their functions since the Song dynasty, was reorganized into a single but expansive institute called “Supervisory Headquarters” (ducha yuan), which was run by two censors-in-chief (zuo you duyushi) (rank: 2a) who, in turn, were supported by two vice censors-in-chief (rank: 3a) and two assistant censors-in-chief (rank: 4a). The Supervisory Headquarters was fully bureaucratized and established a number of internal offices to oversee the supervisory work in the empire.

The Ming local dao supervisory system had several components. First, in each of the thirteen provinces (customarily called dao) there was a provincial surveillance commission (tixing anchashi si) headed by a commissioner (rank: 3a). As agencies of the central government established in provinces to be responsible for overseeing local judicial matters, these commissions were often collectively called the “Outer Censorate” and communicated with the throne through the Ministry of Punishment and the Supervisory Headquarters, although they were neither branch agencies of nor controlled by the latter. Under these provincial surveillance commissions forty-one circuit branches (Dao fensi) throughout all provinces were set up to supervise officials working at a lower level.

Second, in times of need the task of overseeing provincial affairs was formally delegated to general
superintendents (zongdu) or provincial inspectors (xunfu). Affiliated with the central government and the Supervisory Headquarters, a general superintendent or provincial inspector often carried concurrently a title of censor or vice censor-in-chief and was also responsible for coordinating the operations of different government branches at the provincial level.

Third, 110 investigation censors (jiancha yushi) were listed under the Supervisory Headquarters. Carrying a title of regional inspector (xunan yushi) while inspecting provinces, these investigation censors actually reported directly to, and even had an obligation to watch over the Supervisory Headquarters for, Ming emperors.

The most important Ming supervisory institution at the central government level was the so-called ke system controlled directly by the emperor. Two years after abolishing the prime ministership, the Hongwu emperor (reigned 1368–1398) in 1382 created the so-called Six Offices of Scrutiny (liuke), which were independent from the Supervisory Headquarters and enabled the emperor to control the six administrative ministries (liubu) more directly. Each Office of Scrutiny was led by a low-ranking (7a) chief supervising secretary (du jishizhong), who worked with two assistant chief supervising secretaries (rank: 7b) and four to ten supervising censors (jishizhong) to oversee a particular ministry. Proposals made by each ministry had to be examined and approved first by its corresponding Office of Scrutiny before they could be submitted to the emperor.

This dao-ke bifocal supervisory institution of the Ming dynasty was, with some modifications, inherited by the Manchu rulers of the Qing dynasty (1644–1912). A major change, however, took place in 1723 when the Six Offices of Scrutiny were incorporated into the Supervisory Headquarters, making the latter the most centralized and formally bureaucratized supervisory institute in Chinese history. To regulate various censorial organizations and their operations, the Qing dynasty established comprehensive laws, such as the imperial ordained rules governing the Censorate (Qinding taigui) (established in 1743 and revised in 1802, 1827, and 1890), and the regulations of the Supervisory Headquarters (duchayuan zeli). The Qing dynasty also established other institutions, such as the confidential palace memorial (zouze) system operated since the Kangxi reign (1662–1722), to enhance dual (namely, monarchical and Manchu ethnic) control over both Manchu and Chinese officials.

The Censorate Bureau of Remonstrance

*Thoughts from Su Shih, a statesman of the Song dynasty (960–1279), on the Censorate Bureau of Remonstrance, from Charles Hucker’s The Censorial System of Ming China.* Hucker writes:

Su’s memorial is of particular interest because it reveals his attitude toward the service expected of the Censorate and the Bureau of Remonstrance. He considered that the state’s gravest problem was to maintain a proper balance between forces favoring centralization and those favoring decentralization. Overcentralization made it possible for evil ministers to gain imperial favor and usurp the authority proper to the sovereign, while extreme decentralization permitted regional authorities to become strong enough to do so. The Sung government, Su thought, tended toward centralization and was thus susceptible to the abuses of cunning men in high places. He said that he could not presume to explain entirely the measures that dynastic founders had instituted to prevent overcentralization and its dangers, but he added:

However, in regard to the single matter of their employment of a Censorate and a Bureau of Remonstrance, this is the sages’ perfect preventive plan. Successively considering [history from] Ch’in [Qin] and Han and on to the Five Dynasties period [907–960 CE], there were undoubtedly several hundred men who met their deaths because they remonstrated; but from the Chien-lung era [960–962 CE] on, no critics have ever been punished. Even though they were reprieved they have forthwith been granted extraordinary promotions. Being permitted to make use of hearsay evidence, they have not been intimidated by high rank or prestige and have paid no attention to the honorable or humble [status of those criticized]. When their criticisms extended to the imperial person, the emperors have shown disturbance; when [the spoken of] matters concerning state policies, the grand councilors have expected trouble. Thus in the time of the Je- tsung (reigned 1022–1063) public opinion ridiculed the grand councilors, (saying) that they merely accepted and enacted the criticisms of the Censorate and the Bureau of Remonstrance, and that’s all.

The constitution of the People’s Republic of China includes a section on sustainable development that stipulates: Development must use natural resources in a manner that takes future generations into consideration. China’s goal is to restructure the economy to one of low consumption and low pollution, while addressing the needs of the world’s largest population, much of which is uneducated, poor, and aging.

Sustainable development—a use of natural resources that meets human needs while preserving the environment so that those needs can be met not only in the present but also in the future—is one of China’s state strategies. Ever since the term entered China’s public policy vocabulary after the United Nations Conference on Environment and Development held in Rio de Janeiro in 1992, sustainable development has been accepted as a must for China in its modernization drive.

Guideline

China’s basic sustainable development strategy gives priority to peoples need and interests; it aims to coordinate efforts to improve and develop the economic and political aspects of the country, in part by balancing growth among urban and rural regions, and to improve the spiritual quality of life in China by fostering harmony between humans and nature. This guideline, known as the “Scientific Outlook on Development,” has been written into the Constitution of the Communist Party of China.

The “Scientific Outlook” guideline emphasizes sustaining development by taking into consideration the needs of both this and future generations. It aims to build on existing economic and political strengths and lay down a solid foundation for China to rank among the medium-developed countries by the middle of the twenty-first century.

China’s sustainable development strategy specifically aims to: restructure the national economy from the old mode of growth characterized by high consumption of resources, high pollution, and low efficiency to a new pattern of low consumption, low pollution, and high efficiency; justify the utilization of resources and alleviate pressures that would deplete resources and harm the environment; bridge regional gaps in development and narrow the urban-rural divide; eliminate poverty and improve the overall quality of the destitute population; and build up a national economic system that is environmentally friendly.

Population

Because of its size and impact on both resources and development, population constitutes a key concern in China’s sustainable development strategy. Although the world’s largest population of 1.33 billion could be a resource in itself, the limited educational level in China
often works to the country’s disadvantage. Adult literacy has increased from less than 20 percent in 1949, when the People’s Republic of China was founded, to reportedly more than 90 percent at present, but the average time spent in school for those older than fifteen remains low at 8.3 years. According to Niu Wenyuan, principal investigator of the sustainable development strategy project with the Chinese Academy of Sciences, any trifling problem in China can be enormous if multiplied by 1.33 billion, whereas any achievement, however brilliant, will pale if divided by the same figure. China’s annual 10–12 million net new births may cost one-fifth of the increased gross domestic product (GDP).

China has succeeded in bringing down its population growth rate from 2.3 percent in 1990 to 0.6 percent in 2005 and has shifted from the reproduction pattern of high birth rate, low infant mortality, and high growth rate to the pattern of low birth rate, low infant mortality, and low growth rate. But the lowered growth rate has changed the age structure of the population, and senior citizens at or above sixty years old have surpassed 10 percent of the total population, meaning that the developing country is also an aging society.

That change may explain why human resources development is placed high in China’s sustainable development strategy. The country needs to control the population growth to alleviate the pressures on resources and the job market. The need to control the population growth has generated a series of policies to facilitate fewer births; improve people’s living quality with adequate food supply, housing, and better health care; guarantee full employment and support of the old; and provide education for all to maintain a competent labor force. Policies favor parents who practice family planning in rural areas. For
example, they receive priority in loans and in their children’s education and employment. Such policies have helped refute the traditional concept of “more children bringing about greater fortunes.”

An important goal of China’s population policies and sustainable development strategy is to alleviate and eliminate poverty. Statistics shows that 23 million rural people still live below the poverty line of an annual per capita income of 700 yuan, and nearly 50 million barely have adequate food and clothing, in addition to 28 million who are impoverished in urban areas (2006). By the United Nations poverty standard of daily per capita consumption of $1, China’s poor population may exceed 200 million.

Most of the rural poor live in western China, an area

An old man holds his grandchild. While China’s one-child policy has helped to slow the rate of population growth, it has resulted in a disproportionately large population of elderly Chinese. PHOTO BY JOAN LEBOLD COHEN.
in which the populations typically suffer from remoteness, poor accessibility, primitive modes of production, low grain yields, and meager sources of income. China established the Leading Group on Poverty Alleviation and Development under the State Council in 1986 to eradicate poverty. Such programs focus on increasing people’s competence so that they can subsist on their own. While increasing government budgets to alleviate poverty, China also has mobilized the whole society to join the effort. The Chinese Academy of Sciences, for example, dispatches researchers to assume official posts in some poverty-stricken counties in Inner Mongolia, where the researchers introduce appropriate technologies to local people with which they can reduce desertification and become more prosperous. This transformation, however, is not without its challenges.

Environmental Protection

A population’s ever-increasing demands for material and cultural riches can easily take its toll on resources and the environment. As China has accelerated the pace of industrialization and urbanization since the 1980s to respond to pressures imposed by a rapidly growing population, deterioration of the eco-environment has become an increasing problem for China’s sustainable development strategy.

While pursuing sustainable development as an inevitable strategic choice, China has taken the official line that, for a developing country such as China, economic growth is the precondition for sustainable development. “Only when the economic growth rate reaches and is sustained at a certain level can poverty be eradicated, people’s livelihoods be improved, and the necessary forces and conditions for supporting sustainable development be provided,” states the White Paper on China’s Population, Environment, and Development in the 21st Century issued by the State Council Information Office in 1998 (State Council Information Office, Chapter 2).

But domestic and international lessons learned have convinced the Chinese that neglecting the environment can offset achievements made in economic development. As stipulated by China’s eleventh Five Year Plan (2006–2010) China aims to decrease energy consumption annually by 8 percent per unit of GDP, but by mid-2008 had only achieved a 5.7 percent reduction (Kirk 2009). Environmental protection is commonly recognized as vital to China’s sustainable development.

China began to promote environmental protection after the first world conference on the environment, the United Nations Conference on Human Environment held in Stockholm, Sweden, in 1972. Environmental protection policies aim to rationalize industrial structures in favor of those that save energy or use clean energy, develop environmentally friendly high-tech industries and tertiary services (the sector of the economy other than manufacturing or agriculture, such as insurance or banking), improve management of enterprises and the environment, integrate pollution prevention and control, and commit polluting enterprises to bear the cost of recovering wastes and controlling pollution. Along with a quota system for waste discharge, legislation can close plants that use outdated equipment and are small in scale but high in energy consumption and environmental pollution.

Environmental protection has been incorporated into national and local programs for economic and social development. With regard to environmental problems caused by unwise planning of projects, often approved through officials’ preference and intervention, China enacted the Law of Environmental Impact Assessment in 2002. This legislation aims to define the government administration responsible for construction project approval, control the irrational sprawling of destructive development, and prevent hazards to the environment caused by faulty planning by project owners. Environmental impact assessment has been applied to some key construction projects, including the Qinghai-Tibet Railway (completed in 2005), where results are considered positive because the impact on the environment is minimal.

Changing Viewpoints

Another challenge to China’s sustainable development strategy is changing the viewpoint of its officials, who have traditionally identified development as the growth rate of GDP and used that increase as a tool for self-promotion. As a result, social development lagged behind rapid economic growth in many places.

A pivotal moment in changing the viewpoint of Chinese policymakers came in 2003 after the epidemic of
SARS (severe acute respiratory syndrome), which killed 791 people out of 8,300 infected cases in some thirty countries and regions worldwide, with a death toll of 348 in the Chinese mainland. According to the National Bureau of Statistics, the epidemic cost China $11.3 billion, or 0.8 percent of its 2003 GDP. Two high-ranking officials—the mayor of Beijing and the minister of health—were sacked for dereliction of duty at the outbreak of the SARS epidemic.

Heeding calls in the wake of the SARS epidemic to balance economic growth with social development, the Chinese government increased funding to overhaul the country's long-neglected health system, earmarking $822 million for the central and local centers for disease control and prevention to improve their capacity to handle the outbreak of infectious diseases. An additional $1.38 billion was allocated to facilitate handling of infectious diseases in less-developed western China. Such action is in contrast to disproportionate government spending on public health in the previous two decades. From 1991 to 2000 the proportion of overall medical costs in China's GDP increased from 4.11 percent to 5.3 percent, with the annual sum rising from $11 billion to $59.5 billion. Yet the proportion of government spending on public health in
overall medical costs dropped from 22.8 percent to 14.9 percent, while the share of individual spending rose from 38.8 percent to 60.6 percent.

China has yet to produce a set of statistical tools to take into account the utilization of resources and costs of environmental damage in its GDP, but policymakers are abandoning the conventional practice of measuring the quality of governance with the GDP growth rate only. For example, in 2005 the provincial government of Qinghai removed GDP as a criterion in the assessment of officials working in the Tibetan autonomous prefectures of Yushu and Guoluo, where the Yangzi (Chang), Huang (Yellow), and Lancang (Mekong) rivers have their sources, so that they could concentrate on the conservation of the nature reserve, which is the largest in China.

Public Participation

The deteriorating environment has increased people’s awareness of the need for sustainable development, and public participation has become indispensable in environmental protection. The Law of Environmental Impact Assessment allowed public participation for the first time in China’s legislative history, and the country’s burgeoning civil society is playing a more active role in the decision-making process on projects with considerable environmental impact and in monitoring enterprises to assure they abide by laws on environmental protection.

Based on officially released data, the Institute of Public and Environmental Affairs, a Beijing-based non-governmental organization (NGO), produced a list of polluters and their products. Twenty-one environmental NGOs from across China then sent out a petition in March 2007 to consumers nationwide asking them to boycott these products. The action forced a number of offenders to control their pollution and to make an apology to Chinese society through the media. Actions such as the boycott put data released by the government to good use and exert a “healthy supervision” over the government while putting social pressure on polluters, said Mou Guangfeng, an official in charge of environmental assessment at the State Environmental Protection Administration.

Sustainable development in China is a long-range undertaking that will require consistent effort for generations. The government’s openness to public participation is promising for the success of China’s sustainable development strategy.

Suzhou

Sūzhōu Shì 苏州市
6.16 million est. 2007 pop.

Suzhou is located in the eastern province of Jiangsu in the Yangzi (Chang) River delta. It was a center of Wu civilization from the fifth century BCE. The Venetian traveler Marco Polo reportedly called the city the “Venice of the East.” Today it is a tourist destination popular for its architecture, canals, gardens, and nearby Lake Taihu.

Suzhou (sometimes referred to as “Soochow”) is one of China’s most beautiful cities, known for its canals, architecture, arcing bridges, and classical gardens. The Venetian traveler Marco Polo (1254–1324), according to legend, called Suzhou the “Venice of the East.” A popular Chinese saying is that “above the earth, there is the heaven, and on earth, there are Suzhou and Hangzhou.” 上有天堂，下有苏杭, to describe these beautiful Chinese cities.

The city’s gardens, along with Lake Taihu west of the city, are popular tourist destinations. Rail and motor traffic between Nanjing and Shanghai pass through Suzhou’s jurisdiction. The city’s economy has grown rapidly during the past ten years; although its agricultural base has decreased as its industrial system has increased.

The city is located in southern Jiangsu Province and was founded in the fifth century BCE. Much of Suzhou is

Mid-Lake Pavilion of the West Garden in the city of Suzhou. The city’s private gardens, as well as its canals, have survived over the centuries. PHOTO BY PAUL AND BERNICE NOLL.
surrounded by the Outer Moat. The Grand Canal (the world’s longest human-made waterway, connecting Beijing and Hangzhou) also passes through the city. After the canal was completed during the Sui dynasty (581–618 CE), Suzhou became an early trade center.

Suzhou was the capital of the kingdom of Emperor Wu (140–86 BCE), although the city wasn’t named “Suzhou” until the Sui dynasty. The city was destroyed during the fourteenth century and again during the Taiping Rebellion of 1851–1864 (the largest rebellion in China’s history). In 1896 Suzhou became a treaty port and was opened to the West. The city was occupied by the Japanese during World War II and taken over by the Chinese Communists in 1949.

Historically silk has been the most famous of Suzhou’s exports, and the city also is known for its embroidery. The city is located in the subtropical zone and has a mild climate and enough rain and sunshine for good rice crops in the surrounding paddies. The economy is diversified with chemicals, paper, cotton textiles, ceramics, metallurgy, machine tools, and electronics. However, rapid economic growth has harmed Lake Taihu. Suzhou was not located in one of Chinese Communist Party General Secretary Deng Xiaoping’s original four special economic zones (SEZs) established in 1979. Nevertheless, the city’s gross domestic product (GDP) per capita is twice as high as that of the rest of Jiangsu Province, and Jiangsu is the third-wealthiest province in China (after Guangdong on the south coast and Shandong to the north of Jiangsu).

One of the city’s many economic successes is Suzhou Industrial Park, a China-Singapore joint venture. For the past few years fifty to one hundred of the Fortune 500 U.S. corporations have had a corporate presence in Suzhou.

The Humble Administrator’s Garden is the largest of the ten most famous and well-preserved gardens.
of Suzhou, and the Garden of the Master of the Nets is the smallest. The scholar-officials who constructed the Suzhou gardens during the Ming (1368–1644) and Qing dynasties (1644–1912) were weekday Confucians and weekend Daoists. They luxuriated at the end of their work week in the splendor of their nature retreats. To them it was important that the gardens included the five elements of water, specific plants, large and porous rocks, buildings, and calligraphy. In 1997 the United Nations Educational, Scientific, and Cultural Organization (UNESCO) named the Classical Gardens of Suzhou to its list of World Heritage Sites.

Tai Chi

Taijiquan 太極拳

Tai chi is a martial art practiced worldwide whose gentle structured forms combine with deep breathing to balance internal energy, or qi, to improve health and well-being. More popular than ever in its five-hundred-year history, tai chi venues in China today range from large synchronized outdoor groups of all ages to highly competitive tournaments.

Tai (taijiquan) is a Chinese martial art that is linked to the Daoist meditative, philosophical, and medical tradition. In China invalids and the elderly often perform the soft, slow movements of the popular Yang style of tai chi to strengthen the constitution and to promote longevity. Advocates say that disciplined daily practice enhances the quality and circulation of qi (vital energy) within the body, improves bodily functions, tones muscles, and engenders a relaxed mental attitude. The majority of the millions of people who practice tai chi in China and elsewhere do so for these benefits, but tai chi also is a premier martial art that can be practiced even late in life.

Origins

Chinese legendary history attributes tai chi’s origin to Zhang Sanfeng, a Daoist expert who probably lived in the thirteenth century, but was canonized in 1459. Tai chi entered recorded history centuries later as a martial art practiced esoterically by the people of Chenjiagou in Henan Province. A form of the art was first demonstrated and taught in public in Beijing by Yang Luchan (1799–1872), who had learned it in Chenjiagou. Scholars say Yang accepted all challenges from the many Beijing martial arts masters, never to be defeated and never to seriously injure an opponent. He became known as “Yang the Invincible” and was appointed martial arts instructor to the imperial court. Yang Luchan publicly taught the slow and soft performance of a lengthy sequence of patterns, but he transmitted a much larger and more varied body of lore to his private students, a practice in keeping with martial arts tradition. Popular conceptions of tai chi as an only vaguely martial exercise, although beneficial to health and longevity, are drawn from Yang’s and his successors’ publicly taught form. This process of simplifying and softening has made tai chi accessible to many more people than would otherwise be the case. But the more obviously martial and physically strenuous Chen style continues to be practiced, as do the derivative Sun, Wu, and Hao styles.

Practice

As a martial art tai chi employs a subtlety of touch to sense an opponent’s strength in order to redirect his or her motion so that one’s defensive movement neutralizes it and becomes a counterattack as well. In describing this capacity practitioners use such phrases as “when the opponent is still, be still; when the opponent moves, move first,” and “use four ounces to deflect a thousand pounds.”
The technique depends upon the ability to maintain gentle physical contact with the opponent without resisting, that is, to never meet force with force. The tai chi player’s counter to the aggressive move, after the instant has been seized and the movement’s force captured, can be any of several techniques. Most benignly and simply, the tai chi player can accelerate or redirect the opponent’s motion, sending him or her many feet away. Alternatively, a player can use any of several in-fighting techniques, ranging from low kicks to punches to open-hand strikes and grappling techniques, singly or in combination, practically simultaneously with blending with the opponent’s force. The initial contact is said to be as soft as cotton; the counter that is said to be as springy as steel.

The strength, sensitivity, skill, and mental attitude required to perform such feats spontaneously and without effort are cultivated partly by the practice of solo forms (sequences of patterns) and partly by other means. Forms vary in length and in their composition and sequence of techniques; players can practice them at different speeds with larger or smaller patterns and in higher or lower stances. In some forms the tempo is even; in others it varies. Instructors say a player should practice forms with the continuity of one “reeling silk from a cocoon.” In appearance form practice should resemble an eagle in flight; the attitude should be that of a cat when about to pounce on a mouse. Form practice is a kind of meditation in motion and requires concentration without tension. Paired practice routines, in which one works with a partner to simulate martial encounters, have degrees of formality ranging from duo form sequences to freestyle sparring. The full range of tai chi skills includes the use of weapons as well; the sword, broadsword, staff, and spear are used. In some schools students practice auxiliary exercises to facilitate the development of the physical conditioning, skills, and mind-set appropriate to tai chi; in others schools tai chi itself is considered the only necessary exercise. In either case the expectation is that players will learn to direct and augment the flow of vital energy within the body with their mind in harmony with the breath and that bodily functions will be enhanced as the body is renewed by improved circulation of chi. Through this internal aspect of tai chi the body is expected to become supple and limber; both traits are essential to good health and to proper performance of tai chi.

Tai chi’s mechanical principles involve erect stances that combine stability with nimbleness of foot. Movement begins at the dantian, an anatomical point at the body’s center of gravity just below the navel. With no tensing of muscles and with mechanical efficiency and relaxed precision, the weight is shifted and energy is transmitted via the waist to the hands. In effect the legs, spine, and arms become like five bows, resulting in springy whole-body strength to be applied at the optimum instant. Footwork should be like the tread of a cat. Tai chi sport competition involves solo form performance and sometimes tuishou, or push-hands, a demonstration of mastery of the principles of tai chi.

A group of men practice tai chi on the Bund in Shanghai, circa 1970. An admiring crowd has gathered to watch. PHOTO BY JOAN LEBOLD COHEN.
From a Chinese cultural perspective the psychological and medical value of the art and its martial potential are reasonable expectations. Both are in harmony with Daoist philosophical principles that are believed to be universally valid. The Daoist classics Daodejing and I Ching promulgate these principles, the interplay and balance of opposites that tai chi embodies. Thus, one can see tai chi as an art of harmonization with nature that includes the ability to harmonize with an opponent’s attack and the nurturance of chi that animates every living thing in the universe: Tai chi is considered to be a spiritual discipline as well.

The Future

During China’s Cultural Revolution (1966–1976) tai chi was under political attack in China, but the situation has changed. Tai chi has been reinstated as a national treasure and a uniquely Chinese form of art and sport. Basic tai chi is taught publicly in parks and other suitable places, as it is in other parts of the Chinese world. Advanced instruction is available, and form competitions are held. Lacking knowledge of Chinese philosophy and its implications for self-defense and medicine, Westerners have generally been drawn to flashier martial arts. However, that situation is changing, too; gradually tai chi is becoming better known in the West. It is of growing interest to the international medical research community and to martial arts scholarship, but tai chi is still best known in the West as a health and longevity exercise of particular benefit to seniors. Both physically and philosophically, tai chi both influences and defines Chinese health and well-being more than any other non-medicinal practice.

Tainan, the oldest Chinese settlement on Taiwan, is the island’s fourth-largest city. Tainan is an important center of culture, industry, education, and tourism. Two hundred temples ranging from the Tainan Confucius Temple (1662) to the elaborate new Temple of Matzu (Goddess of the Sea) provide some of the best remaining examples of southern Chinese architecture in Taiwan.

Tainan, located on the coastal edge of the fertile Jianan Plateau, is the oldest Chinese settlement on Taiwan and the island’s fourth-largest city. Until the late nineteenth century Tainan was the cultural, political, and economic center of Taiwan. Tainan was a Dutch settlement and trading post from 1624 to 1662. In 1661 the Chinese rebel leader Zheng Chenggong (1624–1662), better known by the English name “Koxinga,” failed in his attempt to restore the Chinese Ming dynasty (1368–1644) and fled to Taiwan. His army soon overcame the Dutch, and he established his government in Tainan. In 1684 the Manchu Qing dynasty (1644–1912) conquered Taiwan and incorporated Taiwan into Fujian Province of China. Tainan flourished during Japanese administration (1895–1945) but declined relative to the city of Taipei after the arrival of the Republic of China on Taiwan in 1945.

This history has left Tainan with many historic sites, including two forts built by the Dutch and more than two hundred temples, ranging from the Tainan Confucius Temple (1662) to the elaborate new Temple of Matzu (Goddess of the Sea) at Luermen. These temples provide some of the best remaining examples of southern Chinese architecture in Taiwan.

Tainan is an important center of education, culture, industry, and tourism. Historically the area has been important for rice and sugar cultivation, fisheries, oyster raising, and salt production. Tainan is home to some of Taiwan’s largest private industrial enterprises, including petrochemical and food-processing plants. It became a...
high-tech center and enjoyed a new period of growth after completion of the Tainan Science-Based Industrial Park in 2002.

Taipei

Taipei, the largest city on the island of Taiwan, was founded in the eighteenth century and has been the capital of the Republic of China since 1949. It is a major political, commercial, and industrial center.

Taipei, the largest city on Taiwan, has been since 1949 the capital of the Republic of China (the Chinese state that does not recognize the sovereignty of the People’s Republic of China). Located in the far north of the island, in the basin of the Keelung, Tamshui, and Takokan rivers, Taipei is a major political and commercial center with a wide range of businesses, cultural institutions, and temples.

China’s ruling Qing dynasty (1644–1912) in 1885 declared Taiwan a separate province, and Taipei, a city formed from Chinese and aboriginal settlements, became its capital. During Japanese colonial rule over Taiwan from 1895 to 1945, Japan’s treatment of Taipei’s Chinese population varied between repression of nationalism and accommodation to some political aspirations of the emergent middle-class elites. When Taiwan reverted to Chinese rule in 1945, tensions with the new Chinese Nationalist Party (Guomindang) governor, Chen Yi, led Taipei to become a major center of the February 28th Incident of 1947, when city dwellers’ protests against the Nationalist government were quashed with some brutality. After 1949 Taipei became the “temporary” capital of the administration of Nationalist Party Chairman Chiang Kai-shek (1887–1975). Taipei benefited during this period from the economic boom in East Asia and became a prosperous city. After Chiang’s death Taiwan democratized, and in the years 1994 to 1998 for the first time Taipei’s mayoralty was held by an opposition politician, Chen Shui-bian. The mayoralty has become a stepping-stone to island-wide power, as Chen’s successor, Ma Ying-jeou (mayor 1998–2006), was elected president in 2008.

Taipei’s architecture reflects the city’s stages of development. Little is left from the pre-1895 era, but the Japanese period left many colonial baroque buildings, including the Presidential Office Building and National Taiwan University. Beginning in the 1950s many undistinguished concrete buildings were hastily built, a process aided by Taipei’s lack of planning laws, but since the 1980s
more care has been taken to build more sympathetically, with many new buildings, such as the Chiang Kai-shek Memorial and the Central Rail Station, incorporating traditional Chinese architectural themes. In 2004 the modernist Taipei 101 building, designed by C. Y. Lee and Partners, was opened and officially acknowledged as the world’s tallest completed building, a position it will hold until the Burj Dubai (Dubai Tower) skyscraper is completed in Dubai, United Arab Emirates (scheduled for completion in 2009).

Taipei’s environment is plagued by pollution. Until the early 1980s highly polluting soft coal was burned without effective restrictions, and Taipei’s position in a basin worsened the resulting smog. Taipei’s relative decline as a manufacturing center reduced emissions (between 1954 and 1986 the proportion of Taiwan’s industrial workers based in Taipei fell by one-half to less than 8 percent), and city authorities have attempted to decrease vehicular traffic by building a mass transit rail system, which has been highly effective.

One dog snarls at a shadow; a hundred howl at each others barking.

一犬吠影，百犬吠声
Yi quan fei ying, bai quan fei sheng
Led by Hong Xiuquan (1814–1864), a frustrated candidate in the civil service examinations and the self-proclaimed younger brother of Christ, the Taiping Rebellion (1851–1864) seriously challenged China’s Qing dynasty and was the largest rebellion in Chinese history. Millions of lives were lost in the ensuing chaos.

The Taiping rebellion occurred in a period of unprecedented crisis, when the Qing dynasty (1644–1912) was plagued by an exploding population (the population tripled in two centuries to exceed 430 million by the 1850s) and challenges from Western powers that it could not meet, as evidenced in its defeat in the First Opium War (1839–1842).

Origins
From a peasant family of the Hakka ethnic group in a village close to Guangzhou (Canton) in southern China, Hong Xiuquan (1814–1864) was raised to pursue a career as a scholar-official. Having repeatedly failed to pass the civil service examinations in Guangzhou, Hong suffered an hallucinatory episode in 1837. A few years later, upon reading a set of Christian tracts, Quanshi Liangyan (Good Words for Exhorting the Age), which was compiled by a Chinese Christian, Hong made connections between Christian theology and his visions and was convinced that he was actually God’s second son, Jesus’s younger brother, and that he was sent to earth to expel devils, namely the Manchus (who ruled China during the Qing dynasty), from China.

Having baptized himself and a few friends and relatives, Hong began his evangelical mission in his hometown. Later, along with one of his converts, Feng Yunshan (1822–1852), Hong went to Guangxi after having lost his teaching post at the village school because of his Christian convictions. In the poverty-stricken Zijing Mountain area, Hong and Feng found enthusiastic adherents among poor peasants. A religious community was formed, which began secretly preparing for an armed uprising.

Early Stage (1851–1856)
In late 1850, Hong called for a rebellion against the Qing dynasty. He proclaimed the establishment of Taiping Tianguo (the Heavenly Kingdom of Great Peace) in January 1851 and declared himself the Heavenly King shortly after. The Taipings, as they become known in English, set up an elaborate military system in which men and women were segregated and submitted all their properties to a public treasury. They began to march north to the Yangzi (Chang) River valley in 1852. The Qing armies, which had not encountered such a fierce enemy for decades, failed to stop the advances of the spirited Taipings. In the spring of 1853, the Taipings, then in the hundreds of thousands, took Nanjing, a political and economic center in southeastern China. Hong made Nanjing his capital and renamed it Tianjing (Heavenly Capital).
After taking Nanjing, the Taipings moved quickly to expand their military victories. A northern expedition was dispatched to take Beijing, the capital of the Qing dynasty, and a western expedition was sent to take control of the middle Yangzi River valley and the areas surrounding Nanjing. Although the northern expedition failed, the Taipings were successful in expanding their territories in the middle and lower Yangzi River valleys. Administrative apparatuses were set up on the conquered territories, which combined military and civil functions. A utopian land program blueprinting equal distribution of land was promulgated. Many social and cultural reforms—including banning opium smoking, foot binding, and prostitution—were carried out. Repudiating Confucianism as the devil’s teaching, the Taipings adopted Hong’s version of Christianity as their official religion and used it as the basis for their civil service examinations, in which both men and women were encouraged to participate.

Intrigued by the Christian dimensions of the Taiping rebellion, Britain, France, and the United States sent envoys to Nanjing to investigate the new regime. Although the Westerners were deeply disappointed by the Taiping religion, which they thought was a great distortion of Christianity, and by the rebels’ lack of commitment to order and construction, the Western powers decided not to act against the Taipings immediately because they had not settled their conflicts with the Qing government. As a result, they adopted temporary neutrality toward the rebellion.

When the Taiping Rebellion reached its peak in 1856, fatal infighting occurred. Threatened by the swelling power of Yang Xiuqing (d. 1856), the de facto prime minister of the Taiping regime, Hong had him killed by another leader, Wei Changhui (1823–1856). Later Hong also had Wei killed. Tens of thousands of Taiping followers were slain in the incident. Feeling that he was no longer trusted, Shi Dakai (1831–1863), a talented general, led his army out of Nanjing and carried on an independent campaign against the Qing.

**Late Stage (1856–1864)**

The Taiping Rebellion was greatly weakened by the events of 1856 and the losing of much territory to the Qing armies in the wake of the infighting. Meanwhile, the Qing dynasty found a powerful force in suppressing the rebellion, the Xiang (Hunan) army led by Zeng Guofan.
Zeng commanded strong support among the gentry class by upholding Confucian values in countering the Taipings’ form of Christianity. Recruited exclusively from Zeng’s hometown in Hunan Province and highly paid and well trained, the soldiers of the Xiang army pushed the Taipings into a defensive position. Two new leaders and outstanding generals of the Taipings, Li Xiucheng (1823–1864) and Chen Yucheng (1837–1862), orchestrated a series of successful campaigns to break the impasse, advanced to eastern Jiangnan, and approached Shanghai, an important treaty port since the end of the First Opium War (1839–1842). Hong Xiuquan’s cousin, Hong Ren’gan (1822–1864), arrived in Nanjing after having stayed in Hong Kong for years, breathing new life into the waning regime by attempting to reform the Taiping political and economic systems by using Western models.

From 1856 to 1860, the Qing dynasty was engaged in the Second Opium War (also known as the Arrow War) with Britain and France. The conclusion of the war coincided with a change of leadership within the Qing dynasty. The new leaders, the Empress Dowager Cixi (1835–1908) and Prince Gong Yixin (1833–1898), effected a radical turn in foreign policy, becoming cooperative with the West, which encouraged the Western powers to side with the Qing dynasty in China’s civil war. In early 1862 Li Xiucheng attacked Shanghai again, triggering Western intervention. A foreign mercenary army, the “Ever-Victorious army,” headed first by Frederick Townsend Wade (1831–1862) of the United States and then by Charles George Gordon (1833–1885) of Britain, became the major agent of the Western intervention. After 1862, the Taipings retreated city by city under the joint attack of the Xiang army and the Ever-Victorious army. In June 1864 Hong Xiuquan died of illness. One month later the Xiang army captured Nanjing, which ended the Taiping Rebellion, even though the remaining Taiping forces continued to fight until 1868.

About 20 million lives were lost in the extensive warfare associated with the Taiping Rebellion and other rebellions of the period. One consequence of the rebellion was that the Qing government lost much of its power to the provincial authorities. Although Taiping Christianity failed to leave any lasting impact on Chinese society, its anti-Manchu nationalism was inherited by the anti-Qing revolutionaries, and its utopian egalitarianism was echoed in the Chinese Communist revolution in the twentieth century.

Taiwan (Republic of China)

Táiwān (Zhōnghuá mínguó)

台湾 (中华民国)

The economically dynamic island of Taiwan, officially known as the Republic of China, is considered by mainland China to be China’s twenty-third province. Most of Taiwan’s 22 million citizens prefer the status quo: de facto independence from the People’s Republic of China, but with ever-increasing economic and social ties to the mainland.

Taiwan, or as it is known by its official name, the Republic of China (Zhong-hua min-guo, in Mandarin), is a hot spot in today’s world politics. China insists that it is a renegade province of the mainland, while for more than four decades the island’s former ruling party, the Nationalists, (Kuomintang, KMT) insisted that the island was the true government of China in exile. After the Nationalists were defeated by the Democratic Progressive Party (DPP) in 2000, the DPP president, Chen Shui-bian, (in office 2000–2008) insisted that Taiwan was “independent” and tried repeatedly to get the United Nations and other international organizations including the World Health Organization to recognize it as a sovereign nation; Shui-bian’s claims and efforts infuriated China. Meanwhile, the United States, under the Taiwan Relations Act of 1979, is bound by Congress to defend Taiwan should China try to reunify with Taiwan by force; yet at the same time the U.S. government follows the line that “there is only one China and Taiwan is part of China,” which it first accepted when President Carter formalized diplomatic ties with the mainland in 1979.

Further complicating the matter is that the overwhelming majority of polls show that most of Taiwan’s 22 million citizens prefer the status quo—that is, de facto independence yet with increasing economic and cultural ties to mainland China—regardless of their leaders’ rhetoric.

Geographically, Taiwan is quite small, comprising 13,977 square miles of islands (36,000 square kilometers; about half the size of Ireland, with five times the population), including the main island of Taiwan, Penghu Islands (the Pescadores), Quemoy and Matsu, which are the two closest islands to China, and a few other minor islands, some located in the South China Sea. At its closest, the island of Taiwan is a mere hundred miles from the Chinese coast.

The main island of Taiwan is composed of high mountain ranges running from the northeast to the southern tip. In addition to the central range there are volcanic mountains, foothills, terrace tablelands, coastal plains, and basins. The climate is subtropical.

During the Ming dynasty (1368–1644) Taiwan was added to the Chinese empire, and Han Chinese, many from nearby Fujian Province, began to migrate to the island during the fifteenth and sixteenth centuries. Before that time, the island had been the home to an estimated eleven aboriginal tribes. During this time, Chinese and Japanese pirates also began to set up residences on the island and turn it into their base.

By 1624 there were some 30,000 Chinese settlers on
the island when the Dutch invaded. The Dutch newcomers promptly set up a trading post. Two years later, Spaniards landed at Keelung and occupied the northern coast. But the Dutch drove the Spaniards out in 1641.

In 1661, after the Ming dynasty was overthrown by the Manchus in China, a Ming general, Cheng Cheng-kung (known in the West as Koxinga), took over the island of Taiwan to use as a base from which to attack the Manchus with the goal of restoring the Ming dynasty. However, the Manchus defeated the Ming exiles in 1683 and Taiwan was made into a prefecture of Fujian Province. In 1886 Taiwan was officially named a full province under the Qing dynasty (1644–1912), which was established by the Manchus.

China's claim to Taiwan grew murkier as the Qing dynasty weakened in power under the attack of Western and Japanese military forces. After the First Sino-Japanese War (1894–1985) the Manchus were forced to cede Taiwan to Japan. But at the end of World War II Japan was forced to return all the lands it tried to take over from China back to the Chinese government, and so Taiwan was returned to Chiang Kai-shek's Nationalist-controlled government, that is, the Republic of China, on 25 October 1945. Taiwan thus again became a province of China.

A civil war between Chiang's Nationalist forces and Mao Zedong's Communist-led People's Liberation Army soon broke out (1945–1949). Mao defeated Chiang's forces in 1949, establishing the People's Republic of China (PRC) on 1 October 1949 in Beijing. Meanwhile, Chiang, along with some two million Chinese, reestablished his Nationalist-controlled Republic of China on Taiwan. Mao was poised to take over Taiwan in 1950, when the Korean War broke out and the U.S. government decided to intervene in the Chinese conflict. In an attempt to stop the spread of Communism in Asia, President Truman sent the Seventh Fleet to the Taiwan Straits, and thus prevented Mao from absorbing Taiwan into the PRC. From then on, the United States assumed the defense of Taiwan and helped Chiang to build up Taiwan into a modern and prosperous independent state with $5.7 billion worth of aid between 1950 and 1965, as well as with modern military equipment.

From 1949 until his death in 1975, Chiang Kai-shek always insisted that the Republic of China on Taiwan was the true government of China and that the island was a mere base that he intended to use to retake the mainland from the Communists. As a result, he tolerated no political dissent and established martial law on the island. After his death Chiang's son Chiang Ching-kuo assumed the presidency (1978–1988) and began to liberalize some of his father's policies, easing up on restrictions that forbade all contact between Taiwanese and their families back on the mainland, for example. But both Chiangs insisted that Taiwan was a part of China and never saw the island as an independent nation.

After Chiang Ching-kuo died in 1988, a new era opened in Taiwanese politics. Many political parties formed and democratic elections were held. Although the first Taiwanese-born president, Lee Teng-hui (in office 1988–2000), was a member of the KMT party, he broke with the Chiangs' tradition and refused to acknowledge that Taiwan was a part of China. The next president, Democratic People's Party (DPP) member Chen Shui-bian (in office 2000–2008), went so far as to call for Taiwan's official independence and even tried to push a referendum in the 2008 presidential election to use the name "Taiwan" rather than the "Republic of China" in order to seek admission to the United Nations, which Taiwan has not been a member of since 1971.

Currently the Taiwanese people have shown they do not want to provoke China into an all-out war by declaring independence. Chen Shui-bian's party, the DPP, was defeated in the 2008 legislative election by the KMT (and
The “One-China” Policy

The issue of cross-strait relations (that is, the relationship between mainland China and the island of Taiwan) has reverberated in the global community since the People’s Republic of China was founded in 1949. Whether and how Taiwan should be included in various international bodies, from the International Olympic Committee to the World Health Organization, has been one source of disagreement. This text comes from a statement issued by the [mainland] Chinese National People’s Congress in the 1990s:

U.S. President Bill Clinton recently signed two bills passed by the House of Representatives and the Senate: one is supportive of Taiwan’s participation in the World Health Organization (WHO) and the other, the Omnibus Appropriations Act, contains clauses showing such support, in an attempt to help Taiwan squeeze into international organizations where statehood is a prerequisite.

The act of the U.S. Congress and Administration wantonly violates the three Sino-U.S. joint communiqués, severely infringes upon China’s sovereignty, brutally interferes in China’s internal affairs, and tramples on the basic norms governing international relations, and for this we express our utmost indignation and strong opposition.

Taiwan is but a province of China no matter how Lee Teng-hui tries to blur this. This fact is universally recognized by the international community including the United States.

As part of China, Taiwan is not qualified nor entitled to participate in any international organization that only sovereign countries can enter. This is a most basic principle guiding international relations that nobody can negate.

The U.S. leaders and administration have repeatedly and openly stated their adherence to the “one-China” policy, and even after Lee Teng-hui started to advocate his “Two-States” remarks in an attempt to split the motherland, they again clearly promised not to support “Taiwan independence,” not to support “two-Chinas” or “one China, one Taiwan,” and not to support Taiwan to enter into any international organization that only sovereign countries can enter. However, the U.S. government so quickly went back on its words and, regardless of the universally-recognized international law and basic norms governing international relations, openly came out to support Taiwan in “participating” in the WHO that only sovereign countries can enter, trying to bolster the Taiwan authorities in their attempt to create “two-Chinas” or “one China, one Taiwan,” and to lay obstacles for China’s reunification cause.

The Taiwan issue is the most essential and most sensitive at the core of Sino-U.S. relations. The governments and leaders of the two countries have a consensus understanding of this. The Taiwan issue is a matter concerning China’s national sovereignty and territorial integrity, from which the Chinese people will never retreat.

Further Reading

The “Taiwan economic miracle” is the island’s rapid economic growth of the last forty years. Most scholars credited the surge to implementing neoliberal principles of a free-market economy.

Since 1962 the economic growth of Taiwan has been impressive. In 1962 Taiwan had a per capita gross national product (GNP) of just $170, placing the island’s economy between those of Zaire and Congo. By 2002 Taiwan’s per capita GNP, adjusted for purchasing power parity, had soared to $22,760, contributing to a human development index similar to that of the wealthy Asian nations of South Korea and Singapore. Business and scholarly communities recognize this economic achievement, with Taiwan often being touted as the prime example of growth with equity. In both Taiwan and abroad this rapid economic growth was called the “Taiwan economic miracle” and in Taiwan was usually associated with the ruling Chinese Nationalist Party (Kuomintang, KMT) and its adherents.

Most economic scholars attributed Taiwan’s economic growth to the implementation of neoliberal free-market economic principles. Others emphasized the role of KMT policy as leading to a developmentalist state. Still others argued that Taiwan’s economic miracle was the result of a Chinese Confucian culture that stresses family values, education, and an industrious work ethic. In all of its variations the Taiwan economic miracle justified KMT rule of Taiwan through depiction of the island as the embodiment of bureaucratic efficiency, capitalist productivity, and Chinese tradition. The ideology of the miracle linked capitalistic development with nationalist...
sentiment, making opposition to capitalism seem unpatriotic and non-Chinese.

But after martial law was lifted in 1987 both Taiwanese and Western scholars questioned the ideology of the Taiwan economic miracle. Some scholars noted that Taiwan’s phenomenal economic growth actually had begun under Japanese occupation of the island. Some pointed out the influence of U.S. aid on Taiwan, which contributed greatly to Taiwan’s gross domestic product during the Cold War of the 1950s and 1960s and opened up the U.S. market to Taiwanese products. These historical arguments were usually identified in Taiwan with the DPP (Democratic Progressive Party).

Some scholars looked beyond the miracle at problems such as the evolution of economic classes, ethnic divisions in Taiwanese society, and the environmental destruction wrought by rapid industrialization. Within Taiwan the feminist and labor movements most vocally criticized the nationalist implications of the ideology. After all, if people believe that hard work is a Taiwanese national characteristic and a reason for the economic miracle, for example, it is difficult for unions to advocate a forty-hour work week. Therefore the ideology has had largely a conservative influence on society, creating greater adherence to the KMT and inhibiting the growth of progressive political movements in Taiwan. In the 2008 presidential elections KMT candidate Ma Ying-jeou capitalized on this theme, promising a return to rapid economic growth if the KMT were reelected. He won in a historic landslide vote. In 2008, however, a global financial crisis led to economic slowdown and a drop in the Taipei stock market, disappointing some of Ma’s supporters and leading others to place hope in closer relations with the People’s Republic of China.

Taiwan Strait
(Cross-Strait Relations)

Táiwān Hǎixiá 台湾海峡

“Taiwan Strait” is political shorthand for relations between mainland China and the breakaway (as China sees it) island of Taiwan (officially known as the Republic of China), as well as the name of the actual body of water separating the two nations.

“Taiwan Strait” has become the shorthand political term for the gulf in relations between the government on Taiwan and that on mainland China, as well as attempts to bridge that gulf. Technically the Strait is the body of water—a mere 160 kilometers at its narrowest—that separates the island of Taiwan from the mainland. “Cross-Strait Relations” is the Chinese media term used to describe interactions between Taiwan and China.

Over the years Cross-Strait Relations have undergone many phases, from armed conflict to periods of negotiation. After the civil war ended in China in 1949, the losing Nationalist Party (Kuomintang, KMT) and its leader, Chiang Kai-shek, fled the mainland to the island to re-establish the Republic of China under U.S. protection. Some 2 million refugees from the mainland also fled the Communist regime to live on Taiwan. During Chiang’s reign, he actively campaigned to retake the mainland from his base on Taiwan, and even sent military missions across the Strait to attack mainland sites. He forbade all contact between the citizens of Taiwan and family members on the mainland.

Taiwanese politics changed dramatically after Chiang Kai-shek and his son and successor, Chiang Ching-kuo, died, in 1975 and 1988 respectively. Taiwanese natives succeeded them, first President Lee Teng-hui and then President Chen Shui-bian, both of whom were determined to create a new Taiwan with its own identity, separate from China. Lee was less radical and more cautious in his dealings with China. For example, he established a National Unification Council on 23 February 1991. Lee also established a semi-official body, the Strait Exchange Foundation (SEF) to make direct contact with China’s Association for Relations Across the Taiwan Straits (ARATS). During Lee’s administration, millions of Taiwanese were permitted to visit China, invest in businesses on the mainland, and establish permanent residences in China. Trade prospered, especially for the Taiwanese. Chen, on the other hand, wanted nothing to do with China and actively promoted a pro-independence political agenda. Relations deteriorated, Taiwan’s economy suffered, and at times it seemed that military conflict was imminent.

President Ma Ying-jeou (elected 2008) promoted the idea of closer ties with the mainland in his campaign and insisted there would be no war with China. After his inauguration, he immediately began encouraging the most open trade policies and travel arrangements for mainland and Taiwanese citizens across the Strait since 1949; direct flights from Beijing to Taipei resumed in July 2008.

Cross-Strait relations, however, still pose security issues for both U.S. and Japanese regional security strategies. Many American conservative and “neo-con” groups do not want to see closer ties between Taiwan, a democracy, and the nondemocratic People’s Republic of China. As for the Japanese, some politicians fear the implications
of Taiwan-China integration, either in economic or political terms, as they feel it threatens Japan's position of power in East Asia. Also, Japan's industries rely almost completely on overseas energy sources, which must pass through the Taiwan Strait and which Japan does not want to see fall into China's hands; nor does Japan want China to be able to control Japan's energy resources. Thus the political atmosphere surrounding the Taiwan Strait will continue to be an issue fraught with tension in the twenty-first century. China is planning to build a tunnel to connect the mainland with Taiwan in twenty years. This Chinese version of the Chunnel (the tunnel under the English Channel connecting England and France) may bring increased economic cultural ties or increased conflicts.

Even more recently, cross-straight relations have been improved by increasing dialogue and the election of more unification-minded politicians in Taiwan. Limited direct flights and trade has resumed between the island and the mainland, and political exchanges are reaching new heights of cooperation and conciliation.

Taiwan–China Relations

Liǎngàn guānxi 两岸关系

Relations between the island of Taiwan (the Republic of China) and its giant neighbor across the Taiwan Strait, mainland China (the People’s Republic of China, which considers the island a breakaway province), stretch back thousands of years and continue to evolve to this day.

Taiwan’s first residents, who make up the island’s aboriginal tribes, migrated to the island about six thousand years ago and are related to ethnic groups from southern China, Southeast Asia, and the Philippines. They now constitute just over 1 percent of the total population. Although Taiwan appeared in Chinese historical records before the Han dynasty (206 BCE–220 CE), the colonization of Taiwan by Chinese settlers began only in 610 CE, during the Sui dynasty (581–618 CE). The next large migration of Chinese to Taiwan started in the twelfth century. During the Ming dynasty (1368–1644), many Chinese settlers in Taiwan were ordered to return to the Chinese mainland by imperial edicts. But Chinese pioneers managed to continue to migrate to Taiwan in spite of the imperial prohibition. Soon Taiwan became a base from which Japanese and Taiwanese pirates attacked shipping in the South China seas.

Europeans also began to arrive on Taiwan. In 1590 Portuguese sailors landed on the main island and named it “ilha Formosa,” meaning “beautiful island.” Formosa remained the name by which Europeans knew Taiwan for centuries. In 1624 the Dutch invaded and occupied the main island. Two years later, the Spanish landed at Keelung, a northern port; they controlled Taiwan’s coastal areas for two years. They were finally driven out by the Dutch in 1641.

In 1661, the Ming-dynasty general Zheng Chenggong (1624–1662), known to the West as Koxinga, took Taiwan from the Dutch and established an exiled Ming government in Anping (Tainan) in southern Taiwan. The Ming dynasty was overthrown by the Manchus (Qing dynasty, 1644–1912) on the Chinese mainland, but Zheng’s son ruled Taiwan with a large number of Chinese followers until the Manchus finally took Taiwan in 1683. By then, Taiwan’s population had exceeded 2.5 million, most of them from China’s Fujian and Guangdong provinces.

By the nineteenth century, China was experiencing economic difficulties and political chaos. Western countries controlled territory along the eastern seaboard. At the end of the first Sino-Japanese War in 1895, Taiwan was ceded to Japan. Japan began its colonization of Taiwan and used it as a major military base for fifty years until the end of World War II.

Relations under the Two Chiangs

In 1911, the Qing dynasty on the Chinese mainland was overthrown by a nationalist revolution (the Qing emperor did not abdicate until February 1912) spearheaded by the Guomindang (on Taiwan, Kuomintang) under the leadership of Sun Yat-sen (1866–1925) and Chiang Kai-
The International Olympic Committee invited both the PRC and Taiwan to participate in the 1952 Helsinki Games; Taiwan withdrew in protest, stating that it could not "compete with Communist bandits on the same sports field."
mainland radio broadcasts, or even receiving mail from friends or relatives still living on the mainland.

After the death of Chiang Kai-shek on 5 April 1975, the real power in Taiwan fell into the hands of his son, Chiang Ching-kuo (1910–1988), who was formally elected to the presidency in May 1978. Like his father, he absolutely opposed any demand for Taiwan’s independence. Both Chiangs believed that Taiwan was a base from which the Kuomintang, and thus the ROC, could regain control of the mainland. To the two Chiangs, Taiwan was part of China, period.

However, Chiang Ching-kuo took significant steps to relax tensions with the Communist mainland government. For example, he permitted indirect trade and contacts with the mainland by Taiwan’s residents. He was prepared to begin negotiations with the Communist government shortly after lifting the travel ban in October 1987, but before direct negotiations could begin, he died of cardiac and pulmonary failure on 13 January 1988.

**Relations under the Native Taiwanese Leaders**

The death of Chiang Ching-kuo opened a new era in Taiwanese politics. A native-born Taiwanese, Lee Teng-hui, succeeded him in 1988. Since then Taiwan has become a more democratic and pluralistic society. In addition to the Kuomintang, another major political party, the DPP (Democratic Progressive Party) is gaining considerable support among Taiwanese voters.

At first Lee Teng-hui continued his predecessor’s open door policy toward the Chinese mainland. Lee established the National Unification Council under the auspices of the President’s Office (the White House of Taiwan). In February 1991 the council adopted “Guidelines for National Unification,” which outlines three phases of unification: Short term (exchange and reciprocity), middle term (trust and cooperation), and long term (consultation and unification). However, Lee refused to set a timetable for the implementation of the guidelines.

Lee Teng-hui also authorized the establishment of a semi-official “Strait Exchange Foundation” (SEF) to make direct contact with the Chinese mainland’s counterpart organization, the “Association for Relations Across the Taiwan Straits” (ARATS).

The Chinese Communists have always maintained that Taiwan is a Chinese province and must be reunited with the mainland. Their plans to achieve that goal have varied. Before 1978, the official policy was to use military force. In 1978 the third plenum of the Eleventh Chinese Communist Party Congress adopted a new resolution calling for “peaceful reunification” with Taiwan. Beginning in 1983, the late Chinese leader Deng Xiaoping (1904–1997) made a number of concessions to Taiwan, and in early 1984 China offered a proposal that would take into account Taiwan’s political and economic concerns: The “one country, two systems” proposal. “One country, two systems” continued to be China’s official policy under Jiang Zemin (b. 1926) and Hu Jintao (b. 1942).

Lee Teng-hui visited the United States in 1995 to give a speech at his alma mater, Cornell University. No Taiwanese top official had set foot on U.S. soil since the United States recognized the PRC in 1979. China feared Lee’s visit indicated a move toward independence and would lead to recognition of Taiwan as a state by the world community. As a result, China conducted military exercises across the Taiwan Strait involving 400,000 troops. By 1996 four Chinese missiles had been fired within approximately fifty-one kilometers of the island state. During that tense period, the United States dispatched two nuclear-armed aircraft carrier groups into the area. Ultimately, China concluded its military exercises...

Relations between China and Taiwan have become extremely tense again since July 1999. At that time Lee Teng-hui introduced a new element by insisting that negotiations must be based on a “special state-to-state” relationship. As a result, China published a white paper, “The One-China Principle and the Taiwan Issue” on 21 February 2000, in which it declared that they “cannot allow the resolution of Taiwan issue to be postponed indefinitely.”

A political earthquake erupted in Taiwan on 18 March 2000, when Taiwanese voters elected a pro-independence DPP candidate, Chen Shui-bian (b. 1950), as president of Taiwan with 39 percent of the votes in a three-way race. China demanded that Chen accept the “one-China” principle based upon an agreement made by Lee Teng-hui’s SEF and China’s ARATS representatives, who in June 1992 came to a “consensus” (known as the 92 Consensus) that both sides accepted the principle of “one China” but with different interpretations of which side represented that one China. However, Chen instead began to promote
a policy of “Taiwanization” within the island while advocating independence in the international community. China reacted with its own anti-Chen and anti-Taiwan policies, passing an anti-secessionist law and installing hundreds of missiles across the Taiwan Strait.

Upon taking office, U.S. president George W. Bush was a strong supporter of Chen and Taiwan. He publicly announced on 26 April 2001, that he would do whatever it took to defend Taiwan. He also approved the sale of a large weapon system to Taiwan.

However, as Chen began his second term in 2004 (which he won in a much disputed election) the U.S. found Chen to be untrustworthy and no longer a “faithful ally” and worried that Chen wanted to start a war between the U.S. and China. Meanwhile, Taiwan’s economy deteriorated under Chen’s administration.

Chen’s DPP originally had offered itself as a “fresh” alternative to the KMT, which had become infamous for its corruption, known as “black gold politics.” After eight years in power, Chen and his DPP had themselves become notorious for their own brand of corruption. Many of Chen’s officials were indicted, including Chen’s son-in-law and Chen’s wife. Chen himself avoided prosecution only because of the immunity afforded the sitting President.

Taiwanese voters on 12 January 2008 ousted Chen’s DPP and returned the old KMT to power with 81 of a total of 113 seats in the legislature. Chen’s presidential successor was the KMT candidate, Ma Ying-jeou, who won a resounding victory over the DPP candidate. Both the U.S. and China welcomed Ma’s victory. President Bush personally called Ma to congratulate him. Chinese President Hu Jintao invited Ma’s vice-president-elect Vincent Siew to meet with him at the April 2008 Boao Forum for Asia in Hainan, China.

Taiwan’s SEF and China’s ARATS met and signed several agreements including the resumption of direct flights between China and Taiwan, and the arrival of Chinese tourists and officials in Taiwan.

### Future Prospects

The victories of the KMT in Taiwan’s 2008 elections will undoubtedly change the dynamics in U.S.-China-Taiwan relations for years to come. Ma pledged not to declare independence and to accept the “one China” principle under the 92 Consensus. Ma also pledged to Taiwanese voters that he would not seek reunification with China during his presidency. However, he welcomed better and peaceful relations with China and invited China’s investments on the island itself.

China, too, promised cooperation during Ma’s tenure, including a continuation of its favorable economic policy toward Taiwan, which gives Taiwan a considerable trade surplus. Both sides expressed the desire to create an interdependent and harmonious environment for the twenty-first century.

The Taklimakan Desert, the world’s second-largest sand desert, is located in the southern part of the Xinjiang Uygur Autonomous Region in northwestern China. The desert covers 338,000 square kilometers (nearly the size of Greece) and is one of the farthest places on earth from the sea. At its lowest point the desert is 154 meters below sea level.

About 85 percent of the desert consists of shifting sand dunes, averaging 100-150 meters in height, whereas dunes in the western parts average only 5-25 meters in height. The desert has a temperate climate and low precipitation of less than 50 millimeters annually. The Taklimakan Desert constitutes the central part of the Tarim Basin, which in the western part rises to 1,560 meters above sea level. The basin is partly surrounded by mountains that rise more than 6,000 meters above sea level. In the north the desert borders on the Tian Shan (Celestial Mountains) range, and in the west and the south it borders on the Kunlun and Altun Mountains. Glacial streams from the mountains run far into the desert, where they disappear into the sands or evaporate. Poplar and tamarisk trees grow along the riverbeds.

The Silk Roads—a network of trade routes that connected Asia with the Mediterranean area—traversed the Taklimakan desert in two routes: a northern route, which ran along the northern edge of the desert, and a southern route along the southern edge. A few oasis towns exist along the Hotan River, which also is the main route across the desert from south to north. Since the 1980s large oil fields have been exploited, and in the 1990s more than 500 kilometers of roads were constructed for the oil industry.
There are small populations of the critically endangered wild Bactrian camel (*Camelus ferus*) found in the Taklimakan. There are an estimated 600 individuals surviving in China in three separate pockets (the largest of which is the Taklimakan) and 350 in Mongolia. The rare Asian wild ass (*Equus hemionus*) also is to be found.

The Tang dynasty (618–907 CE) was a golden age of imperial China. Buddhism developed; poetry flourished; money drafts were invented. Political, legal, cultural, and economic developments of the Tang dynasty influenced later dynasties.

The Tang dynasty (618–907 CE), founded by Li Yuan (also known by his temple name “Gaozu,” reigned 618–626), marked one of the most glorious periods in China’s history. After the short-lived Sui dynasty (581–618 CE) the Tang dynasty ruled China for almost three centuries, governing one of the most successful empires in the world at the time. With its government institutions, cultural achievements, legal establishments, economic developments, and territorial expansions the Tang dynasty exerted significant influence on later Chinese dynasties and defined the identity of Chinese civilization.

Dynastic Politics

Li Yuan, who inherited the title of dynastic duke of Tang during the Sui dynasty, was a member of a northern aristocratic family who had intermarried with the ethnic minority Xianbei tribal aristocracy. When the Sui dynasty collapsed in 617, Li seized the Sui capital Chang’an and ascended the throne in 618, thus founding the Tang dynasty.

During Gaozu’s reign the Tang dynasty expanded and consolidated the empire and established various institutions. Gaozu’s armies defeated several major rivals and completed the pacification of the country in 624. Gaozu basically continued the administrative institutions of the Sui dynasty. In the central government three agencies reported to the emperor (the Secretariat, the Chancellery, and the Department of State Affairs, which were collectively known as the “Three Departments”). They served as the administrative core. Local administration consisted of two tiers: the inferior district and the superior prefecture. The military system of garrison militia (fubing) combined agricultural and military duties. Gaozu revived the civil service examination system to recruit government officials on the basis of merit, although aristocrats continued to be influential in dynastic politics.

Like that of the Sui, the Tang legal system consisted of four major components: the Code, Statutes, Regulations, and Ordinances, which not only laid the foundation for later dynasties of imperial China but also influenced the legal systems of Japan, Korea, and Vietnam.

Gaozu’s second son Li Shimin (temple name “Taizong,” reigned 626–649) took the throne in a military coup. Taizong’s reign, traditionally known as the “era of good government,” was one of close personal interaction between the ruler and his Confucian advisers. Generally, Taizong developed and refined the policies of his father’s reign, including revision of the law codes and expansion of the civil service examination system. He made particular efforts to balance the political influence of the regional aristocratic groups and to uphold the preeminent position of his own clan, the Li. In foreign affairs Taizong subdued...
the eastern Turks and began to expand Chinese power in central Asia.

The Rise of Empress Wu

Taizong’s ninth son, Li Zhi (temple name “Gaozong,” reigned 649–683) ascended the throne at the age of twenty-one. In the early years of his reign Gaozong relied on advice from the statesmen of his father’s court and continued some reform programs. Gradually, however, Gaozong’s court came to be dominated by Wu Zhao (627–710, reigned 690–705), one of the most remarkable women in Chinese history. Born into a merchant family, Wu Zhao had been a low-ranking concubine of Taizong who managed to become Gaozong’s legitimate empress in 655. In 660, when Gaozong suffered a stroke, the empress took charge of the central government. Over the next twenty years, while Empress Wu continued many of the policies of the former Tang rulers, she initiated some practices to consolidate her position. For instance, she designated Luoyang as a second capital in 657 and took up permanent residence there in 683, thus removing the political center from the base area of the northwestern aristocracy. Empress Wu also encouraged lower ranks of bureaucracy by creating new posts, providing more opportunities for advancement, and increasing salaries. In order to promote the legitimacy of the dynasty, Empress Wu revived the ancient feng and shan sacrifices on Mount Tai (Taishan), the eastern holy peak in present-day Shandong Province, and patronized Buddhism.

Under Gaozong and Empress Wu the Chinese continued their efforts to extend and consolidate the empire. By 661 they had defeated the western Turks and established a Chinese protectorate in the western regions. But the Chinese faced serious threats from Tibet. By the early seventh century Tibet had emerged as a unified state. Although Tibet became China’s tributary state under Songtsen Gampo (reigned 620–649), the Tibetans exerted constant pressure on present-day Qinghai and Sichuan provinces. After Gaozong died in 683, Empress Wu, now the empress dowager, took control of the imperial succession and purged her opponents at court by means of terror and a secret police force. In 690 she ascended the throne and proclaimed a new dynasty, sometimes referred to as the second Zhou period (690 to 705). Empress Wu then formally became an “emperor,” the only woman sovereign in China’s history. Some senior officials at court forced her to abdicate in 705 and restored the Tang dynasty.

Li Longji (temple name “Xuanzong,” reigned 712–756) took the throne by means of a series of political intrigues. The early years of his reign were the heyday of the Tang dynasty, a time of institutional progress, economic prosperity, and cultural flowering. The most important change occurred in the military. In the early Tang dynasty troops were organized through the fubing militia system, under which men of agricultural households served in the army on a rotation basis. Such a system proved inadequate to defend the empire against threats from the highly mobile nomadic horsemen of the frontiers. Xuanzong’s reign brought the development of professional soldiers who settled permanently in military colonies and a consequent growth of the military commanders’ power. In the 740s some non-Chinese governors were appointed to take charge of certain strategic military domains, among whom An Lushan, a professional soldier of Sogdian and Turkish ethnic background, rose to prominence and later led a rebellion.

Under Xuanzong the aristocracy reasserted its political dominance. Although under Empress Wu and in the early years of Xuanzong’s government many chief ministers had obtained their positions by passing the civil service examinations, after the year 720 men of aristocratic origins increasingly received appointments. What complicated court politics more was that from the 740s, the emperor refused to take an active interest in government affairs, being taken up by the charms of his concubine Yang Guifei, one of the most famous beauties in Chinese history. Those close to the emperor strove to become the power behind the throne; among them was An Lushan, who rebelled against the Tang dynasty in 755.

An Lushan’s Rebellion

The An Lushan rebellion (755–763) marked a turning point in the history of the Tang dynasty and indeed nearly destroyed the dynasty. The rebel troops seized the Tang capitals Luoyang and Chang’an and controlled most of north China. Xuanzong fled to Sichuan Province. Although An Lushan was assassinated by a subordinate in 757, the rebellion continued for six more years.
Eunuchs

Although the rebellion was put down, the Chinese lost their grip on many frontier areas, including the western regions. Within the Tang empire the political authority of the central government declined. Some northern regions became virtually autonomous, and other regions fell under the control of military governors who enjoyed enormous power in both military and civil matters. Under Xianzong (reigned 805–820) the Tang court regained a great deal of control over the powerful provinces and put down several major rebellions in Sichuan Province, the Yangzi (Chang) River delta, Hebei Province, and Shandong Province. Xianzong's success, however, to a great extent was based on the loyalty of his eunuchs, who controlled the dynasty's elite palace armies and supervised the provincial administrations. Eunuchs began to play an increasing role in Tang politics under Daizong (reigned 762–779). They murdered Xianzong and determined the succession of most subsequent young emperors. Although Wuzong (reigned 841–846) temporarily revived the fortunes of the dynasty by imposing some restrictions on the eunuchs’ power, Yizong’s reign (859–873) brought a resurgence of their influence at court.

During the last several decades of the Tang dynasty severe floods and drought, as well as political chaos and foreign threats, caused suffering and turmoil. In 874 a wave of peasant rebellions broke out; their leader, Huang Chao (d. 884), took Luoyang in 880 and Chang’an in 881. Although the rebel forces were finally suppressed, and the Tang court returned to Chang’an, the dynasty was left powerless. Most parts of the empire were either occupied by non-Chinese forces or controlled by rival military leaders. In 907 the warlord Zhu Wen ended the Tang dynasty and established his own Liang dynasty at the beginning of the Five Dynasties period (907–960).

Economic Prosperity

The Tang dynasty enjoyed economic prosperity. Under Gaozu the government undertook a land distribution policy known as the “equal-field system.” This system had been used during the northern dynasties and under the Sui dynasty; it granted peasants a certain amount of land, in return for which they paid taxes in grain, cloth, and labor on public works projects. This land and tax system remained in force until An Lushan’s rebellion. Gaozu also established mints and issued a new currency that remained standard throughout the Tang dynasty. The Grand Canal, an extensive system of waterways that was constructed during the Sui dynasty to link wealthy south China with the Huang (Yellow) River valley, facilitated the Tang economic transactions as well as political stability.

The Tang dynasty was cosmopolitan and open to foreign influence. About 2 million people lived in the capital Chang’an, the most populous city in the world at that time. A variety of foreign goods was displayed in the marketplaces of the major cities, where Chinese mingled with people from other Asian countries, including Japan, Korea, and India. Foreigners not only came to trade and study but also served as grooms, entertainers, dancers, and musicians. Some foreign customs, such as playing polo, became fashionable.

The social structure of the Tang dynasty changed significantly after An Lushan's rebellion. With the decline of the aristocracy the ruling class obtained its political power more from education and possession of landed property than from birth alone. When the equal-field land distribution system collapsed, many peasants disposed of their lands and, on the basis of formal contracts, became tenants or hired laborers of the rich. Local elites seized opportunities to establish large, landed estates that were managed by bailiffs and cultivated by tenants, hired workers, or slaves.

After the mid-750s the old taxation system ceased to function. During Dezong’s reign (779–805) the chief minister, Yang Yan, applied a new two-tax system generally to the empire. This system combined various taxes into a single tax, which was to be paid, in the summer and autumn, on the basis of the value of property instead of the number of household members. This taxation system generated revenues for the Tang dynasty and remained China’s basic tax structure until the sixteenth century.

The late Tang dynasty also brought important demographic changes. By 742, according to an official population survey, about 9 million households or more than 50 million registered individuals lived in the empire. Because of factors such as warfare and natural disasters, the population in the north declined dramatically, and more
and more people migrated to the lower Yangzi River valley and into Zhejiang Province.

Despite political instability the economy continued to grow in the late Tang dynasty. The population movements to the south promoted the agricultural expansion in the more fertile and productive lands of the country. New crops such as tea, sugar, and new varieties of grain were developed, and the double-cropping of land with rice and winter wheat produced greater quantities of foods. Silk production also increased rapidly in the Yangzi River delta region. The merchant class enjoyed legal freedom to engage in business and became prosperous by dealing in salt, tea, banking, and overseas trade. In addition to the two great markets in Chang’an and Luoyang, large markets appeared in local areas, and the local markets facilitated the development of new urban centers. The increased volume of trade brought an increasing use of money, particularly privately circulated silver, and credit and banking institutions began to emerge. To facilitate commercial transactions, in 811 money drafts were invented.

**Buddhism Develops**

One of the most dramatic cultural achievements of the Tang dynasty was the development of Buddhism. Although members of the Tang court gave their preference to Daoism because of the claim that they were descended from Laozi, the legendary founder of the belief system, they also recognized the strength of Buddhism and provided it with great favor and patronage through most of the period. The famous pilgrim Xuanzang (602?–664) went to India in 629 and returned in 645 with a large number of Buddhist sutras (precepts summarizing Vedic teaching). During the Tang dynasty Buddhist doctrine became sinicized, and Chinese indigenous Buddhist schools emerged. Three were most prominent. The Pure Land (Jingtu) school believed that salvation, or rebirth in the Pure Land, could be attained by chanting the Buddha’s name. The Celestial Terrace (Tiantai) school, named after a famous monastery, emphasized synthesis and harmony of all Buddhist teachings. The Meditation (Chan) school stressed intuitive enlightenment through
meditation. Buddhist monasteries, free of obligations to the state, acquired great wealth by accepting gifts and conducting business. These communities, however, often encountered criticism from Confucianists and Daoists because of intellectual rivalry and because all these belief systems competed for economic resources from the government. From 843 to 845 the pro-Daoist emperor Wuzong persecuted Buddhism; during that period some 4,600 monasteries and 40,000 shrines and temples were destroyed, 260,000 monks and nuns were returned to lay status, and much monastic land was confiscated and sold. This suppression marked the beginning of Buddhism’s decline in China.

Other intellectual currents also developed in the Tang dynasty. Because Confucianism offered political theories and institutional rules to build the centralized empire, the court promoted its spread, particularly through the civil service examinations. During the late Tang dynasty the prominent writer Han Yu (768–824), while attacking Buddhism, emphasized the revival of the orthodox Confucianism, which influenced the development of neo-Confucianism during the Song dynasty (960–1279). Zoroastrianism, Islam, and Nestorian Christianity also entered China.

During the Tang dynasty many fields of art flourished. Poetry reached its golden age. About three thousand Tang poets are known to us today, among whom Li Bai (701–762) and Du Fu (712–770) are perhaps the most prominent. The essayists Han Yu (768–824) and Liu Zongyuan (773–819) promoted the “ancient style of prose” (guwen) movement to reform literature. The Tang dynasty also included the first serious attempts to write short stories. Both Buddhist and secular sculpture flourished. Artisans created large monumental sculptures in Buddhist rock-cave temples and small metal images of the Buddha and bodhisattvas (beings that refrain from entering nirvana in order to save others and that are worshipped as deities in Mahayana Buddhism). The six relief sculptures of Taizong’s battle horses that guarded his tomb represented the masterpieces of the secular sculpture of the age. The frescoes at the caves of Dunhuang synthesized the cultural themes and artistic styles of China, India, and central Asian countries. Under the Tang dynasty wood-block printing also developed.

Legacy of the Golden Age

The Tang dynasty represented the golden age of China’s imperial times. The early Tang dynasty epitomized Chinese civilization to that point in time; the late Tang dynasty initiated reforms that had long-lasting effects on later dynasties. The extensive and unified empire strengthened a political ideology of “great unity.” Its achievements in political institutions and religion attracted a great number of foreign students to study and had far-reaching influences on neighboring countries. Japan, for example, learned from the Tang dynasty the imperial institutions, bureaucracy, law codes, written language, Confucianism, Buddhism, literature, art, and architecture. The economic prosperity in the Tang dynasty promoted international trade, which in turn promoted cultural exchange between Chinese and other peoples. The technology of making paper, for instance, was transmitted to the West during the Tang dynasty. The Tang dynasty was so influential on Chinese culture that present-day overseas Chinese call Chinatowns Tangren jie (streets of the Tang people).

Emperor Taizong of the Tang dynasty was a benevolent ruler who created perhaps the greatest administration in Chinese history. He encouraged people to criticize his policies; he created a bureaucracy based on merit; and in foreign affairs he built alliances and won allegiance by fair treatment.

Emperor Taizong (reigned 626–649 CE) of the Tang dynasty (618–907 CE), who is hailed in Chinese history as exemplifying the ideal Confucian rule of benevolence and righteousness, established a cosmopolitan empire and facilitated the spread of culture and trade in eastern, central, and southwestern Asia and beyond. The fine administration and prosperity of his reign lay the foundation of a strong Tang dynasty; his empire extended to the steppes, and he controlled the Silk Roads in central Asia.

Overview
During Taizong’s reign Chinese government, laws, and culture (including Confucianism, poetry, and architecture) spread to other East Asian states and were incorporated into the local culture. Japan’s Taika Reforms (from 645 CE), in which the Japanese court adopted a Chinese-style centralized government, system of taxation, and law code, is one example. Unlike rulers of later dynasties, Taizong also embraced cultural diversity. While adopting Confucianism as state guideline, he also supported the translation of Buddhist sutras (Buddhist sacred texts) into Chinese, honored the ancient philosopher Laozi and Daoism, and built a Nestorian Christian church along with Zoroastrian temples in the capital city, Chang’an. Magnificent in appearance and culture, Chang’an attracted foreign envoys, traders, and clerics who traveled there by the Silk Roads and by sea. People from all over Asia and even Africa, including the Turks, Persians, Arabs, Japanese, and Koreans, lived among the Chinese in Chang’an and in southern port cities. Their food, clothing, arts, and the religion of Buddhism became part of the Tang culture, while Chinese technology, silk, and other goods spread to the other lands.

Life
Tang Taizong (actually the emperor’s reign title; his birth name was Li Shimin) came from an aristocratic family from northern China. His mother and his wife were both of non-Chinese descent, but they were known for Confucian propriety and were skilled in Chinese literature or calligraphy. Li Shimin was the second son of Li Yuan, a provincial governor under the Sui dynasty (581–618 CE). In 617 Li Yuan rebelled against the unpopular Sui emperor Yangdi. Modern historians question the traditional account of Shimin’s pivotal role leading to the uprising, but all agree that in the next four years Shimin defeated various contenders for the throne. At age twenty-four he secured the empire for his father, who established the Tang dynasty.
Li Shimin excelled in cavalry and was an excellent strategist and commander. His exceptional achievements, however, led to fierce rivalry with his elder brother, who was the crown prince, and with his younger brother. In 626 Li Shimin triumphed over both brothers, who were killed, and ascended the throne at the age of twenty-nine when Li Yuan retired.

Domestic Affairs
Taizong created perhaps the finest administration in Chinese history. To rejuvenate a land devastated by wars, he adopted a benevolent rule. He distributed land to farmers and collected taxes accordingly (approximately one-fortieth of income) in kind. He was frugal in his expenditures and adopted a conciliatory foreign policy in his early reign to avoid wars.

He also established a bureaucracy based on merit, responsible officials, and thoughtful policy (state policies were prepared and reviewed by different offices before implementation). He discussed policy with chief ministers, appointed officials and generals based on their ability, regardless of class, ethnicity, or personal connections, and held civil service exams with questions based on the Confucian classics. Many of his most accomplished and devoted officials and generals had been on the staff of his former enemies or rivals. Independent examiners regularly reviewed officials; the emperor tolerated no abuses, even from his own kinsmen. He also encouraged criticism of any of his policies or behavior that people judged inappropriate. His most outspoken critic was Wei Zheng (580–643 CE), who had once served one of the emperor's brothers. It was not always easy for a monarch to hear frank criticism, but the emperor restrained himself and rewarded his critics when their arguments were reasonable. He kept Wei Zheng at his side and referred to him as his mirror that allowed him to see his mistakes. In fact, he credited Wei Zheng and other officials for making him a fine ruler. Tang Taizong also asked his chief ministers to receive remonstrance. The emperor told them: “If you cannot accept remonstrance yourself, how can you remonstrate against others?” Throughout his reign the emperor and his officials remained vigilant, consciously preserving good rule and bequeathing it to their descendants.

Taizong also ordered the revision of the penal code; the revised code reduced cruel punishments and became the foundation for later Chinese penal codes.

Foreign Affairs
In foreign affairs Taizong preferred forming alliances and winning allegiance through the appeal of fair and kind treatment. In 630 he dispatched troops and defeated the eastern Turks (in modern Mongolia), who often raided Tang cities. In the following years his army conquered more territory, but, more important, it secured the submission of tribes and kingdoms in Central Asia and around the Silk Roads without resorting to war. Often Taizong offered Tang princesses in marriage to tribal leaders to forge friendly diplomatic relations. When leaders submitted to Tang rule, Taizong made them governors of the regions they had formerly ruled independently, and he rarely...
intervened in their affairs. He allowed migration and in some instances ransomed back nomads’ clansmen who were seized by their enemies.

**Arts and Culture**

Taizong loved fine horses, but he was also well versed in poetry and was an accomplished calligrapher. He ordered the compilation of the five Confucian classics, as well as a commentary on them, and these became the standard texts for later dynasties. He wrote a preface for Xuanzang’s monumental translation of hundreds of Buddhist sutras; he also wrote three commentaries in the official history of the previous dynasties. He revered Daoism and claimed its founder, Laozi, whose family name was “Li,” as his royal ancestor.

**Legacy**

When Taizong died in 649, he was buried in Zhaoling on a mountain that eventually was the site of more than 160 tombs. Some of these were the resting places of imperial relatives, but most of the tombs housed meritorious officials, including more than a dozen nomadic generals: Taizong had granted meritorious ministers the right to be buried in his mausoleum complex and included them in his extended political family.

Tang Taizong and his officials created a political legend in Chinese history. His recorded discussions with officials, the Zhenguan zhengyao (Essentials of Government of the Zhenguan Period), became part of the imperial curriculum for later Tang and all subsequent Chinese emperors, as well as for the rulers of Japan and Korea. It influenced even the non-Chinese Khitan, Jurchen, and Mongol peoples. Taizong’s theory and practice of rulership have a unique place in world history.

Guang Si-ma. (1972). *Zi-zhi tong-jian* [Comprehensive mirror for aid in government]. Taipei, Taiwan: Shijie Shuju. (Original work compiled 1084)

Lily HWA
Attuned to the contemporaneous intellectual trends of political reform, philosophical experimentation, and literary innovation, Tang Xianzu invested song-drama with a new philosophical seriousness. His resulting oeuvre, particularly the romance entitled *Peony Pavilion*, has earned him a lasting reputation as one of China’s most accomplished dramatists.

Confronted with the highly autocratic politics, intellectual ferment, and literary experimentation characteristic of his era (the Ming dynasty, 1368–1644), Tang Xianzu transformed song-drama from a vehicle of entertainment, moral didacticism, or political allegory into a literary-yet-accessible, serious-yet-comic medium for the consideration of new philosophical ideas. Born into a scholarly family in Linchuan, a town in the rapidly commercializing region south of the Yangzi (Chang) River, Tang quickly earned the lower civil service degrees at ages fifteen and twenty-one before eventually achieving the highest rank of palace graduate (*jinshi*) at the age of thirty-three. But his unwillingness to ingratiate himself with the powerful and ruthless grand secretaries had not only delayed his metropolitan examination success until 1583 but also precluded any high-level appointments thereafter. More poignantly still, in 1591 a scathing memorial directed at the machinations of one of the grand secretaries incurred the wrath of the Wanli emperor and precipitated Tang’s demotion to a lowly post at the southern periphery of the empire. He was eventually reinstated as a district magistrate in 1594, but even his voluntary resignation in 1598 did not spare him the humiliation of being stripped of all titles in 1600. From 1598 until his death he primarily resided in his native Linchuan.

Even if Tang was too forthright to succeed in the fractious realm of late Ming dynasty politics, his studies and his career nevertheless brought him into close contact with the intellectual avant-garde of his day, who would in turn influence his plays. Tang became the disciple of the Wang Yangming–inspired neo-Confucian Luo Rufang (1515–1588), befriended the luminaries of the political reform movement such as Gu Xiancheng (1550–1612) and Gao Panlong (1562–1626), had lifelong ties to Buddhist notables such as the Buddhist master Zibo Zhenke (1544–1604), conversed and corresponded with other aspiring dramatists such as Mei Dingzuo (1549–1618), Tu Long (1542–1605), and Zang Maoxun (1550–1620), and avidly read the freshly printed works of the iconoclastic thinker Li Zhi (1527–1602).

Tang’s extended sojourns in Nanjing shaped both the form and content of his literary activities. Apart from encountering popular performances and printed dramas in the city, Tang was also exposed to older northern ritual music and newer southern-style performances during his service under the auspices of the Board of Rites. Inspired by a quest for moral integrity and by the potential of new literary forms on the one hand and increasingly disillusioned by the realities faced by public-spirited scholar-officials on the other, Tang elevated *chuanqi* song-drama to a new level of ethical expressiveness and aesthetic sophistication. After earlier dramatic experiments with another play, he completed *Peony Pavilion* (*Mudanting*)
in 1598 and went on to compose two more song-dramas in short order, all of which would collectively be known as the *Four Dreams of Linchuan*. The instant and enduring critical and popular success of *Peony Pavilion* eclipsed Tang’s attainments in other literary forms. Several recent highly acclaimed versions of *Peony Pavilion* staged in China and abroad have cemented his standing as one of China’s most accomplished dramatists of all times.

TANG Yin

Táng Yín  唐寅

1470–1523  Ming dynasty painter, poet, and calligrapher

Tang Yin, who wrote under the pen name Taohuaanzhu, meaning Master of the Peach Cottage, was one of the four masters of the Wu Painting School during the Ming dynasty (1368–1644). After failing to gain a political position in the Ming civil service he joined the ranks of the literati, integrating poetry, calligraphy, and painting into a coherent and harmonious entity.

Ming dynasty (1368–1644) literati painter, poet, and calligrapher, Tang Yin (1470–1523) was born into a tradesman’s family in Wu, the ancient name of Suzhou in Jiangsu Province. In his teen years during the middle Ming dynasty Tang was already acquainted with a literary circle of educated elite. He received the highest honor in the provincial juren (recommended man) civil service examination in 1498. In the next year Tang went to Beijing for the national examination, but he was implicated in bribing the exam supervisor. At trial he was fined, and his juren degree was rescinded. This blow crashed Tang’s hopes of a political career forever.

Tang Yin was one of the four masters of the Wu Painting School, along with Shen Zhou, Wen Zhengming, and Qiu Ying. Tang learned from the Northern Song dynasty (960–1126) master Li Tang (1066–1150) in depicting monumental mountains. In one of his famous paintings, Whispering Pines on a Mountain Path (hanging scroll, ink and color on silk, 1516, National Palace Museum, Taipei, Taiwan), the dominant mountain recedes diagonally to the background and then rises majestically near the top of the painting space. Willows sway in the breeze by the lake, and the setting sunlight permeates the whole painting. Long, thin brushstrokes portray the scene, while light washes of blue green and grayish brown define the shade and texture of the rocks. Two figures, one in a scholarly dress, enjoy the waterfall over a bridge and below the densely foliaged pine trees. It is a refreshing view that embodies the splendor and totality of nature as well as the beauty and elegance of rural scenes.

Tang Yin also excelled in painting tree and flower subjects, such as bamboos, plums, and lilies, a fitting theme that symbolizes the perseverance and regeneration of the ideal literati. In his Plum Blossoms an old bough breaks off short, and in the middle of the break strong young shoots spring to both sides in opposing movements. However, Tang Yin was particularly fond of peach blossoms, as his pen name “Taohuaanzhu” (Master of the Peach Cottage) suggests. He wrote many poems about peach flowers.

When he painted human figures, Tang Yin’s depiction of ordinary ladies and maidens speaks about his familiarity with traditional subjects and his sympathy toward courtesans and prostitutes. In Silk Fan in the Autumn Breeze (hanging scroll, ink and color on paper, Shanghai Museum), a beautiful young lady stands alone, silhouetted against the diagonal hill slope and the shaded rocks. The accompanying inscription disapproves of the degraded
human relations and criticizes those who sought favor with people in power.

Tang Yin contributed to literati painting by combining the intensity and heroism of the northern school’s landscape painting with the subtlety and warmth of the southern school that appeared in the early Northern Song dynasty. He integrated poetry, calligraphy, and painting into a coherent and harmonious entity and expanded the scope of literati painting in a broad range of subjects.

Tangshan Earthquake, Great

Tàngshān Dà Dìzhèn 唐山大地震

The Great Tangshan Earthquake of 1976 lasted only fifteen seconds but was one of the worst natural disasters of all time. The earthquake, possibly the deadliest in recorded history depending on the source consulted—the central government did not release death toll figures for three years—is considered symbolic of the end of Mao’s era in Chinese history.

The Great Tangshan Earthquake of 1976 killed 255,000 people and injured more than 160,000 in the city of Tangshan in northern China’s Hebei Province. The earthquake, with a magnitude of 7.5, occurred directly under Tangshan at a depth of 8 kilometers at 3:42 a.m. on 28 July. Over 90 percent of Tangshan’s buildings were flattened, and economic losses were estimated at 3 billion yuan (US $375 million). The earthquake lasted only about fifteen seconds. It was followed by an aftershock of magnitude 7.1 about fifteen hours later. The tremors caused damage in cities as far away as Beijing, Qinhuangdao, and Tianjin. The Chinese government did not report a death toll until 1979, after economic reform had begun.

Although the U.S. Geological Survey (USGS) lists the official death toll at 255,000, it estimates that the death toll may have reached as high as 655,000. That figure would make the Tangshan earthquake the deadliest in modern times and the second deadliest in recorded history. The 2004 Sumatra earthquake in Indonesia killed 283,106, and the Kanto earthquake in Japan killed 142,800 in 1923. The earthquake of 12 May, 2008 in Sichuan Province is estimated to have killed 87,000 people and was the nineteenth deadliest in recorded history.

Aid Refused

In 1976 the chief members of a radical political faction of the Chinese Communist Party (CCP), known as the “Gang of Four,” considered natural disasters a domestic issue and regarded the refusal of aid and sympathy from the international
community as an opportunity to “display the socialist system’s superiority of being self-reliant” (Rong, 2006).

The Chinese government has changed its attitude after more than three decades of economic reform. When the SARS (severe acute respiratory syndrome) epidemic rocked China and the rest of the world in 2003, the Chinese government joined with worldwide medical and scientific experts to prevent and control the killer disease. China received international aid of $37.5 million, including medical equipment and epidemic prevention materials, from nearly thirty countries, international organizations, and foreign companies. On 12 May 2008, during the Great Sichuan Earthquake, which killed near 70,000 people, the Chinese government also made a great effort to receive international aid and to allow the media the freedom to report the disaster.

After the Tangshan earthquake the Chinese government’s efforts at relief were criticized as inadequate. The government also was criticized for having ignored scientists’ warnings of the need to prepare for an earthquake. Even today earthquake prediction is far from accurate.

The Tangshan earthquake was one event in what came to be referred to in China as the “Curse of 1976.” At the time any extraordinary natural phenomenon, whether snow in summer or droughts in spring, earthquakes or insect plagues, was interpreted as a sign of the displeasure of heaven, indicating that the Mandate of Heaven, which bestowed legitimacy on the Chinese ruling group, might be withdrawn. Enormous political significance was attached to the Tangshan earthquake. In the early 1970s the chaotic Cultural Revolution (1966–1976) had placed the country in a state of social and ideological anarchy. The leadership took great pains to explain away any political significance that might be attached to expressions of cosmic displeasure. For many Chinese the Tangshan earthquake indicated that important developments were about to take place. Many people in Tangshan reported seeing strange lights (so-called earthquake lights) the night before the earthquake. The “Curse of 1976” was also identified with the deaths of Premier Zhou Enlai (1898–1976) in January, Communist military leader and statesman Zhu De (1886–1976) in July, and CCP leader Mao Zedong (1893–1976) in September, and with the arrest the Gang of Four in October. The power struggle between Mao’s chosen successor, Hua Guofeng, and CCP leader Deng Xiaoping (1904–1997) began in 1976 as well.

From Rubble to Recovery

Today more than 7 million people live in the 134,720-square-kilometer Tangshan municipal area, including an urban population of 3 million. By 2006 Tangshan’s gross domestic product had increased to 236.2 yuan, ranking first in Hebei Province. In 2006 the per capita disposable income for urban residents was 12,376 yuan ($6,514) and 5,155 yuan ($2,713) for rural residents.

On 28 July 2006 President Hu Jintao visited Tangshan to commemorate the thirtieth anniversary of the earthquake. In July 2007 the Chinese government, along with the Architectural Society of China, decided that a memorial park would be built on the earthquake ruins; as of 2008, applications for design ideas were still being accepted. The park will cover about 40 hectares around the ruined site of the Tangshan Rolling Stock Plant. The park will be a museum of earthquake science and will provide a place for the public to pay tribute to earthquake victims.

Tao Yuanming was one of the most eminent of pre-Tang poets, effortlessly blending poetic expression with the Confucian and Daoist ideals of simplicity. He was a recluse who rejected the life of the court in favor of that of the country; his poetry exhibits a great concern for the small delights of everyday life. A little over a hundred of his poems survive.

One of the foremost poets of the Jin period (265–420 CE) of the Southern and Northern Dynasties (220–589), Tao Yuanming 陶渊明 or Tao, also known as Tao Qian, was a recluse, preferring rustic settings to courtly splendor and fineries. He was born in Jiujiang in Jiangxi Province to a family that had long served the emperors but had fallen into poverty.

Trained as a scholar-official, Tao was given various minor posts at court, but he could not bring himself to agree with the way things were done by his superiors; he was known for being outspoken and critical. When he lost his sister to an illness, his priorities changed, and at the age of 30, he resigned his post, sold his house, and retreated to the country to do those things that he deemed important in his life—farming and writing poetry—stating famously that he would not humble himself for a few measures of grain. (The salaries of court officials were calculated in measurements of grain.)

At court he saw himself as a caged bird or as a fish in a small, artificial garden pond. During this period of seclusion a theme emerged in his poetry that would define it: bucolic ease. Linguistically he abandoned all things courtly and expunged from his verse all artificially ornate expressions that represented the grave excesses of a life rooted in the rituals and concerns of the court. He chose instead to write about simple pastoral pleasures, such as drinking or appreciating rural landscapes, developing an austere and simple style that reflected the essence of his rural life.

Perhaps in an effort to describe the peace and tranquility he had achieved by escaping from the constraints of the court, he wrote his renowned Peach Blossom Spring (Tao Hua Yuan, 桃花源記), a utopian description of pastoral life in which the virtues of living harmoniously with nature and with fellow human beings are extolled. The story tells of a fisherman who drifts along a stream in his boat and finds himself in an enchanted and unknown valley, where the inhabitants know nothing of the outside world's ills and are concerned solely with living in harmony with nature. When the time comes for the fisherman to return home, he carefully marks his path so that he might visit the valley again, but when he tries to find it he fails; the charmed place is lost to him, and he must live the rest of his life with the knowledge that he briefly lived in a paradisiacal place to which he can never again return.

Tao died on his farm, which he had made into his own utopia. Tao Yuanming is not remembered for his erudition, but rather for his poems that are so intimate and so well crafted that they become perfected reflections on
the individual as he seeks a place within the flow of history. This placing of the infinitesimal within the infinite marks his verses, making their appeal transcendent of both time and space.

Known for its sparse vegetation and extreme climate, the Tarim Basin is located in the northwestern corner of China and will play a major role in China’s oil and energy production in the coming century. It is one of the largest endorheic basins in the world, meaning that rivers that flow into it dry up rather than flowing on to the sea.

The Tarim Basin is located in Xinjiang Uygur Autonomous Region in northwestern China between the Tian Shan and Kunlun Shan mountain ranges. The basin encompasses 906,500 square kilometers (a little over half the size of the state of Alaska) of mostly shifting sands, undulating expanses of arid terrain, and dry lake beds. Rivers that flow into it off the surrounding mountains dry up into the earth or evaporate rather than flowing on to the ocean. (The Great Basin in the American west is an example of another such “endorheic” basin.)

The Taklimakan Desert, which is the fifteenth-largest nonpolar desert in the world and the world’s second largest sand desert, occupies the lower basin of the Tarim. The Silk Roads—a network of trade routes that connected eastern, southern, and western Asia with the Mediterranean area, including northern Africa and Europe—threaded the region and was split into two routes. The northern route ran along the northern edge of the Taklimakan Desert, and the southern route ran along the southern edge.

An Uygur Muslim cemetery in northwest China, Tarim Basin, Turfan, Xinjiang Uygur Autonomous Region. The Uygurs, a Turkic minority people, have inhabited the basin region for two millennia.

PHOTO BY JOAN LEBOLD COHEN.
The term tarim describes a river that either flows into a lake or meanders amid desert sands. The desert climate has temperature extremes of −20º to 50º C and precipitation of just 50–100 millimeters a year. The snow on K2, the world’s second-highest mountain, flows into glaciers that creep down valleys to melt. This melted water forms rivers that flow into the Tarim Basin. Vegetation is sparse except for riparian (relating to the bank of a natural watercourse) stands of wormwood and poplar and willows, Ural licorice, sea buckthorn, and Indian hemsps.

The Han Chinese wrested control of the basin from the Xiongnu people at the end of the first century under General Ban Chao (32–102). Today the basin is sparsely settled by Tajiks and Uygurs and other Turkic peoples. Oasis agriculture in far-flung and small settlements produces cotton, fruits, grains, wool, and silk. Khotan jade, a nephrite jade that occurs in a variety of colors, is mined, and tourism is increasing in importance. Recent discoveries of oil and natural gas will make these an important source of China’s energy supplies in the next century.

Since the 1980s archaeologists have discovered remains of bodies dating back almost four thousand years in the eastern and southern parts of the basin. Dating from 1800 BCE–200 CE, some of the mummies have been linked to Indo-European Tocharian languages in the basin, although evidence is not conclusive. The cemetery at Yanbulaq yielded twenty-nine mummies, which have dated from 1100–500 BCE. The mummies have both Mongoloid and Caucasoid characteristics, suggesting ancient contacts between East and West. Their clothing indicates a common origin with Indo-European Neolithic (8000–5500 BCE) textile techniques. Many of the mummies are in excellent condition because of the desiccation of the corpses caused by the dryness of the desert.

Nuclear tests have been conducted at Lop Nur, a saline, marshy depression at the east end of the basin. Although once an important stop along the Silk Road, the lake, which has a tendency to shift its location due to blowing sands, has mostly dried up, mostly because of human activity.

China's tax system is probably the most ancient and, at the same time, the most recent in the world. While records of land taxes go back almost four thousand years, the current tax structure did not come into existence until after 1980. Despite the Western influences of China's current tax system, it remains compatible with China's culture and politics.

The Chinese tax system looks like other tax systems in many ways. It consists of income taxes, consumption taxes (similar to sales taxes), property taxes, and other miscellaneous taxes. The functions of taxation are to raise revenue, to stimulate economic growth, and to facilitate social and political stability. China's current system is the result of major reforms since the 1980s.

**Tax Reforms**

Soon after the People's Republic of China came to power in 1949, the Communist Party reconstructed the economy. Private capital was nationalized, and foreign investment gradually left China. A type of sales tax and a property tax were introduced and administered by the general tax bureau. The reconstruction was more or less complete by 1956. From 1956 to 1978, a strict Soviet-type economy was practiced, and the private sector almost vanished. Industry and commerce were controlled by publicly owned enterprises. State-owned enterprises delivered all their profits to the government, and sales taxes were generally used to facilitate the transfer of funds from enterprises to the government's coffers. At the peak of the political and economic turmoil during the Cultural Revolution (1966–1976), law and order were in disarray, the role of taxation was disregarded, and the tax department existed only in name.

In 1978, under the leadership of Deng Xiaoping, the Communist Party changed its policy from political struggle to economic development. Deng made it clear that the need for economic development prevailed over the pursuit of the party's socialist ideals. Economic reforms changed the relationship between the state and the market, allowing for the creation of a tax policy.

The new economic policy had two objectives: opening up China to the outside world and reforming the domestic economic system. Establishing a modern tax system was considered critical to the success of the economic policy. To facilitate the transition, a two-track tax system was introduced so that a Western-style tax system would apply to foreign firms and individuals and another system would apply to Chinese firms and citizens.

The foreign track was created first and consisted of the individual income tax, targeted at foreign individuals (1980); the equity joint ventures income tax (1980); and the foreign enterprise income tax, applicable to foreign-owned enterprises and other foreign entities doing business in China (1981). An earlier tax—the consolidated industrial and commercial tax—remained applicable to...
foreign investors because it was the only tax in effect before 1980.

The domestic track was created in 1983 and 1984. State enterprises became subject to taxes, a reform commonly referred to as *li gai shui* (taxation replacing profit delivery). Separate taxes applied to the emerging collective enterprises and private enterprises; sales taxes applicable to domestic enterprise were introduced; and numerous miscellaneous taxes on property and transactions were reintroduced.

More substantive reforms began in 1986. In 1991 the foreign track was consolidated to create the enterprise income tax on foreign investment enterprises and foreign enterprises (FIE tax). In 1994 the three domestic enterprise income taxes were replaced by a one consolidated domestic enterprise income tax. The foreign track merged with the domestic track in the areas of sales tax and individual income tax. The 1994 reform also resulted in a new tax assignment between the central government and local governments as well as a new system of tax administration. Overall, the foreign track is a more Western-style tax. Because China wanted to follow the international tax norm, the FIE tax addresses international issues. The domestic track has more features from the old Soviet-style economy and is much less detailed than the FIE tax is. With respect to deductible expenses, FIEs may deduct the cost of wages, salaries, and employee benefits, whereas domestic enterprises can deduct only the amount of wages in accordance with the standard set by the government.

As of 1 January 2008, China implemented a fundamental enterprise income tax reform that adopts a lower general tax rate and unifies the tax rules applied to all enterprises. This new Enterprise Income Tax (EIT) replaced FIE tax and domestic enterprise income tax. It is a hybrid of international tax norms and China’s indigenous rules. For example, the new tax legislation provides anti-avoidance rules such as transfer pricing rules and thin capitalization rules, which seem to be the most direct adoption from international tax rules and are designed to prevent multinational corporations from shifting profits away from China without paying Chinese taxes. On the other hand, the legacies of economic transition and Chinese culture find their ways into this legislation. For instance, there are still a number of “residual” clauses authorizing the government to determine “other” amounts or issues in the new tax system.

**Current Tax Structure**

The State Administration of Taxation (SAT) is responsible for administering tax laws in China. Its national head office is in Beijing. Local tax bureaus collect local taxes and some taxes shared between the central government and local governments. Although they are part of the local government, they fall under the SAT in terms of tax law interpretation and policy.

Four types of taxes are collected in China: consumption taxes, income taxes, property taxes, and miscellaneous taxes.

**Consumption Taxes**

Consumption taxes (*liu zhuan shui*) generate more than two-thirds of the total tax revenue. A consumption tax is a type of sales tax.

The value added tax (VAT) is the most productive source of revenue—generating about 37 percent of total tax revenue in recent years (e.g., 36.7 percent in 2006 and 37.5 percent in 2005). This tax applies to the sale of goods and certain services. The standard rate is 17 percent; a lower rate of 13 percent applies to necessities, certain culture products, agricultural supplies, and certain other goods. Small suppliers are taxed at 6 percent. Exports are not taxed. The business tax is imposed on business activities that are not subject to the VAT, mostly services. The tax rate is 3 percent for transportation, construction, postal communication, and cultural and athletic activities; 5 percent for banking, insurance, services, and the transfer of intangible property and immovable property; and 5 percent to 20 percent for entertainment (the applicable rate is determined by the local government).

The consumption tax is imposed on the sale and importation of luxury goods, such as tobacco, liquor, cosmetics, fireworks and firecrackers, gasoline, diesel, tires, motorcycles, and automobiles. The tax rates range from 1 percent on nonluxury cars to 45 percent on top-quality cigarettes. This tax is imposed in addition to the VAT.
The resource tax is imposed on the production and sale of crude oil, natural gas, coal, nonferrous metals, ferrous metals, and salt. The amount of tax payable is determined by the Ministry of Finance according to the mining or production conditions of the taxpayer.

**INCOME TAXES**

Income taxes are the second major source of revenue, generating about 22 percent of total tax revenues. Income taxes have been growing faster than consumption taxes since the late 1990s. For example, VAT grew by 22 percent in 2000, while FEI tax grew 50 percent, individual income tax grew 59 percent (SAT http://www.chinatax.gov.cn).

The individual income tax is a schedular tax; that is, different types of income are subject to different tax rates, and certain deductions are allowed. Income from employment is taxed monthly at progressive rates ranging from 5 percent to 45 percent. Income from the business of industrial and commercial activities and enterprise leasing and management are taxable annually at progressive rates ranging from 5 percent to 35 percent. Income from personal services is subject to a 20 percent flat rate tax. Investment income, incidental income, and capital gains are taxed at a flat rate of 20 percent. In computing the taxable amount, a deduction for actual expenses is allowed only in the case of business income. A standard deduction is allowed in the case of employment income, income from services, rents, and royalties. Interest, dividends, and incidental income are taxed on a gross basis. Taxes are withheld at the source. Enterprise Income Tax now applies to all enterprises (any business or organization that is not a sole proprietorship or partnership).

**PROPERTY TAXES**

A large number of taxes are imposed on property, transactions, and other real estate activities, generating about 8 percent of total tax revenues. Taxes on real estate are the most significant. A real estate gains tax was introduced in 1993 to regulate the growing real estate market in China. It applies to gains from the transfer of land-use rights, buildings (other than residential housing), and other structures on the land at progressive rates ranging from 30 percent to 60 percent. The urban real estate tax is imposed on the owners of real estate in urban areas. The deed tax is levied on the transfer of land-use rights and the sale, gift, or exchange of houses and buildings.

**MISCELLANEOUS TAXES**

The stamp tax applies to the signing or issuing of commercial contracts and documents. For example, loan contracts are taxed at 0.005 percent of the loan amount, and technology contracts are taxed at 0.03 percent of the contractual price. Taxpayers pay the tax by purchasing and affixing tax stamps.

The banquet tax is levied at 15 percent to 20 percent of the cost of each banquet costing over 250 yuan (about $37). The tax is withheld by the restaurant.

**Tax Revenue Sharing**

A key function of taxation is raising revenue. Since the 1980s, taxation has become a main source of government revenue. Most taxes in China are collected by the use of consumption taxes. Compared to income taxes, consumption taxes are easier to administer. These taxes are collected from enterprises, not consumers, thereby reducing the cost of administration and compliance. The tax mix has been favorable for generating revenue. Sharing the revenue from taxes between the central government and local governments is an enormous challenge.

China’s financial system is highly decentralized. Expenditures by local governments account for 71 percent of government expenditures. The central government has exclusive taxing powers in terms of legislation. All taxes are introduced by the central government. However, revenue from specific taxes is assigned to local governments. Overall, local governments receive about 50 percent of total tax revenues.

Under the current revenue-sharing system, local governments are entitled to the revenue from the following taxes: 100 percent of property and transaction taxes; 25 percent of the VAT; business taxes (with minor exceptions); domestic enterprise income taxes (other than those paid by centrally owned enterprises, local banks, financial institutions, and railway, banking and insurance companies that pay income tax centrally through their
Taxation and Taxes

head office); FIE taxes (other than those paid by foreign banks); and resource taxes (other than those paid by offshore oil companies).

Tax Expenditures as Policy Instruments

Using tax expenditures as policy instruments is consistent with China's previous practice of central planning, the need to accommodate local economic conditions of different regions of the country, and the desire to compete with other developing countries in attracting foreign direct investment. International competitiveness has always been a key concern in Chinese tax policy.

China has used tax expenditures extensively in both the income tax system and consumption tax system. Every major tax contains tax expenditure provisions. For example, the VAT exempts contraceptive medicines from taxation. The business tax exempts child care, education, and medical services. The individual income tax exempts a large variety of items from taxation. They include awards from the government, settlement fees to military personnel, and salaries of foreign experts sent to work in China international organizations.

The new enterprise income tax law provides a general low tax rate and unified tax incentives to both domestic and foreign investment enterprises. The nominal enterprise income tax rate is 25 percent, which is internationally competitive. The new tax incentives are designed to achieve tax equity between domestic enterprises and FIEs, to reduce administration and taxpayer compliance costs, as well as to achieve an overall, long-term, sustainable development of Chinese economy. They favor high-tech, industry-oriented or environment-oriented investments, and nonprofit organizations, or small, low-profit enterprises. These eligible enterprises obtain tax preferences based on the nature of their investments, other than the form of ownership or special locations.

Tax Policies and Development

Development in any country has three broad dimensions: economic, legal, and social, which are generally interrelated. Since the 1980s, China's tax policies have had varying effects on development.

Tax Policies and Economic Development

In many ways China’s experiment with economic development has been unique. China is a socialist country governed by a single party. The economy is highly fragmented and in transition toward a socialist market economy. China had no modern tax system until the 1980s. Chinese leadership has always resisted the advice of international experts to go for “big-bang” economic reforms in favor of a more gradual, pragmatic approach.

China's development goal has been to build up a relatively well-off (xiaokang) society in which people generally are not rich but have adequate food, clothing, and other material goods necessary for a decent life. Economic development is a precondition for reaching this goal.

According to the National Bureau of Statistics, China's gross domestic product (GDP) grew from 362 billion yuan in 1978 to 21.18 trillion yuan in 2006. In 2006, China was the world's fourth largest economy measured by the size of GDP, the third largest trader, and one of the largest recipients of foreign direct investment.

Unequal Development

But amid its rapid economic development, China has achieved social development only in certain areas. Poverty has been noticeably reduced. The unemployment rate for 2007 stood at 4 percent in urban areas though it was much lower in rural areas. China’s human development index has improved continuously since the 1990s, according to United Nations reports on human development. China’s global ranking rose from number 101 in 1991 to number 81 in 2007.

On the other hand, there have been increasing income disparities, regional disparities, and urban and rural disparities in China. In the early 1990s, for instance, the top 10 percent of the population held 40 percent of the savings in China. In 2006, saving deposits in urban and rural areas were 161.58 trillion yuan; the top 5 percent of the population owned about 50 percent of the national savings. Some parts of the country, typically the
southeast coastal areas and provincial capital cities, are more developed.

Disparities also exist between women and children and men, and between racial minorities and the more dominant ethnic groups. The Chinese tax system disproportionately benefits men because they are generally the higher income earners. In China women make up a smaller proportion of the white-collar workforce than men do, and the ratio of female-to-male earnings is about 0.82.

The regional disparities and shortages of financial resources at the local level also have had significant adverse effects on women and ethnic minority groups. Ethnic minority groups generally live in less-developed regions. A lack of resources at the local level often results in a lack of funding for hospitals, schools, housing, and other public works. Thus local service providers have to charge for their services. Local schools, for example, charge what are high fees for peasants. This has led to a dramatic shift in educational opportunities for women in rural areas. A son is the future “retirement plan” for his parents. A daughter is someone’s wife and will help support the husband’s parents. Thus, in the rural areas and minority areas where the one-child policy is not strictly applied, the daughter is often required to work to pay for the schooling of her brother. The results are that many fewer girls than boys are going on to higher education. Tax policies have played no significant role in income redistribution. By its very design, the tax structure in China cannot play a key role in alleviating inequality in income and wealth. In developed countries, the income tax, especially the personal income tax, has been used as the main instrument for redistributing income. But in China the role of the individual income in redistribution remains largely symbolic. This tax accounts for about 6 percent of total tax revenues. It is progressive only with respect to employment income and business income. Other types of income are taxable at a flat rate. The fraction of population paying the tax grew from 0.1 percent of all wage earners in 1986 to about 32 percent of all wage earners in 2001 and the average amount of annual tax paid by each wage earner was 314 yuan (less than $40) in 2002. More than one-third of the total individual income tax on employment income was collected from workers at foreign investment enterprises. Given the current situations in China, the individual income tax cannot be a meaningful tool of redistribution.

Some provisions of the sales taxes have some progressive features. For example, the consumption tax is imposed on luxury goods and services at progressive rates. This tax is presumably borne by high-income earners. The VAT is slightly progressive with a lower rate on certain necessities, such as grain, edible oil, and running water. Overall, however, these taxes worsen the urban/rural disparities because low-income rural residents must pay these taxes. In many poor rural areas, these taxes are the only taxes collected.

### Tax Policies and Social Development

Compared with the wide variety of tax preferences for economic development, tax expenditures for social development have been fewer in number and less in amount. Most of the tax expenditures under the individual income tax relate to disaster relief, family planning, payments to military personnel, and retired cadres. These measures are largely in response to other policy decisions and are not designed to promote any social activities.

Arguably, tax expenditures on social development are as important as those for economic development during an economic transition. At a time of increasing income gaps, the economic reforms smashed the “iron rice bowl” style of social security (which was tied to lifetime employment at a work unit) when state-owned enterprises were transformed into “economically efficient” entities. Redundant workers lost their jobs as well as their welfare system, which typically consisted of subsidized housing, medical insurance, and retirement income. The government has not introduced any meaningful tax subsidies for housing, education, charitable donations, child care, medical care, family support, or retirement savings. No specific tax expenditure has been designed to create jobs or workers’ training or relocation. Although the government has flirted with the idea of tax-subsidized retirement plans, no concrete tax policy has yet been enacted.

Retirement income security is a significant social and political issue in China. The Chinese population is aging at an accelerating rate owing to three possible factors: the baby boom in the 1950s and 1960s; the single-child policy,
which has produced the four-two-one family structure (four grandparents, two parents, one child); and the increasing longevity of the Chinese people. The percentage of individuals aged sixty and older in the Chinese population was 10 percent in 1999 and is expected to be 20.4 percent in 2030. All this means that there will be fewer young people in the future to pay taxes that can adequately support the elderly.

Since the early 1990s, the Chinese government has regarded employer-sponsored retirement plans as an important pillar in the retirement system and the tax policy as a key instrument for supporting retirement plans. Employer-sponsored retirement plans are expected to supplement the public retirement pillar, which is designed to provide a basic retirement of up to 40 or 45 percent of the average salary at the time of retirement. It is estimated that retirement funds in China could exceed $160 billion by 2030 and become the world’s third largest retirement market. Many enterprises created retirement plans for their workers in order to attract and retain workers in an increasingly competitive labor market. The government introduced regulatory measures in 2004 to require that all retirement plans be defined as contribution plans and be managed in accordance with market principles. Under existing tax legislation, contributions made by an enterprise into a privately funded retirement plan are generally not deductible.

**Tax Policies and the Law**

Taxes and taxation are complex and create the need for rules, regulations, and laws to oversee implementation and collection, protect taxpayers’ rights, and prohibit abuses by taxing agents. Although China does not have the rule of law, it has enacted a number of tax laws.

China’s primary tax policy objectives are revenue, efficiency, and international competitiveness. Establishing a system of taxation based on clear rules is important in achieving these objectives because tax rules are written to govern not only the relationship between taxpayers and the government but also relationship between the State Administration of Taxation (SAT) and local tax offices and the relationship between the tax administration and other government departments.

In terms of promotion of economic development, predictable and clear tax rules are undoubtedly important. Taxpayers need these rules to arrange their affairs and even to decide whether to invest in China. One reason for the two-track enterprise income tax system was to create a tax system that would be perceived as predictable and fair by international investors. The two-track system is highly discriminative now, but its original rationale was sound in the 1980s. China has always been sensitive to its international image, and creating a rule-based system was considered to an important part of projecting a positive image. This sensitivity helps explain why the foreign track of the tax system is regulated by laws enacted by the National People’s Congress.

**Sources of Tax Laws**

Tax laws in China include not only statutes (laws) enacted by the legislature but also administrative regulations authorized by the State Council and administrative rules introduced by the SAT. China has three major tax laws (the Individual Income Tax Law, the Enterprise Income Tax Law, and the Tax Administration and Collection Law), thirty or so administrative tax regulations, and about fifty administrative rules. Administrative policies and documents that have no force of law in Western countries have the status of legislation in China. Court decisions do not have the force of law in China.

Since the 1980s, tax legislation has become more detailed and comprehensive. The trend has been to elevate administrative rules to administrative regulations or to tax laws. For example, tax collection and administration had been governed by administrative regulations until 1991 when the Tax Administration and Collection Law (TACL) was enacted. The TACL, with 94 articles, modernized the collection system, set clear standards on the collection of taxes at both the national and the local levels, and established penalties for various violations of the law. It also provided the framework to allow tax authorities more access to taxpayer information and to better define the rights and responsibilities of both tax officers and taxpayers. The implementation rules for the TACL, 113 articles, provided detailed implementation guidance for the supervision and administration of tax collection in China. The TACL, along with the implementation rules,
has been acclaimed as a breakthrough in China’s tax administration system.

THE ROLE OF THE JUDICIARY

In the area of taxes, the role of the court is limited to adjudicating tax disputes between taxpayers and the tax administration. There are generally two types of disputes. One involves the interpretation of tax legislation to determine tax liability. The other involves taxpayers bringing tax officials to court for wrongful or illegal administrative actions. Because administrative appeals are available to taxpayers in the case of the first type of disputes, most taxpayers resort to administrative appeals. Judicial appeals on matters of interpretation are virtually nonexistent in China. With respect to the second type of disputes, more and more taxpayers bring their lawsuits in accordance with the Administrative Procedures Law. Local tax offices are generally named as defendants in such cases for assessing tax penalties, enforcing tax collections, or other unlawful actions. In such administrative cases, taxpayers have won more than two-thirds of the cases.

The judiciary’s role is limited for several reasons. First, the courts do not have the exclusive power of interpretation: The body that introduces the law has the final power to interpret it. As such, the legislature, the State Council, or even the State Administration of Taxation has the sole power to interpret the meaning of statutory provisions. Since most of Chinese taxes are governed by regulations or rules introduced by the State Council or the SAT, the SAT has the sole power of interpretation in most cases. Even with tax laws enacted by the National People’s Congress (the highest state legislative body) the legislation is vaguely worded, leaving the tax administration with broad powers of interpretation. In the case of entitlement to tax preferences, the legislation generally requires taxpayers to apply to the tax administration for approval before they can enjoy the preferences. This makes it difficult for the court to challenge the administrative interpretation.

Another reason for the limited role of the judiciary is the lack of tax expertise in the judiciary. Tax expertise is concentrated within the tax administration. Although some tax officials have joined private practice, none has become a judge. The small number of tax cases makes it difficult for judges to develop tax expertise. There is a general lack of confidence in the judiciary in treating taxpayers equally in interpretative matters.

Finally, the court and the local tax bureaus are part of local governments. The payroll and benefits of judges and tax officials are determined by the same government. Local protectionism is a serious problem. Local tax bureaus may treat local taxpayers differently than they treat outsiders, whose tax revenue belongs to the central government. The courts’ decisions are sometimes influenced by the local government. Promoting local interest may prevail over the strict application of the law. Personal relationships between a judge and tax officials may also make it hard for the judge to overturn officials’ interpretations.

TAX ADMINISTRATION

The administration of taxes has been increasingly governed by rules and procedures. In addition to the TACL, there are rules governing invoice management, tax administrative reviews, tax audits, internal inspections, assessments of tax penalties, and tax litigation. The administration of taxes has progressed in providing services, becoming more transparent, and respecting taxpayers’ rights.

At the beginning of the economic transition in China in the 1980s, a direct assessment system was necessary because taxpayers were unfamiliar with the tax laws. With the continuing of the transition, direct assessment was gradually replaced by taxpayer reporting. By 1997 a three-part administration system was established: filing of returns by taxpayers coupled with taxpayer services, utilization of information technology, and centralization of tax collection and targeted tax audits and inspections. Taxpayers file tax returns at tax-service centers. Tax collectors are no longer directly involved in establishing a taxpayer’s tax liability. There is less face-to-face contact between taxpayers and tax officials who assess their tax liabilities and thus fewer opportunities for dishonest taxpayers and tax collectors to collude in cheating on the tax system.

Taxpayer services have been improving. Tax officials are required to smile at taxpayers or just be polite and put themselves in the shoes of taxpayers. The move to self-assessment has been accompanied by computerization.
and information technologies. Opportunities for cor-
ruption have been reduced greatly after the computer-
ization of taxpayer records and initial selection of targets
for audit.

The level of transparency in the tax administration
has also improved over the years. During the early years
of reform, many tax documents were labeled “Confiden-
tial,” out of reach to taxpayers. Now the SAT publishes tax
legislation, interpretation documents, rulings, and other
types of information on its website or in print through
the China Taxation Press. The SAT is also developing an
advance ruling system, especially in the area of transfer
pricing. The process of negotiating advance pricing agree-
ments is governed by certain implementation rules.

Taxpayers’ rights are specified in the TACL and Im-
plementation Rules. Taxpayers (and withholding agents)
have the following rights: to request that the tax author-
ities treat the information provided as confidential; to ap-
ply for tax reductions, exemptions, and refunds according
to the relevant tax laws; to make a statement or to defend
themselves against the decision of the tax office; to resort
to the process of administrative and judicial review and
to request compensation for damages incurred; and to use
and disclose illegal activities conducted by the tax
authorities and tax officials. In addition, taxpayers have
the right to deny a tax inspection if tax officials fail to pres-
ent a tax inspection certificate and tax inspection notice
and to request an extension to file returns and to make
tax payments.

Tax authorities and tax officials are required by the
TACL to be independent and impartial in enforcing tax
laws, to act with integrity and courtesy, to respect and pro-
tect the rights of taxpayers and withholding agents, and to
avoid conflicts of interest when carrying out collections or
investigations. If taxpayers’ rights are unlawfully infringed
upon or violated, taxpayers can sue for damages. Tax offi-
cials may be sued for inappropriate conduct, such as with-
holding or seizing taxpayers’ accommodations (including
residential property), misusing daily living necessities in
enforcing tax collections, or abuse of power. Penalties are
enforced on tax officials who show favoritism; commit
malpractice; fail to report criminal acts to lawful authori-
ties; retaliate against taxpayers for reporting tax officials’
wrongdoing; intentionally delay, advance, or allocate rev-
ene quotas; or wrongfully collect taxes.

To secure revenue, the SAT has worked hard to in-
troduce rules to clarify the obligations and rights of
taxpayers as well as those of local tax offices and other
government agencies. The head office of the SAT does not
actually collect any taxes, the SAT requires clear tax rules
to guide and monitor the work of local offices. Clear rules
also enable the SAT to fend off the interference of local
governments with tax collection. In principle, national
taxes are collected by the local offices of the SAT, and lo-
cal taxes are collected by local tax bureaus. For example,
income tax owed by state-owned enterprises under the
control of the central government is collected by the SAT,
while other types of domestic enterprises pay taxes to the
local tax bureaus. Under the previous central planning
model, enterprises were managed by different level of
governments. This legacy has continued into the current
tax system. Since the SAT has only a weak supervisory
role, and there is no effective system for distributing and
enforcing common policy, the SAT sometimes has to rely
on more clear and authoritative legislative rules to carry
out its policies.

To ensure productive cooperation between the SAT
and other government departments (such as the police,
the People’s Bank, and the courts), the TACL specifically
provided the obligations of these agencies in enforcement.
In the absence of legislative rules, departmental conflicts
or noncooperation could be a serious problem. A lack of
support from the police has been a main reason for the
SAT to request a special tax police force and a specialized
tax court. To regulate departmental relations, the rules
must come from a superior body, the State Council or the
National People’s Congress. That is why the TACL is one
of three pieces of taxing statues enacted by the NPC.

The excessive use of tax expenditures as policy instru-
ments threatens not only revenue collection but also the
effectiveness of tax policy and respect of the SAT and tax
legislation. There is a misconception that the tax system
is about obtaining preferences as opposed to collecting
taxes. Once these preferences are considered tradable
commodities, they breed corruption and disrespect for
the tax system. Because most tax preferences are granted
at local levels, they provide opportunities for local pro-
tection. More centralized rules are expected to deal with
these problems.

The number of tax professionals who assist taxpayers
in tax planning, compliance, and dispute resolution has been growing. At present, tax practice is dominated by accountants. On average, 30 percent of the revenue of accounting firms is from tax work. Lawyers are also engaged in tax practice but on a much smaller scale. There are also more than 62,000 certified tax agents, including 20,000 active practitioners who assist taxpayers with compliance, dispute resolution, and other dealings with the tax administration.

A Homegrown System

Overall, the Chinese tax policy is generally compatible with China’s culture and politics. The best tax policy is one that suits local conditions, and China’s tax policy is largely homegrown. At the same time, international influences have helped shape China’s tax policy. The Chinese have always used foreign ideas to meet Chinese needs.

Development is a universal issue, but the path to development is unique for every country. As an instrument of social development, the tax policy has not been used much in China. Redistribution of income has been minimal. Social spending through tax expenditures is insignificant. On the other hand, China’s tax policy has spurred economic development and contributed to major changes in the legal system.

Ultimately in China everything is political. All reforms, changes, and development have taken place within the confines of socialism and under the leadership of the Communist Party. This distinct model of development defines China’s distinct tax policy.

Drinking tea—traditionally a brew made from the leaf, bud, or twig of the *Camellia sinensis*—is today universal in East Asia and much of the world, but the beverage took a long time to catch on. The precise form of tea consumed has also varied over time and by culture, reflecting different times and different tastes.

Tea is a drink made from the leaf, bud, and twig of the *Camellia sinensis* plant, which was probably first domesticated in Southeast Asia, although a number of possible sites have been named, including some in south China. Several varieties exist; some, such as Assam tea from India, are quite distinctive. Tea is cultivated at moderate altitude in China in tropical and semitropical areas, usually in marginal soils not suited to growing highly productive food crops such as rice. This fact was a major reason for tea’s economic importance. During Song dynasty (960–1279) China, for example, tea could be cultivated on a broad scale without limiting food production in any way. At the time it became an economic powerhouse and a primary basis for the prosperity of the dynasty.

Initially tea was grown in hilly areas of Fujian Province and neighboring Jiangxi Province, but its cultivation was later expanded to other suitable areas. It cultivation was later established in Yunnan Province, for example, when Yunnan definitely became a part of China during the Yuan dynasty (1279–1368) and Ming dynasty (1368–1644). Fine tea, including some of the most famous varieties, is still grown there.

Tea Drinking

Tea drinking arose in China around the beginning of the first century CE but was at first a localized practice confined to the south. Tea, at first brewed from green leaves, was originally more a medicinal than a recreational beverage. By the Tang dynasty (618–907 CE) the practice had become common in the south and north, and during the Song dynasty tea drinking became the rage, as it has continued to be to the present. Song dynasty tea was a product greatly in demand, not only in China but also in Tibet and other neighbors of China, later even in the far West.

Although the first teas were made from leaf, the preferred form of tea during Tang times was brick tea. This tea used large square bricks of pressed tea leaves boiled for long periods of time to produce a strong and thick beverage, consumed with milk and cream in central Asia. Later, particularly during the Song dynasty, powdered teas became common and were the form of tea later taken over by Japan as the basis for its tea ceremony. By late Song times carefully selected leaf teas had also become common, and these were associated with a substantial connoisseurship. More recently oxidized leaf and pressed teas, known incorrectly as “fermented teas” (although some teas were fermented), have been popular and were long the preferred tea for the European and U.S. export market. The story that a shipload of tea rotted and that Europeans, not knowing any better, liked the flavor of
the rotten tea, although entertaining, is folklore. Some of the oxidized teas are even highly regarded in China to this day.

Culture of Tea

China never had a tea ritual comparable with the Japanese tea ceremony, but China had a distinct culture of tea beginning during the period of disunity (third to sixth centuries CE) and continuing many centuries thereafter. Playing a key role in the development of this tea culture were Buddhist monasteries and monks. Like the Sufis (Muslim mystics) of the Islamic world, who helped introduce their favorite beverage of coffee to the Islamic world, Buddhist monks seem to have enjoyed tea as a stimulant during dull monastic work or meditation. Probably because of this practice, tea drinking became a formal part of monastic rituals, which helped stress the elegance, simplicity, and introspection involved. Because monasteries were never isolated from the secular world in medieval and early modern China, laymen soon became involved both in monastic tea culture and their own varieties of it. These varieties were developed outside monasteries but incorporated much of the ritualized content of monastic tea consumption. Tea drinking thus became an important link between the literati and the monastic culture of Zen in particular and was an earmark of Song dynasty culture.

Outside both literati culture and the monastery, strictly speaking, was another area of the Song dynasty’s concern with tea: the tea house. Restaurants, as they exist today, and, for that matter, tea houses, first appeared in China. Places where one could go, eat a few snacks, drink tea, and enjoy the company of others, especially females, were noticed by, among others, the Venetian traveler Marco Polo. He expressed amazement that one could go, rent a space—on the West Lake of Hangzhou, no less, famed for its beauty—and be served, individually or as a group, wonderful delicacies and be provided entertainment. Tea houses were more specialized than restaurants, and from the beginning the society of the tea house was associated with prostitution, but this did not make them any less popular. Tea houses were already present in the Tang capital of Chang’an in large numbers in the eighth century. During the Five Dynasties period (907–960 CE) and Song dynasty, tea houses were associated not only with female entertainment but also with a particular form of poetry, the ci. The verses of ci were set to popular melodies and usually sung by the women of tea houses and the formal houses of prostitution. During the period the most famous literati wrote ci, although they did not originate the form, and through their verses we know a great deal about the popular tea houses of the Southern Song capital of Hangzhou, for example.

The more elegant tea houses had well-kept gardens. One could enjoy fine teas not only in repose but also in the most beautiful surroundings. Chinese teahouses became the eventual model for tea houses in the West.
Today Portland, Oregon, for example, has a fine tea house with scores of wonderful varieties of teas available in a beautiful garden closely modeled on the classic Chinese gardens of Hangzhou and Suzhou.

Literature of Tea

Going along with a distinct culture of tea was a distinct literature of tea. The most famous work in this genre is the *Chajing* (Tea Classic) of Lu Yu from the late eighth century. His ten-volume work is a compendium of tea lore, including its Daoist connection as a magic herb, the medical qualities of tea itself, its food value, even tea bowls. Other important books on tea were the *Chalu* (Record of Tea) of Tsan Xiang (1012–1067) and the *Daguan chalun* (Discussion of Tea of the Daguan Period) by Song Emperor Huizong (reigned 1101–1125), who was known for his painting, calligraphy, and refined tastes.

Porcelain

Porcelain tea bowls, created in special shapes, textures, and colors, and made just for tea drinking, became a key component of tea culture during Song times. Porcelain differs from other potteries in its raw materials and high firing temperatures. Although not invented during the Song dynasty, porcelain reached its first high point then. Most famous of Song porcelains were its celadons. They were created in a blue-green color by applying a thick glaze to a relatively delicate base. Celadon was the preferred porcelain of the court, but the Song period is also known for its blackware, including Jian tea bowls. On these bowls a black glaze was intended to contrast with

---

the green color of the tea consumed in them. The body of the bowl, relatively thick, helped maintain the temperature of the beverage. Although considered a popular ware, such bowls were still used at court, by the literati, and at monasteries. Song porcelain was imitated throughout East Asia and beyond, and fine examples continue to be highly prized today.

Mongolian Tea

Although brick tea was already exported to Tibet during the Tang dynasty, tea drinking began much later as a general central Asian practice. The earliest reference to traditional Mongolian tea, long-boiled (later brick) tea with thick milk or cream, for example, dates only to the fourteenth century, where an apparent recipe is found in the imperial dietary for Mongol China, the *Yinshan zhengyao* (Proper and Essential Things for the Emperor’s Food and Drink). In addition to its early recipe for Mongolian tea—in this case a powdered tea boiled with liquid butter and mentioned in the dietary under a Turkic name, suggesting that the Mongols may have borrowed it from local Turks—that same source mentions the following kinds of tea as being drunk at court: jade mortar tea, made from tea and roasted rice; golden characters tea, a presented powdered tea from the south; Mr. Fan Tianshuai’s tea, a tribute bud tea from south China; purple shoots sparrow tongue tea, made from new shoots; another variety of swallow tail tea; Sichuan tea; clear tea, made with tea buds; Tibetan tea, made with liquid butter and highly bitter and astringent; roasted tea, tea buds fried in butter oil and orchid paste; and a powdered tea, flour, and liquid butter made into a paste and boiled in water as a kind of *tsampa* (a Tibetan staple foodstuff). The central Asian interests of the text are obvious, although one cannot be
sure that the teas in question are purely central Asian. The same source also lists a number of herb teas from various sources and even rates fresh waters.

With these beginnings, tea caught on in Mongolia in a big way, as witnessed by the position of tea in the Ming dynasty’s trade with the north. Similar to the Tibetans, who were Song China’s source of horses, Ming China traded masses of tea to the Mongols for ponies. In Mongolia itself tea quickly became a way of life. Not offering a visitor tea became unthinkable, and Mongols, like Tibetans, added barley and other ingredients to their tea, along with butter, to provide a hot staple that is still consumed today.

**Tea in the West**

Not only the central Asian peoples but also the Iranian west, then the Turkish world, and finally Europe became fond of Chinese tea. In Iran, where tea was first a medicinal (as in China) from as early as the ninth century, it has now become the drink of choice and has many local variants, although black teas are preferred. In Turkey tea drinking took hold, but after the sixteenth century coffee became the beverage of choice. Because Chinese tea bowls were preferred over cups with handles in many areas of the West, the tea cultures of Iran and Turkey were not that different from that of China. Even the tea gardens were similar.

Europeans were exposed to tea (and coffee) drinking by those in the Islamic world, but Europe still obtained most of its tea from China, as did the North American colonies. Although Britain tried to push the teas of India, where tea was domesticated and developed independently of China, Chinese teas continued to be imported both to Britain and elsewhere in Europe, leading to a vast trading crisis as European silver went east to pay for Chinese tea, the first true mass commodity of the European trading system, if one excludes slaves. The attempt by Britain to substitute Indian opium for silver to cut its costs ultimately led to a series of wars with China, but the tea trade continued, right down to the present when Chinese teas are making a comeback on the world market. This is the case in spite of the fact that coffee has been of growing importance in Europe and the United States since the eighteenth century. Coffee simply lacks the delicacy of tea, and coffee drinking lacks the simplicity and elegance of tea drinking, thus tea enjoys a continued importance throughout the world.

**Further Reading**

China’s television industry is a latecomer, by international standards, but it has become an important political and cultural apparatus. Although controlled by the state—as is all mass media in China—television offers a wide variety of programming, both domestic and foreign, to some 1.29 billion viewers, the largest TV audience in the world.

Compared to most industrial countries in the world, China has a much shorter television history. Television was not available until the late 1950s, more than a decade later than in most industrial nations. Since television emerged in China, the medium has experienced various drastic changes and has now become one of the largest and most advanced, sophisticated, and influential television systems in the world.

Short but Convoluted History

The country’s first TV station, Beijing Television, began broadcasting on 1 May 1958. Within just two years, dozens of stations were set up in major cities like Shanghai and Guangzhou. Most stations had to rely on planes, trains, or cars to send tapes and films from one to another.

The first setback for Chinese television came in the early 1960s when the former Soviet Union withdrew economic aid to China. Many TV stations closed. In a short time, the number of stations was reduced from twenty-three to five. The second setback derived from an internal factor, the Cultural Revolution of 1966 to 1976. Beijing Television’s regular telecasting was forced to a halt in January 1967 by the leftists of the Chinese Communist Party (CCP) led by Mao Zedong (1893–1976). All other local stations followed its lead. Television stations were criticized for their bourgeois direction and changed to a new, revolutionary direction as a weapon for class struggle and anti-imperialism, anti-revisionism, and anti-capitalism campaigns both at home and abroad.

Beginning in the late 1970s, and the start of the country’s reform, television became the most rapidly growing medium. On 1 May 1978, Beijing Television changed to China Central Television (CCTV). As China’s only national network, CCTV had the largest audience in the world. From the 1980s through the 1990s, television developed swiftly. The number of TV stations once exceeded 1,000, with one national network, thirty-six provincial and major city networks, and several hundred regional and local networks. The government deregulated the development of television when it became somewhat chaotic in the late 1990s.

Since the early 2000s, China’s television industry has further substantially expanded. By the end of 2006, there were 296 national, provincial, and regional stations; 46 educational stations; and 1,935 local radio/television stations. In addition, there were 44,620 radio-TV transmitting-and-relaying stations and 2.2 million satellite-TV receiving-and-relaying stations. At the same time, China had 400 million TV sets, becoming the country with the most TV sets in the world. Statistically, there were two television sets for each Chinese family. By the
end of 2007, the penetration rate of television reached 97 percent, reaching 1.29 billion people. Among households with TV, 40 percent, or 153,246,800 households, had cable TV. Shanghai and Beijing had the highest cable TV penetration rates in the nation at 96 percent and 71 percent. In the same year, households with digital TV reached 26,860,500, which reflected a 112 percent increase from 2006.

Television broadcasting technology has also developed quickly. Most major stations use such technologies as virtual-field production and high definition. CCTV opened its Webcast service in 1996 to a worldwide audience, providing text, audio, and photographic and video images. Digital broadcasting has been set as one of the priorities of China’s National Development Plan. Based on a twenty-year digital television development plan, by 2015 all television programming in China will be transmitted via digital technology.

**Ideological Basis**

Despite the many changes since the reforms launched in the 1970s, all media is still state owned. Neither privately owned nor foreign-owned television is allowed. Receiving foreign TV programming via satellite is prohibited without government permission. There are no license fees for owning a TV set and no charge for viewing broadcast television. Until the late 1970s, television was not allowed to carry advertising; it was completely financed by the government.

Political theories undergirding the organization and uses of television flow directly from Marxis-Leninist doctrine. Mao embellished Marx’s idea of the importance of the superstructure and ideological state apparatus and Lenin’s concept of the importance of propaganda and media control, stressing that media must be run by the Communist Party and become the party’s loyal eyes, ears, and mouthpiece. The current leadership of the CCP inherited this concept and requires broadcasting to be kept in line with party doctrine and serve the party’s purposes voluntarily, firmly, and appropriately.

Under these guidelines, television is regarded as part of the party’s overall political machine. Television is used, to the greatest extent, by the party and state to impose ideological dominance on society. The party and the central government set the tone of propaganda for television at all levels. Although TV stations provide news, entertainment, and education, television’s first and most important function is to popularize party and government policies and motivate the masses in the construction of Communist ideology.

A tightly controlled administrative system has been used to run television. The CCP is the ultimate owner, manager, and practitioner of television. TV stations are under the dual jurisdiction of the Communist Party’s Propaganda Department and the government’s State Administration of Radio, Film, and Television. The Propaganda Department sets propaganda policies, determines programming content and themes, and issues operational directives. Technological, regulatory, and administrative affairs are generally the concern of the Radio-Television-Film Bureau of the State Council. As media are crucial political organs of the CCP, virtually no independence of media is allowed or envisioned. Except for several years in the 1980s—which were criticized later by the party as the period of “Western liberalization” and “bourgeois spiritual pollution”—neither open and large-scale debates on ideology nor serious criticisms of the party, government policies, or high-ranking officials has been permitted, unless organized by the party to meet certain political needs. The self-censorship policy has been long and extensively used. Routine broadcasting material does not require approval from party authorities, but important editorials, news stories, and sensitive topics all require official endorsement before their dissemination.

**Programming**

Television programming in China consists of six categories: news, documentary and infotainment, variety and entertainment, TV plays, advertising and service, and sports and other programs. In 2007, 14,546,700 hours of TV programming were broadcast, a 7 percent increase over the previous year’s hours. The bulk of programming, 45 percent, was TV dramas and movies, followed by advertising (13 percent), news (12 percent), variety (11 percent), services (10 percent), and entertainment (9 percent).

Before the 1970s, most entertainment programs were old films of revolutionary stories, with occasional live
broadcasts of modern operas about model workers, peasants, and soldiers. Newscasts from that era were mostly what the CCP’s official newspaper, The People’s Daily, and official news agency, the Xinhua News Agency, reported. Production capability was low; production quality was poor; equipment and facilities were simple; and broadcasting hours, transmitting scales, and channel selections were limited. Television broadcasted usually three hours a day.

Part of the explosive development of TV since the late 1970s is a result of the CCP’s new move toward openness and reform. Many taboos were eliminated, restrictions lifted, and new production skills adopted. Entertainment programs in the form of TV plays, soap operas, Chinese traditional operas, game shows, and domestic and foreign feature films have become routine. News programs have also changed substantially and expanded enormously. International news coverage and live telecasts of important news events are now often seen in news programs. Educational programs in particular have received special treatment from the government. Production capability has been enhanced as well.

CCTV expanded from two channels in 1978 to sixteen channels in 2006. Channel 1, the main channel, focuses on news; Channel 2, economy and finance; and Channel 3, culture, arts, and music. Channel 4 is dedicated to overseas Chinese and international audiences. Channel 5 shows sports; Channel 6, movies; Channel 7, social programs; and Channel 8, TV plays and series. Channel 9 is an English-language channel that broadcasts twenty-four hours a day, targeting an international audience. Channel 10 focuses on science; Channel 11, Chinese opera; Channel 12, law-related programs; Channel 13, news; Channel 14, children’s programs; and Channel 15, music. Channel 16 is a Spanish-language and French-language channel aimed at audiences in Spanish-speaking and French-speaking nations.

Most provincial and major city networks have also increased the number of their broadcasting channels and offer more programs. In 2006 alone, 546 TV plays with 18,133 episodes were produced. In contrast, during the two decades from 1958 to 1977, only 74 TV plays were produced. TV broadcasting hours have increased considerably as well. In an average week of 1980, 2,018 hours of programs were broadcast. The number went up to 7,698 in 1985, 22,298 in 1990, 83,373 in 2000, and 261,538 in 2006.

**Internationalization and Commercialization**

The most important indication of the internationalization of China’s television industry is the change in the importing of programming. Before the late 1970s, TV imports were quantitatively limited and ideologically and politically oriented. From the late 1950s to the late 1970s, only the national network was authorized to import TV programs. During those years programs were imported almost exclusively from socialist countries, and the content usually concentrated on the Soviet Revolution and the USSR’s socialist economic progress. Few programs were imported from Western countries, and they were restricted only to those that exemplified the principle “Socialism is promising, capitalism is hopeless.”

In the early 1970s, imported programming accounted for less than 1 percent of programming nationwide. That figure jumped to 8 percent in the early 1980s, to 15 percent in the early 1990s, to around 25 percent in 2000, and remained at 20 percent in recent years. Although they still face various kinds of restrictions, central, provincial, regional, and even local television stations are looking to other countries, mostly Western nations, for programming. The government now stipulates that, unless special permission is obtained, no imported programming is allowed to be shown during prime time (7–10:30 p.m.) and that imported programming cannot fill more than 15 percent of prime time.

Another sign of TV’s internationalization is the effort to expand the exporting of China-produced TV programs. Major Chinese TV stations have produced programs for the global market and have even become main programming suppliers of some television stations in other Asian countries. CCTV and a few major city networks have set up offices in the United States, the United Kingdom, France, Belgium, Russia, Egypt, Japan, Hong Kong, Macao, India, Thailand, and Australia to promote business. In addition, CCTV and a few other major Chinese TV stations have established joint-venture businesses with television stations in North America, South America, Europe, Asia, and Oceania to broadcast programs via satellite. CCTV’s international and English-language channels are now broadcast via China’s own satellite and are available in most countries. In 2006 CCTV alone exported 6,000 episodes, more than 4,000
hours of television programs. CCTV’s Channels 4, 9, and 16 are now watched in eighty-six countries by 68 million household subscribers.

Another significant change in China’s television industry since the reforms is commercialization: the resurrection of advertising on television and its impact on programming. Economic reforms have revived the importance of market forces and the power of advertising. Both foreign and domestic advertising have been resurrected. Since the early 1980s, revenue from advertising has increased at an annual rate of 50 to 60 percent.

By the 1990s television had become the most commercialized and market-oriented medium in China and attracted a large portion of advertising investment from both domestic and foreign clients. For the hundreds of television stations across the country, advertising and other commercial activities now constitute the majority of programming revenue, ranging from 40 percent to 90 percent. All television stations are now supported by advertising revenue.

While media advertising accounts for 70 percent of China’s total advertising expenditure, television advertising alone accounts for 80 percent of total media advertising expenditures. Over the last several years, advertising revenues for almost all other media have been declining, but television advertising has continued to increase. In 2006 advertising revenue for the broadcasting industry reached 527 million yuan (approximately $75 million at the time). Some 453 million yuan was from television advertising revenue, a 12 percent increase from 2005. In 2007 advertising revenue for the broadcasting industry reached 601 million yuan (approximately $86 million). Advertising revenue in the television industry alone reached 519 million yuan, a 15 percent increase from 2006.

The television structure in China is quite different from that in most Western nations, where national networks usually are the biggest advertising revenue makers. In China, by contrast, in 2007 provincial TV stations reaped 57 percent of the total of TV advertising revenues, followed by 21 percent for the regional and county-level TV stations, and only 18 percent for the national networks. Over the last several years the top three commodities of China’s TV advertising have been cosmetics, medicine, and food, occupying 21 percent, 16 percent, and 14 percent of the total television advertising in 2007. The top-ten list of television advertising also included ads for telecommunication devices (mobile phones and computers), Chinese liquors and beverages, entertainment and leisure activities, the service industry (hotels), and transportation (cars and domestic/foreign airlines). This list is quite similar to the top-ten list of television advertising in developed nations, a reflection of China TV’s move toward a Western model.

The telecasting of the Beijing 2008 Olympic Games was one of the biggest events not only in China’s TV history but also in the history of world television. More than 4 billion people across the world watched the televised games, a new record in world TV history, surpassing the audience for the 2000 Sydney games (3.4 billion) and the 2004 Athens games (3.9 billion). The Beijing Olympics opening ceremony was said to have hit a record high TV rating: more than 90 percent of TV audiences across the world watched the event. Thanks to the 2008 games, China’s total advertising revenues in 2008 were estimated to have increased 29 percent over 2007 revenues. For CCTV alone, its advertising revenues during the seventeen days of the games were estimated to have reached 2 billion yuan (approximately $300 million). The Beijing Olympics also made many global companies very interested in China’s huge media market. The biggest foreign sponsors of the telecasting of the Beijing Olympics included Coca-Cola, McDonald’s, Adidas, and Johnson & Johnson. In 2008, because of the Beijing Olympic Games, Coca-Cola’s advertising expenditure in China increased 24 percent; Visa’s, 30 percent; Kentucky Fried Chicken’s, 39 percent; Adidas’s, 100 percent; and Nike’s, 143 percent.

**Internet Viewing**

Watching television on a computer or mobile device is increasingly popular in China, as it is in the United States and Western countries. In fact, Westerners looking for their favorite programs sometimes watch pirated versions, in English with Chinese subtitles, on Chinese websites. This unstructured and uncommercialized Internet viewing is even said to have cut into the market for pirate DVDs in China. Volunteer groups download popular U.S. televisions show such as 24, American Idol, Survivor, and Battlestar Galactica from BitTorrent, a peer-to-peer file-sharing site, immediately after new episodes are broadcast in the United States. They locate closed-captioned English scripts, made for the hearing-impaired, and translate them into Chinese. Perhaps in future a commercial version like
the U.S. Hulu.com will compete, but that would be possible only if the Chinese government allowed the distribution of more Western programming.

Future Direction

Under the modernization plan, the open door policy, the transformation from a state economy to a market economy, and the tendency toward lessening controls since the late 1970s, television in China has become a very popular medium, a very technologically advanced broadcast system, and a highly professionally performed service. Television's function has evolved from a single-purposed one for political and ideological propaganda to a multi-purposed one for serving both the party/government and the society/public.

However, by and large, television in China is still a state-owned and party-controlled political and ideological instrument, despite its having evolved to fulfill other purposes. Television, like all other mass media in China, is required to run in the socialist track, but, at the same time, it is forced to operate in a Western way, the capitalist way. This conflict has brought about many unprecedented problems to television.

No signs of change in the character of television are seen for the near future. As long as the country's political system does not change, the Marxist-Leninist-Maoist doctrine on the media, including television, will not change. This obstacle will not be overcome until fundamental changes in the political system occur. It is certain that television's internationalization and commercialization will continue, despite fluctuations that may occur as a result of the change of the political climate and the ideological needs of the Communist Party. But it is unlikely in the foreseeable future that television, along with all other media in China, will become an independent social mechanism, nor will it become truly free from the control of the party and government.

Television in China has developed unevenly. For historical and economic reasons, most TV stations in China—especially those that have larger audiences and, therefore, are more influential—are in the eastern coastal areas or central section of the country, places such as Beijing, Shanghai, Guangdong, Tianjin, Jiangsu, Zhejiang, and Hunan. For example, in 2007, 22 percent of the total TV advertising revenue was from Beijing alone, 47 percent from the eastern coastal areas, and 21 percent from the central part, whereas only 11 percent was from the western section of the nation, which has more than 30 percent of China's total geographic area and population. All of the top ten provincial TV stations of China's television advertising were in the eastern coastal area or central part, with Guangdong first, Jiangsu second, and Shanghai third.

Since the beginning of the twenty-first century, China's television industry has undergone a profound shift toward conglomeration as China aims to become more competitive in the global television arena. New ways of doing business and new technologies will help the television industry thrive and be an important part of Chinese culture.

Television—Dramas and Reality Shows

Diànshìjù yù zhēnrén jīshíxiù
电视剧与真人纪实秀

Everyone likes a good story, and China’s TV viewers are no different. Dramatized retellings—with added embellishments—of the exploits of ancient officials and emperors, and fictionalized accounts of modern revolutionary heroes are among the most popular entertainment on Chinese TV. At the same time, reality-based programs, so popular in the United States, are also gaining an audience.

The most widely viewed television show in the world is the New Year’s extravaganza that China Central Television (CCTV) presents each year. But television dramas and Chinese equivalents of American Idol and other reality shows are also hugely popular.

Rise of Drama

Entertainment programs dominate Chinese television, but dramas have consistently garnered the highest share of ratings since 2000. In 2004 television dramas accounted for 29.4 percent of all program ratings, followed by news programs (16.8 percent), variety shows (7.9 percent), special features (7.7 percent), sports (7.0 percent), and films (5.6 percent). In 2004, 505 television dramas, with 12,265 episodes, were shown. In that same year, 156 channels operated by 33 city television stations aired 1,598 dramas totaling 183,123 episodes.

Dramas’ Run

The average television drama in the early 2000s ran for twenty episodes. Since 2004, that figure has increased to twenty-six, with many dramas having as many as fifty to sixty episodes. Each episode runs about thirty-eight minutes. Among all types of TV programs, dramas have garnered the largest amount of television advertising revenue. In 2004 receipts from television dramas accounted for 44.1 percent of all television advertising revenue. In that year television advertising revenue amounted to over 150 billion yuan ($22 billion). By comparison, box office revenue for the Chinese film industry in 2004 was 360 million yuan ($53 million). This includes domestic revenue of 250 million yuan ($37 million)—of which 100 million yuan ($15 million) came from television broadcasting—and 110 million yuan ($16 million) in international revenue. The number of television dramas produced and broadcast and the advertising revenue generated indicate that television drama, not film, is the top form of entertainment in China.

The first Chinese TV drama was a thirty-minute play called A Veggie Cake (Yikou cai bingzi 一口菜饼子), the bitter story of a starving peasant family under the old regime. It was aired live on the Beijing television station on 15 June 1958. From 1958 to 1966, nearly two hundred single-episode dramas were performed and telecast live. Television drama production—along with much other TV productions—ceased during the Cultural Revolution and did not resume until 1978. In the early 1980s, Chinese
television stations began to broadcast foreign television serials, or soap operas, from Japan and the United States. But domestic television drama arrived in 1990 with the fifty-episode Yearning (Kewang 渴望). Yearning entranced thousands of millions viewers with its melodramatic portrayal of the lives and struggles of ordinary citizens during the Cultural Revolution.

**Popular Dramas**

Modern television dramas not only amass the highest ratings but also covers a rich diversity of subject matter and genres. In 2004 the most popular genres were romance, domestic drama, martial arts, romantic and youth idol drama, crime, revolutionary drama, and history.

Drama genres can be classified in various ways. Romance, for example, can include fictional historical drama, the most popular genre. Within this genre themes from the Qing dynasty (1644–1912) are extremely popular. Examples include Prime Minister Hunchback Liu (Zaixiang Liu luoguo 宰相刘罗锅) (1996), the story of a legendary witty and honest Qing prime minister who fights imperial officialdom and corruption, and Iron-Toothed Ji Xiaolan (Tiechi tongya Ji Xiaolan 铁齿铜牙纪晓岚) (2001), a comic tale about a Qing scholar who bravely challenges the treachery of the emperor. Stories like these touch on popular sentiments against corruption and age-old expectations of honorable officials (qingguan 清官). Also popular are romantic stories that place actual historical figures—such as Qing emperors, princes, and princesses—in totally fictional situations. One such romance, Princess Pearl Returned (Huanzhu gege 还珠格格) (1999), with its mischievous and rebellious teenage heroine, is enormously popular. Although taking place in the distant past, it reflects radically changed social stereotypes and expectations of modern Chinese girls.

Also popular are historical dramas about famous Chinese emperors that recapture China’s past imperial glory, such as The Great Han Emperor Wudi (Han wu dadi 汉武大帝) (2004); Yongzheng Dynasty (Yongzheng wangling 雍正王朝) (1999); and Kangxi Dynasty (Kangxi diguo 康熙帝国) (2003). Revolutionary dramas, such as Years of Burning Passions (jiqing ranshao de shuiyue 激情燃烧的岁月) (2002), remind TV viewers of the revolutionary legacy that is part of modern history. Other popular subgenres include adaptations of Chinese classical novels—such as Dream of the Red Chamber (Hong lou meng 红楼梦) (1987), Journey to the West (Xi you ji 西游记) (1986), and Romance of Three Kingdoms (Sanguo yanyi 三国演义) (1995)—and adaptations of the popular martial arts novels of Jin Yong, such as Dragon’s Eight Tribes (Tianlong babu 天龙八部) (2004).

In recent years television dramas from Korea have become popular creating a Korean cultural boom among urban youth. This trend has caused some concern among officials of the State Administration of Radio, Film, and Television and among domestic television drama producers. China’s imports of television dramas have remained quite small (only about 5 percent of all dramas in 2004), but more cultural and media exchanges are likely to increase the import and export of television dramas.

**Spring Festival Gala**

One television program stands out among all the rest and attracts the largest audience in the world: the Spring Festival gala, or celebration show, produced by CCTV. The gala, which has been an annual event since 1983, is a spectacular variety show. It includes dance and musical performances, sketch comedy, and appearances by national celebrities and is broadcast live on Chinese New Year’s Eve from 8 p.m. till after midnight on New Year’s Day. The program boasts of ratings of more than 90 percent, or approximately 1 billion viewers. It is so popular that it has become a new custom of the Chinese New Year celebrations.

Each year the gala’s producers try to work in new forms of popular culture to go along with traditional folk forms and Beijing Opera while satisfying the Chinese Communist Party’s demand to make the show a comprehensive representation of mainstream, official ideologies. But the most popular part of the show is the comic sketches, often mild satires of modern life. For example, in the 2009 show, Jiang Kun, a popular actor, made the audience laugh with his routine on China’s new look after thirty years of reform and opening up. “In the past,” he said during his skit, “we had no traffic jams and no highways. Now we have congestion everywhere, even though we have so many highways.”

Because of its large scale and the tremendous advertising revenue it generates, the gala is often troubled with
scandals and power struggles. Zhao An, a former director of the gala, was sentenced to ten years in prison in 2004 for taking bribes. In recent years, criticism of CCTV’s monopoly on New Year’s television shows has increased, as the CCTV gala now has to compete with a greater variety of entertainment forms, some of which were unavailable when it first started. However, as a cultural ritual with widespread appeal, the gala remains the highest rated television program in the world.

New Developments

Challenges to CCTV’s monopoly on reality programs have surged in recent years. Hunan Satellite TV has captured the hearts of young, especially teenage, viewers with its enormously successful program Super Girl (Chaojinusheng 超级女声), which debuted in 2004. Modeled after American Idol, Super Girl is a blend of reality show, singing and dancing contest, and beauty pageant. Viewers can vote for contestants by cell phone (more than 300 million viewers cast their votes by cell phone in 2005), and thousands of millions of teenage girls and their families participate. A Super Girl craze swept China in 2005, ending in the selection of three winners. Two of the three—Li Yuchun, the first-place winner, and Zhou Bichang, the second-place winner—were widely regarded as amateurs with poor singing skills and music talent. But their alternative and often defiant and androgynous style attracted fans. As expected, mainstream and academic circles have criticized Super Girl for its vulgarity and bad-taste sensationalism and populism.

CCTV has refused to allow any of the Super Girl winners to appear on its programs. Nevertheless, because of the huge popularity and enormous profitability of the show, many local television stations have introduced copycat shows. In 2005 Dragon TV, the satellite TV channel of Shanghai Media Group, introduced My Hero (Hao nain’er 好男儿), a male version of Super Boy, with only male contestants, and My Show (Wo xing wo Show 我型我), which included both male and female contestants. Since 2006, there has been fierce competition for music talent contest show. Even CCTV has introduced such programming, but in 2007 the central government issued a series of directives to all TV stations to tone down such music contests and reality shows and to uphold high moral and educational standards. Consequently, Super Girl and its clones have lost much of their momentum.

The consistent high ratings of television dramas and the popularity of shows like Super Girl indicate that entertainment is playing a vibrant role in the Chinese television industry, with far-reaching implications for the future of Chinese mass media. Chinese television, despite being caught between political pressure from the Chinese Communist Party and market competition, has rapidly developed into a cultural indicator as well as a profitable industry.

Television—News

Diànshì xīnwén 电视新闻

Television news in China has been broadcast since TV became available in the country in the late 1950s. China Central Television (CCTV)—the national network owned and managed by the government (and the standard for all TV news stations in China)—has begun to offer several popular “news magazine” shows that cover everyday events or touch on a wide range of hot topics in China and the world.

After dramas, news bulletins are the most popular TV shows with Chinese viewers. Broadcast news in China is ubiquitous, popular, and influential. The government stipulates that each television station must have a comprehensive channel to broadcast important news. The people of China are well informed—up to a point. The power of the press belongs to those who own the press. In China the Chinese Communist Party (CCP) owns and manages TV news, along with all other mass media.

News Policy

China Central Television (CCTV), the country’s first TV station, is the only national network and the standard for all other TV networks. CCTV has eighteen channels. CCTV-News, launched in 2003, broadcasts news twenty-four hours a day. CCTV’s domination of news programming is shown by its prime-time Network News (Xinwen lianbo), a program that began broadcasting in 1978, and which still runs daily from 7 to 7:30 p.m. The government requires all local stations to broadcast this program simultaneously.

The editorial board of Network News consists of senior officials of CCTV, overseen by the network’s president. Network News is the model for Chinese television news programs. It serves as one of the most important news outlets for the CCP, in addition to the People’s Daily (Renmin ribao) and the Central People’s Radio Station (Zhongyang renmin guangbo diantai). Network News adheres to CCP media theory and guidelines: Television’s first purpose is to serve as the “mouthpiece” of the government and the party, and should mainly cover political and economic successes and the positive aspects of government, and not spread negative thinking or foster low morale. This media policy is part of the political and ideological agenda of the CCP. And there are no signs that the CCP will relinquish its firm hold on the media in the foreseeable future.

Program Format

The format of Network News has remained unchanged since its first day of broadcasting. Any radical changes in the format are unlikely, and any changes are incremental and gradual. There are two presenters, one male and one female. Two or three pairs of presenters rotate daily. These presenters are merely announcers and have no editorial power to determine the selection of news.

Network News always begins with the public activities
of the top leaders, in order of their rankings in the highest political body, the Standing Committee of the Political Bureau of the CCP. The first appearance is reserved for the general secretary of the CCP. Conferences, meetings with foreign visitors, tours, and speeches involving the top leaders usually take up the first ten minutes, or a third of the program. The next ten-minute segment covers economic news from across China. Some segments are prerecorded and produced weeks or even months in advance. Most news stories are produced by local television stations and cover positive reports of growth, development, and technological advances.

Other News Programming

As part of reforms in news programming, CCTV launched two news magazines in 1993, Oriental Horizon (Dongfang shikong) and Focus (Jiaodian fangdan).

Oriental Horizon is a one-hour program broadcast at 7 a.m., before most of the audience goes to work or school. It features coverage of events in the daily lives of ordinary citizens, portraits of well-known figures, and in-depth reports on a single issue. The program is hugely popular, and some observers claim that it has caused a silent revolution in daytime television.

Focus is a thirty-minute current affairs program broadcast at 7:30 p.m., prime time. It touches on a wide range of hot topics in China and the world, with background analysis, on-the-spot reporting, and in-studio interviews. Focus usually covers issues of significant social impact and of considerable interest to both the government and the public. Sensitive issues—such as corruption, injustice, and rising social disparities—are approached using an investigative reporting style. This kind of tough reporting has made Focus extremely popular. It usually trails only Network News in the ratings.

In 1996 CCTV launched the news magazine, News Probe (Xinwen diaocha), a forty-five-minute weekly program that provides in-depth investigative reporting of sensitive social issues. It is broadcast on CCTV-1 first at 10:30 p.m. on Mondays and then repeated on CCTV-News the following Tuesday, Saturday, and Sunday, all during off-peak times. The issues exposed and the criticism of social problems on News Probe are sometimes more distressing or controversial than those covered on Focus, partly because it is aired during off-peak hours. The editorial board reckons that because fewer people watch the show, its impact is less widespread.

News programs like Focus and News Probe are governed by a complicated and difficult process of selection, negotiation, framing, and censorship. A former director of Focus admitted that for each program he had to carefully weigh the question of its possible negative effects on political stability, in general, against the resolution of the problems it uncovered, in particular. To satisfy the government and meet the public’s demand to know the truth behind incidents, crimes, and disasters, journalists and editors need to walk a fine line. Their work in recent years reflects a trend toward more accurate, balanced, and fair news reporting in an increasingly open society.

In October 1998 then-premier Zhu Rongji met with Focus editors and reporters, and left a written message that paid tribute to the program. Zhu expressed the hope that Focus would function as a leader in reform, the government’s mirror, and the “people’s mouthpiece.” Observers noted that the change from the party’s mouthpiece to the people’s mouthpiece was a significant shift, especially when articulated by a top leader. Although no substantial reorientation occurred at CCTV after this visit, local television stations took the cue from Zhu in their efforts toward reform.

A trend toward a diverse range of television news programs and news magazine shows continued on local television stations into the early 2000s. These programs devote more attention to local issues that have direct impact on the everyday lives of ordinary citizens. On 1 January 2002, Jiangsu Television’s City Channel launched the prime-time news program Nanjing Zero Distance (Nanjing lingjuli), which airs from 6 to 7:30 p.m., overlapping with CCTV’s Network News. (City Channel’s sister channel Jiangsu TV-1 obligingly airs Network News.) Nanjing Zero Distance ushered in a new way of covering the news of people’s lives (minsheng xinwen), dealing mostly with the everyday events and issues that concern the residents of Nanjing. Because Nanjing is the provincial capital of one of the most prosperous provinces on China’s east coast, events in the city have implications for all of Jiangsu Province. The program’s ratings soon soared, and it attracted the highest Nielson rating (17 percent) of all television programs in Nanjing and vicinity, an area of more than 6 million people.
More than ten programs of this type emerged in Jiangsu and Nanjing alone over the next few years and have dominated television broadcasting and ratings. Across China, similar programs have appeared on provincial and city television stations, creating a sort of TV war for programming. Such local news programs meet the needs of a public with ever-growing concerns about issues that affect the rights and well-being of individuals. In addition, such programs are in keeping with the government’s policy priority of building a harmonious society.

Temple of Heaven
Tiāntán 天坛

The Temple of Heaven was the imperial site of prayer to Heaven during the Ming (1368–1644) and Qing (1644–1912) dynasties. The Temple’s most spectacular structure is The Hall of Prayer for Good Harvest 祈年殿, 38 meters (125 feet) tall, built entirely of wood without using a single nail.

The Temple of Heaven, or Altar of Heaven, was built between 1406 and 1420 in Beijing during the reign of Zhu Di 朱棣, the Yongle emperor (reigned 1402–1424). Zhu Di is also credited for overseeing the planning and construction of the Forbidden City. The Temple of Heaven served as the prayer site for the emperors of the Ming (1368–1644) and Qing (1644–1912) dynasties in China. It is regarded as a Daoist temple, although Heaven worship was practiced before the rise of Daoism.

Every year, on the fifteenth day of the first lunar month, the emperor would come to the Hall of Prayer for Good Harvest (祈年殿 Qi Nian Dian) to pay homage to Heaven and pray for a good harvest. He would honor his ancestors as well, as he was regarded as the Son of Heaven. In early winter the emperor would come again to thank Heaven for the good harvest. If a drought plagued China during the summer, the emperor would come to the temple to pray for rain. Accompanying the emperor on these visits would be his entourage of officials, all wearing special ceremonial robes. Ordinary Chinese were not allowed to view the emperor’s procession from the Forbidden City to the Temple of Heaven or the ceremonies that followed.

The temple grounds cover 2.7 square kilometers (1.5 square miles). On the site are three imperial sacrificial
sites: the Imperial Vault of Heaven, the Circular Mound Altar, and the Hall of Prayer for Good Harvest. Within the Imperial Vault of Heaven is the Echo Wall, a marvel of acoustical engineering that can carry sounds across long distances. The Circular Mound Altar is the altar proper. It is comprised of three rounded white-marble platforms. The bottom platform represents Hell; the middle, Earth; and the top, Heaven.

The Hall of Prayer for Good Harvest lies at the center of the grounds and is the most spectacular building on the site. It is a tripled-gabled circular building 38 meters (125 feet) tall, built entirely of wood with no nails. It is considered a masterpiece of traditional Chinese architecture. The hall was designed with many symbolic features. Of the twenty-eight pillars that support the domed structure, the four large ones represent the four seasons, the twelve inner pillars represent the months in the lunar calendar, and the twelve outer pillars represent the twelve two-hour periods of a day.

The uncovering of thousands of clay statues that were buried in 210 BCE during the Qin dynasty has taught archaeologists and other scholars about classes of soldiers, beliefs of the period, and skills of craftspeople. The clay army, originally painted in vivid colors to distinguish different groups of soldiers and featuring individual facial features, is one of China’s most iconic images.

One of the most spectacular archaeological finds of the twentieth century is the army of nearly eight thousand life-size terracotta soldiers and horses that guards the tomb of China’s first emperor, Qin Shi Huangdi (d. 210 BCE), whose name means First (Shi) Emperor (Huangdi) of the Qin dynasty (221–206 BCE), a short-lived and authoritarian dynasty.

The army was discovered beginning in 1974 by peasants digging a well, and is located twenty-two miles east of Xi’an (formerly Ch’ang-an) in Shaanxi Province and about one mile east of the unexcavated mausoleum of the ruler. The figures are distributed over three pits (a fourth was found to be empty) built of rammed earth. The buried army yields more complete and detailed information on Qin military science than the fragmentary texts from the period can provide.

Today, the soldiers are part of a large complex known as the Museum of the Terracotta Army, which opened in 1979 outside of Xi’an. More recently, the burial army was made accessible to an audience outside of China when the British Museum mounted a ground-breaking exhibition in London in 2007. Among the 120 objects on display—the largest number of material related to China’s First Emperor ever to be shown outside China—were twelve complete soldiers and artifacts excavated from around his tomb, which highlighted the achievements of this short but important period in China’s history.

At about 14,300 square meters, Pit 1 is the largest of the pits and contains nearly six thousand figures, primarily armored and unarmored infantry, including archers and charioteers. The pit also contains terracotta horses, the remains of six chariots, and bronze weaponry such as swords, crossbows, halberds, and long and short daggers. Rectangular in form and dug to a depth of five meters, Pit 1 arranges the soldiers in precise military formation in eleven corridors separated by earthen walls. The extreme left and right corridors consist of archers who face outward as if anticipating a flank attack. In the nine wider corridors soldiers stand four abreast with a chariot and four horses at the head of six corridors. Three corridors of unarmored soldiers with bows and crossbows take up the front and the rear. Each corridor is paved with bricks, and has wooden rafters and crossbeams above. Woven matting was used to absorb any moisture that seeped in; on top of the matting the builders put a layer of clay. The pit was originally covered with a mound of earth.

At about 6,000 square meters, Pit 2 is smaller than Pit 1, and held the cavalry. It contains around a thousand figures that include cavalry men and their horses,
eighty-nine chariots each drawn by four horses, and some archers and foot soldiers. Pit 3 is 520 square meters in area and most likely represents the command unit. It contains sixty-eight officers, four horses, and one chariot. Together, these three pits represent a single army composed of an infantry unit, a smaller and more mobile mounted unit, and a command post to oversee operations.

Realistic, Colorful, and Armored Soldiers

The figures were made with local clay and fired in kilns that would have been set up close to the mausoleum. It was generally thought that these kilns were made in an upright pit, but research suggests that the process was much more complicated. The figures were hand built and had solid legs for stability but hollow torsos. The heads were made with molds, but facial features and details such as hair and headgear were added by hand.

The realism of each soldier’s face, individually modeled to show age as well as the multicultural backgrounds of the emperor’s soldiers, and the meticulous detail paid to the clothing are remarkable. Originally, the figures were brightly painted, but much of the pigment has flaked off. The colors were used to distinguish between the different units of the army. For example, Pit 1 had two color schemes. One group had green robes with lavender collars and cuffs, dark blue trousers, and black shoes with red laces; its armor was black with white rivets, purple cords, and gold buttons. The other group had red tunics with pale blue collars and cuffs; its armor was dark brown with red or light green rivets and orange cords.

The terracotta army yields valuable information on armor and weaponry in early China. Eight different styles of armor were used, falling into two categories: armor made by fastening rectangular scales to a base layer and armor constructed by stringing scales together without a support layer. These scales were probably made of lacquered leather—no metal plates from this period have yet been found—and were probably attached to one another by knotted leather strips to allow movement with the body. The armor was slipped over the head and buckled with a right front closure.

The armor in both categories ranges from simple to complex. In all cases the armor was adapted to the rank and weaponry of the individual warrior. The most basic armor of the first type covered only the front of the wearer and was held in place by straps crossed in back. In contrast, the commanding officers wore the most distinctive and complex protection: the front portion of each piece of their waist-length armor had a flexible triangular extension in front that covered the lower abdomen. The wide-sleeved undergarment and the intricate threading of the armor plates signified the overall high rank of the wearer. In addition to the armor, some wore a bright, tasseled cape at the shoulders.

Cavalry, infantry, and charioteers wore armor of the second type. Cavalry wore a short vest, which was suitable for riding because it was trim and efficient. Charioteers wore more substantial and complex armor than any other soldier. Covering more of the body, it included
a neck guard and articulated sleeves, which covered the arm to the wrist. More than three hundred intricately arranged plates allowed for freedom of movement while protecting the wearer.

**Technical Know-How**

The pits also indicate that the Qin metalworkers had a high degree of technical know-how and produced a wide range of bronze weaponry, including swords, daggers, halberds, crossbow mechanisms, and arrows. More than ten thousand finely made weapons were found, and many of them were inscribed, indicating where and when they were cast. Even after two thousand years underground, many of the weapons showed little signs of corrosion.

The terracotta soldiers and the mausoleum they were to protect were designated by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) in 1987 as a World Heritage Site. A museum established at the site covers approximately 16,300 square meters and includes Pits 1, 2, and 3, each covered by large hangar-like structures. Visitors to Pit 1, for example, can view nearly 1,000 restored soldiers and horses arranged in battle formation as well as watch the on-going excavations at the site.

Before the events of September 11, 2001, international terrorism was a remote concern for China. But now that terrorists have attacked in Asia—and the East Turkestan Islamic Movement is a threat on China’s own soil—the Chinese government is no longer willing to sit on the sidelines. As an increasingly large player in global strategic affairs, China has joined the international antiterrorism coalition.

The spread of international terrorism in Asia is of particular concern to China, since terrorism threatens China’s efforts to modernize economically, establish social stability, and improve relations with its neighbors. The September 11, 2001, terrorist attacks on the United States put antiterrorism at the top of Asia’s political and security concerns, creating an unusually strong consensus among Asian nations in support of antiterrorism action on all levels—bilateral, regional, and international. China had its own political reasons for joining the U.S.-led war on terror—specifically, the elimination from the Xinjiang Uygur Autonomous Region of its main terrorist threat, the separatist East Turkistan Islamic Movement (ETIM), supported by al-Qaeda. But China’s cooperation and leadership in the war on terror underscored a more important strategic decision by China to abandon its traditional position of noninterference in other countries’ internal affairs as well as its opposition to multilateralism. In other words, China’s efforts to combat international terrorism indicate that a much broader strategic role is emerging for China in the world and may well elevate China to the ranks of the great powers.

**Background: Terrorism in the 1990s**

Before September 11 international terrorism was a rather remote concern for China and did not figure prominently in its foreign policy. Its exposure to terrorism was limited, and China had been basically on the sidelines in the fight against international terrorism. Although China had signed and ratified most of the international conventions and treaties against terrorism, the participation of China in international counterterrorism activities had been minimal, generally. International terrorism was considered mainly a scourge of the developed world, since the vast majority of terrorist acts were committed in Europe or the Middle East. China and East Asia were largely untouched by terrorism throughout the later years of the Cold War, allowing the region to concentrate more on developing its economies and maintaining internal stability. Furthermore, China was more concerned about its position in the strategic balance of Asia than about conflicts or antiterrorism far removed from China’s sphere of influence.

Of course, some violent and terrorist activities, mostly with economic motivations, did occur in China—for example, kidnappings, bank robberies, and armed drug trafficking. Most kidnappings and robberies took place in the eastern coastal regions, where the economy and overseas
connections were more developed, while drug trafficking generally originated in the northwest (for example, in Afghanistan and Xinjiang) and in the southwest. To be sure, terrorism of a political nature—such as the occasional hijacking of airplanes to Taiwan—also occurred. Yet even these hijackings were often simply a way to escape prosecution for economic crimes committed on the Chinese mainland. On the whole, the Chinese government treated these activities as ordinary criminal acts rather than acts of terrorism.

China became concerned about international terrorism in the early 1990s, after terrorist acts in Xinjiang by the separatist group ETIM; they were the most significant terrorist attacks to occur within the borders of China in modern times. These attacks, which involved bombings and armed attacks that targeted Chinese police and security facilities and personnel, compelled Chinese authorities to formulate an antiterrorism strategy for combating East Turkistan separatist groups—particularly the ETIM, which had gained the support of the Taliban and al-Qaeda in Afghanistan—and for ensuring the security and stability of Xinjiang. In this context, an antiterrorism corps was organized in Xinjiang with the support of the central government. Moreover, because the East Turkistan movement crossed borders, the Chinese authorities recognized that antiterrorism would need to include mechanisms for international cooperation.

But the problem of terrorism was not nearly as acute or pressing in East Asia as it was for the West during the immediate post–Cold War period and was overshadowed both on the international front and in China itself by globalization and the economic and political consequences of the collapse of the Soviet Union, bringing to an end the strategic rivalry between the two superpowers. For most of the 1990s, Chinese scholars and government officials remained focused on keeping up with the rapid pace of global change and the transformation of China’s economic system, while scholars of security and strategic issues were also busy tracking and analyzing the episodic crises on the Taiwan issue, tensions on the Korean peninsula, the break-up of the Soviet Union, and China’s strategic relationships with the United States, Japan, and the European Union. The importance of these international economic and strategic issues to China’s development and role in the world pushed the subject of international terrorism to the background.

Impact of September 11

It was only near the end of the 1990s that Chinese scholars and policy makers began to take more interest in the problem of international terrorism—particularly, that of militant Islamic groups, which were migrating to South Asia, Central Asia, and Southeast Asia. Terrorism was no longer a distant threat; it was actually approaching China’s doorstep. The danger became even greater after the September 11 terrorist attacks on the United States. China’s sense of security was profoundly shaken by September 11 (as was that of the whole international community), causing a rapid shift in Chinese foreign policy toward Central and South Asia to meet the direct threat of al-Qaeda.

Antiterrorism became an urgent consideration in China’s relations with its Asian neighbors—particularly, countries to the west—after the September 11 attacks. Although al-Qaeda and its brand of Islamic extremism were a known and gathering terrorist threat to China’s western frontier prior to September 11, the al-Qaeda terrorist network’s long reach into Southeast Asia, unearthed after U.S. forces went into Afghanistan, was cause for considerable concern, as it might undermine the progress made in regional cooperation and might derail China’s agenda for regional economic integration and development. Thus, antiterrorism cooperation joined regional and global economic cooperation as top Chinese diplomatic goals.

Since the September 11 terrorist attacks, based on its new security concept, China has been actively promoting international antiterrorism cooperation on all levels. On the international level China has spoken out in favor of giving the United Nations the leading role in international efforts against terrorism, arguing that the organization provides an international legal framework for antiterrorism activities and that the Security Council—particularly, the Counter-Terrorism Committee (CTC)—is the best mechanism for coordinating counterterrorism activities. On the regional level, China has made antiterrorism cooperation a priority issue in the Shanghai Cooperation Organization (SCO), Asia Pacific Economic Cooperation forum (APEC), Asia-Europe Meeting (ASEM), and the Association of South East Asian Nations Regional Forum (ARF).

In the immediate aftermath of the September 11 terrorist attacks, China led the push to strengthen antiterrorism
East Turkistan Islamic Movement (ETIM)

The East Turkistan Islamic Movement (ETIM) is a small Islamic extremist group based in China’s western Xinjiang Uygur Autonomous Region. It is the most militant of the ethnic Uygur separatist groups pursuing an independent “Eastern Turkistan,” an area that would include Turkey, Kazakhstan, Kyrgyzstan, Uzbekistan, Pakistan, Afghanistan, and the Xinjiang Uygur A. R. of China. ETIM is linked to al-Qa’ida and the international mujahedin movement. In September 2002 the group was designated under EO 13224 as a supporter of terrorist activity.

Activities

ETIM militants fought alongside al-Qa’ida and Taliban forces in Afghanistan during Operation Enduring Freedom. In October 2003, Pakistani soldiers killed ETIM leader Hassan Makshum during raids on al-Qa’ida–associated compounds in western Pakistan. US and Chinese Government information suggests ETIM is responsible for various terrorist acts inside and outside China. In May 2002, two ETIM members were deported to China from Kyrgyzstan for plotting to attack the US Embassy in Kyrgyzstan as well as other US interests abroad.

Strength

Unknown. Only a small minority of ethnic Uygurs supports the Xinjiang independence movement or the formation of an Eastern Turkistan.

Location/Area of Operation

Xinjiang Uygur Autonomous Region and neighboring countries in the region.

External Aid

ETIM has received training and financial assistance from al-Qa’ida.

In October 2001 China, at the request of the United States, sealed its border of over ninety kilometers with Afghanistan to coordinate with American military actions in that country. After the United States captured some East Turkistan terrorists of Chinese nationality in Afghanistan, Chinese security officials were invited to join the interrogation of the detainees. In August 2002 the U.S. State Department formally included the ETIM on its list of terrorist organizations. This act was followed by a similar move on the part of the U.N. Security Council through an antiterrorism statement and cooperation plan. A year later an ASEM antiterrorism conference was held in Beijing. At the sixth summit meeting of China and ASEAN in November 2002, China agreed to expand its cooperation with ASEAN countries on nonconventional security issues like drug trafficking to include antiterrorism cooperation.
the joint efforts of China, the United States, Afghanistan, and Kyrgyzstan. China-U.S. antiterrorism cooperation has become institutionalized through a number of expert-level working groups that exchange information and methods on terrorist financing, security of container ships, and intelligence. Significantly, the FBI now runs an office in Beijing, which also facilitates bilateral cooperation against drug trafficking, weapons smuggling, illegal immigration, and various other cross-border crimes. Similar bilateral consultation and cooperation mechanisms have been set up with Russia, India, and Pakistan. China has also had a series of bilateral dialogues and negotiations on antiterrorism with the United Kingdom, France, and Germany.

On the Domestic Front

The September 11 terrorist strike, which shocked the world, also reinforced the determination of Chinese leadership to come up with a domestic antiterrorism mechanism for China. Shortly after September 11 China established the National Anti-Terrorism Coordination Group (NATCG) headed up by Hu Jintao. The National Ministry of Public Security also set up an antiterrorism bureau, which is responsible for the research, planning, guidance, coordination, and implementation of national antiterrorism efforts and for all counterterrorism investigations and enforcement. The antiterrorism bureau works closely with other ministries including foreign affairs, national defense, state security, customs, finance, and the People’s Bank of China, as well as with provincial and municipal antiterrorism bureaus, to improve China’s domestic counterterrorism capabilities.

The antiterrorism mechanism developed by the NATCG has four elements: (1) an early-warning and prevention system, which monitors the activities of terrorist groups in order to preempt terror attacks well in advance and to cut off their sources of funds; (2) a rapid-response system, which is designed to quickly remove terrorist threats or to contain the fallout of terrorist attacks (in almost every provincial capital China has deployed armed rapid-reaction antiterrorism troops); (3) an emergency control-and-management system, which focuses on the control of both physical and human losses in the wake of terrorist attacks or during their development (striving to contain the destructiveness of terrorist attacks and to restore order, China has drawn on New York City’s experience of September 11 and has increased coordination of police, fire fighters, armed troops, emergency rescue and medical personnel in emergency cases); and (4) a mass education and mobilization system, which increases the general public’s awareness of the government’s antiterrorism efforts and policies.

China has also expanded and clarified provisions related to terrorism in Chinese administrative, financial, criminal, and national security laws so as to more rigorously and effectively combat terrorism at home and abroad. The most extensive antiterrorism provisions can be found in the Chinese criminal code. In 1997 the Standing Committee of the eighth National People’s Congress amended the criminal code to include a specific antiterrorism provision—Article 120:

Whoever organizes, leads or actively participates in a terrorist organization shall be sentenced to fixed-term imprisonment of not less than three years but not more than ten years; other participants shall be sentenced to fixed-term imprisonment of not more than three years, criminal detention or public surveillance.

Whoever, in addition to the crime mentioned in the preceding paragraph, commits other crimes of homicide, exploitation or kidnapping shall be punished in accordance with the provisions on combined punishment for several crimes.

After September 11 the Chinese government adopted another criminal-law amendment that is even more specific and detailed on terrorist crimes and brought the criminal code into conformity with counterterrorism obligations and requirements of international conventions on terrorism and relevant U.N. Security Council resolutions, particularly, resolution 1373.

Long and Difficult Fight Ahead

The priority target of the Chinese antiterrorism campaign is four East Turkistan organizations: the ETIM, the East Turkistan Liberation Organization, the World Uygur Youth Congress, and the East Turkistan Information Center. While the government has had some success
in thwarting terrorist attacks by these groups in 2007 and early 2008, it has not been able to stop them totally as demonstrated by the terrorist attacks in the Xinjiang towns of Kashgar on 4 August 2008 and Kuqa on 10 August 2008, despite the extraordinary security measures for the 2008 Beijing Olympics. China recognizes that it has a long and hard fight ahead in overcoming the Xinjiang insurgency and will have to strengthen its antiterrorism cooperation, regionally and globally, to win.

China's war on terrorism is not restricted to battling the ETIM in Xinjiang and Central Asian terrorist groups that support and supply the ETIM. China is well aware that the global networks of terrorists and other international criminal organizations are a significant threat to the international system and to China's national strategic and economic interests, which have progressively expanded beyond the Asia-Pacific region. Hence, it is not surprising that China has been very active in the international antiterrorism coalition. The war on terrorism has involved China in global strategic affairs at a much higher level than ever before, testing China's power and influence in the world. Beijing is acutely aware of how much is at stake and that the price of failure will be high. So far, China has demonstrated that it has the capacity and capability to play a leading role in the international antiterrorism coalition alongside the other great powers.

Textile and Clothing Industry

China became a major textile manufacturer beginning in the early 1980s. Its industry quickly expanded to become a top producer and, by the late 1990s, China had become the world’s leading textile-exporting nation. Today, expansion into technical textile products reflects a general trend toward innovation and higher-value products for the domestic as well as export markets.

Textile production has played a key role in the initial stages industrial development in China and its East Asian neighbors. Because it is labor intensive and does not require a large amount of capital, the textile and clothing industry is well-suited to developing economies that have little capital and plenty of low-wage labor. As the industry matures, exports generate foreign capital, mechanization and production techniques become more sophisticated, and wages rise. This leads to a shift toward more capital-intensive and higher-value industries.

Textile Industry in the Newly Industrializing Economies

The newly industrialized economies (NIEs) of Hong Kong, Taiwan, and South Korea began developing their textile and clothing industries in the 1950s and 1960s. Production and exports steadily increased throughout the 1970s as did their export share in the Japanese, U.S., and European markets. As their industries matured, they shifted toward more high-value products, such as manmade fibers. By the end of the 1970s and into the 1980s, the quality of synthetic fibers coming from the Asian NIEs had improved enough to be competitive with other exporting countries.

Hong Kong became the world’s leading clothing exporter from 1973 to 1977 and again from 1980 to 1985. Taiwan’s industry peaked in the 1980s, briefly becoming the leading apparel exporter to the U.S. market and the second leading producer of manmade fibers (after the United States). Throughout the 1980s, the textiles industry played a critical role in South Korea’s exports, consisting of US$11.9 billion, or 19.6 percent of total export earnings. In 1989, the total value of South Korea’s textile exports reached US$15.34 billion, an 8 percent increase over the previous year.

By the late 1980s, the low-wage advantage that the Asian NIEs held in the labor-intensive clothing segment began to dwindle as their industries advanced and labor costs increased. Their textile exports, accompanied by a shift to synthetic fibers, remained at around a quarter of total world trade in the 1990s, while their share of garment exports fell steadily from around a quarter in the 1980s and early 1990s to 16 percent by 1999.

A common response to this situation was for the NIEs to upgrade their technology and the quality of their products. Production was upgraded through automation, mechanization, and computer-aided design. Emphasis was placed on producing upmarket and high-fashion apparel. Taiwan and South Korea increasingly moved away
from the production of textiles and clothing to manufacturing value-added products such as electronics and semiconductors. In addition, as the NIEs and Japan increasingly outsourced the labor-intensive manufacturing of such items as clothing to China and other low-cost producers, they were able to devote more resources to higher value-added activities while still maintaining demand for their textile exports.

**Trade Barriers and Market Shifts**

Throughout their development, East Asian textile exporters confronted challenges that pushed the industry to undergo structural reform. First, considerable trade barriers existed in the global textile trade. In 1974, the Multi Fibre Arrangement (MFA) was adopted by the United States, Canada, and the European Union. It was intended to prevent textile and garment industry jobs in developed nations from moving to developing nations where manufacturing and labor was cheaper.

The effects of the MFA in East Asia were complex. For example, limits on exports for Japan and Hong Kong led to greater export opportunities for Taiwan and South Korea. When quotas were placed on exports from Taiwan and South Korea, Thailand and Indonesia reaped the benefits. This created a shift in the market in which investment in textile production spread throughout the region and often to those countries not yet limited by the MFA. What had been an attempt to limit exports sometimes resulted in greater exports from countries that otherwise might not have attracted the capital and expertise to develop a textile industry of their own.

In 1995, the World Trade Organization (WTO) adopted the Agreement on Textiles and Clothing, which...
called for a 10-year phaseout of the MFA. And in 2005, the MFA ended, giving all WTO members unrestricted access to the U.S., Canadian, and EU markets.

A second challenge faced by East Asian nations was the increase in labor and production costs that accompanied the expansion of their textile industries. As costs increased, their textile industries became more vulnerable to competition from low-cost producers. In many cases, this resulted in relocation of manufacturing facilities to the very countries that housed their low-cost competitors. Hong Kong, for example, relocated factories to China on a large scale beginning in the 1980s, bringing to the mainland the benefits of massive investments and training. Japan also began moving its manufacturing operations offshore in the late 1980s and early 1990s. China received the bulk of these investments, seeing new Japanese-backed plants go from 23 to 187 in the late 1980s while spending rose from US$16 million to US$120 million.

Third, the formation of regional trade blocs, such as the European Union in 1993 and the North American Free Trade Agreement in 1994, threatened market shares of the NIEs in Europe and North America. Hong Kong was hit especially hard, for example, by the erosion of its U.S. market share to lower-cost Mexican and Canadian producers.

China’s Textiles and Clothing Industry

China became a major player in the world textile market after it initiated market reforms in the early 1980s. The production value of its textile and clothing industry grew at an annual rate of 15.6 percent from 1986 to 1995, while exports increased from US$8.5 billion to US$38 billion. In 1991, China surpassed Italy to become the economy with the biggest trade surplus in textiles and clothing. In 1999,
after a decade of 13 percent annual growth, China’s clothing sector captured 16.2 percent of world trade, while Hong Kong garnered 12 percent. In 1997, and again in 1999, China passed Germany as the world’s top textile exporter.

However, as a socialist economy undergoing market reforms, China’s economy suffered from the burden of money-losing state-owned enterprises (SOEs). The SOEs dominated the textile industry but were plagued by labor redundancy, high pension and benefit costs, and outdated equipment. Reform of these enterprises took precedence in government efforts to transform the state-owned sector in 1998. As a result, money-losing factories were closed by the hundreds, 1.16 million workers were laid off, and 9.6 million antiquated cotton spindles were taken out of production by 1999.

After China joined the WTO at the end of 2001, it began upgrading its textile and clothing manufacturing equipment. In 2002, it imported US$3.3 billion worth of advanced equipment, mainly from Western textile producers who had outsourced production to lower-cost producer nations such as China and India. With this new equipment, Chinese textile manufacturers improved their productivity and the quality of their textile exports.

China’s textile industry also saw an increase in investment from internationally renowned corporations, such as Toray Industries and Asahi Chemical Industry of Japan, DuPont of the United States, BSF of Germany, and others from Hong Kong, Taiwan and South Korea. Enterprises from other sectors, such as coal, steel, and chemical manufacturing, also stepped into China’s textiles industry with big investment projects. This influx of funds helped finance upgrades in textile and clothing manufacturing equipment.

In 2003, the industry saw its exports reach US$80.4 billion, a jump of 27 percent over the previous year, accounting for 18 percent of the country’s total export value. But with the surge in exports came problems in the form of trade friction with Western nations, especially the United States. Claiming that Chinese imports were creating a disruption in the U.S. market, the U.S. Department of Commerce announced in 2005 that it was imposing temporary quotas on cotton shirts, cotton trousers, and underwear from China. The announcement came just five months after the lifting of quotas under the Multi Fibre Arrangement.

In 2007, China’s textiles and apparel exports reached US$171 billion, a rise of 16 percent year on year, but 8.5 percentage points lower than the previous year. In the first two months of 2008, China’s exports of textiles and clothing grew by 8.19 percent, a drop of 0.9 percentage points over the previous comparable period. Factors contributing to the slowdown included a higher-valued Chinese currency, cuts in export tax rebates, rising raw materials costs, and higher wages. Since 2003, China’s average wages have risen more than 50 percent, and the value of the yuan has gained about 18 percent against the U.S. dollar since lifting the unit’s peg in 2005. This has made Chinese textiles more expensive and has taken away their cost advantages compared to products from Vietnam, Bangladesh, Pakistan, and India.

Although some in China’s textile and apparel industry have appealed to the government for help, such as adjustment of the export tax rebate, many experts and industry insiders realize that a slowing of the industry offers a good opportunity for restructuring. Many see China’s industry shifting away from production capacity to innovation and product upgrades. For example, the China National Textile and Apparel Council (CNTAC) urged the country’s textile manufacturers to focus on innovation, environmentally friendly production methods, and high-end apparel for the international market. The council supports a strategy of developing Chinese brands and targeting overseas markets with high-end, China-made fabrics and Chinese-designed clothing. Innovation and technological advancement are the two primary directions for the industry at this time, according to the council.

Meanwhile, the government has established a Textile Industry Technical Advancement and Development Program as part of its Eleventh Five-Year Plan, and set up a fund of $180 million to drive technological development and innovation. Many textile factories have continued to upgrade their equipment. According to the German Engineering Federation, China is one of the largest buyers of German textile machines. The Chinese government is seeking faster modernization and higher value, the federation said in a recent report.

Future Trends in the Industry

One of the most promising areas for the future of the textiles industry is technical textiles, which includes those products used for their performance or functional
characteristics rather than for their aesthetics. Technical textiles account for about one-third of the world’s annual consumption of fibers, both natural and manmade. Volume growth in developing countries is expected to average between 4 percent and 5 percent annually to 2010, with a large portion of production coming from China and India. China imported nearly 500,000 tons of technical textiles in 2004, and its consumption has averaged 11 percent a year since 1998.

As China has developed into a consumer society, its demand has grown for technical textile products, such as diapers and feminine hygiene items. Higher standards for medical care have led to an increase in demand for disposable bed sheets, surgical drapes, gowns, and caps. The microelectronics industry has also spurred growth through demand for clean-room (protective) clothing. And the rise in car ownership has resulted in a sharp jump in demand for technical textiles in the auto manufacturing sector.

Chinese companies have increasingly expanded into specialty areas previously occupied by producers in developed countries. And its strategy of innovation and self-sufficiency is likely to be applied to the technical textiles segment. Success in this area will likely help it turn the tables to become a major exporter of technical textile products in the future, although the global financial meltdown of 2008 makes predicting future trends difficult.

The financial meltdown is likely to affect China and its Asian neighbors adversely in the near future: even number-one China has experienced a drop of 10.7% in the growth rate of its textile and garment exports in 2008 as compared to 2007. The State Council announced on 4 February, 2009 a comprehensive national plan to reinvigorate China’s textile industry by increasing the tax rebate rate for textile and garment exports to 15%, providing financial assistance for technology upgrades and branding, promotion of the domestic market, and other measures.

Further Reading

Ancient Chinese trade routes through central Asia are collectively called the “Silk Roads,” indicating the importance that textile has long had for China’s economy. Textile designs, created by weaving, embroidery, or fabric printing, often reflect symbology important in Chinese religious and official life: dragons are symbols of imperial power; fans are motifs in Daoist philosophy.

Chinese textiles reflect many centuries of technology, trade, government, religion, and art. They provide continuing evidence of the Chinese culture’s rich heritage. Although the best known and most highly valued fabrics are of silk, the earliest people relied on reindeer skins, gut, and sinew before beginning to use fibers from stems of plants, such as hemp and ramie, silk, and cotton.

Archaeological Evidence of Early Cloth Production

Loom pieces from Hemudu, an early Neolithic site that dates to over six thousand years ago, are the earliest evidence of cloth production. The Hemudu culture lived in modern-day Zhejiang Province, on the southeast coast. A cut-open cocoon of the silkworm moth (*Bombyx mori*) in Xiyingsan and parts of equipment for reeling silk at Qianshanyang point to the cultivation of mulberry trees for raising silkworms at this time. Other early examples of textile production include parts of backstrap looms at Liangzhu and Yunnan provinces from the second century BCE. Actual silk fabric fragments surviving at a number of late Neolithic sites are the best evidence of the early development of yarn and fabric construction in early China.

Developing Technology and Trade

As looms evolved, so did structures of weaving and ways of creating woven motifs. The addition of shed sticks to looms allowed weavers to incorporate warp patterns into cloth. Early examples of this technology have survived in Scythian burial mounds in the Altai Mountains. The atmosphere of the Han dynasty (206 BCE–220 CE) supported an unprecedented growth of the arts. Surviving figured, pile, and gauze weaves testify to the magnificence of Han fabrics, which made up much of the trade along the famed Silk Road, an interconnecting network of caravan trails across Asia extending to the Mediterranean Sea. A new, complex draw loom in the Tang dynasty (618–907 CE) produced many weft-faced patterned damasks and brocades, slit tapestries, and crepes for the court and for export. Motifs in some of these cloths reflect trade with the Persian Sasanid dynasty (224/228–651 CE) just as Sasanian patterns show eastern influence.

Embroidery also developed into a highly skilled method of decorating fabrics. Traders included the
exquisite embroideries that incorporated a great variety of stitches and silk yarns into packs for the Silk Road trade. Like woven cloths, high quality embroideries still play an important role in Chinese life and trade, as do so-called “resist” methods of printing cloth, including batik and tie-dye, that produce stylized and abstract designs on silk and cotton fabrics.

From a practical standpoint, the Chinese have used textiles for bed hangings and bed covers; on screens, walls, chairs, and tables; for cushion covers, boxes, cases and books; for garments, purses, hats, shoes, and gloves; for banners, curtains, canopies, and as altar coverings for commemorative and religious ceremonies. The rich history of cloth documents its past use as currency, tax payments, tributes, bribes, and dowries. The extensive trade in textiles has sustained the economy and has introduced Chinese design and technology to faraway places, but this trade venue has also brought foreign ideas and customs into the country.

The Power of Design in Dragon Robes

Patterns in woven and embroidered Chinese fabrics reflect governmental efforts to create an orderly universe as well as the philosophical and religious thought of Chinese culture. Dragons, probably the most famous and ubiquitous of Chinese motifs, denoted imperial authority and power.

Dragon robes of the Qing dynasty (1644–1912) are among the most frequently held Chinese textiles in private and public collections. Bright yellow robes reserved for the emperor and empress have eight dragons woven into or embroidered on them. Four of the dragons surround the wearer’s head with positions at each shoulder, at the center front, and at the center back. A pair of dragons set in clouds facing each other in a mirror image decorates the front and back of the robe’s lower section.

The Manchu added twelve ancient symbols of imperial authority among the clouds to the emperor’s garments in the mid-eighteenth century. They include a sun with a three-legged cockerel and a moon and rabbit with the elixir of life on the left and right shoulders, respectively. The other ten symbols had specific positions on the robe and were not present on the robes of the heir apparent.

Creating Order with Rank Badges

Textile collections also often have rank badges that reflect attempts to maintain an orderly society in the four hundred years before the twentieth century.

Conferred by the emperor, a civil official’s rank designated his level of achievement on rigorous tests. In the
Ming (1368–1644) and Qing dynasties, a round or more often square badge incorporated a specific bird that represented each level of achievement. Since the civil officials supplied the badges for themselves and their wives to place on the front and back of their robes, the methods of construction and quality varied greatly. The most expensive rank squares have the bird, clouds, and other motifs incorporated into the tapestry or patterned weave or embroidered design. Others have motifs surrounding a blank center to which a pre-embroidered bird was appliquéd. Upgrading to a higher level would be easier and less costly with the generic ground.

Military officials also had hierarchical badges, but with an animal rather than a bird. Today, these are rarer than civilian squares, especially ones of the lowest ranks. If one of a pair of rank squares is cut in half vertically, the official intended it for a Han-style robe that opened at center front; solid squares fit Manchu-style robes that fastened on the right side. Made of narrow-width silk fabrics, the agrarian Han garments opened in the center front and had a center-back seam. Manchu-style robes, based on a leather tradition and appropriate for horseback riding, originally had large front and back pieces. After taking over (and establishing the Qing dynasty) in the early seventeenth century, the Manchu switched to narrow woven silk fabrics that required center seams, but the silhouette of the garment did not change.

Reflections of Philosophy and Religion in Textile Designs

For over four thousand years printers, painters, embroiderers, and weavers have incorporated symbols representing Chinese culture into their products for individuals, homes, and temples. Many long-established motifs may have represented Confucian philosophy, which became a major influence on the customs and thought of the Chinese people during the Han dynasty. Ancient motifs include stylized pearls, coins, books, scrolls, rhinoceros horns, leaves, clouds, coral, bats, and designs representing the opposites—yin and yang. Even then, these motifs mixed with those of Daoism and Buddhism.

The Chinese often have ordered symbols in groups of eight or four. Eight motifs symbolizing Daoist philosophy and beliefs in textiles and other art forms include a fan, sword in a sheath, pilgrim’s staff and gourd, castanets, a flower basket, a tube holding two rods, a flute, and a lotus blossom. Many textile patterns depict one or more of eight Immortals often holding one of these specific Daoist symbols.

Two Daoist Immortals (reversible slit tapestry weave [kesi]; nineteenth or early twentieth century). Source: University of Rhode Island Historic Textile and Costume Collection.
Buddhism, the third major Chinese religion, came from India during the last half of the Han dynasty. Eight Buddhist symbols represent specific beliefs of the religion, but interpretations have changed over the centuries, and original meanings sometimes become obscure. These symbols, whose meanings are often related to happiness and well-being, include the following: a protective canopy; an ever-changing wheel; a sacred vase; a fish or a pair of fish with the latter possibly representing yin and yang; a lotus representing purity; an endless knot or mystic diagram; a conch that called worshipers to prayer; and a parasol. Particularly by the nineteenth century, artisans mixed the motifs from the three religions along with patterns of other symbolic groupings.

Patterns for Ceremonies and Expressions of Nature

Symbols of indefinite origin support special ceremonies, such as weddings, which also incorporate the color red or red-orange. A bride’s robe may contain motifs such as a pomegranate with some exposed seeds (symbolizing fertility), ducks (because they mate for life), and phoénixes (reserved for the empress and brides who became an empress for a day). Wishes for a marriage to produce many children are reflected in numerous “hundred children” or “thousand children” designs that depict colorfully dressed children playing a variety of games.
Many designs in Chinese textiles reflect nature and familiar scenes, often incorporating architectural features.

Beautifully executed colored blossoms and butterflies decorate skirt panels, robes, and sleeve bands. Many textile collections have women’s robes with embroidered bands sewn on the bottom edge of wide sleeves. Collections also may hold sleeve bands not sewn to a robe. Sometimes these bands are decorated only in the areas that are exposed to a viewer when the wearer holds her bent arms in front of her body. The surface of the band on the side of the sleeve toward her is undecorated since this area would be subject to abrasion.

**Worldwide Influence of Chinese Textile Design**

Occasionally the design in Chinese textiles has reflected outside influence, such as roundels with a pair of affronted mounted warriors from the Sasanid dynasty in Persia, but more often textiles in other parts of the world contain Chinese motifs. That these patterns have been such an inspiration to other cultures speaks for their strength, beauty, and appeal, even without their symbolism. The entire world is enriched by the heritage of China’s textiles.

The Third Front policy, a response to the perceived threat of U.S. and Soviet aggression at the height of the Cold War, refers to an ambitious but ultimately wasteful program for the military-industrial development of China’s remote mountainous hinterland.

The large scale of “Third Front” or “Third Line” (da sanxian) policy, a reaction to China’s vulnerability to U.S. and Soviet aggression during the Cold War, entailed massive investment in developing a military-industrial complex, including mining, metallurgy, machine building, and transportation that could serve as the basis for continued military capability in the event of an invasion of China’s capital, coastal cities, and core territories. Although the most intense period of investment and construction was brief, from 1964 to 1971, the effort had a strong negative impact on China’s economic development and provided few lasting benefits.

Origins of Third Front Policy

The term “Third Front” was first used by Lin Biao in a speech in January 1962 to refer to a redoubt (fortification, in this case military-industrial) in Anhui Province in the event of the need to retreat from Shanghai. By the time Mao Zedong revived the program and incorporated it into the revised Third Five-Year Plan in 1964, the area defined as the “Big Third Front” included a vast swath of territory stretching from Beijing in the north to Hainan Island in the south. Much of this area is rugged mountainous terrain 500 meters or more above sea level, including the provinces of Guizhou, Sichuan, and Yunnan in the southwest, Gansu and Qinghai in the northwest, and parts of the provinces of Shaanxi, Hubei, and Hunan. It was hoped that this region, distant from both the coast and the northern plains, might serve as a base for a continued war of resistance in the event of an invasion from the north or the Pacific. As the economist Barry Naughton puts it, through the “Third Front” strategy, “China was preparing to fight a ‘people’s war’... in which the ‘people’ were equipped with the products of modern industry” (Naughton 1988).

There was no precedent for the massive effort to build up advanced industrial capacity and the accompanying infrastructure in this mountainous region. During the Japanese invasion from 1937 to 1945, the Nationalist government retreated to southwest China, moving an impressive amount of industrial capacity, including armaments factories, into Sichuan and Yunnan provinces. But this was a temporary emergency measure and not an attempt to build up a permanent industrial base.

From 1963, as China was recovering from the disasters of the Great Leap Forward (begun in 1958), Chairman Mao and Lin Biao, who became Minister of Defense in 1959, actively promoted the ‘Third Front’ policy. There would seem to have been a strong consensus in favor of the policy among the party’s top leadership in the years leading up to the Cultural Revolution (1966–1976). China’s nascent nuclear program, which successfully tested its first atomic weapon in 1964, was also located in the western...
provinces of Qinghai and Gansu. There were also considerable mineral and hydropower resources available in the southwest and northwest, including steel and aluminum. The Third Front policy was also broadly consistent with the economic policies implemented since 1949. In the 1950s, the government consistently transferred resources, including plant, capital, and personnel, from the industrial centers of the east coast and Manchuria to inland provinces and rural areas in order to distribute the benefits of economic development more evenly throughout the country. Similarly, the emphasis on heavy industry such as mining, metallurgy, and machine building was consistent with the investment policies of the First Five-Year Plan (1953–1957) and the Great Leap Forward. Nonetheless, the attempt to develop a massive military-industrial complex in some of the most remote and mountainous terrain in China was extraordinary, and was motivated primarily by international and strategic concerns.

**Policy Implementation**

The initial impetus for the first phase of Third Front projects was the intensification of U.S. involvement in the war in Vietnam following the Gulf of Tonkin incident in August 1964. That year, the government of the People’s Republic of China initiated a program of railroad construction and development of heavy industry in the southwestern provinces of Guizhou and Yunnan that was intended to facilitate both Chinese defense of the region and support for the Communist forces in Vietnam.

It soon became apparent, however, that while the U.S. was taking great pains to avoid conflict with China, China’s relationship with the Soviet Union had reached a crisis. In January 1966, the USSR signed a mutual defense pact with Mongolia and stationed large forces there. By 1969, the two socialist giants had fought several border skirmishes, and Soviet actions in Czechoslovakia and the announcement of the Brezhnev Doctrine (that the Soviet Union had the right to intervene to preserve the socialist system in other countries) made China’s leaders apprehensive. By the autumn of 1969, Lin Biao had ordered the evacuation of the party’s top leadership from Beijing, and China’s leaders were expecting and prepared for an apocalyptic final conflict between socialism, imperialism, and revisionism.

The amount of resources invested in Third Front projects reflects the urgency and importance of this defense-related program. From 1965 to 1970, the “third front” received more than half of all state investment, and an even higher proportion of investment in capital resources. Third Front projects also received the most advanced industrial equipment and some of the most skilled personnel China possessed. Initially, the Third Front was centrally managed, and “general command headquarters” for construction were established at key project sites. These projects also enjoyed direct and priority access to funds and materials through supply offices and branches of the Construction Bank established at various project sites. As the planning system broke down during the Cultural Revolution, however, control over these projects devolved to local authorities.

Changes in the international and strategic context are reflected in shifts in Third Front investment, and the Third Front policy can be divided into three phases. In the first phase, from 1964 to 1969, investment and construction was focused mainly in the southwestern provinces of Guizhou, Yunnan, and Sichuan. The first task was to connect the railroad lines feeding into the region from Shaanxi and Guangxi provinces with the French-built line from Vietnam. The link from Chongqing to Guiyang was completed in October 1965 by mobilizing hundreds of thousands of laborers and shifting funds from the national rail network to this single priority project. The centerpiece of the project was the massive iron and steel combine built at Panzhihua, on the mountainous border between Yunnan and Sichuan. The first phase in the southwest also developed mining operations and hydroelectric power to supply the new heavy-industrial base. Armaments and machine-building factories were established in the area of Chongqing and northern Guizhou, including facilities for aluminum smelting and stamping, rubber, precision instruments, and optics. Hundreds of factories throughout China, including the famous Anshan Iron and Steel Complex in Manchuria, sent skilled personnel and equipment to support Third Front projects in the southwest. In some cases, entire plants were relocated, along with their employees, to remote valleys from coastal cities like Shanghai.

The second phase, from 1969 to 1972, was partly a response to the worsening of Sino-Soviet relations and the threat of invasion from the north. Second phase projects were located mainly in the mountainous region where
the borders of Shaanxi, Henan, Hubei, Sichuan, and Hunan provinces meet. Like the first phase, the second phase included rapid and large-scale development of railways, hydroelectric power, and metallurgical and machine-building industries. An effort to build a steel complex at Wuyang in Henan Province, smaller than but similar to the one at Panzhihua, was ultimately unsuccessful. The second phase continued the high rates of investment and mobilization of hundreds of thousands of workers to build three new railway lines, which were completed in less than four years. Construction of what was then China’s largest dam, at Gezhouba, was also initiated in 1970, but the project was not completed until the 1990s.

Machine-building industries, mainly for military uses, dominated the second phase projects, especially the Number Two Automobile Plant at Shiyan in the mountains of Hubei Province, which was built to produce two-and-a-half-ton trucks. More than 140 factories, including the Number One Auto Factory in Changchun, provided assistance in the form of personnel and equipment. This reflected an effort to remove productive capacity from the northeast, which was vulnerable to Soviet attack, into the mountain vastness of northwestern Hubei. Nearly all of the equipment installed in the plant was designed and produced in China, which had only begun producing its own trucks with Soviet equipment in 1957. Like many Third Front projects, however, the plant suffered from flaws in design and inefficiencies born of perceived defense requirements. Subsidiary factories were built in mountain valleys, and even caves, dispersed across 32 kilometers. This naturally created transportation difficulties and dramatically increased production costs.

Throughout the same period, several projects in the northwest provinces of Gansu, Ningxia, and Qinghai were also included in the Third Front. Railways and military industries, including China’s nuclear program, were built up in this region from the 1950s. From 1964, these projects were accelerated and supported with massive investment from the central government. Projects designed to supply specialty steel and hydroelectric power to the nuclear program in Gansu Province were given top priority from 1965. As in other Third Front regions, these projects were supported by the transfer of resources from other parts of China, and factories were dispersed and built into sites that were naturally fortified but difficult to access.

The year 1972 marked a sudden and dramatic reversal of the Third Front policy and the beginning of the third and final phase of the program. Most Third Front projects were discontinued by 1973 and many construction crews were transferred to new projects in eastern China. There were several reasons for the reversal of policy, but with the death of Lin Biao, one of the policy’s most ardent advocates, as well as the beginnings of rapprochement with the United States, the sense of military urgency was reduced.

Most importantly, however, the dramatic inefficiencies and tremendous waste inherent in the effort to establish a modern industrial base in China’s mountainous hinterland had become apparent to central leaders. The levels of investment required could not be sustained given China’s level of economic development. When Premier Zhou Enlai regained control of the organs of government in 1972, following the peak years of chaos and violence during the Cultural Revolution, he quickly ordered a reduction in the rate of investment. Third Front projects were particularly inefficient. The entire program was so massive that it was clearly impossible to complete most of the individual projects in a timely fashion. The push for immediate accomplishments and practices such as simultaneously designing, constructing, and operating new plants produced many design problems. Poor design and siting necessitated wasteful redundancies.

Despite these many obvious problems, however, and the need to reduce the rate of investment, from 1972 to 1978 some Third Front projects continued to receive support from central planners. Continued concern with the Soviet threat was one motivation. But the simple fact that so much manpower and resources had already been invested in these projects inclined the party’s leaders to continue to develop certain key projects, such as the Panzhihua iron and steel complex. By 1979, however, it had become clear that even these key projects were unworkable. Following China’s brief war with Vietnam in 1978, military preparedness became less of a priority and the Third Front program was finally abandoned.

Implications of Third Front Policy

In the short term, the Third Front probably did enhance China’s capacity to withstand a major conventional invasion. But this event was unlikely even at the height of
China’s strategic isolation, and the threat passed well before most of these projects came on line. The goal was far more ambitious than previous attempts to remove industry to the interior during a military crisis as the Third Front aimed to establish a comprehensive industrial sector from mining and electric power provision to metallurgy to machine building. Only 20 percent of Third Front investment went to specifically military industries. The rest was for transportation or dual-use industries such as steel making.

The program was too massive and ambitious, however. It would take too long to complete and would require more resources than China possessed at the time. It is furthermore doubtful that these installations were that much more protected than any other part of the country considering the developments in military technologies such as intercontinental ballistic missiles (ICBMs), long-range bombers, and nuclear weapons. In any case, much of this investment in China’s defense was wasted and many projects were left uncompleted. Only one of the four large steel plants included in the Third Front was operating near capacity by the 1980s. In some locations, such as Wuyang, advanced equipment and skilled personnel were wasted because insufficient supplies of ore and poor transportation made the plant’s efficient functioning impossible.

The total costs of the Third Front projects are still unknown, but it is clear that the central government invested tens of billions of yuan, most of it never recovered and left to rust in the form of disused or inefficient plants located in remote mountain valleys. According to Barry Naughton’s estimates, China’s industrial output in the 1980s was 10 to 15 percent below what it would have been if China’s leaders had not pursued the Third Front policy.

Most economists similarly agree that the Third Front projects, in contrast with other efforts at developing inland industries, provided little or no benefit to the national economy. Not only were many projects abandoned before completion, they were often located in the most inaccessible areas, which prevented them from fostering the development of industries supplying inputs in the immediate neighborhood. For example, the construction of Number Two Auto in northwestern Hubei could have spawned a whole string of support industries. But the plant’s remote location prevented it from serving as an engine for further industrialization. By the mid-1980s, this problem led to the removal of 121 factories (and their personnel) from their rural mountain locations to urban centers such as Chongqing.

Even the construction of a railway network in China’s mountainous regions, perhaps the most positive legacy of the Third Front, exhibited many problems. Priority development of Third Front railway lines diverted resources for the maintenance and expansion of the rest of China’s national rail network, and the costs per kilometer of track were five or six times higher than average. Nonetheless, the expansion of rail service to remote hinterland areas is one of the few positive legacies of this otherwise wasteful and misguided project.

Thirteen Ming Tombs ▶
Thirteen Ming Tombs
Míng Shísānlíng 明十三陵

Built between 1409 and 1644, the Thirteen Ming Tombs is the largest imperial burial compound in the world, with thirteen emperors and twenty-three empresses entombed. Dingling 定陵, the only excavated mausoleum of the compound, is known as the Underground Palace. On display in the Palace are the emperor’s intricately woven gold crown and the empress’s phoenix crown laden with pearls and precious stones.

Situated in Tianshou Mountains (Heavenly Longevity 天寿山) in Beijing’s northwestern suburb of Changping (Prosperity and Peacefulness, 昌平), the Thirteen Ming Tombs is the largest complex of imperial burial grounds in the world, covering an area of more than forty square kilometers (15 square miles).

Emperors’ Resting Place
In these mausoleums, about fifty kilometers from Beijing, rest thirteen emperors, twenty-three empresses, two princes, more than thirty concubines, and one eunuch of the Ming dynasty (1368–1644). The construction of the mausoleums started with Changling (Perpetuity Mausoleum 长陵) in 1409 and ended with Siling (Remembrance Mausoleum 思陵) in 1644.

Of the sixteen Ming dynasty emperors, thirteen constructed their last dwellings in the Tianshou Mountains. The Thirteen Ming Tombs has the densest population of former emperors anywhere in the world. Chronologically, the mausoleums and their respective emperor occupants are as follows:

1. Changling 长陵 (Emperor Chengzu 成祖)
2. Xianling 献陵 (Renzhong 仁宗)
3. Jingling 景陵 (Xuanzong 宣宗)
4. Yuling 裕陵 (Yingzong 英宗)
5. Maoling 茂陵 (Xianzong 恭宗)
6. Tai Ling 泰陵 (Xiaozong 孝宗)
7. Kangling 康陵 (Wuzong 武宗)
8. Yongling 永陵 (Shizong 世宗)
9. Zhaoling 昭陵 (Muzong 穆宗)
10. Dingling 定陵 (Shenzong 神宗)
11. Qingling 庆陵 (Guangzong 光宗)
12. Deling 德陵 (Xizong 熹宗)
13. Siling 思陵 (Sizong 思宗)

Architectural Wonder
Closely observing Chinese feng shui guidelines, architects of the Ming mausoleums sought harmony between architecture and nature, and between Heaven and human. Each mausoleum stands by a mountain, which enabled the builders to integrate the mountain landscape.
with the underground space of the mausoleum. Each mausoleum is square in the front and circular in the back, corresponding to the ancient Chinese concept of “circular heaven and square earth.”

Listed as a United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage Site in 2000, the Thirteen Ming Tombs is a popular tourist attraction. To date, only two of the mausoleums have been opened to visitors: Changling and Dingling (Stability Mausoleum), the latter being the only excavated mausoleum of the complex.

About 120,000 square meters (100,890 square yards), Changling is the mausoleum of Chengzu, the third emperor of the Ming Dynasty, and his Empress Xu. As the first mausoleum built in the complex, Changling is the centerpiece of the Ming tombs. A ruler for twenty-two years, Chengzu started constructing the mausoleum in the sixth year of his rule and saw it completed five years later. With walls, gates, buildings for ceremonies, security, storage, and cooking, the mausoleum looked like a functional small imperial palace. Its layout influenced the designs of other mausoleums in the years that followed.

Marble Gateway, the entrance to the mausoleums, was added as part of Changling in 1540. On the grand five-arched Gateway are carved auspicious symbols such as dragons, clouds, lions, and qilin (a mythical animal). Changling’s ten-kilometer-long (6 miles) Divine Path has served as the main path to all the mausoleums. It is flanked by twenty-four stone sculptures of animals and twelve stone sculptures of imperial officials. To the left of the Divine Path stands the Dragon Hill while the Tiger Hill crouches on the right, matching the Daoist preference in placing dragons on the left and tigers on the right for beneficial positioning.

While each mausoleum has a Ling’en Hall (Hall of Most Imminent Favor) for memorial services, Changling’s Ling’en Hall is exceedingly magnificent, measuring 1,956 square meters (1,644 square yards), almost as large as Taihe Hall (Supreme Harmony, the largest structure at 2,377 square meters (1,997 square yards) in the Forbidden City, where emperors met their ministers to discuss state affairs. Most impressive in the hall are the thirty-two precious nanmu wood pillars with diameters up to 1.12 meters (4 feet). These majestic one-piece wood pillars came from nanmu trees that grew in China’s southwest. They are even more precious today, as no one is able to find nanmu trees of similar sizes any more. During the Ming and Qing dynasties, Changling’s Ling’en Hall was the designated location where shrines of deceased emperors and empresses stood and where emperors held memorial services for family members.

Located at the foot of Zi Jin Shan (Purple & Golden Mountain) in an eastern suburb of Nanjing, Jiangsu Province, these two elephants guard the Sacred Way that leads to the Tomb of the first Ming Dynasty Emperor Hongwu (reigned 1368–1398) and Empress Ma. Nanjing was the capital of Ming China during this period. Photo by Joan Lebold Cohen.
Dingling Mausoleum

In power for forty-eight years (1572–1620), Dingling’s occupant Shenzong was the longest ruling emperor of the Ming dynasty. It took six years to build the mausoleum of 182,000 square meters (152,941 square yards) at the cost of over eight million ounces of silver—the equivalent to two years’ taxes collected by the central government. Excavation of Dingling, which lasted from May 1956 to July 1958, unveiled the mystery that had shrouded the mausoleums. An all-stone underground palace lies 17 meters (56 feet) below the ground. The underground vault, free of beams and pillars, is 87.34 meters (287 feet) long and 47.28 meters (155 feet) wide, divided into five halls with a total area of 1,195 square meters (1,004 square feet).

In the central hall are three thrones for the emperor and his two empresses, all carved out of stone. Images of dragons are carved on the emperor’s throne while those of phoénixes are on the empresses’ thrones. In front of each throne is a large porcelain container, originally filled with oil, which was meant to provide lighting for the emperor and the empresses.

The three coffins are placed in the rear hall. Twenty-six wood trunks, lacquered in red and filled with sacrificial objects, lie next to the coffins. Among the more than three thousand unearthed artifacts are the emperor’s 24-centimeter-high gold crown with images of two dragons at play, which is woven with extremely fine gold thread, and the empress’s phoenix crown, adorned with 3,500 pearls and 150 precious stones.

Three and Five Antis Campaigns

Sanfăn Wŭfăn  三反五反

The Chinese Communist Party’s Three Antis Campaign of 1951–1952 targeted waste, corruption, and bureaucratism. The party’s Five Antis Campaign, launched soon afterward, targeted bribery, tax evasion, theft of state assets, cheating on government contracts, and theft of capital. Both campaigns led to mass suicides, as well as placing many hitherto private industries in the hands of the government.

In the early years after the People’s Republic of China was founded in 1949, the Chinese Communist Party (CCP) launched two political campaigns to reinforce party control over the population over 1951–1952. Both campaigns targeted mainly urban dwellers and people who worked in the modern business sector.

First, the CCP launched the Three Antis Campaign against waste, corruption, and bureaucratism. The campaign targeted cadres in industry and government, especially those who had become (or were thought to have become) overly acquainted with China’s capitalists. Second, the party launched the Five Antis Campaign against bribing, evading taxes, stealing state assets (that is, state property and economic information), cheating on government contracts, and stealing capital. This campaign targeted capitalists themselves. Some of the blacklisted capitalists were left to function as government employees; many were simply eliminated and disappeared. Estimates vary, but it is thought that upwards of 200,000 disgraced or displaced people committed suicide during the two campaigns (Chow 1980, 115 and 133, quoted in MacFarquhar 1997, 37).

The Five Antis Campaign also had a hidden agenda: It seized factories and capital from the blacklisted capitalists and placed them under government control. Through these efforts the CCP expanded its influence over China’s modern economic sectors. At the same time the campaign helped the party to identify people who could be recruited into the party, thereby consolidating the party’s grip over every aspect of Chinese society. Between 1947 and 1953 membership of the CCP increased from 2.7 million to 6.1 million.

The Three Fundamental Bonds and the Five Constant Virtues are separate Confucian terms for the most important human relations and social virtues. In early Confucianism, one who perfectly fulfilled these relationships and manifested these virtues was the highest form of human—a sage. The neo-Confucians combined these two terms into a single cosmological principle that stood for human social order.

The expression Three Fundamental Bonds and Five Constant Virtues sums up a Confucian doctrine that was designed to guide people’s behavior and aspirations in traditional China. The Three Fundamental Bonds deal with traditional society’s most fundamental social relationships: father and son, lord and retainer, and husband and wife. As essential relationships, these three serve as shorthand for all human relationships. The Five Constant Virtues mean the Confucian virtues of benevolence (ren 仁), righteousness (yi 義), propriety (li 義), wisdom (zhi 智), and trustworthiness (xin 信). As with the Fundamental Bonds, these five virtues are the most significant ones and thus serve as shorthand for all the Confucian virtues. In other words, the Three Fundamental Bonds designate the social relationships that are essential for structuring human social life, while the Five Constant Virtues are the values needed to live a moral life.

For late imperial neo-Confucians the Three Fundamental Bonds and Five Constant Virtues (sangang wuchang 三纲五常), or the shorter Bonds and Constants (gangchang 二常), was the heart of Confucianism. Zhu Xi 朱熹 (1130–1200), the great synthesizer of Neo-Confucian thought, criticized the teachings of Buddhism and Daoism in the following manner:

[It] is unnecessary to analyze them to understand that they both abandon the Three [Fundamental Bonds] and Five Constant Virtues. Just this one omission earns them a reputation for committing a grave crime. It is unnecessary to say anything else about them.

In other words, if a teaching did not promote the Fundamental Bonds and constant virtues, then not only was it of no account, but, even worse, it was guilty of promoting disorder. Zhu Xi believed that humans could become sages by perfecting these three relationships and realizing these five virtues. Interestingly though, in terms of China’s long history, these concepts of the Three Fundamental Bonds and the Five Constant Virtues did not have an ancient pedigree: they were creations and expressions of the unified Han empire (206 BCE–220 CE). Hence, one could cynically argue that the guides and virtues were Confucianism in the service of the state. The full four-character term sangang wuchang was not commonly used until the tenth century CE.

Three Fundamental Bonds

Searching the Confucian classics for a reference to the Three Fundamental Bonds, one encounters Confucius’s...
conditions for a well-ordered society: “Let the lord be lordly, the retainer loyal, the father fatherly, and the son sonly” (Analects 12.11, Lún yǔ 论语). Here though, Confucius presents only two relationships: lord and retainer, and father and son. In the Mencius (Mèngzǐ 孟子) one finds five rather than three principal human relationships (renlun 人倫); moreover, the text stresses their reciprocal basis: “Father and son have love [for each other]; lord and retainer have obligations [to each other]; husband and wife have distinct [spheres]; senior and junior have precedence; and friends have faith [in each other]” (Mencius 3A.4). Although clearly a strong sense of hierarchy pervades each set of relationships, both Confucius and Mencius underscore that everyone, whether a superior or an inferior, has obligations to properly fulfill his or her role. As the Confucian scholar Hsü Dau-lin has pointed out, the first text that more overtly promotes what would become the Three Fundamental Bonds is one of the later chapters of the Legalist text written by Han Fei Zi 韓非子. The chapter, which probably dates from the beginning of the unified Han empire, states: “A retainer serves his lord; a son serves his father; a wife serves her husband. If these three principles are followed, then all-under-Heaven is well-governed; if these three principles are betrayed, then all-under-Heaven is in chaos” (Chapter 51). What is striking is that no mention is made of mutual obligations.

The first person to label these relationships was Dong Zhongshu 董仲舒 (197–104 BCE), the great Han dynasty Confucian philosopher and statesman. Dong called them the Three Cardinal Guides or Bonds (sangang). For him, these relationships are not social constructions; instead, they are natural expressions of the cosmological principles of yin and yang. He tells us in The History of the Han (Han shu 漢書):

The lord is yang 陽, the retainer is yin 隱; the father is yang, the son is yin; the husband is yang, the wife is yin. The way of yin cannot proceed anywhere on its own…. Therefore, the retainer depends on his lord to gain merit; the son depends on his father; the wife on her husband, yin on yang, and the Earth on Heaven…. The Three [Fundamental Bonds] of the kingly way can be sought in Heaven. (Chapter 53)

Since for Dong yang is superior to yin, lords are superior to their retainers, fathers to their sons, and the husband to his wife. In other words, Dong accepts Han Fei Zi’s formulation of these relationships as entirely vertical and one sided. That Dong was living in a centralized empire and serving a powerful monarch undoubtedly helps explain his view.

The most extensive formulation of the concept behind the Three Fundamental Bonds is found in Baihutong 白虎 (“Comprehensive Discussions in the White Tiger Hall”) by Ban Gu 班固 (32–92 CE). The book devotes an entire chapter to a discussion of this notion. Interestingly though, here the Three Fundamental Bonds are not matched up with the Five Constant Virtues but rather with the Six Rules (Liuji 六紀), which are relations with one’s paternal uncles, brothers, clansmen, maternal uncles, teachers, and friends. The Three Fundamental Bonds
and Six Rules thereby incorporate all the most important social relationships that constitute society. Without them society falls apart. This same book tells us: “In past times, the Three Fundamental Bonds and the Six Rules did not yet exist; as a result, people only knew the identity of their mother, not their father” (Chapter 2). That is to say, without these fundamental relationships, civilized social order cannot exist.

The Five Constant Virtues

Even though the Five Constant Virtues (benevolence, righteousness, propriety, wisdom, and trustworthiness) were articulated as such only in the Han dynasty, the idea of five interrelated virtues appears earlier. The fourth-century BCE Confucian text known as the Wuxing 五行 (“Five Types of Action”) argues that there are five types of favorable behavior: benevolence, righteousness, propriety, wisdom, and sagacity (sheng 聰). The person who harmonizes and enacts four of these actions, is good. The person who realizes all five of these actions is a sage (shengren 聰人), in accord with heaven. Here, four of the Five Constant Virtues are articulated, and sagacity substitutes for trustworthiness. The Mencius sets forth four of Five Constant Virtues, leaving out sagacity. In an argument about whether human nature is intrinsically good, Mencius notes: “Benevolence, righteousness, propriety, and wisdom are not welded onto me from the outside. They are that which I have always had” (Mencius 6A.6). In other words, these four virtues are inherent in all people.

Once again, Dong Zhongshu, the Confucian statesman and philosopher, was the first person to unambiguously use the term wuchang to designate the Five Constant Virtues. He relates:

Benevolence, righteousness, propriety, wisdom, and trustworthiness—i.e., the Way of the Five Constant Virtues—should be that which the king cultivates. If the king cultivates the Five Constant Virtues, then he will receive blessings from Heaven and will enjoy the spiritual efficacy of the spirits; moreover, his virtue will extend across the world and will reach all creatures. (The History of the Han 56.2504)

Many scholars believe that Dong added the fifth virtue, trustworthiness, to Mencius’s four-virtue formulation so that it would be in accord with the Five Phase (wuxing) cosmological theory that was in vogue during the Han dynasty.

The Baihutong provides the first extensive discussion of the Five Constant Virtues. It states:

What are the Five Constant Virtues? They are benevolence, righteousness, propriety, wisdom, and trustworthiness. Benevolence means not being able to endure (seeing others suffer), loving others, and aiding all living things. Righteousness means doing what is proper. In making judgments one hits the mark. Propriety means to enact. That is, to realize the way and perfect the refined. Wisdom means knowledge. One has a special understanding and can know things before hearing about them. He is not befuddled by matters and can discern the subtle. Trustworthiness means sincerity. One cannot be deterred from his purpose. Therefore, people are born and respond to the Eight Trigrams, thereby obtaining the five energies (qi 氣) that are the Constant Virtues. (Chapter 30)

In other words, the five virtues are inherent in us and consist of qi (energy, ether, psychophysical matter). The Baihutong further equates the Five Constant Virtues with the Five Viscera; hence, benevolence resides in the liver, righteousness in the lungs, propriety in the heart, wisdom in the kidneys, and trustworthiness in the spleen. Similarly, because of the existence of the Five Constant Virtues, there are also the Five Musical Notes, the Five Classics, and the Five Cardinal Directions.

The Neo-Confucian Interpretation

From the Han dynasty on, scholars and politicians made frequent mention of the Three Fundamental Bonds and Five Constant Virtues, but usually separately, not together. However, by the Song dynasty (960–1279), these two lists were often fused. In fact, for Zhu Xi, the Three
Three Fundamental Bonds and Five Constant Virtues became cosmological principles:

Within the cosmos there is but one eternal principle. Heaven, by getting hold of it, becomes heaven. Earth, by getting hold of it, becomes earth. All things which live between heaven and earth, by getting hold of it, become what they are. Expanded, it becomes the “three bonds.” Elaborated, it becomes the “five constants.” All these are this principle in operation. Wherever one goes, it is there. (Hsü, 1970–71, 32)

Rather than naming humankind as the third element of the cosmos (which is the common formulation), Zhu Xi puts the Three Fundamental Bonds and Five Constant Virtues in that place. Hence, heaven, earth, and the Three Fundamental Bonds and Five Constant Virtues compose the universe. Clearly these human relationships and virtues were the most important characteristics of mankind. Chen Chun (1159–1223), Zhu Xi’s student, thought that the Five Constant Virtues were so important that he devoted a whole chapter of his book Beixi ziyi 北溪字義 (Neo-Confucian Terms Explained) to explaining them. He believed that all good stemmed from these virtues: “Generally speaking, in human nature there are only the four virtues of humanity, righteousness, propriety, and wisdom. All the ten thousand good deeds are produced from them. In reality, they are a summary of the ten thousand good deeds” (Chan 1986, p. 85). Goodness is born out of these virtues, so to become a sage it is essential that one practices them. Likewise, since the Three Fundamental Bonds constitute the most significant human relationships, Zhu Xi believed that perfecting them would also lead to sagacity. As Hsü Dau-lin indicates, though, in making the Three Fundamental Bonds a cosmological principle, the neo-Confucians enshrined the guides’ emphasis on the hierarchical rather than the reciprocal duties inherent in the relationships. As a consequence, Zhu Xi stressed that parents could never be wrong, while another neo-Confucian philosopher, Cheng Yi (1034–1106), emphasized that a woman could never remarry.

By late imperial times, the Three Fundamental Bonds and Five Constant Virtues had been transformed from being general Confucian concepts about social structure and virtues to being a specific term that designated all social relationships and values and, by extension, human social order itself. To not adhere to these Confucian norms and virtues was to threaten both social and cosmological order. Hence, particularly in the late imperial period, Three Fundamental Bonds and Five Constant Virtues was a concept of immense significance.

Three Gorges Dam

The Three Gorges Dam project, the world’s largest engineering venture, will harness the mighty Yangzi (Chang) River and supply China much needed hydroelectric power. But the costs of the project—financial, environmental, political, and cultural—have many people questioning its true worth to China and the world.

The Three Gorges Dam project is the world’s largest engineering feat and the largest in China since the building of the Great Wall. Electricity generated by the dam will meet almost 10 percent of China’s requirements. But the project has forced the relocation of 1.3 million people, drowned valuable farmland, and destroyed ancient settlements of historical and cultural importance. Declining water quality resulting from submerged industrial sites, increased landslide risk, biodiversity decline, and accumulating silt are unresolved problems. The full impact of the dam on China is yet to be realized.

Old Dream

For centuries Chinese emperors and dictators dreamed of building a great wall across the Yangzi (Chang) River. This cradle of Chinese civilization originates in perpetual snows of the lofty Qinghai–Tibet Plateau. It flows southward across treeless plains before dropping 4,000 meters (13,123 feet) into the deep valleys that separate Sichuan from Tibet. Near Yibin the river enters the fertile Sichuan Basin, where the Minjiang, Tuojiang, Jialing, and Wujiang Rivers—just four of more than seven hundred tributaries—swell its size. Beyond the industrial city of Chongqing, the Yangzi slices through limestone strata of the Wushan Mountains to create a spectacular 200-kilometer (124-mile) section of narrow and precipitous gorges: Qutang, Wuxia, and Xiling. Beyond these celebrated Three Gorges, the river spills onto the fertile Yangzi Plain at Yichang and meanders to the Pacific Ocean. At 6,276 kilometers (3,900 miles), the Yangzi is China’s longest river and the third longest in the world, behind the Nile and Amazon. The watershed covers 19 percent of China’s total landmass.

As one of Asia’s most emblematic landscapes, the Three Gorges of the Yangzi River figure prominently in Chinese cultural lore. Although local water diversions date to the Han dynasty (206 BCE–220 CE), modern China’s revolutionary founder, Sun Yat-sen, first proposed damming the river in 1919. During the 1940s the United States Bureau of Reclamation cooperated with the Chinese to explore potential dam sites and evaluate costs and benefits. The Chinese civil war (1945–1949) derailed these plans until the 1950s, when the victorious Mao Zedong, leader of the Chinese Communist Party, revived the idea, although political and economic problems again trumped construction. In 1992, with the urging of Chinese Premier Li Peng, a trained engineer, the National People’s Congress approved the plans by the smallest margin in the history of that normally compliant legislative body. Construction on the $25 billion project started in 1994 at a site below the Three Gorges in central Hubei Province.
The World Bank declined support, citing major environmental and human rights concerns. The closing of diversion gates in 2006 promoted nationalistic pride. The government predicts that the full hydropower complex will operate by 2009.

The concrete gravity dam at Three Gorges is the world’s largest engineering feat and the largest in China since the Great Wall. It consumed record amounts of soil, steel, and concrete. It also forced relocation of a record 1.3 million people. The project continues to generate unprecedented domestic and international controversy, fanned by the concurrent evolution of digital communications and emerging supranational environmentalism. The controversy stems from environmental and human rights concerns.

**Environmental Challenges**

Declining water quality in the Three Gorges Reservoir quickly emerged as a major problem. The rising waters submerged 1,600 industrial enterprises (factories, mines, and waste dumps) that retained tons of unmitigated hazardous waste and other pollutants. Added to this waste is ongoing waste from municipal, agricultural, and industrial enterprise that continues to flow unrestricted into the reservoir. Whereas the free-flowing Yangzi once diluted and transported pollutants downstream, trapped chemicals now trigger algal blooms that contaminate municipal drinking water and kill fish. A recent bloom in Fengdu County, for example, tainted domestic water for fifty thousand people.

Landslides are another major problem. The rising waters exert pressure on unstable hillsides that encircle the 5,300-kilometer (3,293-mile) shoreline. Seepage into rock joints weakens the steep slopes. Hundreds of slides occur each month, although Chinese officials overseeing the project insist the new reservoir does not promote instability. In 2007 a landslide just upstream from the Three Gorges Dam crushed railroad workers and a bus, killing more than thirty people. More slides are expected as the reservoir rises to a maximum expected height of 175 meters (574 feet) in 2012.

Trapped silt behind the static reservoir waters presents two problems. Silt deposited during floods in the lower Yangzi Basin now settles in the reservoir floor. Accumulating silt is already reducing the hydropower capacity of tributary dam projects, and planners expect sedimentation to become an issue within twenty years near the city of Chongqing at the upper end of the reservoir. Furthermore, although the dam should reduce catastrophic downstream flooding, it will also block much of the silt that has enriched the lowland soils for centuries and was the source material for the natural levee system.
As a result agricultural productivity in the lower Yangzi basin may suffer from the loss of flood-deposited silt.

Scientists are also monitoring riparian (relating to the bank of a natural watercourse) and aquatic biodiversity loss resulting from the changes in the flood regime, water temperature, and water chemistry.

The potential for an earthquake-induced failure of the dam itself also exists although the dam has been build to withstand large earthquakes. The dam survived the massive 7.9 Richter scale quake in May 2008 and the subsequent aftershocks. But there is some speculation that the dam itself may have caused the quake. A phenomenon known as reservoir-induced seismicity occurs when the sheer weight of water in a reservoir causes tectonic plates to shift, resulting in an earthquake.

**Human Cost**

The Three Gorges reservoir inundated 17 cities, 109 towns, and more than 1,500 villages, forcing permanent relocation of a 1.3 million people. Resettlement began in 1997 and is four times greater than any prior infrastructure resettlement program in world history. The government was not prepared to manage or mitigate the three-pronged humanitarian crisis resulting from forced displacement, labor dislocations, and the more recent unanticipated dislocation of people fleeing landslides. Moreover, this ancient and densely populated land offered few places for resettlement, especially of farmers, who comprised half the number. As population density in resettlement zones increased to double the national average, farmers pushed higher into steep and less fertile hillsides where forest clearing contributed to slope instability. Resettled people had little involvement in policymaking and relocation decisions. Many were forced to change livelihood and move far away from their former homes. Those resettled face unemployment and poverty rates higher than those of people who were not removed, and one-third live in severe poverty. Insufficient government compensation for this loss of land and livelihood is magnifying the crisis although an effective state security apparatus minimized both refugee flight and

**Boats on the river at the Three Gorges Dam, which forced the resettlement of more than 1.3 million people.**
Three Gorges Dam

vocal resistance. In 2007 the Chongqing municipal government decided to relocate an additional 4 million people as a result of new slope instability problems.

The reservoir is also destroying thousands of cultural and archaeological sites, including temples, hanging tombs, and historic landmarks. Evidence of human habitation in the area dates to the Paleolithic era (2 million–10,000 BCE). Many sites in newly depopulated areas are looted before underfunded government teams arrive to catalog and remove the artifacts.

Benefits versus Risks

The government believes that the benefits of the Three Gorges Dam exceed the environmental and social challenges. When the twenty-six generators reach full operational capacity in 2009, the 8,200 megawatts of power will meet almost 10 percent of current Chinese requirements and be the largest source of clean, renewable energy in the world. It may also temporarily curb the millennia-old problem of downstream flooding, such as the 1998 event that killed thousands. The placid reservoir now allows 10,000-metric ton freighters to safely navigate 2,250 kilometers (1,398 miles) inland from Shanghai, free of the treacherous shallows and strong currents of the once-untamed Yangzi River.

The project gave birth to a nascent Chinese environmental movement. An unexpected twist occurred in June 2007 when Chinese Premier Wen Jiabao publicly announced that solving the environmental problems created by the Three Gorges Dam should be a national priority. It remains to be seen how the government and the Chinese people will adjust to the economic, environmental, and social changes—good and bad—of the world’s largest engineering project.

Further Reading

The Three Obediences and the Four Virtues describe precepts for womanly behavior that derive from Confucian ideals of harmony and order. The first century CE book Lessons for Women states that the proper role of a woman is to be a submissive daughter, wife, and mother who restrains her speech, dresses in a pleasing manner, and manages her household.

The role and function of women in Chinese society has long been defined by the Confucian moral precept of the Three Obediences, or Submissions, and the Four Virtues. The Three Obediences seek to give stricture to the entirety of a woman’s existence, and accordingly state that the woman, in her youth, should be obedient to her father and her older brothers; in married life, she should be obedient to her husband; and as a widow she should be obedient to her son. The Four Virtues, on the other hand, impart rules of propriety, whereby a woman may be able to govern her life and her conduct. The first virtue is the ability of a woman to know and adhere to a submissive place in society and to modulate her behavior accordingly. The second virtue consists of restraining speech, since a talkative woman is not only considered impolite but even tiresome. The third virtue instructs a woman to dress and adorn herself in order to please a man. The last virtue states that a woman must know the proper management of her household and she must cheerfully do all the work needed in the home.

Origins

The idea of defining and instilling a mode of conduct for women may be traced back to the first half of the Han Dynasty (206 BCE–220 CE), during which time the scholar Dong Zongshu (179–104 BCE), who was instrumental in making Confucianism the state religion, formulated his Three Cardinal Guides and Five Constant Virtues, through which he sought to describe the ethical relationship that existed between humankind and heaven. The Three Guides consisted of axiomatic formulations on the proper correlation between the individual and institutional power. Thus it was stated that (1) a prince was the guide of his ministers; (2) the father was the guide of his sons; and (3) the husband was the guide of the wife. These Three Cardinal Guides led to the Five Constant Virtues, which consisted of mercy, correctness, propriety, wisdom, and trustworthiness. The guarantor of both the Virtues and the Guides was heaven itself, which required obedience in order to ensure that human society functioned well, and in order to bring about a consistent ethical balance, or harmony, in the world. Therefore, to go against the Virtues and the Guides was to go against the will of heaven itself. For women, the stipulation of being obedient to the husband meant that the state of being a mother and a wife was deemed the highest achievement, which brought about an ethical stability of sorts, in which all persons knew their place in society.

The perception of women as wives and mothers is intimately related to the Confucian understanding of the two essential principles that govern both the world and the universe: the yin–yang (shady/sunny), and the
Three Obediences and the Four Virtues

nei–wai (inner/outer). Care must be taken to ensure that these principles are not interpreted as mutually exclusive or even oppositional; rather, they are to be seen as complementary opposites, in that the one principle finds completion in the other; nor can the one exist without the other or come into a position of dominance; and both are required to achieve harmony and balance. Whereas the yin–yang principle defines the characteristics of men and women, the nei–wai elaborates the realm in which each of them functions.

The Four Books for Women

It was within this Confucian context that the earliest woman historian of China, Ban Zhao (45–116 CE), composed her small but influential book Lessons for Women, in which she expounded the precept of the Three Obediences and the Four Virtues. The book received wide acclaim and was often entirely memorized by women to serve as a convenient vade mecum (Latin for “manual”) of proper behavior and comportment. The book consists of seven chapters: “Humility,” in which the female is described as being humble by nature; “Husband and Wife,” in which a woman is instructed to do all she can to serve and attend to her husband; “Respect,” in which a man is given the nature of hardness, while a woman is soft and yielding—therefore, a husband and wife are to treat each other with respect; “Female Virtues,” in which the Four Virtues and their benefits are stipulated; “Devotion,” in which a wife is advised to be entirely devoted to her husband; “Obedience,” in which the Three Obediences are outlined and explained; “Harmony among Younger In-Laws,” in which a wife is advised to work towards creating harmony among in-laws that are younger than she, as if she were their mother.

These various moral precepts sought to describe the ideal station for a woman in the world, namely, that of a wife and mother. Wisdom for a woman, therefore, resided in her ability to gain the knowledge that would ensure the achievement of her place in society. In other words, the realm of the woman was the house; that of men was the public sphere. But a woman did not naturally come by such domestic wisdom; she had to be taught it, just as men had to be taught the ways of the world. This brought about a concern to create and establish a system of education for women that would inculcate in them the spirit and willingness to become good mothers and good wives. Indeed, it was argued that just as men brought order into the world, so women brought order into the family and to the house; and an orderly family led to an orderly society. By the time of the latter Ming period (1368–1644), a specialized educational system for women was firmly established. Just as men studied the Four Books (The Analects, The Mencius, The Doctrine of the Great Mean, and The Great Learning), women were provided with their own four books, the first of which is Lessons for Women. The other three are The Women’s Analect by Song Ruoxin, the eldest of the famed Song sisters, in which the proper behavior of a woman is outlined: how she may educate...
herself in womanly virtues, how she is to bring up her children, how she is to treat her husband and her in-laws, and how she is to observe the various religious rituals. Then, there is Domestic Lessons, written by the Empress Xu, wife of the Ming Emperor Ch’engtsu (1360–1424), in which the courtly behavior of women is delineated: the rules of proper conduct, the need for restraint and moderation, and the pursuit of those things that will bring honor in her dealings with those around her. Lastly, there is The Traditions of Exemplary Women, by Liu Xiang (77–6 BCE), in which the traditional Three Guides and the Five Virtues were made relevant to women living in the domestic sphere by way of examples drawn from the past.

The Traditions of Exemplary Women brought about a subgenre of books for women in which the lives of women deemed worthy were recounted, the reading of which would provide tangible examples which other women could imitate in order to become worthy themselves. However, these biographies of sorts do not simply relate the lives of good mothers and wives; rather, they show women involved in the entire breadth of Chinese society. For example, there are women who are both virtuous in the Confucian sense, as well as women who exist outside this traditional definition, namely, demonic and power-hungry women who act for their own benefit and advancement, and women who are skilled in debate, argumentation, and intellectual and cultural activities. Further, these biographies in no way show women to be docile creatures, who submit to the will of fathers, husbands, and then sons; rather, they show women who seek to fulfill their destinies as they will them to be, entirely outside the demands and wishes of men. Thus we read of women admonishing and shaming their husbands into action, of women defiantly mutilating their faces in order to avoid having to marry a man they cannot respect or love. In effect, these biographies seek to define what the realm of a woman is in Chinese society; they do not seek to demarcate that realm. It may even be stated that when we read of such active and engaged women, we are being presented with the various possibilities available to them, rather than simply reading about the reification of the docile and submissive woman. But these examples may also be seen as the chaos that results when a woman does not follow the precepts that have been laid down for her.

Women and Universal Harmony

The Confucian ideal of womanhood was closely related to notions of order and disorder, in that personal behavior reflected universal harmony. Thus, a disobedient woman who acted without virtue created chaos in the sphere assigned to her, namely, the home; this chaos extended outwards to disrupt the world and society. Since women were inseparable from domesticity, they had no right to divorce or separate from a husband. But a husband could divorce his wife if she failed to obey and serve her in-laws, if she bore no son, if she talked too much, if she stole, if she was libidinous, or even if she became ill with some disease. The only time a husband could not divorce his wife was if he had married her when he was poor and had eventually
got rich, if she had given birth within a given year, if she had no family to return to, or if she had officially mourned the passing of one or both of her husband’s parents.

The strength of this tradition is still prevalent in China, despite Maoist teachings to the contrary, and the old adage that men are in charge of external things and women are in charge of internal things is very much part of Chinese society.

Historical illustration of two Chinese girls caring for their younger siblings. Being a mother and wife was traditionally viewed as the highest achievement a woman could reach.
Tian Han was a founder of the Chinese spoken drama (huaju 话剧) and a prolific writer who produced a large body of plays, operas, and film scripts. His death during the Cultural Revolution (1966–1976) represented the tragic fate of many Chinese intellectuals caught up in this political upheaval.

A native of Hunan Province, Tian Han followed the trend of his time to study in Japan. During his stay in Japan from 1916 to 1921 Tian discovered the works of many Western dramatists, which inspired him to devote his life to drama. In 1921 he and his fellow students, Guo Moruo 郭沫若 and Yu Dafu 郁达夫, established the Creation Society (Chuangzao She 创造社) to promote romanticism in literature and the arts.

His Early Plays: In Search of the Self

After his return to Shanghai in 1922, Tian Han organized the Southern Drama Society (Nanguo She 南国社), which became an important training school for actors as well as a production company for the performance of modern plays, including Tian’s own works. Representative plays of his early period, Night in a Café (Kafei dian zhi yiye, 咖啡店之夜, 1922), The Night a Tiger Was Captured (Huo hu zhi ye, 获虎之夜, 1924), and Death of a Famous Artist (Mingyou zhi si 名优之死, 1927), all deal with adverse effects of social environment on love and artistic fulfillment. They also reflect Tian’s own search for the meaning of life and art.

His Proletarian Dramas: Art to Serve Politics

His agonized search ended in 1930 with publication of his article “Our Self-Criticism” (Women de ziwo piping 我们的自我批评), in which he criticizes the petty bourgeois sentiments in his and other dramatists’ writings. In the same year he joined the League of Left Wing Writers. These events marked a turning point in his career. The romantic tone of his early plays would be replaced by realism; his belief in art for art’s sake would shift to that of art serving political goals; and his Southern Drama Society would henceforth produce proletarian dramas. During the War of Resistance against Japan (1937–1945, known outside of China as the Second Sino-Japanese War and fought in the context of World War II) Tian Han wrote a number of patriotic plays such as The Song of Beautiful Women (Liren xing 丽人行, 1947), which depicts the suffering of the Chinese people under Japanese occupation. He also tried to reform traditional opera by incorporating...
modern stage techniques and injecting new meaning into old plays. In his Beijing Opera (Jingju, a style of opera known for its spare stage sets evoking the Ming dynasty) adaptation of *The Legend of the White Snake* (*Baishe zhuan* 白蛇传, 1950), for example, the “snake monster” is transformed into a brave young woman who fights for her right to love and happiness.

**His Historical Plays: Using the Past to Criticize the Present**

After the founding of the People’s Republic of China in 1949, Tian Han’s creative output decreased, but he did produce two historical dramas worthy of note: the spoken drama *Guan Hanqing* 关汉卿 (1958) and the Beijing Opera *Xie Yaohuan* 谢瑶环 (1961). The first play tells the story of the Yuan dynasty (1279–1368) dramatist Guan Hanqing, who wrote the play *Injustice Done to Dou E* (Dou E yuan 拼娥怨) about a young woman wrongly accused of murder by corrupt officials. The courageous Guan who spoke out for the people could be Tian Han’s self-image, and the oppressive rule of the Mongols depicted in the play could also be a reflection of the current situation in China. In *Xie Yaohuan*, Tian Han created another character who dared to speak out for the people—a woman official in the court of Empress Wu Zetian of the Tang dynasty (618–907 CE).

Tian Han’s use of the past to criticize the present (*jie gu feng jin 借古讽今*) was, of course, recognized by the authorities. After the outbreak of the Cultural Revolution (1966–1976), a political campaign launched by Mao Zedong against his enemies, Tian was arrested and died in prison in 1968. Like many other writers and artists who perished during this upheaval, Tian Han became a victim of the Communist revolution that he had supported for forty years.

Tian Shan
Tiānshān 天山

The Tian Shan range, located mainly along the border between China and Kyrgyzstan, is 2,414 kilometers long and covers more than 1 million square kilometers. Oil and gas extraction, mining of nonferrous metals, and tourism are all important industries. The highest point in the range is 7,439 meter Pobeda Peak, famous among mountaineers.

The great arc of the Tian Shan range and its intervening valleys stretches 2,414 kilometers east to west along China’s frontier with Kyrgyzstan and southeastern Kazakhstan and the Xinjiang Uygur Autonomous Region of southwestern China. The range is 320 to 480 kilometers wide and covers 1,036,000 square kilometers. The Pamir ranges lie to the southwest, the Dzungarian and southern Kazakhstan plains lie to the north, and the Tarim Basin lies to the southeast.

A central cluster of tall peaks reaches 7,439 meters on Pobeda Peak, which is also the highest point in Kyrgyzstan and lies on the border with China. The second-highest peak of the Tian Shan is Khan Tengri (Lord of the Spirits). At 7,010 meters it lies on the Kyrgyzstan-Kazakhstan border. These two peaks are known among mountain climbers as the two most northerly mountains...
of more than 7,000 meters, although whether or not Khan Tengri qualifies as a 7000m peak is a matter of debate: its geographical elevation is 6995m, but its glacial cap brings the peak to 7010m.

At 154 meters below sea level the Turfan Depression is the lowest elevation in the Tian Shan and the lowest point in central Asia. Issyk-Kol, in western Tian Shan, is the ninth-largest lake in the world by volume.

The Silk Roads that linked China and Southwest Asia to the Mediterranean world followed the southern edge of the Tian Shan. To early travelers of the Silk Roads these “heavenly mountains” (tian is Chinese for “sky” or “heaven”) offered an alpine respite from the steppe (a vast, usually level and treeless tract in southeastern Europe or Asia), forests, and glacial lakes. The interior continental location of the Tian Shan produces short, cold winters that are followed by long, hot summers. Winds of Gulf of Arabia and Mediterranean origin bring moisture to the windward western and northwestern slopes (up to 800 millimeters annually) but leave the eastern and interior regions in an arid rain shadow (less than 100 millimeters annually). Common fauna include bear, snow leopard, wolf, fox, wild boar, mountain goat, Manchurian roe, and mountain sheep.

Mount Tian Safari Park, located north of Liumu Lake, covers 63 square kilometers and is part of the Bogeda South Foot Conservation Area. It is home to sixty-nine species of animals. The United Nations Educational, Scientific, and Cultural Organization (UNESCO) is considering naming the western Tian Shan to its World Heritage List.

The Kyrgyz people predominate in the western Tian Shan; Uygurs predominate in the eastern Tian Shan. Ethnic Kazakhs, Tajiks, Russians, Chinese, and Tartars also settle the periphery. The economy revolves around irrigated agriculture (in the lowlands) and livestock herding (in the uplands). Oil and gas extraction, mining of nonferrous metals, and tourism are also important.

The eastern Tian Shan contains an autonomous county for Mongols, who remain Buddhists. Sunni Islam

Snow on Mount Tian, 1755, Palace Museum, Beijing. This painting by Hua Yan (sometimes considered one of the Eight Eccentrics of Yangzhou) is reproduced in Three Thousand Years of Chinese Painting.
predominates among the Uygur and Kyrgyz communities, whereas small Russian Orthodox Christian and Jewish communities are settled in and around Ürümqi in the Xinjiang Uygur Autonomous Region.

Tiananmen Square
Tiān’ānmén Guǎngchǎng 天安门广场

Events in Tiananmen Square, at the heart of Beijing, have shaped modern China, and the People’s Republic of China’s sixtieth anniversary celebrations in October 2009 will again bring the world’s attention to the largest public open space in the world. The student protests of 1989, which took place there and elsewhere in China, significantly influenced China’s diplomatic relations with the United States and other nations and continue to symbolize the Chinese government’s determination to control the pace and focus of social change.

Tiananmen Square 天安门广场 is located in the center of Beijing, the capital city of the People’s Republic of China (PRC). Originally designed and built in 1651, the square was enlarged fourfold in 1958 to cover 100 acres, making it the biggest public square in the world. It is best known in the West for the “Tiananmen Incident” (Guāng chāng shì wèi 天安门广场示威) of 1989.

The square is named for the Tiananmen Gate (Gate of Heavenly Peace), which is on the northern side of the square. Outside the gate are two marble pillars called the huabiao. The huabiao are said to date back to the sage kings of Yao and Shun in China’s mythical times. Originally wooden, they served as the notice boards, or “wood of direct speech” (jiēbǎng zhī mù), which stood just outside the court for the purpose of soliciting public criticism. They were replaced during the Han dynasty (206 BCE–220 CE) by stone pillars, eventually becoming elaborately sculpted columns in traditional Chinese architectural style and a common sight on the grounds of imperial palaces. But they still symbolize people’s right to speak up against official injustice.

The Presence of Mao

The posthumous presence of Mao Zedong (1893–1976) is visually and physically prominent at the square. The official portrait of the former chairman of the Chinese Communist Party (CCP) has hung on Tiananmen Gate since 1949. It is flanked by two slogans: “Long Live The Unity of the Peoples of the World!” and “Long Live The People’s Republic of China!” Mao is also the only permanent resident of the square: In a mausoleum on the south side, the body of Mao lies in a crypt covered in a crystalline sarcophagus surrounded by flowers. The body is retired after public viewing hours to an earthquake-proof chamber deep in the bowels of the square. An Ancestral Hall of the Revolution contains relics of other first-generation revolutionary leaders like Liu Shaoqi (1898–1974), Zhu De (1886–1976), and Zhou Enlai (1898–1976).

In the center of the square, a marble obelisk known as the Monument to the People’s Heroes commemorates those who died for change and revolution in China from 1840 on. Every morning at daybreak a ceremonial guard facing it hoists the five-star red flag of the PRC. To the east, the Museum of History and the Revolution has more often than not been “closed to the public” due to the constant
vacillation of party policy and the rewriting of Chinese history. Instead, it has been used for exhibiting official and avant-garde artwork, contemporary fashion shows, and so forth. To its west is the Great Hall of the People, which, with its ten thousand seats, is the annual meeting site of the National People’s Congress. All major plenums of the CCP and government are held there as well.

The Tiananmen Incident

On 15 April 1989, students gathered in Tiananmen Square to mourn the death of reformist CCP general secretary Hu Yaobang. When government officials refused their petitions at the Great Hall of the People, the students clashed with police. The party mouthpiece, People’s Daily, published an editorial on 26 April accusing a “handful of plotters” of creating “turmoil” with the object of overthrowing the regime. The next day, 200,000 students from over forty universities marched to the square in protest. Hundreds, then thousands, of Beijing University students began a hunger strike on 13 May around the Monument to the People’s Heroes. Premier Li Peng (b. 1928) and moderate officials affiliated with General Secretary Zhao Ziyang (b. 1919), who was later dismissed, failed to defuse the situation before the arrival of Soviet leader Mikhail Gorbachev (b. 1931) for a summit with Deng Xiaoping (1904–1997), China’s paramount leader. The welcoming ceremony at the square for Gorbachev was abandoned: Chinese president Yang Shangkun (b. 1907) later gave Beijing’s loss of face and international prestige as one reason for the crackdown. On 20 May, martial law was
declared, but for two weeks the students, now joined by workers, reporters, army personnel, and civil servants—numbering at one point over 2 million—blocked the advance of 150,000 troops toward the city. On 3–4 June, army tanks rolled in, clearing the square and killing an undisclosed number of civilians.

The term “pro-democracy” would oversimplify description of a student-led movement that made a complex set of demands, which included dialogue with the government, crackdown on official corruption, vague political reforms, greater funding for education, a freer press, and so forth. The students used the word “democracy,” but they were short on specifics. They stressed the need to improve the existing system, not to overthrow it. Many acknowledged party leadership and believed that an American-type democracy was unsuitable for China. It may also be argued that they were not sufficiently versed in liberal democratic traditions to represent their interests and aspirations. They did, however, think that by playing to the international news media (over one thousand foreign journalists had converged in Beijing for the Deng-Gorbachev summit), they could gain Western sympathy and thereby advance their cause. This partly explains why, on 30 May, students unveiled the ten-meter-high Goddess of Democracy statue in the square. Ironically, Deng himself had been misled by Premier Li to believe that the demonstrators wanted to overthrow the party government.

This was not the first time Chinese students demonstrated against government policies in the twentieth century, but it was certainly one of the biggest demonstrations and the focus of huge international media attention. The Tiananmen Square protests represented a debate between young, liberal, and progressive-minded students and an older generation of political leaders attempting to maintain control even while considerable economic and social transitions were underway. There were repercussions within the government itself: Some leaders took a more sympathetic approach; others were committed to a strong and swift response, including military action against the students.

In the aftermath of the 1989 incident, the CCP organized Young Pioneers parades to show that the “revolutionary successors to the Communist enterprise” had taken back the square from protestors.

Today Tiananmen Square remains a source of tension for Chinese officials, with a considerable police presence, as it is thought to be a focal point for some activist groups. Security concerns often focus on such events as the twentieth anniversary of the Tiananmen Square protests in June 2009. Western media companies were, after lengthy discussion with Chinese Olympics officials, allowed to broadcast live from the Square during the 2008 Olympic Games. The Square remains, nonetheless, a major tourist attraction and venue for public events.

An ancient system for dating events, *tiangan dizhi* was replaced after the end of the Chinese imperial system by the Gregorian calendar. But some Chinese people still rely on the sixty-year cycle of *tiangan dizhi* to determine where and when to plan events both momentous and mundane in the course of their lives.

*tiangan dizhi* is a cyclical time-measuring system used in China since antiquity. The system juxtaposes two parallel sequences: the sequence of heavenly stems (*tiangan* 天), which consists of ten equal-length named units, and the system of earthly branches (*dizhi* 地支), which consists of twelve equal-length named units. Specifically, the calendrical system identifies major time units, principally a year or a day, by pairing one stem and one branch.

Because of the difference in the number of stems and the number of branches, it takes sixty counts before the original pairing reappears, thus forming the sexagesimal, or sixty-year, cycle in Chinese time reckoning. Enumerated below are the sixty pairings that occur as the heavenly stems, numbered here 1 through 10 for the purpose of illustration, pair with the heavenly branches, coded here A through L for the purpose of illustration. (The actual *tiangan dizhi* system does not use numerals and letters; the system uses Chinese characters to stand for the ten branches and twelve stems.)

1A, 2B, 3C, 4D, 5E, 6F, 7G, 8H, 9I, 10J,
1K, 2L, 3A, 4B, 5C, 6D, 7E, 8F, 9G 10H,
11I, 12J, 13K, 14L, 15A, 16B, 17C, 18D, 19E, 20F,
11G, 12H, 13I, 14J, 15K, 16L, 17A, 18B, 19C, 20D,
11C, 12D, 13E, 14F, 15G, 16H, 17I, 18J, 19K, 20L,
11A (the beginning of a new cycle) …

**History of Tiangan Dizhi**

Scholars generally agree that this sexagesimal system began during the Shang dynasty (1766–1045 BCE), when the kings attached the names of the heavenly stems to their personal names. The paired names also appeared on oracle-bone inscriptions (called *jiaguwen*, 甲骨文 which means “words carved on tortoise shells or cattle scapulas” and which were used by Shang kings for divination purposes). The paired names carved on bones were used to indicate the day but not the year when a spiritual quest was to be performed. The late historian Derk Bodde believed that it was not until the Han dynasty (206 BCE to 220 CE) that this sexagesimal system was used to date both years and days.

This sequential system had been complicated in the late Zhou dynasty (1045–256 BCE), when other cosmological signs or beliefs were correlated with *tiangan* and *dizhi* to map space and time. The ten heavenly stems were split into the duality of yin and yang: 1, 3, 5, 7, 9 belong to yang and 2, 4, 6, 8, 10 belong to yin. The ten heavenly stems were further paired to correlate with the five elements (wuxing, 五行) or the “five movements”—wood bending (1, 2), fire rising (3, 4), soil growing (5, 6), metal molding (7, 8), and water sinking (9, 10)—and the five cardinal
directions—east (1, 2), south (3, 4), center (5, 6), west (7, 8), and north (9, 10).

In the same manner, the twelve earthly branches were categorized into the yin–yang dichotomy: yang—A, C, E, G, I, K; yin—B, D, F, H, J, L. They were further correlated with the twenty-four solar terms (jieqi 氣節) in a solar year, the twelve zodiac animals representing the years (rat, ox, tiger, hare, dragon, serpent, horse, sheep, monkey, rooster, dog, and boar), the twelve lunar months in a year (the Chinese months are called by their numerical order), and, lastly, the twelve two-hour units (shicheng 时辰) in a day.

These two greatly enriched sequences in post–Han China (after 220 CE) thus constituted a composite cosmological order of space-time configuration for interpreting the existence and meanings of ephemeral human lives, from the nature and affairs of the emperor to individual mundane existences. For example, unlike the followers of the lineal Gregorian calendar, which extends from the time of Christ’s alleged birth to infinity and represents a year by a number in sequential order, the Chinese typically chronicled and named years following this sexagesimal cycle of each reign, such that the Gregorian 1840 CE was chronicled as the 1G year of Emperor Daoguang. Besides chronicling the yearly order for the entire state, the court astronomers also determined the auspicious time and place for the emperor to visit, the proper direction of the main gate of the court, the spatial allocation of household furniture—all based on the calculation of this tiangan dizhi system. At the time of the emperor’s death, the court astronomers also prescribed the most auspicious time and location for the funeral, the physical construction of the coffin and the tomb, and the direction of the cemetery.

**Tiangan Dizhi Today**

With the downfall of the imperial court in 1912, the sexagesimal system was replaced with the Gregorian calendar system. Except for respected scholars who still date important events by using the traditional and formal tiangan dizhi names, few people today use tiangan dizhi to name the years.

Other parts of the tiangan dizhi system are better preserved and widely in use in daily life. For instance, people may figure out the unique characteristics of a specific space-time period, or node, and arrange activities (such as scheduling a haircut, launching a new business, taking a trip, and so on) accordingly. This practice has persisted throughout Chinese history, down to the twenty-first century. A newborn baby’s birth characters called shengcheng bazhi (生辰八字 the eight characters of birth)—for the birth year, month, day, and hour—are still carefully recorded according to the designated characteristics of the paired heavenly stems and earthly branches. Fortune-tellers use these eight birth characters to predict the ebb and flow of an individual’s life cycle. It is a common practice for parents to bring the eight birth characters of a prospective bride and groom to a fortune-teller to see if the two sets are compatible. At the time of death, a fortune-teller or a Daoist priest will analyze the eight birth characters of the deceased in order to pick the proper time and location for the funeral.

Tianjin 天津

Tianjin is one of the four Chinese municipalities that reports directly to the State Department. It is important for its role as the economic center of China. It is the third largest city in China after Shanghai and Beijing (which it is linked to by a new high-speed rail), and serves as the gateway to the capital city, 120 km away. It is a port city and an economic powerhouse.

Tianjin, China’s third largest city, is one of China’s four province-level municipalities (the others being Beijing, Shanghai, and Chongqing). It is a relatively young city by Chinese standards. The city received its current name (which translates literally as “ford of heaven”) from the Ming emperor Zhu Di (r. 1403-1424), who marched through the area with his army on his way south to dethrone his nephew in 1400 CE. To commemorate that auspicious event, Zhu created a walled garrison next to a settlement called Zhigu in 1404, bestowing on the new walled city the name Tianjin. Located at the confluence of the many navigable rivers of the North China Plain, the Grand Canal, and the Haihe, which drains into the Bohai Gulf (an arm of the Yellow Sea), the city’s commerce began to prosper.

Tax collectors soon followed, joined by the Changlu commissioner and his sprawling bureaucracy, who supervised the production, collection, transportation, and distribution of salt as a state monopoly and were responsible for the collection of the gabelle (salt tax), a major source of revenue for the central government behind land tax. Wealthy salt merchants were joined by traders importing goods from central and south China through a vibrant coastal junk trade, as well as by native bankers specializing in long distance remittance banking.

Recognizing Tianjin’s economic importance, the city was promoted in 1725 from a guard station to a department and became the seat of Tianjin Prefecture in 1731. By the nineteenth century, if not earlier, the city served as the economic center of north China (as opposed to Beijing’s cultural and political centrality), with a commercial hinterland that stretched from the coastal plain over the Taihang Mountains and into the steppes beyond.

The arrival of foreign imperialism altered Tianjin’s developmental path. In the aftermath of the Second Opium War (1858–1860), the city was declared a treaty port, and foreign concessions were established. The city suffered xenophobic incidents such as the Tianjin Massacre in 1870, during which foreigner missionaries and residents were killed, and the Boxer movement in 1900 which resulted in the occupation of the city by the Allied Expeditionary Force until 1902.

In the aftermath of the destruction, Chinese reformers began to promote industrial development and modernization, stimulating Tianjin’s early industrialization, led by the Beiyang arsenal, the telegraph service, and flour and cotton-spinning mills, and followed by heavy industries such as the Kailuan Mining Administration and Yongli Chemical Industries. Before the Second World War, the city was the country’s third largest industrial center (after Shanghai and Wuhan) and the largest in...
north China, while serving as the provincial capital for Hebei Province.

Under Beijing’s shadow, after 1949, the role of Tianjin changed yet again. State investment largely bypassed Tianjin, while the city served the capital as a transportation hub with railroad and ocean links. The post-Mao economic reforms created an even larger gap between the city and growth centers such as Shanghai, Canton, and Shenzhen.

The 2006 master plan for the city finally made it the core of the Bohai economic region. With the construction of a high-speed rail link between Tianjin and Beijing, Tianjin and the capital are becoming one, supported by a ring of cities to form a circum-Bohai economic region. In 2008, the central government authorized Tianjin as the site for new land use and financial policies. Utilizing the new high-speed rail, it served as a venue of soccer events for the 2008 Beijing Olympics at the newly created
Tianjin Olympic Center Stadium, and has become a host city for many international conferences. A new exchange for over-the-counter (OTC) trading of equity securities and corporate bonds, together with direct access to the Hong Kong stock market, ensured that the city would reclaim its place as the economic center of north China, while Beijing would continue as the political and cultural center of the country.

Further Reading

The first truly Chinese school of Buddhist thought, Tiantai, was founded in the sixth century. With its Chinese perspective on an Indian religion, Tiantai spread through East Asia, establishing itself in Japan and Korea.

Geographically, Tiantai refers to a mountain as well as a mountain range in Zhejiang Province; historically, this mountain became home to a school of thought that came to revolutionize Buddhism in China, imbuing it with a uniquely Sinitic approach that broke away from a continued dependence upon India as the place of authority for all things Buddhist. Therefore, Tiantai philosophy gave the Far East (China as well as Japan and Korea) its own form of Buddhism.

The infiltration of Buddhism into China depended on the sporadic appearance of texts and traditions retrieved by travelers to India. Consequently, the result was a plethora of teaching and practices that were both divergent and even at times contradictory. For example, some prescribed strict observance of rituals, others denied such practices entirely. More importantly, however, the Chinese worldview was most unlike the Indian Buddhist one, for the former gave eminence to the development and nurturing of the individual and the body while the Indian view regarded the body and the person as only a brief illusion. In effect, China was strongly Confucian and Daoist; that is, Chinese culture was intensely “humanistic,” concerned with understanding how to live in the world and how to achieve a just society through good governance. Buddhism, on the other hand, was antihumanistic; for it cared for neither of these things and privileged the search for nonexistence as the chief end of human existence; the body was a barrier that needed to be overcome in order for the soul to be free from suffering. Thus, the real source of the varieties and disparities of Buddhism in China was the result not only of divergent texts, but also of divergent cultures. China was not northern India, and the process of inculcating Buddhism was not simply a matter of transplanting what had worked in India and Central Asia. The process of translation of an entire worldview required the creation of a new set of ideas and ideals. Indeed, translation is not only a linguistic act, it is also a philosophical one.

It was the monk and philosopher Zhiyi (538–597 CE), who came to a Buddhist retreat at Tiantai Mountain around the year 587 and began to address the twin problems facing Buddhism this far from its place of origin: First, how to make the faith relevant to China, and second, how to synthesize and unify Buddhist teachings so there would not be confusion and disparity.

The immediate need was for synthesis, and Zhiyi took an innovative approach. Rather than seeking to refute each and every text that contradicted another, he instead provided a methodology to understand the contradictions, and he did not deny that the Buddha himself was the source of these contradictions. In this way, Zhiyi avoided creating conflict among the various followers of these contradictory traditions, each of whom believed in the verity of what they taught and practiced. He stated that the various approaches, texts, and scriptures found in the China of his time were certainly teachings of the
Buddha, but they were only partial ones, because over his lifetime the Buddha realized that a person could not encompass the entirety of the enlightenment process in one attempt; rather she or he had to achieve this state gradually. Therefore, each of the many teachings and texts that appeared contradictory were in fact small steps towards enlightenment; or in the words of his famous dictum, “All was One, and One was All.” In effect, the model he used was that of the student who proceeds from an initial, preparatory stage, to a beginning stage, to a middle stage, and finally to an advanced one. The many teachings represented each of these stages, and each was important for it brought the student to the highest, most accomplished state. Once this highest state was reached, the student had no more need for the other stages. Thus, each stage was utilitarian and not complete in itself. Accordingly, the many teachings would ultimately be abandoned once they had fulfilled their function. Truth, implied Zhiyi, is revealed a little at a time; once it is known in its fullness, partiality or semi-concealment is no longer possible. For example, the experience of reading a book for the first time can only be undertaken once, a page at a time. Once the book is entirely read, nothing remains hidden. This is what Tiantai philosophy refers to as “Round Teachings,” or that approach which encompasses everything so there is no room for contradiction or conflict.

For Zhiyi, the highest state of all was explained in one text only, the Lotus Sutra, which is a very significant Mahayana sutra that takes the form of a dialog with the Buddha and which consists of parables that seek to explain skillful means, or those skills through which an individual may terminate suffering and also acquire the ability to teach others in the path of the Buddha. It became the central work for Tiantai philosophy. The purpose of this sutra is to expound on the nature and purpose of those means that will allow a person to reach the highest state, that is, the end of personal suffering. Importantly for Zhiyi, the suta also hints at the notion that the teaching found in it replaces all other Buddhist teachings. This brought authority to Zhiyi’s notion of the various stages.

Further, Zhiyi gave precision to the definition of phenomena, or, things that are observed. He saw their nature as threefold: Things are empty because they contain nothing intrinsically their own; things exist solely because they are the result of external causes and are therefore impermanent; and things are middle, meaning that things are both empty and temporary, and thus their true reality is ultimately unknowable. This epistemology led Zhiyi to conclude that each phenomenon is one with true emptiness (the state of being devoid of absolute identity, the complete lack of permanence, the entire erasure of the self). And on a more pragmatic level, he found room for all activity; even deluded thoughts are initial, preparatory steps towards achieving enlightenment. This guided Zhiyi to formulate various methods of contemplation or meditation to allow the individual to observe his or her mind in order to continue climbing upwards into enlightenment.

This approach makes Tiantai philosophy uniquely Chinese and forever ruptures its connection to India. By equating things to provisional instances of enlightenment, the phenomenal world acquires significance and this in turn leads to a uniquely Chinese Buddhist position: The erasure of the self is not self-negation but the acquisition of bliss, permanence, and purity. Perhaps it may even be said that in China the purpose of meditation is to confront the world and seek to solve its problems because the process is a step towards enlightenment. This broadening of perspective allowed Buddhism to extend easily throughout China and into Japan and Korea. Tiantai is still important in China, but in Korea and Japan it has lost its Chinese perspective and has been made more indigenous, such as Nichiren Buddhism in Japan.

From the Lotus Sutra

The Lotus Sutra is by far the most popular and influential of Mahayana scriptures. This excerpt translated by Kumarajiva in 406 CE illustrates one of the main doctrines of the text: that the Lotus Sutra itself embodies the Buddha’s truth.

At that time Sakyamuni Buddha saw the Buddhas that were his emanations all assembled, each sitting on a lion seat, and heard all these Buddhas say that they wished to participate in the opening of the treasure tower . . .

Sakyamuni Buddha with the fingers of his right hand then opened the door of the tower of seven treasures. A loud sound issued from it, like the sound of a lock and crossbar being removed from a great city gate, and at once all the members of the assembly caught sight of Many Treasures Thus Come One seated on a lion seat inside the treasure tower, his body whole and unimpaired, sitting as though engaged in meditation. And they heard him say, “Excellent, excellent, Sakyamuni Buddha! You have preached this Lotus Sutra in a spirited manner. I have come here in order that I may here this sutra.

At that time the four kinds of believers, observing the Buddha who had passed into extinction immeasurable thousands, ten thousands, millions of kalpas in the past speaking in this way, marveled at what they had never known before and took the masses of heavenly jeweled flowers and scattered them over Many Treasures Buddha and Sakyamuni Buddha.

Tibet (Xizang) Autonomous Region
Xīzàng Zìzhìqū 西藏自治区
2.84 million est. 2007 pop. (this figure is debatable) 1.22 million square km

Tibet—“the Roof of the World”—is one of China’s five autonomous regions. A distinction is made between “political” Tibet, the area governed by the Lhasa government before 1950, and “ethnic” or “cultural” Tibet, the area inhabited by mainly Buddhist people of Tibetan origin. Tibet has been the focus of international attention because of calls for increased autonomy or independence, and at the same is being developed as an international tourist destination.

Tibet—since 1965 officially known as the Tibet (Xizang) Autonomous Region (TAR)—is made up of the central Asian landmass between the Kunlun mountain range to the north, the Himalayan Mountains to the south, and the Karakoram range to the west. It is one of China’s five autonomous regions (areas dominated by one or more of China’s fifty-five officially recognized minority ethnic groups: in this case, the Zang people).

On the east Tibet is bounded by a region of three great rivers: the Yangzi (Chang), Mekong, and Salween. With most of its territory located above 4,500 meters and its capital, Lhasa, located at 3,607 meters, Tibet has been called “the Roof of the World.” The total Tibetan population remains uncertain, and is a highly-politicized issue, particularly given the movement of Han Chinese into the TAR over the last five decades. While around 130,000 Tibetans live in exile in India and elsewhere, estimates of the Tibetan-speaking population of China range between 2 and 5 million.

Although the degree to which Tibet was a part of China in earlier eras is disputed, Tibet certainly has been a part of China since the Chinese Communist invasion in 1950 and exists today only in the much-reduced area of the TAR. A Tibetan government-in-exile, headed by the Dalai Lama (the spiritual and temporal leader of the Tibetan people), has been established in India, and significant Tibetan exile communities exist in the United States and Switzerland. The Tibetan government in exile continues to campaign for self-determination for Tibet, and the ongoing Sino-Tibetan dispute invests facts and figures regarding Tibet with political implications. However, a distinction historically has been made between “political” Tibet, the area governed by the Lhasa government before 1950, and “ethnic” or “cultural” Tibet, the area inhabited by mainly Buddhist people of Tibetan origin.

Geographic Features

“Political” Tibet had an estimated population of 1.8–3 million, around half of whom were seminomadic yak herders. The settled urban and agricultural populations were concentrated in the river valleys, particularly in the triangle formed by the major settlements of Lhasa, Gyantse, and Shigatse (Xigaze). Today the TAR population includes a large number of Han Chinese immigrants, and with the
completion of a railroad connecting Lhasa with other Chinese cities, the Han Chinese are now believed to form a majority of the Lhasa population.

Although Tibet is located at a latitude similar to that of Algeria, the location and altitude of the Tibetan plateau produces a cold and generally dry climate, although southeastern Tibet includes tropical jungle. The western Tibetan area around the Gangdise (Kailas) mountain range and Lake Mapam Yumco (Manasarowar) is the source of four great rivers: the Indus, Brahmaputra, Ganges, and Sutlej. Mount Everest, located on the Tibet-Nepal border, at 8,848 meters is the world’s highest mountain.

Tibet’s climate limits its sedentary agriculture. Barley is the major crop and, in its roasted form as tsampa, comprises, along with yak meat and tea (a traditional import from Sichuan and other parts of China), the staple diet of most of the Tibetan population.

**Origins**

The origins of the Tibetan peoples appear to be linked to central Asian nomadic tribes such as the Yue Zhi (Tokharians) and Qiang. The first unified Tibetan state was a tribal confederacy formed in the seventh century under the rule of King Songtsen Gampo (or Srong-brtsan Sgam-po (c. 608–650 CE), who established his capital at Lhasa. The introduction of a Tibetan script and Buddhist teachings is among the innovations attributed to his reign. His dynasty lasted until the assassination of King Langdharma around the year 842.

During this period Tibet was a formidable military power, constantly warring with neighboring powers and strong enough to sack the Chinese capital of Xi’an in 763. At its zenith the Tibetan empire reached as far west as Samarqand in modern-day Uzbekistan. Buddhism became
increasingly important, particularly in the court, and the first monastery in Tibet was established at Samye around 779. However, there was considerable opposition to the new religion among aristocratic factions associated with followers of the indigenous Tibetan belief system, which was later identified with the Bon faith but probably at that time was an unsystematized tradition that included elements of divine kingship and sacrifice.

During the eleventh and twelfth centuries Buddhism became firmly established when Indian Buddhist texts were translated into the Tibetan language. Of the four major sects of Tibetan Buddhism that developed on the basis of these teachings, the Gelugpa sect eventually emerged as prominent, and from the sixteenth century onward Tibet was ruled by a line of incarnate Gelugpa monks with the title of “Dalai Lama.” Religious factions in Tibet tended to seek Mongol or Chinese patronage, and in the eighteenth century China became increasingly involved in events in Tibet. Thus, from 1793 until 1911–1912 China exerted at least nominal suzerainty (dominion) over Lhasa.
The British imperial government of India in 1903–1904 dispatched a mission to Lhasa that forced Tibetans to accept British representatives and effectively opened the country to Western influences. However, despite some modernization during the next couple of decades, Tibet remained an essentially conservative religious society and strongly resisted change. The thirteenth Dalai Lama (1876–1933), a strong nationalist leader, led Tibet to independence after the Chinese revolution in 1911, and Tibet survived as a de facto independent state until the Communist Chinese invasion in 1950. However, its independence was not officially recognized by any major powers, with China continuing to claim Tibet.

**Society**

In spite of the continuing existence of the Bon faith and its many cultural manifestations, the outstanding feature of Tibetan culture generally is considered to be its unique...
form of Buddhism, a synthesis of the Mahayana and Tantric forms of the faith. Buddhism influenced virtually all aspects of traditional society. An estimated 20 percent (although some estimates place the figure as high as 50 percent) of the male population were monks, and more than six thousand monasteries were located throughout the Tibetan cultural world. These were important economic and political centers as well as guardians of Tibetan artistic and cultural expression. Aside from the monasteries, pilgrimage to sacred cities and mountains was an especially significant religious expression for all classes of people.

A small aristocratic class enjoyed considerable privilege, although the Tibetan peasantry, in comparison with their contemporaries in neighboring states, were tolerably well treated. Women also enjoyed greater-than-average freedom, particularly in the economic and social spheres, although they were almost entirely excluded from religious power.

Cultural influences from both India and China were present, but Tibetan culture was strikingly distinct from the culture of its neighbors. This was particularly true in such areas as literary traditions (in particular the Gesar of Ling epic), language, and art and architecture, with buildings such as Lhasa's Potala Palace and Jokhang Temple, as well as the regional monasteries, being of striking originality. Some of this culture has been destroyed in the TAR, but much is remembered or preserved in exile, and the Chinese government has in recent years focused on developing Tibet as a domestic and international tourist destination. The Qinghai-Tibet railway links the Tibetan capital of Lhasa with Beijing and is the world's highest railway line, with nearly 1000 km of track at an altitude of more than 4,000 meters above sea level.

Tibetan Uprising of 1959

1959 nián Xīzàng Qìyì 1959 年西藏起义

In 1959 Tibet, now an autonomous region of China, revolted against Chinese rule. Many Chinese were surprised when they were not welcomed as liberators following the 1949–1950 invasion, viewing their takeover of Tibet as succor from a feudalist system. The Tibetans were greatly outnumbered and ill-equipped for revolt. Their uprising was crushed, and the Dalai Lama, the Tibetan spiritual and temporal leader, was forced to flee to India.

The status of Tibet, located in southwestern China, has long been disputed. Tibet enjoyed de facto, if not legally recognized, independence during the era of Republican China (1912–1949), but the Chinese, in their period of turmoil, oddly claimed that Tibet was still part of their territory and that the Tibetans were one of the “five races” that made up China. They continued to claim Tibet as part of China in such forums as the Simla Convention of 1914—at which British India and Tibet agreed on the Indo-Tibetan frontier and various trade issues, but China’s participants refused to sign—and at the 1922 Washington conference, a meeting between nine nations to decide post–World War I policy in the Far East.

The Communist takeover in China in October 1949 was an obvious threat to Tibetan self-determination because the Chinese Communist Party (CCP), led by Mao Zedong (1893–1976), was prepared to use military force to take over Tibet, for Mao, like his Republican predecessors, considered Tibet to be a part of China lost as a result of the actions of the European imperial powers. During 1949–1950, Communist forces took over Tibetan-speaking areas such as Amdo, and gathered on the frontiers of the Lhasa-controlled regions of Kham (eastern Tibet). After attempts to arrange negotiations on neutral territory failed, in October 1950 Chinese military forces invaded Tibet from the north-east and east and quickly conquered the largely demilitarized Tibetan state after the commander of their garrison at Chamdo, Ngawang Jigme Ngapo, fled and was captured by the Chinese.

During the 1950s China applied with increasing force policies designed to transform traditional Tibetan society and to integrate Tibet into the Communist system. As a result, Tibetan resistance to the assault on their culture and religion quickly increased, culminating in the nationalist revolt of 1959. However, the Tibetans were greatly outnumbered and ill equipped for armed conflict. Their resistance was crushed, and the fourteenth Dalai Lama (b. 1935), Tibetan spiritual and temporal leader, was forced to flee into exile in India. Since then China has continued to rule Tibet by military force, and the Dalai Lama, who was awarded the Nobel Peace Prize in 1989, remains leader of the Tibetan government-in-exile in northern India.

Events of 1950–1958

In January 1950, when India formally recognized the new Communist government in Beijing, China informed India of its plans to peacefully “liberate” Tibet from its
traditional monastic rulers and from foreign powers. To the Communists the Tibetans were an oppressed people living at the mercy of a feudal elite, and the Chinese expected to be welcomed as liberators. When Sino-Tibetan negotiations failed, China launched a full-scale military invasion of Tibet on 7 October 1950. An appeal by El Salvador on behalf of the Tibetan Government-in-exile to the United Nations went unanswered because of Tibet’s ambiguous status under international law. Tibet had an army of only eight thousand men, and within days Chamdo, the main Tibetan administrative center in Kham Province, fell to the invaders.

Kham was home of the Tibetan-speaking Khampa peoples, who, although loyal to the Dalai Lama as head of their Tibetan Buddhist faith, had considerable autonomy and did not necessarily view themselves as subjects of either Lhasa or Beijing. The Khampas had a strong martial tradition, and Kham became the center of armed opposition to China.

After the invasion by China the Tibetan National Assembly asked that the young Dalai Lama assume full secular power in Tibet several years earlier than planned. Meanwhile, China forced a Tibetan delegation to sign the Sino-Tibetan Agreement of 1951 (known as the “Seventeen Point Agreement”), by which Beijing absorbed Tibet into its territory. China soon breached guarantees of Tibetan autonomy and religious freedoms in that agreement as China began to absorb the Tibetan administration and to usurp functions of the Tibetan government. Chinese soldiers and settlers moved into Tibet in increasing numbers, especially after completion of a drivable road to Lhasa through eastern Tibet in 1954. Many Chinese Communists had sincerely expected to be greeted as liberators by the people they saw as feudal masses; they were surprised by Tibetan opposition to China.

In 1954 the Dalai Lama went to Beijing, where he met Mao Zedong, and in 1956 the Dalai Lama was allowed to travel to India for celebrations of the 2,500th anniversary of the enlightenment of the Buddha. While he was there the Indian government advised him to accept Chinese control of Tibet, and, with China hinting at compromise, the Dalai Lama returned to Tibet hoping to reach a solution through discussion with the Communist leadership.

The years 1955 and 1956 brought a quick acceleration of the transition to Communism throughout China, climaxing in the disastrous Great Leap Forward policy in 1958. Tibet experienced an accelerated program of collectivization, the widespread institution of “class struggle,” especially against monastic authorities, and attempts made to render the large Tibetan nomadic population sedentary.

These Chinese policies triggered a strong reaction by Tibetans. By 1956 a guerrilla movement, the Chushi Gandruk (Four Rivers, Six Ranges) was active in eastern Tibet. The Dalai Lama’s policy of nonviolence meant he was not able to offer his personal support to the guerrillas, and he continued to attempt to mediate a peaceful solution to the crisis until his departure from Tibet. However, many elements of the Tibetan government supported the guerrillas, who were then defending primarily Tibetan Buddhism and the Tibetan social system rather than explicitly trying to create a nationalist movement.

Tibet’s resistance to the Chinese Communists attracted the intention of the intelligence services of various countries, including the U.S. Central Intelligence Agency (CIA). By 1958 CIA aid began to reach the guerrillas.

Uprising and Exile

By 1959 the turmoil in eastern Tibet had created a sizable influx of refugees entering Lhasa, which worsened food shortages created by the large numbers of Chinese troops stationed there. By early March of 1959 the population of Lhasa was further increased by the large crowds who gathered for the Monlam Chenmo (Tibetan New Year) celebration, traditionally an unruly period when the monastic powers dominated the secular structures of state.

Contributing to the instability in Lhasa was an invitation to attend a theater performance issued to the Dalai Lama by the Chinese military commander in Lhasa. On 9 March the Dalai Lama was instructed by the Chinese to come to the military barracks the next day without his usual armed escort. The Tibetan public interpreted his invitation as a Chinese attempt to seize the Dalai Lama.

A crowd estimated at thirty thousand people (Lhasa’s population in 1950 was around twenty thousand) gathered around Norbu Lingka, the Dalai Lama’s summer palace. The primary goal of the crowd was to prevent the Dalai Lama from accepting the Chinese invitation, but the apparently spontaneous demonstration took on
a nationalist character as the crowd also began to protest Chinese presence in Lhasa and to demand Tibetan independence. A showdown became inevitable.

On 17 March Chinese troops fired artillery shells into the grounds of the Norbu Lingka, apparently in an attempt to frighten the Tibetans into submission. That night a plan was put into operation whereby the Dalai Lama, disguised as a Tibetan soldier, was smuggled out of the palace. His escape was kept secret for several days, and with a small group of supporters he traveled south through the mountains to India. Eighty to a hundred thousand Tibetans joined him in India, and a Tibetan government-in-exile was established at Dharmsala in northern India.

Meanwhile, in Lhasa the Chinese began a full-scale military crackdown. Exact figures are difficult to ascertain, but thousands of Tibetans were killed or executed, with Chinese army intelligence reports admitting that Chinese forces “eliminated” 87,000 of their opponents in Lhasa and surrounding areas in March–October 1959 alone.

Forgotten Footnote

The Communist invasion of Tibet stimulated a sense of Tibetan national identity, and in the eyes of Tibetans and much of the world, the uprising of March 1959 was a nationalist uprising against the rule of a foreign power. Tibetan resistance subsequently coalesced around the Dalai Lama, whose insistence on nonviolent resistance has meant that armed Tibetan resistance to China has been largely forgotten. The uprising of 1959 remains a historical division between traditional and modern Tibet and with events in 1989 and 2008 is often referred to by those who are involved in campaigns for Tibetan autonomy or independence.

Further Reading

Living in the highest mountainous region in the world, the Zang people of Tibet arrived from India over two thousand years ago. Numbering around 5.4 million people in the 2000 census, they are one of China’s fifty-five officially recognized ethnic minority groups.

The Zang ethnic minority of China, or Tibetans, mainly live in the Tibetan Autonomous Region and in Qinghai, Gansu, Sichuan and Yunnan provinces. Their population in the 2000 census was around 5.4 million, although statistics can be unreliable. The Zang’s ancestors, known as Ch’iang, were nomads from India who herded sheep and cattle. They moved westward, climbing the Himalayan mountain chain along the Yarlung Zangbo River over 2,000 years ago. Zang live in the highest mountainous region in the world, about 7,000 meters above sea level, which is remote and inaccessible, with virtually uninhabited high mountains and plains of intense cold, and abundant mineral resources.

Zang people developed two basic ways of life: one agricultural, settled in the warmer river valleys, and the other nomadic, which spread north and east into mountainous steppe grasslands also inhabited by Mongolian tribes.

Today Zang people live in three main regions: U-Tsang (west and central Tibet), Kham (Qinghai, Sichuan and Yunnan provinces), and Amdo (northeast and Gansu Province), and speak regional dialects of a Tibeto-Burman non-tonal language. They have their own writing system, based on the Devanagari script similar to Sanskrit, which was developed in the 600s under the great Tibetan warrior king Srong-btsan sGam-po (620–650? CE) who unified the country. He is credited with introducing Buddhism to Tibet and building the Jo-Khang temple in the capital of Lhasa, influenced by Nepalese and Chinese
Tibetans (Zang) - Xizànggrén - 西藏人

wives. The Chinese Princess Wencheng cemented an alliance with the Tang Dynasty (618–907 CE).

Zang have been known for their great devotion to religion. Tibetan Buddhism or tantric lamaism is a mixture of Mahayana Buddhism and the Tibetan nativist religion of Bon, a kind of animistic shamanism. It has a number of schools emphasizing different traditions, and, until the era of the People’s Republic of China (PRC), many Tibetan males (estimates vary between 20 and 50 percent of the male population) lived as monks in thousands of monasteries. During the Cultural Revolution (1966–1976) it is claimed that 6000 monasteries were destroyed, and hundreds of thousands of religious killed or forcibly laicized. In recent decades, the government of the PRC has rebuilt many of the destroyed monasteries and permitted some monks to return.

The Tibetan kingdom from the 660s to 1200 was powerful and independent until the rise of the Mongols. After envoys of Chinggis Khan (1162–1227) demanded Tibetan submission in 1207, the Mongols and the Tibetan Buddhist sect of Sa-skya developed a Patron-Priest relationship with the Mongolian army installing its grand lama as the religious leader of Tibet in exchange for support of Mongolian military and political power in Tibet. The ṢPhags-pa Lama (1235–1280) became the tutor of Khubilai Khan (1215–1294), who introduced Tibetan lamaism to his court during the Yuan Dynasty (1271–1368). With the end of Mongol rule in China, Tibet degenerated into political and religious turmoil.

Tsong-kha-pa (1357–1419) was a great Buddhist reformer who established the dGe-lugs-pa (“Yellow Hat”) sect of reincarnating lamas. The highest reincarnation was called the Dalai Lama. This system rose to religious and then political supremacy in Tibet through the support of Western Mongol leaders, particularly Altan Khan (1507–1582), who created the title of Dalai Lama and renewed the Patron-Priest alliance between Tibet and Mongolia of Khubilai’s period that competed against the Ming Dynasty (1368–1644). A Mongol army invaded Lhasa to install the 5th Dalai Lama (1617–1682), the first to combine religious and secular power in Tibet and the builder of the Potala Palace (the largest structure in Tibet). During the Manchu Qing Dynasty (1644–1912), Tibet closed itself off from foreigners, who were not allowed to enter the capital of Lhasa under pain of death. In 1720s the Kham and Amdo regions of Tibet were incorporated into the Qing Empire and Chinese high commissioners (ambans) were posted in Lhasa. The Qing emperors financially supported lamaism and engineered the selection of the Dalai Lamas by the drawing of lots in Beijing.

The twentieth century was a turbulent one for the Zang. The British Younghusband expedition of 1904 invaded...
Tibet to temporarily occupy Lhasa. Chinese armies invaded in 1905 and in 1910, but retreated during the decades of civil war and Japanese invasion, although neither the Republic of China nor the PRC ever renounced claim to control over Tibet. In 1951 Tibetan and PRC authorities signed an agreement affirming Chinese sovereignty. In 1959 an anti-Chinese rebellion spread to Lhasa and the 14th Dalai Lama (b. 1935) fled to Dharamsala in north India where he still lives with his government in exile; in 1989 the Dalai Lama was awarded the Nobel Peace Prize. In 1965 U-Tsang and western Kham were made an autonomous region, monastic estates were disbanded, and secular education introduced. The regional government today includes Han Chinese as well as members of the Zang ethnicity. Since 1980, economic development has accelerated, most religious freedoms have been restored, and Tibet has been opened up for tourism, although the situation of the Zang is a sensitive issue for the PRC and the outside world, and violent demonstrations are not uncommon.

Tibetan culture and customs are unique. Its Buddhist iconography, epitomized by thankha painting, is vividly colored with elaborate religious representation. The palace and temple architecture consists of massive wooden structures with flat roofs and multiple windows, and ornate interiors. Homes are made from rocks, wood, and cement, while nomads live in yak-hide tents. Zang men and women have plaited hair. Women wear long-sleeved wrapped gowns over white blouses with colorfully stripped woolen aprons, while nomadic men wear trousers covered by a long-sleeved gown. Zang often exchange khatas, a long, usually white, ceremonial silk scarf.

Tibetan cuisine is distinctive, utilizing the main agriculture crop, barley. Tsampa, the main staple of Tibetan cuisine, is barley flour that is roasted and rolled into dough; barley is also made into meat-filled dumplings called momo. Yak, goat, and mutton meat, cheese, yogurt, and buttered milk-tea are common. Tibetan wool rugs, a Tibetan calendar, and Tibetan medicine are renowned. Zang celebrate many religious festivals and the Tibetan New Year’s festival.

Once a royal symbol of war, tigers have become a casualty of both traditional Chinese medicine and environmental destruction in modern China, fading into extinction. The most endangered species of tiger, the South China Tiger, has not been spotted in the wild since the 1960s, and only a few dozen survive in captivity, making it “functionally extinct.”

Deeply ingrained in Chinese culture as a fierce symbol of war, tigers were, for millennia, the emblems of the highest ministers of defense in China, second only to the dragon and the phoenix of the emperor and empress. The Asian equivalent of the lion as the “king of the jungle,” the strong and elegant tiger has also been an important icon as the White Tiger of the West, one of the Four Constellations of Chinese astronomy, and a prevalent image in Buddhist lore and martial arts such as Shaolin.

Although the Indochinese tiger (Panthera tigris corbetti) is found in China, Cambodia, Laos, Myanmar (Burma), Thailand, and Vietnam (the International Union for Conservation of Nature and Natural Resources estimates that only 630 survive), the South China or Amoy Tiger (Panthera tigris amoyensis), is the indigenous species with which most Chinese relate. With no official sighting since 1964, the Amoy has faded into “functional extinction” since the 1950s, when at least four thousand

A paper cut-out depicting Wu Sung, the folk hero from the famous Chinese novel Water Margin, who was revered for killing the tiger that had terrified the people living on Mount Ching Yang.
remained in the wild forests and grasslands of central and southeastern China. Now one of the world’s ten most endangered animals, the dilemma of the South China tiger is three-fold: first, the dried bone of the tiger has been a coveted ingredient in Chinese traditional medicine (TCM) for thousands of years; second, agricultural expansion has put it at odds with farmers and herders upon whose cattle, pigs and goats it naturally preys, qualifying it as an official “pest” in the anti-pest campaigns of the 1950s and 1960s; and third, China’s burgeoning population has converted much of its wooded habitat and previous range. By 1982 it was estimated that only 200–300 of these tigers remained; domestic trade of traditional medicines and “tiger wines” made from tiger bones was outlawed in China in 1993. Other preservation efforts have included the establishment of nature reserves by China’s State Forestry Administration in the 1990s. Nevertheless, by 1996 the Amoy tiger population had been reduced to less than one hundred animals, with less than fifty in the wild. Today, about sixty-five individuals live in zoos and on breeding preserves, all located within China. However, since 2002 an organization called Save China’s Tigers has sponsored a project in coordination with the Chinese government in which several Amoy have been exported to a South African preserve, with some breeding success. The hope is that a wild population can be developed there for eventual repatriation to China. But some genetic research suggests that all of these captive tigers are descended from only a few animals, making the genetic pool too small to prevent eventual attrition from inbreeding.

The South China Tiger (Panthera tigris amoyensis) is thought to be the original “stem” tiger from which all tiger subspecies evolved, and it is considerably smaller than its Siberian cousins. In addition to wild populations which some scientists and farmers insist still exist, it is as endangered as the panda and even more of an historic cultural symbol. Yesterday the tiger embodied China’s fierce power of conquest, and today it is an emblem of China’s modern environmental controversy.

Tofu

Dòufu 豆腐

The Chinese food staple tofu, made from soybeans, is ancient. The discovery of how to process soybeans in order to derive food value from them was a breakthrough in human nutrition.

Scholars are not sure when the food tofu was first made, but the technology was well known in China by early medieval times and possibly as early as the Han dynasty (206 BCE–220 CE). Scholars have cited imitation of cheese making in the Altaic region—between Mongolia and China and between Kazakhstan and Russia—as one possible source of the technology. Regardless, one of the great breakthroughs in human nutrition was the discovery of how to process soybeans, which are difficult to digest, into nutritious tofu (doufu). To make tofu one soaks soybeans overnight, grinding them finely with water, boiling them into a slurry, and filtering the slurry to produce soy milk. The milk can then be precipitated (caused to separate from solution or suspension) using settlers, commonly magnesium salts, and pressed into slabs.

Recently tofu has become a staple of Chinese cooking as a readily available and inexpensive source of protein. Tofu is less well represented in early recipe books, but this status might be because of tofu’s common origins. Other tofu products include the fermented choudoufu (“stinking bean curd,” an acquired taste) and the “skin” (doufupi), which is skimmed off and dried.

**Tongdian**

**Tongdian** 通典

_Tongdian_ 通典 is an encyclopedia compiled in the Tang Dynasty (618–907 CE) by the prominent scholar-official Du You 杜佑 (735–812 CE). A survey of the social, political and cultural institutions of Chinese history, the _Tongdian_ served as a longstanding model for the compilation of Chinese encyclopedias.

The _Tongdian_ (Survey of Institutions) is an historical encyclopedia of two hundred chapters that was presented to the court in 801 by Du You (735–812 CE). Widely revered for his broad learning, Du was a successful official and influential figure in politics of the Tang dynasty (618–907 CE), serving mostly in provincial posts with occasional appointments in the central administration. Drawing upon a wide range of sources for his compilation, Du took thirty-six years to complete the _Tongdian_.

During this period the empire partially recovered after the disastrous An Lushan Rebellion (755–763 CE), an era of great cultural and intellectual foment. Scholars such as Du You felt that a considered analysis of the social, political, and cultural institutions of Chinese history was crucial to understanding and addressing the challenges of his era. In his writings Du You held to the traditional Confucian view that the past serves as a guide for the present. In a rather non-Confucian stance, however, Du argued that the emulation of high antiquity is insufficient and that social and political institutions need to change with the times. Only by carefully examining the evolution of human institutions in history can proper administrative practices be determined. The _Tongdian_ reflected these concerns and was designed as a broad reference guide for the scholar-officials of the realm.

The _Tongdian_ is composed of quotations from varied sources, arranged in topical order, and punctuated with the compiler's own comments and observations. The materials included traced the institutions from the dawn of Chinese history up to the Tianbao reign (742–755) of the Tang dynasty, just before the An Lushan Rebellion. Du You intermittently added comments about changes made between that time and his own day. The inspiration for the _Tongdian_ was an earlier work, the thirty-five-chapter _Zhengdian_ (Institutions of Governance), compiled by Liu Zhi, the son of the famous Tang historian Liu Zhiji (661–721). The _Zhengdian_ is no longer extant, although the _Tongdian_ quoted liberally from this work. In fact, so much of this earlier text was incorporated into the _Tongdian_ that it is frequently difficult to discern Du's own views from those that apparently came from the _Zhengdian._

**Social and Political Focus**

Although the _Tongdian_ makes frequent references to Confucian moral cultivation and harmony, the focus of the text is social and political, economic, and pragmatic rather than philosophical or doctrinal. Du You did not include extended accounts of cosmology, metaphysics,
or moralistic historical judgment. The Tongdian presents a view of human history shaped largely by its social and political institutions. The bottom-line value in this encyclopedia is social and political order and the institutional formulations necessary to achieve it. In his opening chapter on economic matters, Du You observed that the first priority in governance is the edification of the people. That edification depends upon first making sure that the people have sufficient food and clothing.

Beyond these basic human needs, however, the Tongdian strongly emphasized ritual: the ceremonies and protocols of the court and society. One hundred chapters—half of the encyclopedia—are devoted to ritual prescriptions from earliest times down to the eighth century. Included here are important commentaries on early ritual texts that are no longer extant elsewhere. A large portion of the ritual section of the Tongdian dwells on current prescriptions. Much of this part was taken directly from the official Tang ritual code, the Kaiyuan Li (Rituals of the Kaiyuan Reign), compiled in 732.

Organization

The Tongdian is organized by a number of chapters grouped in categories and subcategories.

- **Economics** (*Shihuo*, chapters 1–12). A broad survey of economic management issues, including land tenure and organization, population fluctuation and registration, different forms of taxation, money and coinage, canal transportation, and the government salt and iron monopolies.
- **Civil Service Selection** (*Keju*, chapters 13–18). A description of the systems of selecting officials, dynasty by dynasty, followed by summaries of the various debates on civil service selection.
- **Bureaucracy** (*Zhiguan*, chapters 19–40). A survey of the various official positions and bureaucracies, the changing meaning of titles in different periods, and the allocation of rank and compensation for service. This section includes both the civil and military bureaucracy and both central and provincial administrations.
- **Rural** (*Li*, chapters 41–140). A broad summary of the ritual ceremonies and the protocol obligations of the imperial family, the court and top officials, and families throughout the empire. Prescriptions include ritual performances, clothing and ornamentation, transportation, seasonal timing of activities, and arrangements for birth, marriage, illness, death, and the veneration of ancestors.
- **Music** (*Yue*, chapters 141–147). A description of theories of music and its place in society, music offices in different dynasties, the twelve tones of music, instrument calibration, song, and ceremonial music.
- **Punishments** (*Xing*, chapters 163–170). A description of the theories of punishment and its uses and a survey of penal systems through the dynasties, followed by a summary of debates on the subject.
- **Administrative Districts** (*Zhoujun*, chapters 171–184). An overview of the administrative units of China, with a description of the evolution of each prefecture and county.
- **Border Frontiers** (*Bianfang*, chapters 185–200). A description of the tribes and kingdoms of the four directions.

Model for Later Works

The Tongdian was one of the first encyclopedias of its kind and served as a model for many future compilations. A two hundred-chapter sequel to the Tongdian, the Xu Tongdian, was commissioned by Emperor Taizong (reigned 976–997) of the Song dynasty (960–1279), although that work is no longer extant. Another 150-chapter work by the same name was ordered in 1767 by the court of Emperor Qianlong (reigned 1736–1795) of the Qing dynasty (1644–1912). The Tongdian was regarded as one of the “Three Surveys” (Santong), the other two being Zheng Qiao’s (1104–1162) Tongzhi (Survey Monographs) and Ma Duanlin’s (1254–1324) Wenzian tongkao (Survey of the
Du You’s Preface to the Comprehensive Institutions

In his preface to the “Food and Goods” section of the Comprehensive Institutions (Tongdian), Du You explains why he believes that satisfying the people’s material needs is a prerequisite to educating them.

Although I engaged in the study of books from an early age, because I was a dullard by nature, I did not succeed in mastering the arts of number or astrological sciences, nor was I good at literary composition. Thus my Comprehensive Institutions actually amounts to no more than a compilation of various records that, if used in dealing with human affairs, might be helpful in governmental administration.

The first priority in ordering things according to the Way lies in transforming the people through education, and the basis of education lies in providing adequate clothing and food. The [Classic of] Changes [I Ching] says that what attracts people is wealth. The “Grand Model” [chapter of the Classic of Documents] lists eight administrative functions, of which the first is food and the second provision is goods. The Guanzi says: “When the storehouse is full, then people can understand rites and good manners; when there is a sufficiency of food and clothing, people can understand the difference between honor and shame.” The Master [Confucius] spoke of enriching people first and then educating them. All these saying express the same idea.

To carry out education one must first establish offices; to establish offices, one must recruit people with the requisite talents; and to recruit talent one must have an examination system, establish proper rites to rectify popular customs, and have music to harmonize people’s minds-and-hearts. These were the methods employed by the early sage kings to establish proper governance.

It is only when there has been a failure in education that one resorts to laws and punishments, to commanderies and prefectures for local administration, and to fortifying the borders against barbarians. Thus “Food and Goods” come first; official recruitment next, offices next after that; then rites, music, punishments, and local administration, with border defenses last. Anyone who reads this book should keep in mind my reasons for arranging things in this order.

Tourism

Tourism in China has experienced revolutionary change, growing from its most basic level to a strategic industry in China's evolving socialist market economy. Two decades of development have brought positive experiences and presented some challenges, both with an impact on local attitudes, culture, and practice.

Before the economic liberalization that accompanied China's open door policy in 1978, the country really did not have a modern tourism industry. Even after opening and normalization, change in the tourism industry was slow. The structure of China's tourist industry remained relatively simple, although gradual changes could be noted as China moved more and more toward trade and commerce.

Not until the 1990s did an increase in the Chinese people’s annual income and improvements in public transportation infrastructure result in a considerable increase in domestic tourism. The number of domestic tourists increased from 300 million in 1991 to 629 million in 1995. Travel was becoming fashionable in China.

A 1998 survey on domestic tourism showed that the main motivations of Chinese tourists were sightseeing and visiting family and friends, accounting for 46.9 percent and 27.2 percent of the total, respectively. But such leisure travelers represented only the wealthiest portion of the Chinese population— even in 1998 the vast majority of people in China did not “vacation.” Rather, the only

travel periodically done by the masses was for business, academic, health, and religious reasons.

Reformed Gold Weeks

The introduction of the reformed “Gold Weeks” holiday policy allowed the concept of leisure travel to really take hold in China, and the country began to experience an unprecedented travel boom. The Chinese government in September 1999 introduced a new holiday policy that extended three major public holidays—the Spring Festival (Chinese New Year), which occurs in January or February, International Labor Day (1 May), and National Day (1 October)—such that each became a week long. Zhu Rongji, prime minister at the time, hoped that this holiday policy would quicken development of the tourism industry in China, increase domestic demand, and stimulate economic growth. The new policy had an immediate effect. During the first Gold Week in October 1999, 28 million Chinese went on holiday, which earned 14.1 billion yuan ($1.8 billion) for China’s tourism industry. Experts have said that the institution of the Gold Weeks was probably the most effective policy ever introduced in China. Called “gold” because of the great economic benefits they would bring, not only did these holiday periods stimulate the development of the tourism industry, but also they had a great impact on Chinese lifestyle and culture. More Chinese, especially young people, have become willing to spend money on their holidays, traveling to tourist

destinations inside or outside China. The word leisure has become a part of the Chinese vocabulary.

**Travel and Leisure**

Leisure, formerly a concept known only to the wealthy, now encompasses the masses in China. Farmers have embraced the concepts of travel and leisure, with more farmers traveling every year.

The holiday policy has had a direct impact on some of the most valued and prominent traditions in China. This impact is seen most poignantly by the nationwide debate of how to spend time during the Spring Festival, the most important festival in China—as important as Christmas is in the Western world. The festival traditionally is a time for families to reunite and to celebrate the New Year. But today more and more people are traveling elsewhere during the Spring Festival rather than returning home to their families. This option has created conflict. Generally speaking, the older generation insists that people respect the traditions of Spring Festival and return home for the holiday, whereas the younger generation insists that tradition is outmoded. For the young travel is a good alternative.

**Mixed Opinion**

Public opinion in China is varied regarding the impact of tourism. Whereas many people enjoy the benefits that the tourism industry offers, others point to the negative ways it has affected the lives of people, especially those living in tourist areas.

Tourism promotes interaction between people in the tourist destinations and the outside world. Travelers to remote areas bring new technology and ideas, which in turn can promote social development of the local community. Thus, most local communities appreciate the

PHOTO BY JOAN LEBOLD COHEN.
opportunities given them by tourism, including knowledge of other languages, lifestyles, and ideas, as well as the chance to share their own culture with others.

But many people believe that this exposure has been a corrupting influence, damaging the local culture of the people—often minorities—who live in remote areas, which include many of China's tourism destinations. With development of the tourism industry, many of these peoples have begun to adopt the language, clothing, and cultural values of tourists.

The development of domestic tourism in China has created a number of other problems, most notably problems of environment and heritage protection. Travel in China, extremely congested during the Gold Weeks, placed a great burden on most tourist destinations during those times. Lacking sustainable practices, many tourist destinations, especially natural and heritage sites, are suffering the impact of mass visitation.

For example, at the Dunhuang Caves, a United Nations World Cultural Heritage site in Gansu Province in northeast China, carbon dioxide and water vapor from the breathing of the great number of visitors during the Gold Weeks discolored the caves' centuries-old murals. Implementation of sustainable practices has often taken a backseat to recovery measures; people working with these attractions spend all year recovering damaged works.

Travel safety was always an issue from the time the Gold Weeks were first declared. The Traffic Control Bureau of the Ministry of Public Security always reported an increase of traffic incidents and fatalities during these times. According to its statistics, 1,107 people were killed in a total of 3,358 traffic accidents during the Spring Festival peak tourist season in 2007, although the death toll dropped by 36.5 percent and the number of injured people decreased by 56.7 percent fewer than the same period of 2006. As a result of the traffic and other problems Gold Weeks presented, National Day, along with Labor Day, was reestablished as a one-day holiday in December 2007.

Travel Abroad

As domestic tourism has increased, the Chinese have had a growing perception that the quality of their trips is declining significantly. Overcrowding and deterioration of attractions are having an adverse effect on the tourism experience during the Gold Weeks to the point that inbound tourists have learned to avoid travel to China during these times.

Chinese authorities in recent years sought solutions to these problems, such as introducing compulsory annual leave to ensure that workers had chances to travel during times other than the Gold Weeks. In the meantime a large middle-class population with disposable income has become more dissatisfied with traveling inside China, and outbound tourism has been increasing rapidly since the beginning of the twenty-first century. China's outbound tourists totaled 20.2 million in 2003, overtaking Japan's total for the first time. Around 100 countries or areas are open to Chinese tour groups with the USA receiving its first leisure tour groups in 2008. Also in July 2008, direct leisure flights from mainland China to Taiwan increased significantly.

What the increase in outbound tourism will mean is yet to be learned, but as with the increase in domestic tourism, the cultural and heritage implications are certain to include both positive and negative effects.

Township and Village Enterprises

Township and village enterprises (TVEs) were businesses designated to operate in the countryside or in small and medium-size towns. These enterprises created a large number of jobs from the late 1970s to the 1990s, and are responsible for a huge proportion of China’s economic development. In recent years, their contribution has become more limited, and as more people move to urban areas the wealth gap between countryside and cities is increasing again.

The growth of township and village enterprises (TVEs) is linked to the first wave of China’s economic reforms from the late 1970s to the beginning of the 1980s. The implementation of the household responsibility system (HRS) and the decentralization program of the 1980s fueled the growth of TVEs and the industrialization of the countryside. The HRS revealed much underemployment in rural areas, possibly 100 to 150 million people, and part of this redundant labor force found jobs in TVEs.

The growth of TVEs can be divided into at least three phases. During the first phase (from 1978 to about the end of the 1980s) the scale of growth was unexpected, and academic and political debates emphasized the advantages of either the Wenzhou (city) model (i.e., the development of private enterprises) or the Jiangsu (Province) model (based on the importance of collective enterprises).

During the second phase (from the end of the 1980s to the mid-1990s) growth accelerated further. Scholars then shifted to the debate over whether local governments or populations were more important in the course of local development. Finally, during the mid-1990s specialists began to question if the growth of rural enterprises was sustainable in the long term as the development of China became more urban driven.

Definition and Statistics

The amount of research generated by the growth of TVEs during the 1980s and 1990s has led to the proliferation of definitions of TVEs. Yet, the definition itself affects the interpretation one can have of this phenomenon (for example, whether or not individual enterprises are included). The most expedient solution is to refer to the official definition.

This definition has two major dimensions. The first is historical and geographical. Originally the term TVEs (in Chinese xiangzhen qiye 乡镇企业, or literally “town and township enterprises”) applied only to enterprises that were under the ownership of the People’s Commune and the Brigade of Production. They were collective in nature and anchored in the countryside. The second dimension includes details of the mode of property. With the HRS individual activities were greatly stimulated and resulted in the creation of “individual businesses” (of fewer than eight workers) and, since 1988 (officially), private enterprises (of eight workers or more). When such enterprises are located at the county (xian) level or at any administrative
unit under this level (towns and townships), they are also TVEs. Finally, TVEs also comprise enterprises created by several households, various forms of joint ventures, and so forth. In short, the official definition of a TVE incorporates any type of enterprise that is located at the county level or lower than state-owned enterprises. This categorization had to be gradually adjusted since the end of the 1990s because of a multiplication of the types of property, but the theoretical differences between the collective and private sectors remain. This is an important point because most TVE scholars have ignored the private economy (especially individual enterprises).

Indeed, a large part of TVE growth can be attributed to the private sector, which in 1990 employed more workers than the collectives for the first time. All in all, this growth has been impressive: In 1978 only 28 million people were working for TVEs, all of which were in collective enterprises. By 1996 the number of TVE workers reached 135 million, but since then the growth has slowed, inching up to 142 million by 22.5 million enterprises by 2005. That year total net TVE profits were RMB¥106.9 billion (US$133.63 billion) and the taxes they paid were RMB¥51.8 billion (64.75 billion).

Wenzhou Model versus Jiangsu Model

The origins of the TVEs are twofold. The first dates back to the collective era at the time of the promotion of rural industries. Even though this experience was not successful (especially during the Great Leap Forward), it gave the local cadres the experience of managing industrial ventures (particularly after the development of the “five small industries” during the 1970s). With the 1980s decentralization policies that placed resources in their hands, these cadres were able to make use of their experience and develop collective enterprises—mostly for local taxation income. The second origin relates to the long existence of nonagricultural activities in the Chinese countryside, a phenomenon already noted by John Buck, the then-renowned specialist of China agriculture during the 1920s, but which were banned during the collectivization period. The HRS revived these activities, especially small commercial and industrial businesses that did not require a substantial amount of capital.

During the 1980s the coexistence of these two forms of rural enterprise raised concerns among the Chinese leadership and academia alike. They perceived the growth of TVEs as a tool for keeping people in the countryside or in small and medium cities instead of having them move to large metropolises (in accordance with the strategy elaborated by Fei Xiaotong, the sociologist at the roots of the rural reforms in China). However, questions arose over the respective roles of the private and collective sectors within the national economy—sometimes over the very existence of the private sector itself. The debate converged on the mode of development of the two regions, which were especially successful in terms of TVE growth. The first mode one was in the Wenzhou area of Zhejiang Province, where the private economy was especially large; the other was in the Wuxi area of Jiangsu Province, which is famous for its collective sector. This debate was, of course, not only academic but also political because it questioned the role of the private sector in a socialist economy. Deng Xiaoping definitively settled this matter in 1992 with his highly publicized tour in the south, during which he gave explicit support to the private sector.

Government Intervention or Private Initiative

Therefore, beginning at the end of the 1980s the previous debate had to shift. The reasons for this shift were not only the definitive acceptance of the private sector and the conceptualization of the “socialist market economy” but also the appearance of multiple property forms in which private and collective sectors were tightly intertwined—making the distinction between them somewhat blurred. An increase in foreign investment (in particular in the coastal provinces) also contributed to the confusion. Therefore, after ten years of TVE growth, an assessment of the various roles of the private and collective sectors in this growth was necessary. Similarly, the reasons for the evolution of the mode of property and their complexity had to be analyzed.

Private enterprise (mainly in the form of individual enterprises) started in 1978 or even earlier, usually by people with little social and financial capital. A large proportion of these genuine entrepreneurs was demobilized.
soldiers, “educated youth,” former political prisoners, people with a “bad” class origin, the unemployed, and so forth. They offered services that were no longer provided in the countryside (such as small restaurants, tailors, etc.) or made simple goods that the planned economy did not provide. For example, in the Wenzhou area households started producing buttons for clothes. By the end of the 1980s Wenzhou’s button market became famous in China and beyond.

During the mid-1980s the economic success of these entrepreneurs stimulated a host of imitators, among them local cadres or their relatives. This second wave of entrepreneurs was much better connected and could access resources such as raw materials, information, technology, bank loans, and so forth. At the same time, to find enough financial resources for the development of their counties, local authorities also continued to stimulate the collective sector in order to reap the profits of and the taxes paid by these enterprises: Despite national regulations the separation between the budgets of the collective enterprises and the local budget was rather thin. Little by little the two waves of entrepreneurs started to merge into a single category while maintaining strong relationships with the local bureaucracies. Therefore, these enterprises were regarded, at the local and national levels, as a tool to promote the development of the local economy, not only through the employment they created but also through the taxes and the resources they generated.

In addition, the decentralization process put local authorities in control of major resources, such as raw materials, technological and marketing information, networks, and so forth, located in their areas. It was therefore necessary for private entrepreneurs to cultivate good relationships with the local authorities, who could either help them or ruin them (by refusing to issue the necessary authorizations or confiscating their ventures for example). Scholars such as Jean C. Oi described the phenomenon as “local state corporatism,” in which local governments act as corporate firms (Oi, 1996). Other scholars, such as Daniel Kelliher, emphasized the role of private initiative.

Whatever the position adopted, the collusion between private entrepreneurs and local authorities was patent and generated negative externalities (corruption, for example). On the other hand, the system generated confusion between the different modes of property, which stimulated growth: The collective made use of the flexibility of the private sector, while the private sector got protection from the collective. For example, during the economic downturn of 1988–1990 many private enterprises registered as collectives while keeping their original management structure because the private sector did not have much political momentum at the time. Similarly, many collective enterprises lost money because of poor management and were contracted to the private sector in order to be more competitive. Still others were sold to management teams or to the workers (under the so-called cooperative system) while officially remaining under the collective banner. In this last case the decisions might have rested with the local cadres.

This system shaped a development pattern that was controlled by the local authorities and in which a strong bond existed between the private and collective sectors, so it was difficult to draw a border between the two property modes. Whether or not this arrangement is still suitable for the future development of China’s economy and TVEs remains to be seen.

**TVEs as a Factor for Development**

In 2001 out of 21 million TVEs, 18.5 million were individual enterprises employing more than 60.2 million people (46 percent)—an average of three people per enterprise. Another 2 million private TVEs employed an average of eighteen people per enterprise. This meant that nearly all TVEs (20.5 million), totaling 97 million workers (or nearly 75 percent of the TVEs’ labor force), were small businesses. A more recent breakdown is unavailable, but partial statistics confirm the previous trend.

These enterprises have been instrumental in creating employment, lowering the revenue gap between rural and urban areas, and offering a partial solution to unemployment. Nevertheless, despite their overwhelming statistical importance, these enterprises do not constitute a solution for China’s long-term development because most have not increased in size or provoked organizational or technological changes. Their contribution to investment, for example, remains extremely limited. This is why most TVE scholars mistakenly omit them in their analysis.

In fact, few TVEs have played a major role in transforming the countryside, apart from those in selected...
rural areas (the Pearl River delta in Guangdong Province, for example). These enterprises have built connections with local authorities, as described earlier. Nevertheless, their functioning mode has also cast a shadow on their potential for sustainable development because the opportunities to benefit from both the collective and private systems in the short term are offset by the confusion over the property system. To give one example, enterprises that have been contracted to private hands have to return to collective management at the end of the contract (typically five years). However, in practice contractors and local governments have held endless debates over this setup, especially when the contractors have invested a significant amount of money (which is usually the case) in the venture. Signs indicate that the mode of development based on local government control of their resources has provoked waste and duplicated infrastructure, while corruption feeds growing discontent in the countryside. This is why Beijing now aims, with difficulty, to recentralize.

China’s development based on TVEs has lost momentum since the end of the 1990s. The wealth gap between rural and urban areas has increased again, showing that the full potential of TVEs to provide jobs and be a tool for development has been reached. In recent years urban areas have generated most of China’s economic growth, which has provoked a shift in the interest of researchers. The development of TVEs, however, remains an important experience and demonstrates to the developing world the potential of the countryside.

Since its beginnings in the 1920s, China’s toy industry has grown to become the largest in the world. Though faced with accusations of poor working conditions and taking the blow of recent recalls, the toy market in China remains the leading toy market today.

China is the world’s largest toy maker and exporter with more than 8,000 toy manufacturers producing around 30,000 kinds of toys. The country’s toy exports in 2005 totaled $15.18 billion, accounting for 70 percent of the world toy market. But the industry suffered a blow in 2007 with a series of recalls that dented the industry’s reputation but did not alter predictions for continued growth, especially in the country’s expanding domestic market.

**Growth of China’s Toy Industry**

Toy making in China began to take shape with the arrival of tin-can manufacturing around Shanghai in the 1920s and 1930s. Western influences in the area led to the manufacture of Western tin-plate toys that became quite popular. War-related toys, such as fighter planes, tanks,
and soldiers, dominated the market around the time of the Japanese invasion of China in the mid-1930s. After the Communist Revolution of 1949, toys became a vehicle for propaganda, especially during the Cultural Revolution (1966–1976) when dolls in Mao suits and cars painted with political slogans flourished.

By the early 1980s, Hong Kong had become the world’s largest toy exporter, but rising labor and land costs pushed the colony’s toy manufacturers to relocate across the border to China. In 1984, China designated Shenzhen, Guangdong Province, its first special economic zone (SEZ), offering foreign investors a tariff-free environment with low-cost labor and cheap factory space. Hong Kong toy manufacturers moved more and more production into China while leaving in Hong Kong the value-added work, such as product design, production planning, quality control, management, and marketing.

Drawn by the incentives of the SEZs, multinational toy companies began to set up shop in China, especially in the Pearl River delta region of Guangdong. China developed a solid network of supporting industries and services, such as logistics, communications, and component manufacturing, which helped international companies to strengthen productivity, reliability, and delivery.

By 1993, China had become the world’s largest toy manufacturer and leading exporter, reaching an export volume of $8 billion. China’s accession to the World Trade Organization in 2001 strengthened its domestic industry, and its exports rose sharply. In 2006, China exported 22 billion units of toys worth $7.5 billion. By the end of the year, Chinese toys accounted for 75 percent of world output.

### Economic Challenges

By 2005, many toy factories faced difficult challenges that threatened to impact the structure of the industry. Powerful foreign buyers demanded lower prices while the cost of labor and raw materials increased. In addition, U.S. and European brands increased pressure on China’s toy companies to meet their high labor standards. This caused some manufacturers to leave Guangdong for second border locations or even the Chinese hinterland. Other Chinese manufacturers blamed Western corporations for squeezing their margins so tightly there wasn’t enough money to improve worker conditions. Bama Athreya, director of the International Labor Rights Forum, testified before the U.S. Congress in 2005 that “Wal-Mart bears a lion’s share of responsibility for pushing the [Chinese] toy industry to a place where worker health and safety are basically nonexistent” (Written testimony, 2007).

China’s toy industry also faced increasing scrutiny of its product safety. The Chinese government responded in 2006 with the China Compulsory Certification (CCC) scheme, which allowed only those toys that meet CCC standards to be exported to foreign markets or sold domestically. Later the same year, the government, responding to an EU report that many “problematic imported products” were toys from China, signed a draft Guide for the Strengthening of Sino-EU Cooperative Action for Toy Safety. A month later, China and the EU held a toy-safety forum on enforcing stricter quality and safety standards.

Despite the persistent quality and safety issues, foreign buyers remained confident in China’s toy manufacturing industry. Besides, international toy companies and China’s manufacturers had become so intertwined trade group Toy Manufacturers of America estimated that U.S. toy consumers would see prices rise up to 50 percent, and 25,000 jobs in the American toy industry would be lost.

After much pressure from both sides of the controversy, President Clinton renewed China’s trade privileges in 1994, saying that the United State needed to see its relations with China in a “broader context” than simply human rights. He renewed China’s trade privileges annually until 2000, when the U.S. Congress voted to grant China permanent Normal Trade Relations status.
over the years that neither could easily survive without the other. “China has a very systematic toy production system involving layers of suppliers in screws, paint, electronics, and other components. No other countries have this cutting edge,” said Ben Lau, technical director of toys and premiums at Specialized Technology Resources, an international safety and testing lab, in an interview with a Forbes magazine reporter. “There is no alternative to China, no contingency plan. If you shift production to other countries, you’ll face similar problems or even worse” (Shen 2007).

The Year of Recalls

Problems for China’s toy industry escalated in mid-December 2006, when the first warning in what was to become a spate of recalls was issued by the U.S. Consumer Product Safety Commission (CPSC). Chinese-made products, such as bell rattles, Christmas lights, and four other types of toys, were listed as having parts that posed a choking risk to children. High lead content and leaking batteries were given as other reasons for the warnings. Several retail outlets in the United States recalled the toys. The EU also issued warnings around the same time for a list of fifteen toys made in China.

In February 2007, the CSPC and international toy maker Hasbro recalled nearly 1 million China-made Easy-Bake Ovens because the door could trap children’s fingers, causing serious burns. In June of the same year, the CSPC and RC2 Corporation recalled 1.5 million Thomas & Friends railway toys because the paint on the toys contained unsafe levels of lead.

In July, the CSPC and Hasbro recalled another 1 million Easy-Bake Ovens, citing an additional 77 cases of children’s hands or fingers getting stuck in the door. In one case, a 5-year-old girl suffered serious burns that required the partial amputation of fingers.
In August, Mattel twice announced recalls of China-made toys due to unsafe levels of lead and magnets that could be swallowed by children. In September, Mattel recalled another 8,440,000 toys because of high lead levels. In all, Mattel recalled about 20 million toys. The scandal cost the Dali Toy Limited Company, a Mattel supplier in Guangdong, a devastating $30 million and drove CEO Zhang Shuhong to commit suicide.

Mattel apologized for the recalls, but the damage was done. With the toy scandals combining with earlier recalls of tainted seafood, toxic toothpaste, and poison-laced dog food, U.S. and European consumers were losing faith in the “Made in China” label.

The Chinese government responded by setting up a task force led by a well-known trade official, Wu Yi, to get a handle on product quality and food safety. The General Administration of Quality Supervision, Inspection and Quarantine promised to check every shipment of goods leaving the country. And new rules were put into effect that required Chinese companies that manufacture defective products to cease production and sales until the problems are resolved.

Some analysts suggested that the recalls underscored the problems facing toy makers and other manufacturers in China. Pressure to keep prices low in the face of rising costs for labor, raw materials and transportation, as well as an appreciating yuan, pushed some manufacturers to cut corners and use cheap and illegal substitutes.

Despite the recalls, China’s toy exports grew in the first 10 months of 2007, reaching $7.07 billion, a 20 percent increase over the previous comparable period. The United States and EU bought 67.6 percent of those toys.

Outlook for China’s Toy Industry

Many analysts see economic changes in the U.S. and China as the real threat to China’s toy industry. In China, efforts to improve safety checks have caused shipment delays and product rejections. In 2007, the yuan appreciated 7 percent against the dollar, migrant-labor wages increased at least 17 percent, and new environmental controls all helped to push up the cost of production.

In the United States, a slowing economy resulted in slower retail sales of toys. An industry report released in February 2008 said that U.S. retail sales for toys were down 2.2 percent in 2007, a downward trend that has continued into 2009.

Nevertheless, toy companies don’t see a realistic alternative to China as a producer nation. Its infrastructure and manufacturing costs still give it an edge over alternative locations. Philip Shoptaugh, owner of the Oakland, California-based Shoptaugh Games, quoted in an article posted on the Green Options blog, wondered whether consumers would pay more for toys produced in other locations. “Are you going to spend twice as much for a doll because it’s not made in China? The thing is you cannot make these things in the United States and have them be competitive on the shelf” (Lance 2008).

Meanwhile, China-based toy makers are looking at the potential of its domestic market. By some estimates, China has a population of 300 million children in the under-eight-year-old age group compared to 50 million in that group in the United States. Industry experts also stress the importance of the Chinese toy industry to undergo innovation-oriented reforms and create its own brands.

The global financial meltdown of 2008 has made the reorientation towards the domestic market and the upgrading of quality a matter of urgency for the toy industry, which suffered the closing of 49 percent of its export-oriented companies by early 2009.

Further Reading

The China Seas, a term coined by European navigators and cartographers, comprise five bodies of water adjacent to the country’s 14,000-kilometer-long coastline. Although the Chinese were not generally seafarers, throughout much of China’s history the major ports of the China Seas have been important in coastal, regional, and long-distance trading patterns.

During most of its long history Chinese civilization turned its back to the sea and looked inward, towards fertile river basins in which most of its people lived. As a general rule the Chinese were not seafarers. Only a small fraction of the population derived its livelihood from maritime activities—fishing, overseas trade, piracy, or naval warfare. Chinese mariners, with the notable exception of Admiral Zheng He (c. 1371–1433), attempted few long-distance voyages, and China never ruled any of the major oceanic waterways. However, having a coastline of 14,000 kilometers makes maritime defense a major part of any government’s security policies, despite the fact that historically, most threats to China came from the north. Even more important, port cities developed along that coastline, many of them in the river estuaries of south and central China. The main economic function of these cities was to organize exchange with commercial communities across the China Seas.

Three Functions of the China Seas

China Seas is a summary term coined by European navigators and geographers. The term is rarely used in China. Chinese maps and geographic manuals distinguish between five expanses of water adjacent to the Chinese coast: the Gulf of Zhili, called in Chinese “Bohai,” south of Manchuria; the Yellow Sea, called “Huanghai,” between north China and the Korean peninsula; the Strait of Taiwan, called the “Taiwan Haixia,” separating that island from Fujian Province; the East China Sea, called “Donghai,” into which the Yangzi (Chang) River discharges its waters; and, finally, the South China Sea, called “Nanhai,” which is the maritime “foreland” of the southernmost Chinese province, Guangdong.

These five maritime spaces are clearly separated from the high seas of the Pacific Ocean and the Indian Ocean. Yet in an important way they form a connection between both: For centuries after the arrival of European shipping in East Asia, the main route from India into Pacific waters led through the Strait of Malacca and the South China Sea and then around the northern tip of the Philippine archipelago.

This fact points to the triple function of the China Seas, considered in terms of economic geography. First, the China Seas serve as an avenue for China’s coastal trade. Coastal trade has always been vital for the integration not only of the various seaboard districts but also of all of China’s eastern provinces. Before the advent of the railroad coastal trade was indispensable for transporting...
bulky goods in a north-south direction. Second, the China Seas are the arena in which regional trade between China, Japan, and the countries of Southeast Asia transpires. No other function is more vital than this one. The China Seas gave rise to and still support a thick network of commerce connecting different economic systems that in many ways complement one another. Third, access to the oceans necessarily leads through the China Seas. In the long run the China Seas’ transit function is probably their least important, assuming major importance only with the rise of the Canton (Guangzhou) trade in the early eighteenth century. But at least for modern times, it forms part of the complete picture. By definition the predominant emporia (places of trade) are those that combine all three functions. These major ports are pivots of coastal, regional, and long-distance traffic and commerce.

Trade from the Fourteenth to the Eighteenth Century

Modern scholars have reconstructed the great achievements of Chinese nautical engineering for epochs even earlier than the establishment of the empire in 221 BCE. Only with the Ming dynasty (1368–1644), however, does a comprehensive picture of maritime trade emerge. The basic type of ship, in use for many centuries, had already been developed during the tenth century. This “Fujian ship” (fuchuan) was safe, spacious, fast, and admirably suited to the trading conditions in the China Seas. It later evolved into the cheap and popular “shallow-water ship” (shachuan), an even more advantageous flat-bottomed watercraft. Southeast Asian shipbuilders also provided technical innovation. The result was the ubiquitous junk (the word junk probably originated in Javanese but later was applied mainly to Chinese ships), which shaped European perceptions of the Asian maritime world.

Extended trading networks covering the South China Sea emerged as a result of two developments that occurred in the fifteenth century. First, the Chinese government dispatched several huge fleets under the aforementioned Admiral Zheng He to establish contact with numerous countries in Southeast Asia and on the Indian Ocean. Although the government soon discontinued this policy, several of the links formed by these naval missions were maintained as “tribute” relationships, in which ritual, diplomacy, and commercial interest interacted in a complicated way. The best example of a tribute relationship with a strong economic content was the Sino-Siamese (Thai) tribute trade, conducted officially between the Siamese royal court and imperial representatives in South China. Its material underpinnings were the complementary structures of the two economies: Siam produced rice, which was needed to feed the rapidly growing population of the southern provinces of Guangdong and Fujian. The Chinese demand for rice, in turn, was partly the result of the conversion of rice paddies into fields for cotton, tea, and mulberry trees for silk—all commodities used at home and in trade. In the opposite direction Siam imported copper from mines in the Chinese province of Yunnan. This trading pattern persisted until the middle of the nineteenth century.

Second, during the fifteenth century emigration from Guangdong and Fujian seems to have increased. Chinese merchant communities settled in various parts of insular and continental Southeast Asia. The Ming dynasty viewed them with suspicion, and after the Chinese authorities restricted maritime commerce much of their trading activity was considered illegal. This ban did not prevent a flourishing trade in spices, silk, timber, copper, tin, skins, gold, medicinal materials, and other goods. Apart from Chinese merchants, many local groups, Arab traders, Indian businessmen (many of them from Gujarat), and even Japanese ships participated in these commercial transactions, many ultimately driven by demand in an increasingly thriving Chinese market. For example, the famous pepper trade to Europe found its equivalent in vast exports of pepper from Sumatra and other islands to China.

The arrival of European ships altered the established trading patterns within the region without overturning them. The main advantage of Europeans lay in the size and armament of their ships. After a brief period of intrusive violence, the Portuguese understood the wisdom and even the necessity of partially adapting to Asian trade. The Dutch and later the British developed their own forms of “country trade,” conducted by private European trading firms along intraregional trading routes. European traders were closely dependent on indigenous producers, merchants, and providers of credit. Long-distance trade to Europe remained in the hands of the European chartered companies. Whereas the East
India Company (EIC) preferred direct contact with Chinese merchants in Guangzhou and other south Chinese ports, the Dutch Verenigde Oost-Indische Compagnie (Dutch East India Company or VOC) relied on Batavia (present-day Jakarta) as its central emporium and collecting point in the East. Thus, Batavia served as a link between the various Eastern networks and the transoceanic shipping routes.

Little statistical evidence exists for the scope of trade in the China Seas in the early modern era. Data on maritime customs revenue collected at ports in south China, however, indicate that the volume of trade multiplied between the 1500s and the 1820s. The expansion of foreign trade facilitated regional specialization all around the China Seas and thus had a huge effect on economic activity in the entire region. The rise of port cities, with their cosmopolitan communities of sailors and traveling merchants, contributed greatly to social differentiation. Yet China made no steady progress in opening up to the world. Japan’s Tokugawa shogunate, the military government in power from 1600/1603 to 1868, drastically limited Japan’s foreign trade from the 1630s onward, and although Chinese maritime commerce flourished after about 1720, many noncolonial entrepôts (intermediary centers of trade and transshipment) in Southeast Asia lost their dynamism at about the same time. Trade in the China Seas not only constantly changed its patterns in space but also went through long-term as well as short-term cycles of expansion and contraction. These cycles were partly driven by political and military factors.
because the market economy of maritime Asia in early modern times operated under conditions set by rulers and nations.

**Treaty Ports, Steam Ships, and the Global Market**

The opening of China and the establishment of the earliest treaty ports (ports designated by treaty for trade) in 1842 were soon followed by the introduction of steam shipping to Chinese coastal and riverine traffic. Although Chinese-type sailing vessels proved remarkably resilient and were completely superseded hardly anywhere, steamers had advantages that had a great impact on trading patterns. Their carrying capacity was virtually unlimited; they could easily operate on the sea as well as on major rivers; and their deployment could be organized by large-scale capitalist enterprises. In the China Seas, especially in the south, steam and sail continued to coexist. The most dynamic lines of business, however, were captured by modern forms of transportation.

From the 1820s through the 1870s illegal and, from 1858, legalized shipments of opium from India to China dominated China’s foreign trade. This trade used the South China Sea for transit but hardly affected Southeast Asia, where different networks of drug traffic existed. An important change occurred with the economic development of the European colonies in that area of the world during the last quarter of the nineteenth century. The introduction of large-scale plantations and of mechanized mining as well as the intensification of peasant production for export integrated Southeast Asia much more into the world economy than ever before. Expatriate entrepreneurs of Chinese origin were pivotal in forging these connections. By this time an impoverished China was no longer the promising market it had been. China now became important as a supplier of cheap labor. Chinese emigrants took advantage of the agricultural and mining opportunities in insular and continental Southeast Asia and beyond. The migration of contract labor from southern China to various overseas destinations, termed the “coorie trade” by contemporaries, was largely organized by Chinese recruiting firms, although transport remained in the hands of European-owned steamship companies.

A structural hallmark of Chinese foreign trade between the First Opium War (1839–1842) and the establishment of the People’s Republic in 1949 was that indigenous shipping companies secured a substantial share of the market in coastal and inland transport but never succeeded in entering overseas shipping. China’s lack of a merchant navy was symbolic of the country’s subordinate position in the international economy. Another new feature of the early twentieth century was incipient industrialization. British sugar factories in Hong Kong and Japanese sugar factories in colonial Taiwan exported their products to countries around the China Seas. Part of the factories’ raw sugar came from the Dutch East Indies.

**Fall and Rise of Maritime Commerce**

The Great Depression of the 1930s, along with Japanese aggression against China and the Western colonies in Southeast Asia, severely strained the trading networks in the region. Exports of conventional commodities fell sharply during the Depression as demand fell in Asia, Europe, and the Americas. Chinese emigration, formerly a mainstay of steam traffic in the South China Sea and also between north China and southern Manchuria, declined. After the Japanese occupation of Manchuria in 1931, the activities of Japanese shipping companies became ever more imperialistic. The formation of a Japanese-dominated trading sphere known as the “yen bloc” was a bid for autarky (self-sufficiency) and protected export markets. In the early 1940s the Japanese restructured large segments of long-distance trade according to the needs of their war economy. The United States’ petroleum embargo against Japan, imposed in July 1941, made it clear to the Japanese that a self-sufficient empire unaffected by the world market was an impossibility; economic factors such as this contributed to Japan’s aggression on all fronts of war in the Pacific (the War of Resistance against Japan, often called the Second Sino-Japanese War) and World War II itself.

The collapse of the Japanese empire in 1945, the Chinese revolution of 1949, and the disappearance of European colonial rule in Southeast Asia after World War II ruled out a return to prewar patterns of maritime commerce.
Only Hong Kong survived as a first-rate emporium, now with a substantial industry of its own. A large part of the People’s Republic of China’s trade with Southeast Asia and Europe was channeled through Hong Kong. At the same time the Communist government in China began the long-term process of reestablishing China’s lost military sea power and mercantile presence in the China Seas and on the world’s oceans. Today that process continues.

Transfer Gas from West to East Program

Xī qì dōng shū 西气东输

As an increasingly important energy source in China, natural gas needs to follow the rule of balance between supply and demand. But the supply of natural gas, mainly from western parts of the country, and the demand for natural gas, mainly from eastern parts, are not balanced; this created the background of the project “Transfer Gas from West to East.”

In 2003 China surpassed Japan to become the second largest energy consumer in the world after the United States. China’s consumption of natural gas has been increasing with amazing speed through the years. During the tenth Five-Year Plan (2000–2005), the annual consumption of natural gas was 13 percent of total energy consumption, and this number increased to 20 percent in the past two years. In response China launched the Transfer Gas from West to East Program (the Program) in 2002.

Supply and Demand

China’s supply of natural gas comes from west China. Some 77 percent of China’s natural gas is located in the Talimu Basin (which stores 22 percent of China’s total natural gas reserves), E’erduosi Basin, Sichuan Basin, Chaidamu Basin, Yingqiong Basin, and East Sea Basin. The first four basins mentioned store 60 percent of China’s total natural gas deposits.

The demand for natural gas, the other side of the energy story, comes largely from east China, in which the Yanzgi River delta stands out as an example; 85 percent of the energy used in the delta, including natural gas, comes from outside the area. Experts predict that natural gas consumption in the Yanzgi River delta will only continue to rise. The area consumed 4 billion cubic meters of natural gas in 2002 and 10 billion cubic meters in 2003 and is projected to use 20 billion cubic meters in 2010.

The economic law of supply and demand is the theoretical foundation of the Transfer of Gas from West to East Program. In addition, sending what is needed to areas of high demand will do more than provide a balance between supply and demand. It will also stimulate related industries, further activate the industrial base in the west, and reduce pollution. This program, therefore, is extremely important in one of China’s preeminent national strategies: the Great West Development Plan.

The Program’s Impact

The first phase of the Transfer of Gas from West to East Program involved building a 4,000-kilometer gas pipeline network stretching from the west to the east of China. The pipeline starts at the Talimu oilfields in Lunnan; continues through Xinjiang, Gansu, Ningxia, Shanxi, Shaanxi, Henan, Anhui, Jiangsu, Zhejiang, and Shanghai; and terminates in Baihe town in Shanghai. The pipeline is the first world-class pipeline designed by China. Construction began in February 2002, and the pipeline began to transport natural gas on 1 October 2004. It is estimated...
that the gas pipeline can transfer at least 12 billion cubic meters of natural gas per year.

The Program, however, undertakes more than setting a balance between gas supply in the west and gas demand in the east. The Program will help promote related industries—such as steel, cement, and machinery—which will form a new industrial growth belt. The pipeline project itself used 1.74 million tons of steel, 5,100 tons of welding rods, and many air pumps and other hand tools and precision instruments, along with enormous amounts of water and timber. Some 67 percent of the gas pipeline runs through the west of China, which greatly stimulates local economies and connections between the west and the east. In Xinjiang, for example, the Program attracted more than 20 billion Chinese yuan in investments. The Xinjiang part of the Program also created large tax revenues for local governments and created employment opportunities for local peoples.

China’s energy consumption structure will be largely upgraded by the Program. Natural gas can be widely used not only for people’s daily needs but also for fueling industry by generating electricity. And compared to coal, natural gas is a much more environmentally friendly choice of fuel, especially in areas of rapid economic development. The development of the gas pipeline should actually help improve the environment.

**Improving the Environment**

Natural gas is much more effective than coal is in terms of thermal efficiency, cost, and negative impact on the environment. Coal is a heavily used source of energy in China, accounting for 72 percent of China’s total energy consumption. Although burning coal creates power, it also creates sulfur dioxide (SO2), nitrogen oxide (NOx), carbon dioxide (CO2), and dust, which are all harmful to the environment. China exceeds the United States in SO2 emissions, and is now Number 1 in the world. China ranks second in CO2 emissions, right behind the United States.

Twelve billion cubic meters of natural gas—the amount the pipeline can transfer annually—is equivalent to 9 million tons of coal. At these amounts, using natural gas instead of coal would eliminate 135,000 tons of SO2, 153,000 tons of NOx, and 270,000 tons waste-smoke emissions and dust from the environment. While producing the same amount of thermal efficiency, the ratio of dust emissions from burning coal to natural gas is 148:1; the ratio of SO2 emissions is 700:1; and the ratio of NOx emissions is 29.1. The ecosystem of east China is fragile and can no longer afford the pollution burden from burning coal. Moreover, Shanghai and Jiangsu suffer from a high frequency of acid rain.

In many ways it appears that utilizing natural gas from the west of China is an effective choice for minimizing environmental pollution without significantly sacrificing the country’s drive toward economic development.

The construction of the west-to-east natural gas pipeline is only the first stage of the Program. A planned project based on market forces is making a success of the Project Transfer of Gas from West to East, and this combination of markets and government planning is going to speed up both economic development and environmental protection in China. With the success from Project Transfer Gas from West to East, more similar projects started, to boost commodities exchange, smooth supply and demand and further apply the rules of market economy.

Transportation Systems ▶
As China expands its economy, increases its population, and opens up to the outside world, its political leaders and urban designers face increased pressure to create more efficient and environmentally friendly transportation systems.

China, with its enormous and increasingly urbanized population, faces unprecedented challenges and opportunities in the way in which it transports its people and goods. The country’s recent rapid economic growth will continue for the foreseeable future, placing increased pressure on its political leaders and urban designers to create more efficient and environmentally benign transportation systems.

Roads

The main focus of upgraded transportation systems has been on China’s road and vehicle network. China’s light industry and agricultural sectors rely heavily on road-based transportation. China has roughly 88 motor vehicles per 1,000 people, compared with approximately 765 motor vehicles per 1,000 people in the United States. The number of motor vehicles in China more than tripled between 1985 and 2000; by 2007 some 118 million vehicles were traveling the nation’s roads. As of early 2009, China is on the verge of surpassing the U.S. to become the world’s largest vehicle market (Kurtenbach 2009).

More foreign automobile companies are entering China to meet the demand for new vehicles. Volkswagen began manufacturing automobiles in Shanghai in 1985. Other major companies have also begun manufacturing

for the Chinese market, including Daihatsu, Citroen, Peugeot, General Motors, and Daimler-Chrysler. Most vehicles are built in the Shanghai region and near Dalian in the northeastern province of Liaoning.

China has enlarged its road system such that now all towns can be reached via the highway system. Approximately 1.3 million kilometers of roads stretch across the country. In 1998 alone 37,000 kilometers of highways were built; of those, 1,487 kilometers were expressways. The central government’s eleventh Five-Year Plan (2005–2010) calls for investing $700 billion in highway infrastructure, with the goal of building 2.3–2.5 million kilometers of new roads, including 55,000 kilometers of expressway, which are being built to connect cities with populations of 200,000 or more.

A consequence of China’s growth in motor vehicles is increased use of energy (mostly oil). If China achieved U.S. levels of vehicle ownership, it would have more than 900 million vehicles—nearly 50 percent more than the total number of vehicles in the world in 2001. China would need to consume more oil than is currently produced throughout the world.

**Rail**

China has an extensive rail network, with Beijing being the hub for the north-south line to Shanghai and Guangzhou (Canton). Rail lines also extend to the west and connect China to Europe. New lines are being built, particularly in southern China and other industrial areas. In 2006, China opened a new 1,100 kilometer railroad from central China across the high Tibetan plateau to the Tibetan capital of Lhasa.

China’s first subway was constructed in Beijing in 1969. Many of the densely populated cities have developed or plan to develop commuter rail transportation systems involving subways and light rail. These include the cities of Shenyang, Changchun, and Harbin in the northeast and other major cities, including Shanghai, Guangzhou, Nanjing, Shenzhen, and Chongqing.

In April of 2008 China opened a new 120 km high-speed rail line linking the cities of Beijing and Tianjin in time for the Beijing Olympics; three trains initially operated at speeds of up to 300 km per hour, cutting travel time from 80 minutes to 30 minutes between the two cities. According to the Xinhua news agency, fifty-seven high-speed trains (reaching speeds up to 350 km per hour) are expected to be in commercial operation by the end of 2009.

In 2004 the length of China’s rail system was approximately 75,000 kilometers. By 2020 it is expected that 100,000 kilometers of rail transit systems will have been built at a construction cost of more than 130 billion yuan ($15.7 billion).

**Air**

Since 1970 China has constructed and expanded numerous airports, mainly to handle increasing tourist traffic and to link remote areas. As of 2007 there were 148 airports open to civil airplanes. Beijing is the hub of domestic air travel from which airlines reach all provinces, autonomous regions, and municipalities. The other two international gateway airports are in Guangzhou and Shanghai. Around thirty Chinese airlines serve the domestic market. China has a fast-growing fleet of Western aircraft and is one of Boeing’s top three customers.
In 2009, China hopes to launch new airport hubs in Chengdu, Xi’an, and Guangzhou, and plans to invest over 200 billion RMB Yuan (about 28.6 billion USD) into the building of over forty regional airports.

**Water**

Because China has a coastline of more than 18,000 kilometers and 110,000 kilometers of navigable inland waterways, it is easy to understand why water transport has a long history in the country. Countless boats transport goods along rivers and the coast. The major inland navigable rivers are the Yangzi (Chang) (known as the “golden waterway” of China’s inland river transport, and much altered by the new Three Gorges Dam, expected to be fully operational by 2009), Huang (Yellow), Pearl, Heilongjiang, Huai, Qiantang, Minjiang, and Huangpu, as well as the Grand Canal between Beijing and Hangzhou. The volume of passenger transportation is approximately 12 billion trips per year. Around seventy major inland river ports have more than five thousand berths. China has twenty large ports for international shipping, with Shanghai Harbor being one of the largest in the world.

**Transport Options**

China is presented with enormous dilemmas concerning the most appropriate mode of development as the country continues its economic growth. The mode it chooses will significantly affect numerous countries. China’s transportation policies will increasingly influence the world energy market and transboundary environmental deterioration, particularly a reduction in regional air quality and an increase in greenhouse gases if there are

---

**Historical illustration of junks on a river.** Water transport has a long history in China, which has a coastline of over 18,000 kilometers and 110,000 kilometers of navigable inland waterways.
increased emissions of gasoline-driven vehicles. China's transportation policies will also affect the health of its citizens because the emissions from gasoline-driven vehicles are detrimental to people's health. However, China can focus on less environmentally harmful alternatives, such as vehicles powered by natural gas or batteries, as well as electric hybrids and fuel-cell vehicles powered by nonpolluting and renewable hydrogen. China is relatively unhindered in developing these options because the country is not heavily dependent on oil. It has few petroleum vehicle-related investments, such as are common in many Western countries, and it can base its transport infrastructure on cleaner fuels. China is particularly interested in vehicles powered by natural gas because natural gas is abundant in several provinces.

China is investigating cleaner fuel technologies through institutions such as the Institute of Natural Gas Vehicles in Beijing. Currently China's transportation policy is focused both on developing "cleaner" vehicles and on increasing investment in mass transportation systems in the cities. China's latest Five-Year Plan focuses on coordinating economic development among different regions and between urban and rural areas. The plan increases the priority given to environmental protection and indicates that China will attempt to pursue less environmentally harmful transportation systems than were favored by many Western countries at a similar stage of economic development.

One of the most important of the “unequal treaties,” the Treaty of Tianjin developed as an outcome of the Second Opium War (1856–1860) and greatly expanded foreign rights and foreign control over the China coast.

The Treaty of Tianjin, signed in June 1858, was the chief diplomatic outcome of the Second Opium War (1856–1860, also called the Arrow War). Actually four separate Tianjin treaties were written with England, France, United States, and Russia. The British were the main force behind the war and the treaties. Lord Elgin, high commissioner to China, had been sent to China to force the Chinese government to agree to an expansion of foreign rights and to honor rights granted in the Treaty of Nanjing (1842), especially the right to trade in Guangzhou (Canton). For Elgin the most important rights were the right of residence for foreign ministers in Beijing and the right of Britain and the other powers to conduct relations with China on the Western model of diplomatic equality rather than as part of the Chinese tribute system (the traditional method of dealing with foreign relations).

Elgin was particularly concerned that China be willing to permanently accept whatever agreement was reached, which led him both to ignore some of the broader demands of British merchants in China and to be willing to use force to impress the Chinese court with the necessity of coming to a permanent accommodation with the foreigners.

After initial fighting around Guangzhou, a joint Anglo-French expedition sailed north and seized the Dagu forts and forced the negotiations that led to the Treaty of Tianjin. The treaty expanded the number of treaty ports—ports open to foreign trade and residence—from five to sixteen and opened the Yangzi (Chang) River to foreign navigation. The treaty also was to make travel outside the treaty ports easier for foreigners. The British and French each were to receive a large indemnity, which was to be guaranteed by the revenues of Chinese Customs. Foreign legations also were to be established in Beijing.

The Chinese court was unhappy with the treaty even after it was agreed to. Although officials in charge of dealing with the foreigners were convinced that China had no option but to accept the terms, the Xianfeng emperor (reigned 1851–1861) was convinced by more conservative advisors that diplomatic equality in particular could not be granted. The British fleet coming to exchange the final ratification of the treaty was driven off when it attempted to force a passage at the Dagu forts in June 1859, and the court took advantage of this unexpected victory to abrogate the treaty. A large Anglo-French force was sent to Tianjin in the summer of 1860. The foreign troops defeated the Qing dynasty (1644–1912) armies, and the emperor was forced to flee Beijing. The foreigners burned the imperial Summer Palace outside Beijing in retaliation for the killing of foreign prisoners, and the Qing court was forced to accept the terms of the treaty.

The Treaty of Tianjin, along with the end of the Taiping Rebellion, ushered in an era of rapid growth of foreign influence on the China coast. Foreign economic activity increased, and the number and geographical spread of
foreign missionaries, merchants, and military forces grew. The Treaty of Tianjin fully established the treaty port system. Although the treaty did not explicitly legalize opium, the Qing court did legalize domestic opium production in the aftermath of the treaty. After the treaty China also established the Zongli Yamen (the equivalent of a modern foreign ministry) to deal with diplomatic relations with Westerners and began its program of self-strengthening to begin borrowing foreign technology.

Further Reading

The 1844 Treaty of Wangxia set a pattern for Sino-American relations, as United States diplomats sought to build upon British imperialism and to stand apart from it, to establish principles, and to maximize profit. Chinese usually point to the 1844 treaty as proof that the United States had joined the ranks of the imperialists.

Before the 1840s, the Chinese, then led by the Manchu-dominated Qing dynasty (1644–1912), did not see the United States as important, particularly in the context of British naval power and wealth. The United States was a minor player in the Canton (Guangzhou) System, a monopoly of Chinese merchants created by the Qing to limit trade and contact with the West. The Chinese placed the United States in the context of the traditional tribute system and did not seek the establishment of formal diplomatic ties.

British victory over China in the First Opium War and the subsequent Treaty of Nanking spurred Americans to take more aggressive action. In response to lobbying by merchants, President John Tyler dispatched Caleb Cushing, a Massachusetts lawyer and former congressman, as commissioner to China. Cushing met with Qiyìng (Ch’i-ying), who represented the Qing dynasty as governor-general of Guangdong and Guangxi, and as superintendent general of trade and foreign intercourse of the five ports. The treaty itself was signed at Wangxia near Macao on 3 July 1844 but was not ratified and in effect until December 1845. The 1844 agreement was modeled on the 1842 Treaty of Nanking and included the right to trade in five treaty ports, extraterritoriality, and most-favored nation (MFN) status. Extraterritoriality gave Americans in China immunity from Qing criminal and civil law. The Qing, reflecting a traditional Chinese expectation that outsiders would more effectively police themselves, initially accepted extraterritoriality. Westerners portrayed China’s criminal procedures as barbaric and biased, and extraterritoriality became one of the most humiliating provisions of the unequal treaties. MFN meant that United States merchants and diplomats would enjoy whatever privileges or benefits were granted in future treaties with other nations. Although the MFN provision would devastate China over the next century, at the time the Qing hoped that it would spur competition among the Western powers to the dynasty’s benefit. Other provisions were less onerous to the Chinese. The treaty enabled Americans to benefit from future military conflicts initiated by the British or other European powers. The treaty stated that any ports closed to belligerents would remain open to American merchants with “full respect being paid to the neutrality of the flag of the United States.” Wangxia also called for diplomatic equality in official correspondence, in effect undermining the traditional Chinese practice of treating foreigners as “barbarians” because of their lack of knowledge of Confucianism and Chinese culture. Finally, the 1844 treaty outlawed the hated opium trade, although enforcement remained sporadic at best.

This agreement would be further expanded to the advantage of the United States in 1858, which occurred as a
result of another unequal treaty obtained by the British after the Second Opium War (1856–1860, also called the "Arrow War. While Americans would dream of a special, benevolent relationship with China, Chinese usually point to the 1844 treaty as proof that the United States had joined the ranks of the imperialists.

狡兔三窟

Jiāo tù sān kū
Tribute System
Cháogòng zhìdù 朝贡制度

In premodern China foreign relations were both hierarchical, with all foreign rulers paying tribute to the Chinese emperor as their superior, and systematic, conducted through a single set of bureaucratic rules and institutions. The forms taken by these relations varied greatly over the centuries; only from about 1425 to 1550 were all foreign relations actually managed through a single set of rules and institutions.

The premodern Chinese tended to conduct their foreign relations hierarchically, with all foreign rulers paying tribute to the Chinese Son of Heaven, the emperor considered to be the sole supreme ruler of the world, and to manage foreign relations systematically via a unilaterally developed set of bureaucratic rules and institutions. In the long span of China’s history as an empire, only for a little more than a century during the Ming dynasty (1368–1644), circa 1425–1550, did China’s rulers seek to manage all of their foreign relations through a unified set of institutions centered on the tribute embassy, a tribute system in the full sense of the term.

The concept of tribute (gong) appears in the classics, most importantly in the “Tribute of Yu” (Yu gong) section of the Classic of Documents (Shu Jing). There it refers to gifts of representative products of various areas to the central sovereign as symbolic acknowledgments of his sovereignty. Such tribute from areas of foreign or “barbarian” nature is a small part of this picture. In another section of the same classic it takes the form of gifts of exotic animals, a theme that would recur in the lore of tribute embassies down to the elephants sent by Siam (modern Thailand) and the lion sent by Portugal to Qing-ruled Beijing. In the centuries of political transformation and bureaucratic unification from the Warring States period (475–221 BCE) to the Qin dynasty (221–206 BCE) and Han dynasty (206 BCE–220 CE), there was much discussion of the differences between civilized and barbarian peoples.
but little focus on the ceremonial subjection of the latter; on the inland frontier it was all the Chinese rulers could do to keep the dangerous nomads at bay by building walls and buying peace with gifts and imperial princesses given in marriage. In the reign of Emperor Wu, 141–87 BCE, more assertive policies toward the Xiongnu had some success, especially when rival Xiongnu groups could be turned against each other, and the more submissive groups were required to leave hostage princes in the imperial capital. The mid-Han turn toward ceremonialism produced some disastrous attempts to give all foreign rulers titles inferior to the emperor’s under Wang Mang and some spectacular collections of homage-paying foreigners at the New Year in the early years of later Han dynasty.

It is instructive to follow the thread of ceremonial practice through the dynastic records of foreign relations. It is not at all surprising that the most elaborate set of ceremonies for receiving foreign envoys is recorded for the Tang dynasty. Envoys were received and banqueted and their presents displayed before the emperor, all in one dazzling ceremony. For powerful and threatening Inner Asian rulers, extra layers of splendor could be added. All this was in the service of the survival of the Tang dynasty in a polycentric world of powerful empires—Tibetan, Uygur, Turkic. The Tang rulers were not as distant in culture from their Inner Asian challengers as the Song and Ming rulers were and were quite capable of facing down an invading nomad army in person or, in desperate straits, of granting equality to the Uygur ruler with an imperial wansui (ten thousand years). The immense impression that the splendors of court and capital made on Korean and Japanese envoys was an important facet of the spreading influence of Chinese culture in those countries. In south coast ports, beginnings can be seen of the use of tribute embassies as instruments of marginal advantage for foreign traders.

The even more dangerous Inner Asian world faced by the Song dynasty (960–1279) was reflected in the differentiation of ceremonies for contemporary embassies—the Liao dynasty was most favored, then Koryo and Xi Xia, then all the rest. The treatment of the Liao as near-equals may have been a realistic solution to a dangerous confrontation but was criticized by many officials. The various acknowledgments of equality or even inferiority to the Jurchen Jin dynasty from 1142 on were widely resented and contributed to unrealistic calls for reconquest of the north; foreign relations were an important facet of the emergence of the moralistic Learning of the Way (Daoxue), or Neo-confucianism, in this period. Maritime trade to southern ports under the guise of tribute embassies flourished and became an important facet of the power and prosperity of such Southeast Asian states as Srivijaya on Sumatra and Champa in what is now southern Vietnam.

### Rulers Summoned

In the early Ming dynasty the example of wide conquests and lavish court ceremonies of the Mongol-ruled Yuan dynasty (1279–1368), resentment of the cultural alienness of the Mongol rule, and the mutual co-optation of an uncouth despot and some very able Daoxue literati produced visions of systematic institutional perfection in many aspects of government, not least foreign relations. Messages were sent to all known foreign rulers, ordering them to come and pay homage to the new dynasty. An early spectacular result was the parading through the streets of Nanjing, the first Ming capital, of elephants—forty in one year and forty-two two years later—from Champa. Fears of Japanese pirates and their Chinese allies, some left over from the rivals of the Ming founder, led to the prohibition of all maritime trade in Chinese shipping and the limitation of foreign shipping in Chinese ports to that in connection with tribute embassies. Maritime rulers, often advised by émigré Chinese, made the most of the loophole; the kingdom of the Ryukyu Islands was among the most successful.

The usurping Yongle emperor, a great warrior needing all the legitimation he could get, sent envoys and expeditions out in all directions to summon foreign rulers to present tribute; the maritime expeditions of Zheng He are the most famous of these expansionist efforts. The assembly of rulers and ministers paying homage at the new capital of Beijing in 1421 was without parallel since the early Tang dynasty. However, the elaborate ceremonies of the founding reign already had been somewhat reduced, and after the Yongle reign there were many limitations on the size and frequency of embassies. Of course, there also was only one more maritime expedition. Efforts to control the Mongols by giving them titles and trade in connection with embassies were not
successful. Management of relations among Hami, Turfan, and more distant Muslim city-states in Inner Asia was incoherent. The Jurchen people became experts in manipulating the privileges of the tribute system, sending oversized embassies that threatened mayhem in the streets of Beijing if they did not like the terms of trade or the quantities of gifts they received.

The succession of the Jiajing emperor in 1524 was accompanied by intense discussions of many facets of the imperial ceremonial tradition, the publication in the Da Ming huidian (Collected Statutes of Great Ming) of 1530 of the most comprehensively idealized picture of a millennial tribute system ever produced, and a major effort to enforce all the rules and restrictions of the system, which often had been violated in the previous reigns. The results included an epidemic of sham ambassadors from Inner Asian kingdoms and the growth of out-of-control piracy and smuggling networks along the coast. There were no more embassies from Japan after 1548. The Ryukyu tribute window was decrepit long before the Satsuma conquest of those islands in 1609. The trade agreement with Altan Khan, de facto ruler of the Western tribes of the Mongols, in 1570 used tribute rhetoric but did not allow the Mongols to come to Beijing. The Portuguese were allowed to settle at Macao without establishing any kind of place in the tribute system. Tribute rhetoric would live on, and the precedents of the full-fledged system would remain in place for later statesmen and the Qing conquerors to consult, but never again was the tribute embassy the center of a system for the management of all foreign relations.

The Manchu rulers were descendants of one branch of the Jurchen people who had been the most adept and cynical exploiters of the Ming tribute system. They understood its rules very well and had the Ming precedents on hand to use as starting points in working out their policies, but, being themselves outsiders with their own language and culture, they could scarcely be expected to go along with the culturally sinocentric rhetoric of the tradition. The Dutch sent three embassies in the early Qing dynasty and the Portuguese two. They were treated as tribute embassies and conformed to all the ceremonial routines but accomplished little for those who sent them. Court literati wrote poems about a lion brought all the way from Mozambique by the Portuguese embassy of Bento Pereira de Faria in 1678, and it gave the Kangxi emperor a chance to show favor to his court Jesuits and to Macao. But in 1684 the Qing dynasty moved to open trade in its ports to all foreigners regardless of their relation to the tribute system. This was the origin of the famous Canton (Guangzhou) trade of the eighteenth century; despite occasional pictures of Europeans in compendia on tributaries, their trade was institutionally completely separated from the tribute embassy matrix.

An early Qing dynasty illustration portrays nomadic representatives offering tribute to Chinese officials.

Unbending Resistance

Two more Portuguese embassies in the eighteenth century were received as tribute embassies and accomplished nothing for the beleaguered Catholic missions.
The famous embassy of Lord Macartney in 1793 was a British initiative, an effort to enlighten China concerning the wonders of open trade and European science. The ambassador’s resistance to the required ceremonies, especially the three kneelings and nine prostrations of the ketou (kowtow), became iconic in European-U.S. perceptions of a China mired in tradition and self-regard. The Qing dynasty was glad to find more compliant Europeans in the Dutch embassy of Titsingh and Van Braam in the years from 1794 to 1796 and in dealing with several more British and Russian embassies was anxious not to give any openings for Macartney-style resistance to the accustomed ceremonies.

The amazing widening of Qing control in Inner Asia in the course of the eighteenth century was a result of activist organization and leadership that owed much to the Manchus’ Inner Asian heritage and very little to the institutions and attitudes of the tribute system. Garrisons and resident administrators, assignment of grazing territories, and management of legal cases reaching all the way up to Beijing were key mechanisms; Inner Asian subordinate rulers might pay symbolic tribute, often of fine horses, to the emperor, but this was not the focus of their relation to the Qing dynasty.

The tribute system continued to be central in management of relations with Korea, Ryukyu, Annam (modern Vietnam), Siam, and Burma (modern Myanmar). Korea sent several embassies every year; it, Ryukyu, and Annam all had genuine affinities with Chinese elite culture, and their ambassadors exchanged poems in
classical Chinese while they were in Beijing. No regular formal communication existed between Qing China and Tokugawa (1600/1603–1868) Japan. The Siamese connection, astutely managed by émigré Chinese, facilitated the import to south China of substantial quantities of Siamese rice, exempted from import duties. When both Siam and Annam experienced major collapses of order in the late eighteenth century, the tribute system provided a matrix for reestablishment of normal relations. This was especially striking in the Annam case, where the Qing dynasty launched an ill-advised intervention in support of the collapsing Lê dynasty in 1788 and then had to accept the victorious T'y Sìn rebels as the new kings of Annam and then their conquerors, the new Nguyễn dynasty. Émigré Chinese advisors again were important, especially in the later, Nguyễn phase of the transition. Thus, in these cases a tribute connection seemed to have been of real use and to have revived under the new dynasty of foreign rulers, but the difficulties of the Annam changes probably also contributed to the anxiety with which the Qing rulers confronted the resistance to traditional ceremonies by Macartney and those who came after him. The distant tribute relation with the rulers of Burma does not seem to have either hindered or helped the Qing dynasty in its inept and costly ventures across the Yunnan frontier.

In the nineteenth century the heritage of regional hegemony (influence) embodied in the tribute system led the Qing dynasty into unsuccessful resistance to French conquest in Vietnam and Japanese conquest in Korea. Siam made its own transition to modern diplomatic standards and stopped sending embassies. The Ryukyus were fully incorporated into the Japanese state. European nations and the United States established resident diplomatic missions in Beijing after 1860 and were intensely opposed to any bit of language or protocol that might be a distant echo of the days when all foreign envoys reaching the capital would prostrate themselves in the great court before the Taihe Hall of the Palaces.

Tujia

Tǔjiāzú 土家族

The Tujia are a large minority ethnic group in central China, numbering 8 million in the 2000 census. The Tujia language, with no written form, belongs to the Tibeto-Burman subfamily of the Sino-Tibetan family. With a long history of involvement in China’s national politics, the Tujia have striven to maintain their traditional culture along with their efforts to develop modern education.

The Tujia are the eighth-largest ethnic group in China. Numbering 8,028,133 in the fifth national census (2000), they are more numerous than the better known Mongols and Tibetans. Settlements of the Tujia are distributed over western Hunan, western Hubei, and northeastern Guizhou provinces, as well as in several autonomous counties under the jurisdiction of the Chongqing municipality.

Tujia Language

Some linguists consider the Tujia language to be part of the Yi language branch of the Sino-Tibetan language family. According to others, however, although the Tujia language shares some characteristics with the Yi languages, those characteristics are not enough to make the Tujia a member of that branch. Nonetheless, it is beyond question that the language, like those in the Yi branch and some others, belongs to the Tibeto-Burman subfamily of the Sino-Tibetan family. The language has no written form.

Chinese is the dominant language used by the Tujia. Many Tujia speak nothing but Chinese. Some are bilingual, speaking both Chinese and Tujia. A number also speak the language of the Miao (known outside of China as the Hmong), one of their immediate neighbors. Fewer than 200,000 Tujia still rely on the Tujia language as their major means of communication.

Tujia Names

In their own language, the Tujia call themselves Bijdzih-ka. Throughout history they have been called various names by their neighbors, based on perceived ethnic markers or distinguishing signs, such as their totem (the white tiger, at one time the totem of their chief), or names of rivers or places where they lived. The name Tujia came into being in the late seventeenth century when a large number of Han Chinese (the Chinese ethnic majority people) migrated into the Tujia area. The term, which means “aboriginal families” in Chinese, was coined to distinguish the natives from the immigrants. This name did not become official until October 1956, when the Tujia were granted the status of unitary ethnic group (danyi minzu) by the Chinese government.
Tujia History

The early history of the Tujia is a matter of dispute. Based on clues in Chinese historical literature, some scholars believe that the Tujia are descendants of the Ba, a tribe extinguished by the Qin Dynasty (221–206 BCE). Based on linguistic characteristics and some customs that are close to the Yi’s in Yunnan, other scholars think that the ancestors of the Tujia are the wuman, or black barbarians, who lived in southwestern China. The fact that in the 1970s two significant Neolithic sites were found in Tujia area suggests that those regions were inhabited as early as the prehistoric period.

The picture since the Later Han dynasty (25–220 CE) is clearer. Located close to the great historical powers, the Tujia have a longer history of involvement in China’s national politics than do many other Chinese minorities. As early as the tenth century, so-called bridled-and-tethered prefectures (jimi fuzhou), or native tributary administrations, were established in the area. The establishments were converted into a system of native chieftains (tusi zhidu) in the thirteenth century. Under this system minority areas in the Chinese empire were ruled by families of native chieftains instead of officials appointed by the central government. This system lasted in the Tujia area until 1723.

Conflict was the keynote of the recorded early history of interactions between the ancestors of the Tujia and Chinese society. With the establishment of the tributary system and the subsequent system of native chieftains, the Tujia became increasingly assimilated into the greater Chinese culture. During the Ming (1368–1644) and Qing (1644–1912) dynasties, a considerable number of Tujia soldiers, called different names at different times, were sent to coastal areas to fight against the Japanese and British invaders.

In the meantime, many upper-class Tujia received a Confucian education and entered the gentry-scholar rank. Some accomplished poets and scholars of the Tujia gained national reputations. When the native-chieftain system was abolished in the eighteenth century, some Tujia customs and conventions were condemned as corrupted or ugly and were reformed by force. As a result the Tujia were further assimilated, and many of their ethnic characteristics were lost.

Tujia Culture

Love-based marriage was a tradition among the Tujia. In recent centuries until the early 1950s, however, parental approval had become a norm, and wealth and social status became decisive factors. Cross-cousin marriage (a preferential rule requiring marriage between cross-cousins: mother’s father’s brother or father’s sister’s daughter if such a person is available) and levirate (the custom whereby a man marries the widow of his deceased brother) are commonly practiced among the Tujia. In some areas maternal-parallel-cousin marriage (a convention in which one marries an opposite-sex child of one’s mother’s sister) is also practiced.

Seniority of age is highly venerated by the Tujia. Elderly men and women are respected and treated well while alive, and elaborate funerals are held at their death. Mortuary rituals are also held for people who die at a younger age, but with less care and expense. No ceremony is held for the death of a child.
There is no organized religion among the Tujia. Their faith—a mixture of animism, ancestor worship, and worship of deified deceased chiefs and heroes—has apparently been influenced by the folk religion of the neighboring Han Chinese.

The Tujia have a long tradition of sophisticated folk arts. More than seventy prescribed movements are available for dancers of the popular *bai shou wu* (hand-waving dance) to depict such things as hunting, agricultural activities, battling, and feasting. Legends tell about the genesis and migration of their ancestors as well as their aspirations for and fantasies about the ideal life. Almost every Tujia is an accomplished singer of improvised or traditional ballads, which cover all aspects of daily life and feeling.

The traditional Tujia economy is diversified. Agriculture in narrow strips of terraced fields is complemented by logging, hunting, fishing, and growing or working on cash crops. The Tujia are also known for their traditional weaving, knitting, and embroidery. A variety of light and heavy industries has been developed in the Tujia area, and Jishou University was established there in 1958. In the past two decades, more than 95 percent of Tujia children have received at least a primary education.

Twelve Muqam
Shi’er Mukamû 十二木卡姆

The Twelve Muqam are a suite of songs of the Uygur people of northwestern China’s Xinjiang Uygur Autonomous Region. The pieces may be sung, danced, or instrumental, and may be performed individually or in small groups. Their lyrics are drawn from many sources, including Persian, Turkic, and folk poetry, although the actual origins of the Muqam are hazy. The lyrics are often infused with Sufi imagery.

The Uygur* people of northwestern China’s Xinjiang Uygur Autonomous Region are closely identified with the Twelve Muqam, a suite of songs drawn from several Central Asian traditions that may be sung either individually or in small groups. The Twelve Muqam are related to the Arabo-Persian maqam system; the term muqam is the Turkic-language variant of this Arab term, and many names of suites are also drawn from Arabic. However, musically the Muqam are more closely related to central Asian art-music traditions, such as the Bukharan Shashmaqam (music of Tajikistan and Uzbekistan). Unlike the Arabo-Persian traditions, which involve some improvisation in performance, each of the Uygur Twelve Muqam is basically a tripartite (divided into three parts) suite consisting of (1) chong naghma (great music)—a series of vocal and instrumental pieces beginning with a meditative, unmetered bash muqam (introduction); (2) dastan (stories)—slower metered pieces; and (3) mashrap (festival)—fast dance pieces.

Rhythmic formulas marked out by the hand-held dap (drum) characterize the pieces. Each of the Uygur Twelve Muqam has a defining pitch range and mood, but the modulation of the notes played is so frequent that it is hardly possible to link a Muqam to one mode, or range of notes (as compared to a Western classical piece, for example, which generally stays in one key throughout the course of the piece).

The Twelve Muqam lyrics are attributed to the great Persian and Turkic poets or drawn from folk poetry. They are imbued with Sufi (Muslim mystic) imagery and ideals. Said to have originated in the fifteenth-century Kashgar court (an oasis city on the old Silk Roads, now in Xinjiang Uygur A. R.), their current form is more realistically traced back to the nineteenth century. Muqam may be performed by one singer with a bowed or plucked lute (satar or tanbur) and a drum or with a small group of supporting voices and instruments. Men, women, beggars, and religious men may practice this tradition for religious purposes or for enjoyment. The Twelve Muqam have an important place in Uygurs’ affections and are often referred to in terms of moral authority and spiritual necessity.

Recordings

La Route de Soie, Chine, Xinjiang [The Silk Road, Xinjiang, China] [Recorded by Anderson Bakewell] (1992). On Recordings by Anderson Bakewell [CD]. Boulogne, France: Playasound PS.
The economic and political ultimatums presented to China by Japan in 1915 are called the “Twenty-One Demands.” They marked the beginning of Japan’s emergence as the most aggressive foreign power pressuring China.

In January 1915 the Japanese government presented the Chinese government with a diplomatic ultimatum that came to be known as the “Twenty-One Demands.” Many of these demands were fairly specific, aimed at expanding Japan’s economic and political influence in China, especially in south Manchuria and eastern Inner Mongolia. The Japanese were particularly interested in the right to build railways in China and to deny other powers the right to do so. Specific demands also aimed at increasing Japanese control over the Hanyeping mines in central China, Japan’s most important source of coal and iron. China was also to allow Japan to keep the German concessions it had recently seized in Shandong Province.

Most troubling to the Chinese government was the fifth set of demands, requiring the Chinese to hire Japanese political, financial, and military advisors and to allow joint Japanese-Chinese administration of certain districts in China. All of the other demands were expansions of Japan’s existing position in China; the fifth set suggested that the Japanese were moving toward turning China into a protectorate.

From the Japanese point of view the Twenty-One Demands were a way of taking advantage of World War I to increase Japanese influence in China. Japan had been expanding its formal and informal empire in China ever since the First Sino-Japanese War (1894–1895), but rivalry between the powers had limited the expansion of Japanese control. With the coming of World War I Japanese imperialism was no longer constrained by the balancing interests of other imperialist powers. The Japanese were not entirely sure what to do with this newfound freedom of action, as reflected in the mixed goals of the demands.

Yuan Shikai’s Chinese government realized that it could neither risk a war with Japan nor accept the demands as given, and so it attempted to negotiate a compromise. Yuan conducted these negotiations as publicly as possible. As expected, these public negotiations led to popular outcry among Chinese both in China and overseas. Anti-Japanese boycotts were organized, mass rallies were held, and citizens donated money to national salvation funds to prepare for war. Yuan’s attempts to resist the demands briefly increased his popularity, and Sun Yat-sen’s refusal to denounce them further isolated him from possible supporters. Yuan Shikai’s government was able, partially because of support from England and the United States, to get the Japanese to agree to withdraw the fifth set of demands and accepted the modified demands on 9 May. This result was unacceptable to almost everyone involved. Yuan himself called the agreement a “national humiliation” and the date was later remembered as National Humiliation Day. The Kato government in Japan eventually fell because it had not secured enough from the Chinese. The long-term effects were limited. The popular anti-Japanese movement quickly died out, although Chinese became increasingly
unlikely to take Japan as a model for Chinese development after 1915. The Twenty One Demands were a harbinger of things to come because in the following decades Japan would be the chief imperialist power attempting to expand its power in China, and China would attempt to resist by mobilizing public opinion and seeking aid from the United States and England.

Further Reading
The United Front strategy in China and Korea was the implementation of the theory that Communist groups should form a united front with Nationalists to win their liberation before beginning their socialist revolutions.

The United Front strategy developed from a belief of the Soviet Comintern (the international organization of Communist parties) that Communist groups in nations subject to foreign subjugation should form a united front with nationalists to win their liberation before beginning their socialist revolutions. The Russian Communist leader Vladimir Lenin expressed this tenet succinctly: “Hostile classes are united by a common interest in opposing foreign exploitation” (Schram 1969, 134). The strategy was first used in China and, after a successful start there, was adopted by Korea. In the end both attempts were unsuccessful, and the societal divisions that emerged linger in the divided Korean Peninsula and in the politically divided governments of China and Taiwan.

In China until the Communist purge in 1927, the union of the Communists and the Guomindang (Chinese Nationalist Party) led to the formation of a government with Communist participation; one Russian adviser even noted that members of the right-wing Guomindang were moving toward the left. This observation was premature, with the brutal purge of the Communists by Chiang Kai-shek’s (1887–1975) Nationalist group ending any hope of a strong united front to challenge Japanese imperialism in China.

In Korea the United Front strategy was intended to create “a broad national revolutionary front that included handicraftsmen, the intelligentsia, and the petty and middle bourgeoisie along with the workers and peasants” (Scalapino and Lee 1972, 95). The structure for this united front was the Korean National Party (KCP), which was formed in early 1926, organized by Korean Communists in an attempt to form an alliance with Korean nationalists. It thus placed Korean Communist Party members at its core. This effort was weakened by the roundup of many KCP leaders by the Japanese after the funeral of former Emperor Sunjong in June 1926.

Formation of the Singanhoe (New Korean Society) in 1927 was Korea’s best chance to unify rival factions. The society accommodated a variety of groups ranging from the moderate to the radical and soon established a national network of 386 branches with more than seventy-five thousand members. The beginning of the end for the New Korean Society came in 1929 when its leaders were rounded up by Japanese police and charged with supporting the student riots in Kwangju in 1929. The society’s subsequent move to the right caused many leftist members to quit, resulting in its demise in 1931 and ending hope for a Korean united front against Japan.

These efforts by the Soviets to create united fronts in China and Korea failed because of the political differences facing the leaders of the respective nationalist and conservative parties. In both nations these differences eventually erupted into civil wars, deepening divisions that persist into the twenty-first century.

United Kingdom–China Relations

Yīn-Zhōng wàijiāo guānxì 英中外交关系

China and the United Kingdom have a long history of relations—some contentious, some collaborative—with Hong Kong at the center. In the twenty-first century, both countries look toward cooperation.

China and the United Kingdom, two nations that have greatly affected regional and world affairs for centuries, seemed destined by history to interact on a grand scale. Relations between the two nations since the eighteenth century have, in turn, helped and hindered China.

Empire to Empire

For a major seafaring and exploring nation, Britain was a late arriver in China. The main European interests in China in the sixteenth and seventeenth centuries were from the Portuguese and to some extent the Dutch. But Britain’s interests, when they became more substantial in the eighteenth century, concentrated on trade. Britain sourced tea, silk, and spices in China and was part of what was largely viewed by the court of Emperor Qianlong (reigned 1735–1796) as unwelcome commercial foreign encroachment.

To defend its interests, Britain sent a trade mission in the late 1780s, which was aborted due to the illness of its main emissary. Britain sent a more successful and well-known mission under Lord Macartney in 1793. Macartney, a respected diplomat and statesman, was given tasks by the government of King George III of opening up the Chinese market and establishing some kind of embassy in Beijing. Summoned from Beijing to the emperor’s summer residence in Jahol, 100 kilometers (about 62 miles) northeast of the city, Macartney spent huge amounts of time and effort in negotiations with the Qing court on how he should kowtow before the emperor, finally agreeing to bow on one knee and not abase himself fully. In an early example of how an event is given “spin,” the Chinese account says that even having agreed to this, Macartney still fell to his knees when in the presence of the emperor, so overcome by awe was he. Conflicts regarding trade (and imperial protocol) were to become commonplace over the next two centuries and escalated when Britain’s requests were rebuffed. Qianlong famously responded that China had no need of Britain’s manufactures. This typified the empire’s inward-looking and somewhat conservative stance.

Britain’s interests in the next half century continued to be based on trade, but they would become increasingly fractious. The most highly industrialized and economically powerful nation at the time, Britain was keen to address what it saw as trade imbalances in China. Britain, part of the carefully controlled foreign presence in the open ports of Guangzhou (Canton), through its companies (particularly Jardine Matheson) became involved in the thriving opium trade, importing immense amounts into China. Dissatisfaction with this led to the Chinese government’s military opposition in 1839.

This First Opium War (1839–1842) escalated to full military conflict, which Britain, with its superior army
and firepower, easily won. The Treaty of Nanjing in 1842, what has come to be called the first of the unequal treaties imposed on China, granted the island of Hong Kong to the British to house their warehouses and allowed them to continue trading in opium and other goods more freely.

Continued tensions over the freedoms granted to trading culminated in a second war in the early 1860s, which, like the first, resulted in China’s defeat and the granting to Britain of further land in Hong Kong (the Kowloon peninsula) and further trading privileges. In 1898 a ninety-nine-year lease was given for the rest of the Hong Kong area. British and the other European powers were attacked during the Boxer Rebellion in 1900, resulting in massive reparations that financially crippled the Qing court. By 1911 the Qing era was over, although the emperor did not abdicate until 1912.

Modern Concerns

In the early part of the twentieth century, Britain was the largest investor in China, with massive interests, mostly headquartered in Shanghai, in energy and mining. Companies like British American Tobacco and Shell were already active. Britain controlled almost 70 percent of China’s energy supply through coal and electricity production. The British concession in Shanghai was the home to British entrepreneurs, intellectuals, and, to an increasing extent as the century went on, artists. This era of openness in China’s history was to result in a tragic outcome, however, when the war with Japan in 1937 created massive refugee issues and swept away much of the business community. By 1949 and the establishment of the People’s Republic of China (PRC), most of the business infrastructure (including banks) had been either eradicated or dramatically scaled down.

Britain was one of the first countries to recognize the PRC, in 1950, if only to preserve its key interests in Hong Kong, which remained under British control. For the next half century, this protectorate remained Britain’s priority, and Hong Kong became one of the world’s important business centers, something that the increasingly radical government of the PRC was to tolerate in view of the economic lifeline it gave to the rest of the world. By the late 1960s, even with the Cultural Revolution spilling over into Hong Kong and causing disruption and riots there—notably the sacking of the British Embassy Office by the Red Guards in 1967, when the Chinese demanded that the British release individuals convicted of perpetrating terrorist attacks in Hong Kong—the importance of this trade link was still recognized by Beijing. In 1971 Hong Kong–related trade accounted for almost all of the PRC’s foreign business. The visit by President Nixon in 1972, reopening relations between the United States and
China, was quickly followed up by a visit from British prime minister Edward Heath, who also upgraded relations to the ambassadorial level.

**NEW “LEASE ON LIFE” FOR HONG KONG**

While the issue had been put on hold during the uncertainties of the 1970s, the arrival of a more liberal leadership under Deng Xiaoping (1904–1997) in 1974 raised the question of what would be done about the ninety-nine-year lease agreed on Hong Kong in 1898. Tentative enquiries in the early 1980s by British officials about the possibility of simply extending the lease by another ninety years were met with firm rebuttals. Deng suggested a one country, two systems arrangement, whereby Hong Kong’s unique political and economic structure be respected and the region be returned to Chinese sovereignty in 1997. The Basic Law, which acted as a de facto constitution, was promulgated in the late 1980s. The shock of the Tiananmen Square riots in 1989, while causing panic and consternation in Hong Kong, did not prevent the final agreement for the full return of Hong Kong on time on 30 June 1997. The final five years under the reforming governorship of British politician Chris Patten, with whom the Chinese had strained relations, had not derailed the agreement. With the return of Hong Kong to China, one of the largest and most contentious issues between Britain and China had been resolved.

Since 1997, the government in Beijing has kept its side of the agreement, interfering very little in Hong Kong, allowing it to govern itself, and acting only in foreign affairs and military issues.

**TRADE RELATIONS**

In the meantime, Britain’s main interests in China have reverted to trade. Britain has continued to be China’s main investor from Europe, with more than 6,000 joint ventures with Chinese companies and almost $25 billion of contracted investment in every province and autonomous region. The largest British companies investing in China include energy companies BP and Shell, telecommunications company Vodafone, the Royal Bank of Scotland, and retailers like Tesco, B and Q, and Marks and Spencer.

Since 2003, China has also increased its investments in the United Kingdom, with more than 350 companies now active there, ranging from the Bank of China to the telecommunications giant Huawei. China has also invested through its State Administration for Foreign Exchange in more than 100 London-listed companies and bought a 3 percent stake in Barclays Bank. China’s role
as an investor in the United Kingdom is likely to increase dramatically in the years ahead.

Nevertheless, Britain shares with the rest of Europe and the United States concerns over the trade imbalance with China. In June 2008, while it increased its exports to China to $800 million a month, this still ran at a massive deficit, with China exporting back to the UK over $2 billion worth of goods. Britain undertook most of its negotiations on the trade deficit through the European Union.

**Toward an Understanding**

While relations have remained warm since 1997, history continues to leave a stain. Arguments within and outside China continue over the role that Britain played during what has been labeled China’s century of humiliation. Some historians argue that the Qing empire was complacent and that it overreacted to foreign overtures for greater links. If China had been sharper and more sensible in its reaction, it might have used these links to make itself more secure and stronger. Others argue that economic and social development in China, particularly in Hong Kong, was established and expanded by the Chinese with little help from the British.

In one particular area, Tibet, Britain’s colonial past still reverberates: Britain is the only country in the world that does not recognize Chinese sovereignty in the region. In spite of, or because of, past connections, Britain and China have expressed the desire for continued relations. Britain has become a destination for large numbers of Chinese tourists, though the fact that it is not yet part of the European Schengen visa zone (and unlikely to be one for the foreseeable future) has kept these numbers limited. In 2007 British prime minister Gordon Brown and Chinese premier Wen Jiabao agreed to joint efforts in further developing Sino-British cooperation in economic, educational, and cultural matters.

United Nations–China Relations

China is a founding member of the United Nations and, as a permanent member of its Security Council, holds veto power over resolutions brought before the U.N. Due to political unrest in China during the years following the U.N.'s founding in 1945, China's representation in the U.N. became a source of unresolved domestic strife and international conflict for over two decades.

The United Nations was established as an international peacekeeping organization on 26 June 1945, several weeks after the conclusion of World War II in Europe, when representatives of fifty nations, including China, met in San Francisco to sign the U.N. charter. As one of the “Big Five” Allied nations (along with the United States, the Soviet Union, France, and Great Britain), China participated in negotiations leading to the U.N.'s creation at the Teheran (1943), Dumbarton Oaks (1944), and Yalta (1945) conferences. China is not only a founding member but also one of the five permanent members of the U.N.'s Security Council.

The charter-signing ceremony was staged with great fanfare and publicity. Since each delegation signed in English alphabetical order, the Chinese were first and contributed to the pageantry by preparing fresh ink for traditional brush calligraphy. In 1945 the U.N. enjoyed support from the major political organizations in China. The ten-member delegation in San Francisco was comprised of high-ranking officials representing diverse political views but all officially appointed as delegates by Republic of China (ROC) president Chiang Kai-shek (Jiang Jieshi) (1887-1975). The ROC’s ruling Guomindang (Nationalist Party) sent four representatives: T. V. Soong (Soong Ziwen), minister of foreign affairs; Ambassador V. K. Wellington Koo (Gu Weijin); Defense Council Minister Wang Chung-hui (Wang Conghui); and Ambassador Wei Tao-ming (Wei Daoming). Dong Biwu was sent by the Chinese Communist Party (CCP). The State Socialist Party sent historian Carson Chang (Zhang Junmai), and Li Huang represented the Nationalist Youth Party. Also in attendance were philosopher Hu Shih (Hu Shi), Ginling College president Wu Yifang, and Hu Lin. After ratification by the ROC’s People’s Political Council, the charter was signed by President Chiang Kai-shek on 24 August 1945. Soon, however, cooperation and goodwill among political rivals in China disappeared as civil war led to a CCP victory and the fleeing of Chiang and the Guomindang government to Taiwan. Within five years of the charter’s signing, China’s representation in the U.N. would be a source of domestic strife and international conflict that would not be resolved for over two decades.

PRC-ROC Conflict over U.N. Membership

The founding of the People’s Republic of China (PRC) on 1 October 1949 set in motion a controversy over which government, Beijing or Taipei, should occupy China’s seat. On 18 November 1949, Beijing’s premier Zhou Enlai
(1898–1976) communicated to U.N. authorities that the PRC was the sole legal government of China and the legitimate representative of the Chinese people. He further notified the president of the General Assembly that his government repudiated the legal status of the U.N. delegation headed by Ambassador T. F. Tsiang (Jiang Tingfu) (1895–1965) and called for the immediate expulsion of Guomindang representatives. However, during the 1950s and 1960s Cold War politics prevailed when the U.S. government worked to keep its ally, the ROC headed by Chiang Kai-shek, in the U.N. while the Soviets and many Third World nations called for the PRC’s admission. Beijing’s Ministry of Foreign Affairs has blamed hostility to China’s new government and “deliberate obstruction,” mainly by the United States, for preventing the PRC from assuming China’s seat despite “unremitting efforts” by the CCP beginning in 1950.

In September 1950 the U.N. General Assembly first considered the question of China’s membership when it rejected resolutions supporting the PRC sponsored by the USSR and India. The General Assembly then set up a special committee to review China’s representation, during which time the ROC held China’s seat. In 1951 the USSR repeated attempts to secure Beijing’s admission by putting forward proposals to place the question of China’s representation on the General Assembly agenda. At the time, PRC forces were fighting U.N. troops in the Korean War. After Soviet efforts failed the General Assembly approved a resolution sponsored by Thailand to postpone any review of China’s representation. Meanwhile, on 1 February 1951, the U.N. voted to condemn China as aggressor in Korea and initiated a global embargo of shipments of war materiel, further isolating the PRC from the international community. From 1951 to 1960, during

A delegation from the National Committee on United States–China Relations visits the United Nations in 1973. COURTESY OF NCUSCR.
each session of the United Nations, the General Assembly approved U.S.-sponsored motions to keep the question of China’s representation off the agenda. As a result, effective deliberation of the representation question was thwarted while the CCP openly condemned certain U.N. member states, particularly the United States, for what the Chinese referred to as subversive manipulation.

Despite Beijing’s failure to secure a U.N. seat, throughout the 1950s CCP leaders maintained a positive public outlook toward the U.N. CCP representatives occasionally participated in U.N. discussions on ad hoc basis on issues of concern to China, including talks on the agenda item entitled “Complaint of Armed Invasion of Taiwan (Formosa)” (1950) as well as Security Council debate on the Korean War. In 1955 Premier Zhou Enlai told delegates at the Afro-Asian (Bandung) Conference that the Chinese people supported the purposes and principles of the U.N. Charter. In addition, many of the bilateral treaties signed by the Beijing government cited U.N. principles. By the end of the decade, however, CCP leaders began to question the value of the U.N. as a vehicle to promote international peace and openly criticized its actions, claiming, for example, that the U.N. had begun to serve the goals of “imperialism” and “neocolonialism.”

The 1960s were years of transition for Beijing’s official position toward the U.N. As more Asian and African nations won independence and joined the U.N., many of their governments called for the PRC’s admission as the legitimate government of China. In response, supporters of the ROC successfully sponsored resolutions in the General Assembly to consider China’s representation as an “important question,” thereby requiring passage by a two-thirds majority vote of member states. Such procedural changes made Beijing’s case problematic into the next decade. As a result, the PRC apparently abandoned hope of replacing the ROC, publicly accused member states of departing from the charter’s intentions, and refused to participate in ad hoc deliberations on issues involving China. In 1965 the CCP called for revisions to the U.N. Charter and proclaimed its support for the establishment of an alternative “revolutionary” United Nations organization.

Beijing’s position was influenced by two issues during the 1960s: the Sino-Soviet dispute and the development of the Cultural Revolution (1966–1976). China’s open break with its former ally, public by 1960, led to assertions by the Chinese that both the United States and the USSR were conspiring to keep Beijing out of the U.N. The power struggle within the CCP and turmoil associated with the Cultural Revolution kept the government focused on domestic issues. The PRC press during these years avoided the topic of China’s U.N. seat and advocated that third-world nations either not join or drop out of the U.N. By 1969, however, CCP leaders acknowledged the dangers of international isolation and the potential threat of the USSR, causing them to take another look at U.N. membership. A more moderate tone toward the U.N. was apparent in an October 1969 speech by Premier Zhou Enlai honoring Premier Alfred Raoul of the Congo, in which Zhou thanked that country for taking up China’s cause in the U.N. and advocating the expulsion of the Guomindang delegation.

The early 1970s were characterized by significant changes in China’s foreign policy that coincided with a shift in the U.N. vote on China’s representation. In 1970 General Assembly members who supported Beijing’s claim outnumbered the opposition for the first time. The ballot question on China’s resolution sponsored by eighteen member states resulted in fifty-one nations voting for the PRC and forty-nine voting against, with twenty-five abstentions. Apparently emboldened by the more widespread support, the Chinese government began to adopt new strategies aimed at winning the U.N. seat. A multifaceted campaign promoted a more pragmatic approach to foreign policy. Abandoning the antiforeign polemics associated with the Cultural Revolution, the CCP began courting the goodwill of dozens of nations through improved relations, increased contacts, and aid programs. After the visit of U.S. National Security Advisor Henry Kissinger to China in July 1971, Beijing’s success seemed assured, causing U.N. Secretary-General U Thant to predict the likelihood of a solution to the representation conflict in favor of the PRC. At the General Assembly’s twenty-sixth session in 1971, 131 nations voted on Resolution 2758, the question of China’s seat. Seventy-six voted pro-PRC, thirty-five opposed, and seventeen abstained. PRC representatives arrived in New York and replaced those of the ROC on 11 November 1971.

Beijing’s first delegation was an experienced team. Vice Foreign Minister Qiao Guanhua (1912–1983) served as delegation head until 1976. He had represented China at several international conferences and had been present at
the U.N. in 1950 when he spoke for the PRC as ad hoc participant during Korean War debates. The vice chairman and permanent representative to the Security Council, Huang Hua, also had considerable diplomatic experience and served as advisor to Premier Zhou Enlai. Huang was the PRC’s ambassador to Ghana and Egypt during the 1960s. Other delegates included Fu Hao, Chen Chu and U.S.-educated Xiong Xianghui, all of whom held high rank within the Foreign Ministry.

**Champion of the Third World**

In his first speech before the U.N. General Assembly in November 1971, Ambassador Qiao Guanhua outlined the theme for China’s role in the U.N. He announced that “like the overwhelming majority of the Asian, African and Latin American countries, China belongs to the Third World,” pledged Beijing’s support for “oppressed peoples and nations,” and condemned the “power politics and hegemony of big nations bullying small ones or strong nations bullying weak ones.” During the early 1970s the PRC occasionally used the U.N. as a stage to air its grievances against the two “imperialist superpowers,” the United States and the USSR, but, for the most part, the Chinese advanced their national interests with a pragmatic approach to U.N. politics aimed at improving relations with member states worldwide.

China’s early voting record revealed, for the most part, Beijing’s adherence to its stated goal of championing Third World initiatives. Throughout the 1970s China’s votes were more consistent with those of poorer Third World nations than with those of either the Western or Communist worlds. The PRC garnered favor with Asian, African, and Latin American nations by supporting, for example, resolutions on the “Declaration of the Indian Ocean as a Zone of Peace,” demands by Latin American governments to extend territorial seas to 200 nautical miles, enlargement of the Economic and Social Council so as to include more developing nations, and relocation of Security Council meetings from New York to an African city. Moreover, China’s delegates were known to mingle informally with Third World colleagues, a practice in which the United States and Soviet Union participated infrequently. In addition, the U.N. became the platform for China’s critique of U.S. and Soviet positions on several contentious issues, including Middle Eastern politics and arms control, that promoted, in China’s view, “superpower hegemony.”

**Veto Power**

As a permanent member of the Security Council, China is one of five nations that holds the power to veto resolutions coming before the U.N. China’s use of the veto has been selective compared with that of the other permanent members, which together already have cast 254 vetoes. Since the founding of the U.N. China has used the veto six times, including the 1955 veto of Mongolia’s admission by the ROC on the grounds that Mongolia is a province of China. The five resolutions that the PRC vetoed are admitting Bangladesh (1972); calling (with the USSR) for a ceasefire during the Yom Kippur War (1973); sending 155 ceasefire observers to Guatemala (1997); extending the U.N. Preventative Deployment Force in Macedonia (1999); and criticizing (with Russia) Myanmar (Burma) on its human rights record (2007). Beijing used the veto to promote China’s foreign policy goals as well as to challenge many U.N. initiatives that the Chinese deem to be violations of sovereignty or territorial integrity. For example, the Beijing government vetoed the sending of U.N. peacekeeping forces to Guatemala and Macedonia because the two governments accorded diplomatic recognition to the government of Taiwan and not the PRC at the time. Pressure by China in the U.N. bore some success for Beijing as Guatemala resolved to stop pressing Taiwan’s interests in the U.N., resulting in the PRC’s lifting the veto within weeks. The Republic of Macedonia opened bilateral ties with Beijing in 2001. With the remaining three vetoes China took unpopular stands on several contentious issues.

The PRC cast its first veto on 25 August 1972, when it refused to support a Security Council resolution granting Bangladesh U.N. membership. China’s blocking the admission of a new Third World nation appeared to contradict its aim of promoting the rights of poorer nations. The Chinese, however, had argued for postponement of the vote because issues involving Bangladesh’s independence from Pakistan had not been resolved, including the status of over ninety thousand Pakistani prisoners of war held by India. The Chinese accused the Soviets of

© 2009 by Berkshire Publishing Group LLC
attempting to embarrass Beijing by introducing the measure prematurely, forcing the Chinese to take an apparently hypocritical stand. China’s veto was in support of Pakistan, its ally since the 1962 invasion of China by India. Bangladesh gained a U.N. seat in September 1974 with no opposition from China.

The October 1973 Arab-Israeli War was the occasion for China to cast a negative vote along with the Soviets on a resolution calling for a ceasefire, presumably in protest of the United States’ sponsorship of Israel. After the cessation of hostilities the Chinese vigorously denounced what they deemed Soviet-U.S. manipulation of the Security Council when a U.N. emergency force (UNEF II) was deployed in the Sinai Peninsula. The Security Council representative, Huang Hua, referred to UNEF II as “an attempt to occupy Arab territories.” China, however, never blocked the establishment of U.N. peacekeepers for the Middle East and either abstained or was absent from Security Council votes on the issue.

The 2007 veto of a U.S.-sponsored Security Council resolution criticizing the government of Myanmar for its human rights record is consistent with Beijing’s view that the U.N. should not interfere in the internal affairs of member states. The resolution garnered support from nine Security Council members. Russia and South Africa also cast negative votes, while three others abstained. Beijing has maintained that the U.N. has no mandate to sanction governments for actions within their own borders.

Abstentions as Policy

Beijing’s sparse use of the veto since 1971 does not necessarily reflect China’s approval of Security Council actions that passed because the Chinese delegation failed to cast a negative vote. The Chinese have abstained or chosen not to participate in votes on many controversies. The strategy of abstaining is consistent with Beijing’s unwillingness to approve U.N. initiatives, such as peacekeeping forces or sanctions, that infringe upon a nation’s sovereignty or that could alienate China’s friends in the international organization. By not using its veto, China does no damage to its relations with either side in the conflict and also allows the U.N. to act.

The PRC has been critical of U.N. peacekeeping forces, claiming that they violate a nation’s sovereignty. The use
of sanctions, the Chinese argue, can be a “double-edged sword” that harms innocent civilians along with the target government. The Chinese have not, however, consistently upheld these principles. Beginning in 1990 the Chinese have deployed military personnel to thirteen U.N. peacekeeping operations. China did not veto Security Council Resolution 1333, which placed sanctions on Afghanistan in 2000, nor did China veto any of the Security Council proposals since 2004 that imposed sanctions on Sudan, a state with which China has close economic ties.

China’s actions during the first Persian Gulf War are another example of the strategic use of the abstention. The U.N. has authorized the use of force only twice—in 1950 in the Korean War and in 1990 against Iraqi forces in Kuwait. China approved the eleven Security Council resolutions condemning Iraq’s aggression during the first Persian Gulf War, including the imposition of sanctions, but condemned the use of U.N.-sponsored military force against Iraq. Nevertheless, the Chinese chose not to veto military intervention. China’s selectivity in its use of the veto has caused many Third World leaders to question whether China’s interests will continue to coincide with those of poorer nations.

Millennium Challenges

On 8 September 2000, the U.N. overwhelmingly approved the Millennium Declaration, whose objective is to promote peace, security and disarmament. It also pledged to reduce by half the number of people with incomes of less than one dollar a day by 2015. With its phenomenal economic growth, China is on target to meet the economic targets established by the U.N., but other challenges for the twenty-first century may not be so easily resolved.

Since 1991 the government of Taiwan has indicated its desire to return to the United Nations. In 2004 Taiwan’s president, Chen Shui-bian, made the provocative claim, “Taiwan is a sovereign state, and should join the United Nations by the name ‘Taiwan.’” As a result, the controversy of China’s representation has been revisited. Taiwan’s allies have attempted to put the question of Taiwan’s inclusion on the General Assembly’s agenda but have failed to procure the required votes. Beijing remains steadfast in its position that Taiwan is part of China. Since the PRC can veto any resolution that acknowledges Taiwan’s sovereignty, the likelihood of Taiwan’s gaining a seat in the U.N. is dim.

Beijing has also promised to veto efforts to enlarge the Security Council. In 2005 four nations referred to as the “Group of Four” (G-4)—India, Germany, Japan, and Brazil—have called for increasing the Security Council from its present fifteen members to twenty-five. The G-4, moreover, has demanded the veto. The Chinese claim that the proposal fails to uphold the interests of most developing nations. It also diminishes the clout of the original “Big Five” founders of the United Nations. As China’s rise as a global power continues, China’s role in the United Nations will evolve.

United States–China Relations

China and the United States have recently forged close economic ties, but relations between the two nations have often been marred by political tension. Beginning in the eighteenth century when the U.S. emerged as a nation during China’s Qing dynasty, through the Nationalist period, and for much of Chinese Communist Party rule, the two nations often clashed.

In February 1784 the Empress of China left New York harbor on its historic voyage to China’s southeastern port of Guangzhou (Canton). In August it became the first U.S. ship to trade in China at a time when Europe had already dominated the China trade for decades. By the turn of the nineteenth century an average of twenty-five U.S. vessels arrived in Guangzhou annually, and continued to grow even during the periods of upheaval which typified the twentieth century. At the beginning of the twenty-first century China became the United States’ number one trading partner, surpassing European Union nations and powerful neighbors such as Japan. The development of U.S.-China relations, however, has not always been smooth, and political entanglements continue to complicate relations. Both economic and political conflicts have been the source of controversy for the governments of both nations, but throughout much of the comparatively brief history of the United States, commercial relations have played a paramount role in U.S.-China relations.

Competition with the British for Opium Trade

U.S. traders arrived in China in the late eighteenth century as relative newcomers who benefited from inroads made by their European counterparts. Like the Europeans, U.S. traders had few commodities to sell to the self-sufficient Chinese, so they had to use silver, primarily Spanish silver dollars, to pay for Chinese tea and silk until they, like the British earlier, turned to selling opium. Before 1820 U.S. traders had a profitable monopoly in Turkish opium that allowed them to take a small share of Guangzhou’s market from the British East India Company, which sold opium originating in India, a British colony. However, when British “free” or private traders began competing for Turkish opium sources, the U.S. traders found themselves at a competitive disadvantage because U.S. ships were prohibited from carrying opium directly from British India to China. Nevertheless, U.S. dealers became adept at procuring opium stocks from a variety of sources, and in the years leading up to the First Opium War one U.S. company, Russell & Company, was ranked third among foreign firms dealing in Indian opium in Guangzhou.

Attempts by the Qing dynasty (1644–1912) at halting opium sales led to war and consequently the “unequal treaties” that permitted foreign merchants and missionaries in China’s coastal cities. Still in the shadow of the Europeans, U.S. traders gained advantages from the terms of the treaties. The “most favored nation” clause in the Treaty of Nanjing ending the First Opium War granted foreign powers in China a share in whatever concessions
were granted to any one of them. Extraterritoriality, a legal provision that allowed foreigners to ignore China’s laws, made trade in opium possible without fear of prosecution. U.S. citizens and Europeans in China during the decades after the opium wars engaged in commercial and missionary activities, but, unlike the Europeans, the U.S. government did not seek territory in China. That difference in policy would influence U.S.-China relations into the twentieth century.

Burlingame Mission and Its Consequences

The Second Opium War concluded with China’s defeat by the British and French, who then demanded that the Qing rulers establish permanent foreign embassies in Beijing. The Treaties of Tianjin, signed with several European states and the United States, forced the opening of Beijing to foreign residence. In response the Chinese government created the Foreign Office (Zongli Yamen) to handle diplomatic matters. The first U.S. minister sent to Beijing was Anson Burlingame, appointed in 1861 by President Abraham Lincoln, who expected Burlingame to ensure U.S. interests by defending China’s territorial integrity in the face of European colonial expansion. In 1867, in an unusual move, Burlingame was recruited by the Foreign Office to head China’s first delegation abroad, serving as an official representative of the Qing throne. The three-year-long Burlingame mission featured visits to foreign capitals and other points of interest. One accomplishment included the negotiation of an amendment to the Treaty of Tianjin, called the Seward-Burlingame Treaty (1868), asserting that the United States did not have territorial designs on China and providing freedom for citizens of both nations to emigrate and trade without discrimination.

The Seward-Burlingame Treaty was denounced by members of the U.S. Congress from western states who, responding to intense nativism, worked to curtail Chinese immigration into the United States. In 1880 the treaty was revised when both Beijing and Washington agreed that the U.S. government could suspend but not prohibit Chinese immigration. Congress responded in 1882 by passing the first of the Chinese “exclusion laws” that suspended Chinese immigration for a decade. In 1892 California congressman Thomas Geary proposed an extension of the law for another ten years in the Act to Prohibit the Coming of Chinese Persons into the United States, also known as the “Geary Act.” Despite protests by the Qing throne and Chinese-Americans, the Geary Act passed and was upheld by the U.S. Supreme Court in 1893. In 1902 Congress renewed the exclusion act with no terminal date and included the requirement that all Chinese in the United States possess a certificate of residence or face deportation. (The exclusion laws were not repealed until the passage of the Magnuson Act in 1943.) The restrictions placed on Chinese by the United States were in stark contrast to simultaneous attempts by the U.S. government to protect U.S. interests in China.

Open Door Policy

By the close of the nineteenth century the Qing dynasty faced increasing pressure from imperialist powers, especially after China’s defeat in the Sino-Japanese War (1894–1895). The years from 1895 to 1900 have been referred to as the time of the “Slicing of the Melon” when China was carved into spheres of influence by Europe and
Japan. In 1899 the U.S. government responded to China’s situation with the concept of an “open door” aimed at protecting U.S. trade by promoting equality of economic opportunity in China. In 1899 U.S. Secretary of State John Hay sent the Open Door Notes to governments with interests in China, including Great Britain, France, Russia, Germany, and Japan. Hay was successful in securing tacit acceptance of the principles of free and open markets throughout China, but within a year the outbreak of the Boxer Rebellion (Yi Ho Tuan Movement) threatened to negate the agreements. As foreign armies fought their way inland to rescue their citizens in Beijing, Hay feared that the creation of colonies throughout China would follow the defeat of the Boxers and their supporters in the Qing royal family. In the Open Door Circular (1900) Hay reiterated the need to maintain open access to markets and emphasized that all nations should respect the “territorial and administrative integrity” of China. The Open Door agreements were not binding but were upheld by the United States over the next several decades.

When the Open Door policy was initiated, the United States had just begun to expand into the Pacific with the annexation of Hawaii (1898) and the acquisition of the Philippines and Guam from Spain (1899). Access to China’s markets served U.S. interests at a time when other powers, such as Russia and Japan, threatened to close their territories in China to foreign trade. After the Qing dynasty collapsed in 1911, the Open Door policy expanded to include the goal of preserving China’s independence. In 1915 Secretary of State William Jennings Bryan announced the Non-Recognition Doctrine after Japan attempted to colonize China with the Twenty-One Demands presented to President Yuan Shikai. Because of its commitment to the Open Door policy, the U.S. government refused to recognize any Sino-Japanese treaty that violated its principles.

The conclusion of World War I in 1918 brought new challenges to U.S.-China relations. Because China was an ally of the United States, many Chinese assumed that their country would benefit from having contributed to the victorious side. In particular, Chinese intellectuals counted on an international commitment to President Woodrow Wilson’s Fourteen Points, one of which guaranteed “national self-determination.” But the terms of the Treaty of Versailles were disappointing; Japan won former German possessions in Shandong. The failure of the United States to uphold China’s territorial integrity reflected the complexity of the international situation, including Japan’s secret treaties with European powers, Wilson’s focus on Japan’s joining the League of Nations, and the timing of a joint British-U.S.-Japanese invasion of Siberia. The Chinese, however, responded to the rebuff with the widespread, violent antiforeign demonstrations of the May Fourth Movement (1919). Some of China’s
intellectuals then rejected U.S.-style democracy and turned to Bolshevism for a new model.

**Ties to the Guomindang**

The absence of political unity characteristic of the warlord decade (1916–1927) was relieved to some extent with the defeat by the Guomindang (Chinese Nationalist Party) of southern warlords and the establishment of the Republic of China’s (ROC) new capital at Nanjing in 1927. China’s new government, headed by the Guomindang’s Chiang Kai-shek, immediately sought to improve relations with Western nations. The close ties that Chiang forged with the United States produced an alliance that lasted for decades.

In 1927 Chiang embarked on a quest to alter China’s image from that of hapless victim of imperialism to that of a united and modern nation. He undertook a personal image change when he divorced his wives and married U.S.-educated Meiling Soong in a Christian ceremony in December 1927. Known as “Madame Chiang,” Soong was a political asset and a passionate advocate for an independent, Guomindang-controlled China. Beginning in the 1930s she raised money and lobbied for support from wealthy U.S. citizens and the U.S. Congress. Fluent in English, Christian, modern and attractive, Soong symbolized what many in the United States hoped would be China’s future. In 1937 Chiang and Soong were named *Time* magazine’s “Man and Woman of the Year.”

Despite U.S. support, Chiang’s government faced insurmountable challenges during the 1930s as Japan colonized Chinese territory, and the Chinese Communist Party (CCP) became the Guomindang’s primary enemy. Although the U.S. government approved of the Guomindang’s anti-Communist posture, concern over Japanese aggression in Asia took precedence for U.S.-China policy. The 1931 Japanese invasion of Manchuria and subsequent creation of the puppet state of Manzhouguo led the United States to reemphasize the Doctrine of Non-Recognition. When Japan’s large-scale military operations in China began in 1937, U.S. secretary of state Cordell Hull offered that the United States serve as a neutral ground for representatives from Nanjing and Tokyo to address the conflict. After Tokyo ignored the gesture, Hull announced the Doctrine of Non-Intervention aimed at keeping U.S. forces out of international conflicts while heaping condemnation on Japan for its aggression in China.

Japan’s attack on Hawaii’s Pearl Harbor in December 1941 and subsequent U.S. entrance into World War II caused President Franklin D. Roosevelt to strengthen ties to the Guomindang. In 1943 the United States negotiated a treaty on equal terms with the ROC that relinquished U.S. extraterritorial privileges and provided the United States with bases in China to facilitate the fight against Japan. Roosevelt pushed to elevate China’s international standing, making Chiang one of the “Big Five” Allies. Nevertheless, U.S.-China cooperation during World War II was troubled.

In March 1942 U.S. Army Lieutenant General Joseph W. Stilwell, Roosevelt’s choice to command the China-Burma-India theater of war, arrived in Chongqing, China’s wartime capital. Stilwell was initially welcomed by Chiang and appointed chief of staff, but their relationship soon became strained. For Stilwell conditions in the Guomindang army were cause for dismay. Civil conflict, tentative control over warlord forces, corruption, erratic supply lines, and overwhelming Japanese strength made the outlook bleak. Despite assistance from the American Volunteer Group, the Flying Tigers, who flew supplies to Chinese forces, the United States could not provide the logistical support needed to make the Guomindang army effective. As the war wore on, Stilwell opposed Chiang’s
tactics that he deemed defensive and criticized deployment of forces against Communist strongholds. In September 1944 Roosevelt urged Chiang to put Stilwell in command of Chinese ground units. When Chiang refused, Stilwell was replaced with Major General Albert C. Wedemeyer, but relations between Roosevelt and Chiang cooled.

Japan’s defeat was followed by the repatriation of more than 1 million Japanese troops and the airlift of a half-million Guomindang forces to cities throughout China by the U.S. military. Then the United States stepped in to avert civil war by sending General George Marshall to mediate between Chiang and the CCP. The Marshall mission attempted to create a coalition Guomindang-CCP government with Chiang as head, but after talks broke down in 1946 civil war began. The United States sent to the Guomindang aid worth more than $2 billion, not including the nearly $2 billion in aid delivered during World War II. In 1948 the defeated Chiang and his government fled to the island of Taiwan.

**Recognition for the Republic of China**

The establishment of the People’s Republic of China (PRC) in October 1949 was a blow to those in the United States who expected victory for their wartime ally, but the administration of President Harry Truman, aware of Chinese conditions, had predicted a CCP victory. In the State Department’s white paper on China released in August 1949, Secretary of State Dean Acheson wrote: “The unfortunate but inescapable fact is that the ominous result of the civil war in China was beyond the control of the government of the United States.” In the months after the CCP victory, Truman adopted a “wait and see” policy, assessing whether the United States would recognize Chinese Communist Party leader Mao Zedong’s government and establish commercial ties, as it had in 1948 with the Communist head of Yugoslavia, Josip Broz Tito. Many factors, however, worked against possible conciliation. An intense “Red scare” had reemerged in the United States. Provoked by Senator Joseph McCarthy’s allegations of Communists within the State Department, conservatives in Congress vehemently denounced the Truman administration for being “soft” on Communism. When the CCP signed the Sino-Soviet Treaty of Friendship, Alliance, and Mutual Assistance in February 1950, Truman’s critics rushed to exaggerate his failures.

For Truman China’s entrance into the Korean War (1950–1953) ruined any chance for normal relations with Beijing and assured continued recognition of the ROC. The Korean War caused Truman to declare a national state of emergency, increase draft calls, urge the United Nations (U.N.) to condemn China as an aggressor nation, and station the U.S. Seventh Fleet in the Taiwan Strait. Premier Zhou Enlai denounced the action as “armed aggression against the territory of China.” Meanwhile, Moscow’s efforts to seat the PRC in the U.N. were blocked by the United States. In December 1950 the United States announced a total trade embargo on the PRC that would last for twenty-one years.

For two decades the United States recognized the ROC while adhering to the official position that “the
regime in Peiping” (Beijing) was not China’s government. Beginning in April 1951 the United States resumed direct military aid to the Guomindang. In 1954 the United States signed a mutual defense treaty with Taiwan, followed by the passage of the Formosa [Taiwan] Resolution (1955), which guaranteed protection against armed attack. U.S.-China relations became inextricably tied to the intensification of the Cold War. U.S. policies were aimed at stopping the spread of Communism, while China policies focused on supporting the “revolutionary struggles” of former colonial peoples. In 1965 People’s Liberation Army commander Lin Biao described the United States as “the most rabid aggressor in human history” in his essay “On People’s War.”

Ping-Pong Diplomacy

The unlikely champion of opening ties with the PRC was President Richard M. Nixon, once a hard-line anti-Communist associate of Senator Joseph McCarthy. Nixon’s historic journey to Beijing in 1972 opened a dialogue when both sides saw advantages to ending the decades-long feud. China’s aging leaders, Mao Zedong and Zhou Enlai, in the years after the violent and divisive Cultural Revolution (1966–1976) and the failed coup attempt by Lin Biao (1971), began to moderate their views, even reappointing to government positions once-jailed associates such as Deng Xiaoping. Moreover, hostilities with Moscow made China increasingly isolated and vulnerable. On the U.S. side Nixon began sending positive signals to Beijing as early as 1969 when he sought to reevaluate U.S. policy in Asia and end the conflict with China’s ally Vietnam. The first break came in 1971 with the start of “people’s diplomacy” after the Chinese invited the U.S. table tennis team to Beijing. U.S. national security advisor Henry Kissinger followed up with a secret trip to China, arranging Nixon’s future visit and announcing that the United States would no longer block Beijing’s entrance into the U.N. In February 1972 Nixon and Zhou Enlai issued a joint statement, the Shanghai Communiqué, outlining the provisions for establishing diplomatic and commercial ties. Because no agreement could be reached on the future of Taiwan, separate statements summarized each government’s position. Full diplomatic relations between the United States and China were officially restored in January 1979, but Congress responded by passing the Taiwan Relations Act (April 1979), which encouraged continued economic, cultural, and military ties with Taiwan.

Two Superpowers

Cooperate and Compete

Beginning in 1978 economic reforms by Premier Deng Xiaoping opened China’s markets to the world. Soon China’s economy boomed from exports and foreign investment. U.S. citizens were quick to take advantage of opportunities once denied them and embraced new possibilities while ignoring, for the most part, the reality of the CCP’s strict authoritarianism. U.S.-China commercial ties, including joint ventures and buyouts of U.S. firms, rapidly expanded, and by 2005 China became the United States’ number one trading partner. But with closer economic ties came conflict. Citing complaints of closed markets, rampant infringement of copyright laws, and government crackdowns on dissidents, the United States blocked China’s initial bid to join the World Trade Organization in 1997. Eventually China’s entrance in 2001 gave Chinese greater access to member states’ markets and contributed to a trade surplus with the United States of nearly $300 billion in 2007.

With the Cold War’s conclusion the United States became the sole superpower, but China’s ascendance as a potential rival in east Asia is apparent. As China reaches superpower status, it will challenge U.S. hegemony (influence) in the Pacific. U.S.-China relations can be described as both cooperative and competitive. On the one hand, for example, Beijing was successful in curtailing North Korean nuclear proliferation after Chinese president Hu Jintao led six-nation talks that proved more effective at reining in North Korea than had earlier U.S. threats. On the other hand, unresolved issues, such as Taiwan’s future, continue to loom. The United States remains committed to defend Taiwan from military attack. The outlook for the twenty-first century appears to be characterized by close commercial ties, political disagreements, and strategic rivalry for the United States and China.

Recent events that continue to influence public opinion in China include the accidental 1999 bombing of the Chinese Embassy in Belgrade by the United States and
the forced landing of a U.S. spy plane on Hainan Island on 1 April 2001, as well as U.S. and other Western protests during the Beijing Olympic torch relay, all of which provoked a nationalist backlash both in China and from Chinese people living overseas. The U.S. plan to sell $6.5 billion of advanced weaponry to Taiwan announced in October 2008 also caused negative reactions in China, even though tension over Taiwan, the most important challenge to U.S.-China relations since 1949, had eased after PRC-Taiwan relations began a new phase with the election of Taiwanese president Ma Ying-jeou in March 2008.

During the U.S. elections of 2008, the trade deficit and job outsourcing were prominent in the public discussion, and product and food safety were much commented on in the press along with extensive coverage of human rights and Tibet-related protests before the Olympic Games. These issues and differences of perspective continue to affect U.S.-China discussions.

The thirtieth anniversary of the “normalization” of U.S.-China relations was on 1 January 2009, and 1 March 2009 marked thirty years since the U.S. Embassy reopened in Beijing. Many celebratory events were held in the United States and in China to bring together those who were involved in the events leading to normalization with younger leaders in the diplomatic, academic, and business communities. Initiatives such as the Strategic Economy Dialogue started under President George W. Bush draw support from a broad spectrum because both countries and leaders around the globe recognize that in spite of differences the cooperation of the United States and China on the global economic crisis, climate change, and terrorism is essential to future global stability.
But tensions between the two countries escalated again just one week after the celebratory events on 1 March. An American surveillance ship, the USNS Impeccable, and five Chinese ships were involved in a military confrontation 60 miles off the coast of Hainan Island in the South China Sea on 8 March 2009. Director of Naval Intelligence Donald Blair called it the “most serious” dispute since the April 2001 EP-3 incident. Both sides have insisted their actions were justified; U.S. military leaders and policymakers met soon after the incident to discuss its ramifications on U.S.-China relations.

University Education

China's university system, the world's largest, has the fifth-largest international-student enrollment in the world. Once funded solely by the state, today universities must raise an increasing proportion of their operating funds from such sources as tuition fees, research grants, endowment gifts, and income from university-run enterprises.

As China's economy has liberalized and grown, enrollments in China's institutes of higher education have been shooting up, with an unprecedented expansion just in the past decade. In 1990, only 3.3 percent of the age cohort between eighteen and twenty-two benefited from any form of higher education. This percentage reached 7.2 percent in 1995, 12.5 percent in 2000, 15 percent in 2002 (thus reaching the internationally acknowledged threshold of higher education for that age cohort), and 23 percent in 2007, with roughly 27 million students enrolled in 2008 in what has become the world's largest higher education system. The expansion of access to higher education in all subjects is an essential component to developing skilled workers who will be able to contribute to China's global ambitions. In fact, China is unique in educational history as it simultaneously pushes for rapid enrollment growth, institutes new governance structures, and seeks to build world-class universities.

Decentralization & Diversification

This rise in China's higher education system in the twenty-first century is qualitatively different from the rise it experienced in the 1950s under Soviet tutelage. The growth back then occurred within the parameters of detailed planning for a socialist economy and resulted in highly specialized institutions that trained personnel for each sector of the economy. The whole system was regulated from above, with minimal autonomy given to individual institutions or regions. Now the Chinese government has been gradually moving away from a centralized model of governance, in which it controlled the detailed operations of higher education institutions. As the numbers of institutions and students grew, it became increasingly difficult for the state to exercise control in a way that was compatible with the growing market economy.

As a result, the government began to develop the legal framework that would designate universities as independent legal entities and to establish the mechanism on which the universities' managerial autonomy could rest. The legal framework would allow universities to set their own strategic goals and define their own academic focus (including the establishment of new specializations) in order to respond to the increasing competition, and also to control their own resources. The architecture for a less centralized higher education system began to emerge in the late 1990s and was enshrined in the Higher Education Law that took effect on 1 January 1999.
A new and decentralized higher education structure, in which provincial governments play principal roles, has taken shape in China. The boundaries among different types of institutions have blurred, with universities now being allowed to add programs of their own choice. As a result of these changes is the impulse toward more comprehensive patterns of knowledge, with all higher education institutions seeking to broaden their curricular coverage. This has involved quite a remarkable development of social sciences and humanities programs in institutions originally designated to teach highly specialized technical subjects. The rationale of current reform seems to be to make “comprehensive universities” the norm, and to a large extent this trend has been driven by market forces that reward expanded enrollments.

The diversification also has implications for the financing mechanisms of higher education. Chinese universities used to be solely funded by the state, but today they must raise an increasing proportion of their operating funds from such non-governmental sources as tuition fees, research grants, services, endowment gifts, and income from university-run enterprises. Strategically, the state now concentrates resources on a small number of elite universities, while encouraging all other institutions to mobilize local resources through student fees and income-generating activities.

The Ambition for World-Class Status

This dramatic change in the size of China’s higher education system also has qualitative dimensions. The Chinese government launched programs, such as Project 21/1 in 1993, to enable one hundred top universities to reach world-class (elite) standards in the twenty-first century. Since 1998, Project 98/5 has been providing additional funding to a smaller number of top institutions. (It was named for the date of the centennial anniversary of Peking University, May 1998, since the project was announced shortly after that event.) The universities included in Project 98/5 were initially nine in number and have expanded to thirty-nine in 2009. The country’s two top universities, Peking University and Tsinghua University, are exclusively funded by the central government (getting ¥1.8 billion each for the first three-year cycle of the program), while the rest are funded by the Ministry of Education with matching funds from multiple sources at lower levels. The top echelon universities of the system enjoy significant advantages from the extra resources provided under the elite-university development projects and carry out most of the graduate education and research across the whole higher education system.

Chinese higher education institutions are being structured in a hierarchical way according to their functions and goals. On the top are the national elite universities that focus on research, mainly those in Project 21/1 and particularly those in Project 98/5. They educate the majority of doctoral students, in addition to master’s and bachelor-degree students. They are designated to function as the “national team” that will move China’s capacity for innovation to a higher level, play a leading role in performing research activities that are of great importance to national development and security, and to collaborate in international research efforts as well. The universities at the second rank are oriented to both research and teaching, mainly educating master’s and bachelor students, with doctoral students only in a few specific disciplines. The universities at the third rank are those that are fundamentally teaching-oriented, training mainly undergraduates. Finally, at the bottom of the hierarchy is a new tier of institutions, the higher vocational college, providing only two-to-three-year sub-degree programs. Their number has grown rapidly since 1999, when the central government delegated authority over approving and establishing such colleges to local governments at the provincial level.

The last two categories constitute the majority of China’s higher education institutions, and they have increased their enrollment dramatically, taking on the main burden of enrollment expansion while the elite universities have played a mainly symbolic role. The deliberate policy of creating a hierarchical structure of higher education, combined with the integration of curricular offerings, serves China’s needs to address both global competition and domestic demands. With this approach China seems to be able to maintain the world’s largest higher education system, and nurture a few players at a global level.
Academic Autonomy

Recent reforms have made possible a higher degree of autonomy than has been seen since the revolution of 1949. University autonomy is usually viewed as an important condition for the protection of academic freedom, and there can be little doubt that academic freedom has also increased greatly in recent years in China. Nevertheless, China’s socialist government is still intensely concerned about maintaining “stability” in the face of the rapid economic transformation under way, and it still exercises considerable control over China’s press and publishing industry. For their part, Chinese scholars have never found it easy to limit themselves to critical comment in their fields of study; academic criticism tends to overflow into political and social arenas, as happened in the tragedy of Tiananmen Square in 1989. Given these opposing tendencies, the road to academic freedom is likely to be an arduous one.

In spite of the constraints on academic freedom that the government places on them, China’s universities have become global actors, capable of holding their own in international circles of research and scholarship in many fields of the natural sciences as well as in some social and professional areas of knowledge. They already have well-established patterns for offering support to countries in Africa through the training of students and through bilateral projects, and they have recently begun a series of dialogues with leading scientists and intellectuals in India to share ideas and perspectives on Asian responsibility for global development. It remains to be seen when they will be accepted as genuinely equal partners with universities in Europe and North America.

Characteristics of an Emerging Chinese University Model

Despite controversies around quality and equity issues in the rapid expansion of Chinese higher education, as well as some continuing constraints on academic freedom, a number of characteristics can be detected that might signal the emergence of a Chinese model of the university. China has a rich history of education, and some aspects of its traditional education philosophy and pedagogy are evident in its contemporary methods of teaching. As more and more Chinese universities organize their curriculum around a core of basic subjects and emphasize interdisciplinary education, they are deliberately connecting reform to their own educational traditions.

China is perhaps one of the first systems to take a bold step to concentrate public research resources in an effort to create world-class universities. Its world-class university development plans, Project 21/1 and Project 98/5, might be seen to have triggered a worldwide competition. Related to this competition, the Academic Ranking of World Universities, launched by China’s Shanghai Jiao Tong University since 2003, has quickly gained international prominence. It is now widely viewed as providing a legitimate evaluation of universities worldwide.

Chinese universities exhibit a high level of engagement with national and local development and thus can be seen as providing services for economic and community development. This can be regarded as a legacy from the planned economy, which formed self-enclosed higher education “systems” that related to various sectors in the economy, but it turns out to be a strength in the market context. The recent expansion in size has dramatically enhanced the capacity at both the institutional and system level to have an impact on national and local social development and economic growth. Most Chinese universities are engaged in unique industry–university relations or the so-called integration of production, teaching, and research, which enables the universities to contribute directly to building China’s capacity for innovation capacity and its infrastructure. In particular, top universities are facilitating a transformation of the national economy from one with a solely industrial focus to a more knowledge-based economy through a variety of ways, including the creation of a series of science and technology parks in their proximities, which combine education, research, and industry. The most famous of these, Zhongguancun Science and Technology Zone, which is often called “China’s Silicon Valley,” surrounds China’s two most renowned universities, Peking and Tsinghua, in northwestern Beijing.

In addition, China has been extremely active in internationalizing higher education. The past thirty years witnessed 1.2 million Chinese students and scholars studying
abroad, among whom nearly 320,000 have completed their study programs and returned to China, with the result that the majority of leaders and many faculty in top universities have had international academic exposure. China has also recently become the world’s fifth-ranking destination for international students. Chinese universities have responded to globalization in other ways as well, such as through active participation in international university consortia. For instance, Peking University is an active member of the prestigious International Alliance of Research Universities (IARU), along with the Australian National University, ETH Zurich, the National University of Singapore, the University of California at Berkeley, Cambridge University, the University of Copenhagen Oxford University, the University of Tokyo and Yale University.

Urban Geography

Chéngshì dìlǐ 城市地理

Urban geography addresses the development of cities—from their origins and organizational principles to their evolving infrastructures and policies. China’s urban development has been most dramatically affected by shifts in its economic strategies, from a focus on national self-sufficiency to an increasingly active participation in the free market.

China boasts the largest urban population in the world (516.57 million in 2005) and a long history of urban development; its earliest city can be traced back at least 4,000 years. China also has more officially designated urban centers than any other country: 661 cities and close to 20,000 towns in 2005.

Cities in the Pre-Socialist Era

The earliest Chinese cities were built as administrative centers and were hierarchical in nature, with the national capital at the top, then several province/prefecture-level administrative centers at the next level down, followed by many local centers, and then, finally, by outposts such as county towns. After a period of significant commercialization of agriculture and coastal trade in South China in the tenth and eleventh century, commerce-based urban centers emerged and grew rapidly, adding another layer of cities to the preexisting administrative cities. In the vast countryside of the more developed regions, large numbers of market towns, either permanent or periodic, came into being as a result of the rise in agricultural productivity. These cities were organized based on the economics of trade.

Some of world’s largest cities of the time, such as today’s Hangzhou, emerged in China in the thirteenth century. Most preindustrial Chinese cities, however, were smaller in size and population and were set up largely as extensions of the rural economy. Unlike medieval cities in Europe, traditional Chinese cities never developed into autonomous political entities but remained seats of the centralized imperial power. Chinese cities were where government officials, wealthy landlords, merchants, and their families and servants lived. The cities also housed other service personnel such as artisans, sojourning traders, and entertainers. In general, different social groups lived in segregated quarters of the city.

A different genre of cities and towns (about 100 in total), called treaty ports, came into existence or grew rapidly in size in the nineteenth and early twentieth centuries in response to a new set of political and economic imperatives. These port cities (including Shanghai, Guangzhou, Shantou, Xiamen, and Hankou) were forced open for international trade under various unequal treaties whose terms were dictated by Western powers and Japan in this era of imperialism and colonialism. Hong Kong had a different political fate as a ceded territory to Britain, but the nature of its growth was very similar to many other treaty ports.

In the late nineteenth and early twentieth centuries, these cities also became the locus of modern China’s industrialization and Westernization. Extraterritorial
concessions controlled by Western countries were set up in many of them—a reflection of foreign dominance. The concessions were totally outside China’s legal and often administrative control. With a large foreign and domestic migrant population and a greater diversity of economic activities, the spatial social structure of the treaty ports was quite different from that of the “indigenous” cities.

**Urbanization from 1949 to 1978**

The industrialization strategy China adopted following the Communist victory in China’s civil war had tremendous impact on the urban geography of the country. The new government pursued an autarkic development strategy (one geared at national economic self-sufficiency) that put emphasis on promoting domestic industry—especially heavy industry—at the expense of agriculture; it also gave priority to production over consumption in an attempt to build a strong defense industry and catch up with the West in modernization. Achievement was often measured in terms of the physical output of steel and other industrial and military products. As part of this strategy, urbanization was curtailed in the 1960s and 1970s through the household registration (hukou) system, and other mechanisms tied to employment and housing. As a consequence, while China had a high industrial growth rate from 1950 to 1980, the rate of urban growth was comparatively low. Similarly, relative to China’s level of industrialization, its percentage of urban population was low by world standards.

This approach substantially curtailed the development of the service sector in cities and turned many cities into “producer cities,” cities heavily skewed toward manufacturing. The approach also fostered the emergence or growth of a large number of mining- and manufacturing-based cities, many of which were located in interior regions. The Third Front industrialization program in the period between 1965 and 1975 also pushed industrialization and the associated urbanization further inland. Inevitably, these producer cities became highly polluted. China’s command economy also reinforced the hierarchical nature of its cities. For example, provincial capital cities, as the centers of regional administration and economies, increased their dominance and became “primate cities” in the regional economy.

During this period, many elements of the urban landscape were designed to serve a specific political purpose and/or to showcase the grandeur of socialism. In almost all large and medium-sized cities, government buildings dominated the city center, large public squares were designed mainly for political gatherings, and statues of Mao were erected in the middle of traffic roundabouts in the

city center. Chinese city centers during this period usually had a low residential population density.

In this era, the danwei (work unit) was the constituent unit of urban society and economy. A danwei is a state-owned enterprise or an institution, such as a government agency, university, hospital, or military office, but it functioned more like a comprehensive cellular economic and social unit. A large danwei often occupied a walled compound, with one or more normally guarded gates, and were divided into workplace and residential areas. The residential structure was typically composed of rows of functionally and visually homogeneous low-rise buildings. Basic facilities and services, such as hospitals or clinics, grocery stores, cinemas, and dining halls, were also set up near the residential area.

The danwei served as a mechanism through which the state provided social services such as child care, education, employment, marriage, housing, health care, and retirement benefits. The state also exercised its social and political control through the danwei. Even leisure activities, which consisted largely of political studies, sports, and watching movies, were organized by the danwei. It is not an exaggeration to say that every urban worker was tied to the danwei from the cradle to the grave. Urban land was owned by the state and was assigned to the danwei at no charge. Urban housing was considered to be a welfare benefit, which was mainly provided at a nominal rent by work units and local housing authorities. Urban residents had few housing choices and had to wait for subsidized public housing, which they received based on a set of criteria, such as seniority, job rank, and marital status.

Without competition from a private real estate market, the state had little incentive to invest much in building new residential housing, and a severe housing shortage developed as China’s population increased. The quality and maintenance of urban housing were also very poor; the average per capita living space in the late 1970s was below four square meters. Cities remained compact, and there was not much suburbanization.

Even though the official ideology was to construct a socialist society with a uniform spatial and social organization, and the physical settings might have appeared to be similar, the social space varied considerably because work-units were ranked according to status and access to resources. This social differentiation was reflected in many aspects of life, such as the quality of housing, schools, and medical benefits.

Urban Geography in the Reform Era (1978–present)

The late 1970s saw a significant change in China’s economic strategy. The autarkic approach was finally abandoned in
favor of producing goods for export. By the end of the twentieth century, China rose to become the “world’s factory.” At the same time, measures to marketize the economy were also gradually introduced, though even today the government still plays a decisive role in running the economy. With China’s rapid economic growth, cities have also grown and changed, one major change being the higher rates of rural-urban mobility (mostly in the form of “temporary” migration). By the 1990s, many large cities became increasingly cosmopolitan and diverse socially and culturally, and marked by unbridled consumerism.

“LETTING SOME PEOPLE AND SOME PLACES GET RICH FIRST”

Different regions and cities have fared differently in the reform era, depending on their development history and, more importantly, government policies. Under Deng Xiaoping’s principle of “letting some people and some places get rich first,” China’s development focus shifted to the coastal cities. Shortly after the beginning of the reform, four cities (Shenzhen, Zhuhai, Shantou, and Xiamen) on the south coast were established in 1980 as special economic zones; Hainan joined this category in 1998. In 1984, fourteen cities on the east coast were designated as “coastal open cities.” The central government established economic development policies that favored these cities in an effort to attract foreign investment. Their good location and access to the international market and human resources has led to booming economic growth for these coastal cities.

THE WESTERN DEVELOPMENT PROGRAM

The development gap between the coastal zone and the interior has widened and become a major public and policy concern. In 1999, the government announced its Western Development Program, which was designed to channel more attention and resources to the Western provinces in order to reduce these regional gaps. At present, the core of the Chinese spatial economy is concentrated in three major regions centered on several large cities: the Pearl River Delta region (including the cities of Guangzhou, Shenzhen, Dongguan, and Zhuhai), the Changjiang Delta region (based on the cities of Shanghai, Kunshan, Suzhou, Wuxi, Nanjing, Hangzhou, and Ningbo), and the Bohai Gulf region (Beijing, Tianjin, and Dalian). Despite the establishment of the Western Development Program, the
western region and its cities are not an economic center, and the devastation wrought by the earthquake in May 2008 has created a further setback.

**Local Autonomy**

Fiscal decentralization since the 1980s has granted local governments (cities) more economic and political autonomy, and they have played a greater role in the national economy. Indeed, some have argued that local autonomy has brought *de facto* competitive federalism to China, but that is not an accurate reading of the situation. The hierarchical system of urban administrative jurisdictions means that local governments are evaluated by their supervisory units. Because the governments directly participate in the economy and because economic growth (fairly narrowly defined) is the prime objective of the central government, the criteria by which local cities are evaluated are necessarily heavily tilted to this set of rather parochial economic indices, such as various GDP indices, budgetary revenue, and foreign investment. To reach those targets, individual local governments adopt practices and policies that often sacrifice other public goods (such as the environment and labor welfare) and the broader regional and even national interests.

The pursuit of parochial interests within a small jurisdiction often leads to local protectionism as well as costly duplications. The hierarchical nature of the architecture of the administrative system is not congenial to horizontal cooperation. Answerable only to upper-tier governments and lacking a means to deal with neighboring jurisdictions, local governments often have to appeal to the upper-level governments to resolve interjurisdictional conflicts.

**The Transformed Landscape**

Rapid urban and economic growth has not only changed the spatial relations between regions and cities, it has also altered the internal structure of individual cities. There has been a parallel process of urban expansion and renewal. Economic growth in the urban sector has led to suburbanization and establishment of urban-type activity at the perimeter of urban zones. Cities push their administrative boundaries outward to include large amounts of farmland and many villages. Factories are relocated to the city outskirts, and new housing estates have mushroomed, encroaching on the farmland. At the same time, every major city has undertaken large-scale inner city (city center) redevelopment, striving to become an international economic and cultural center. Land development and sales are also important to local government finance.

Housing reform and urban land-use reform initiated in the late 1980s have contributed greatly to the transformation of the urban landscape. The urban land reform and land leasing system have commercialized urban space, which has gradually morphed into more discernible commercial, industrial and different grades of residential zones. The reform has opened households to more choices in housing location and tenure type. The traditional *danwei* have gradually declined, but they have not totally disappeared. Separation of workplace and residence has become increasingly common. However, the lack of coordination and governments’ and developers’ pursuit of short-term monetary benefits mean that the development is often piecemeal: Urban structure in Chinese cities is fragmented and multimodal, with mixed densities.

Many large Chinese cities now have a more Western look, with high-rise office towers, suburban housing estates, large shopping centers, special economic and technical zones, science parks, and college districts. These new, “modern” capitalist-type elements are juxtaposed, at times uncomfortably, with the large socialist-style public squares and uniform apartment buildings left from the prereform era. For example, the city center often contains both dilapidated lodging for the urban poor, new high-end apartment complexes, and skyscrapers hosting financial and commercial companies. In the suburbs, “economical” housing for low-income families are often put up next to luxury villas, and new industrial zones can be adjacent to residential neighborhoods and farmland. With continuing expansion and inner-city redevelopment, living in the city center has become more and more expensive. The suburbs and outlying areas have thus become a more important area for those who need to relocate, but many of these areas still lack quality facilities such as schools and shops.

Being gradual, adaptive, and partial in nature, economic reforms have resulted in a dual system of urban land and property development involving both market
and administrative mechanisms that are still fraught with problems, including corruption and disputes between displaced residents and developers and governments. At the urban periphery one finds many “villages in the city” that are often occupied by migrant workers who can only afford this type of low-end housing (they are not eligible for low-income public housing because they are not considered as “locals” under China’s hukou system). Many migrants congregate in enclaves based on their place of origin. A famous example is the Zhejiang Village in south Beijing. But the ambiguity of ownership makes these “villages” a headache for city planning and management; the common problems are overcrowding and the illegal installation of utilities infrastructure.

Even though the housing reform has improved people’s living conditions and granted them tenure, not everyone has benefited from it; new housing is too expensive for many urban residents, particularly rural-urban migrants, who have no association with the formal state sectors, and those who occupy the lower rungs of the employment hierarchy, such as laid-off workers from the state-owned enterprises. Due to increasing income and housing disparities, residential segregation, a term that was once alien to Chinese society, has become more frequently used within the lexicon of recent China scholarship.

Looking Forward: Accomplishments and Challenges

It is commonly acknowledged that China’s spatial environment and social space changed drastically after the reforms that began in 1978. Many big Chinese metropolises look much more cosmopolitan than their counterparts in other developing countries; as a whole, the national economy has grown rapidly, and many people’s living standards have been greatly improved. But these achievements have not been without costs and the improvement has not been equitably shared. In addition to the burden on the environment, there has been widening inequality among China’s population, due partly to the newly arrived market and partly to the many unreformed socialist institutions in the country. These pose serious challenges to the long-term sustainability of China’s development and urbanization model.

Urbanization

Because of its agrarian nature and socialist control over cities, until the 1980s China’s level of urbanization remained low. Since then, rapid rural-urban migration and aggressive reclassification have quickly transformed China into an increasingly urban society. Urbanization, now seen as a tool for economic development, has given rise to problems of inequality, social stratification, environmental degradation, and loss of arable land.

Urbanization is defined as the increase in the proportion of the overall population living in cities. It refers also to the social and economic changes that occur as a society becomes more urbanized. In the twenty-first century, China is being transformed from a predominantly rural economy to one that is predominantly urban.

The Level and Speed of Urbanization

For most of its history, China has been an agrarian society. Its earliest cities, created during the Shang dynasty (1766–1045 BCE), served mainly administrative, political, and ceremonial purposes. From those early days to recent decades, for thousands of years, the vast majority of China’s population was primarily rural; the urbanization level was extremely low.

At the time of the People’s Republic of China’s (PRC’s) first national census in 1953, only 13 percent of its population lived in urban areas, which was considerably lower than the world’s average (about 30 percent) and lower than the levels in most Asian developing countries, including India, Thailand, and the Philippines. Between the 1950s and early 1980s, China’s level of urbanization increased, albeit at a slow speed. (See table 1.) Urbanization accelerated from the 1980s onward and gained an average of more than one percentage point annually between 1990 and 2007, a rate faster than that of most Western industrialized economies at their respective stages of urbanization. In 2007, 44.9 percent—just shy of 600 million—of China’s population lived in urban areas. It is projected that by 2030, China’s level of urbanization will reach 60 percent, surpassing the world’s average.

Note: Except for the year 2030, all data are from China’s National Bureau of Statistics.
The measurement of urbanization in China is complex and hotly debated. For example, it is difficult to accurately estimate rural-urban migration, and reclassification often incorporates a large number of rural people into a newly defined urban area. These issues obscure the documentation of urban areas and urban population, a task delegated primarily to China’s National Bureau of Statistics. In the 1982 census, the urban population was defined as the total population found within the administrative boundaries of cities and towns. During the 1980s, however, the criteria for establishing cities and towns were significantly relaxed, and as a result, the number of cities and towns increased dramatically. Counting all the population in cities and towns as urban would have resulted in a grossly inflated level of urbanization. Therefore, in the 1990 census, a new and more restrictive set of criteria, focusing on population within cities’ urban districts and towns’ residents’ committees, was used. The 2000 census employed additional criteria of population density, population size, and the extent of built-up areas. Most scholars consider the definition used in the 2000 census more realistic and desirable than those in previous censuses. However, definitional changes from one census to the next have complicated comparison of urbanization levels over time.

Researchers have warned against taking Chinese urban statistics at face value. A common mistake is to neglect the role of reclassification when interpreting the number and population size of cities. The number of Chinese cities increased from 193 in 1978 to 655 in 2007. This rapid increase reflects not only rural-urban migration and urban natural growth but also aggressive efforts by rural and town governments to seek reclassification into cities, as reclassification would increase their autonomy and access to resources. At the same time, large cities have actively pursued annexation of adjacent counties and cities so the latter’s land could be put to revenue-generating uses. The city of Guangzhou in southern China, for example, incorporated Huadu County and the city of Panyu in 2000 and as a result more than doubled the amount of land under its jurisdiction. Chongqing became a municipality in 1996, and during that process incorporated a large span of rural areas. The total population of Chongqing in 2006 was close to 32 million, which has led some to consider it the largest city in the world, but in fact two-thirds of its population was rural.
While reclassification leads to an inflated picture of urbanization, the opposite occurs when only the resident population is considered and migrants are ignored. For cities that have received a large number of migrant workers, the difference can be enormous. For example, the number of permanent residents in Shenzhen in 2005 was less than two million, but if all migrants were included, then the city’s total population would have been more than 11 million.

**Socialist Control**

During the Maoist period (1949–1976), China followed a socialist model of development, one that emphasized industrialization, defined cities as sites of production rather than consumption, and discouraged rural-urban migration. Although rural-urban migration did exist—especially during the 1950s when rural collectivization, poverty, and crop failures pushed peasants to seek opportunities and survival in cities—the *hukou* (household registration) regulations that were promulgated in 1958 severely limited rural people’s ability to survive in urban areas and became a powerful tool for curbing rural-urban migration. The *hukou* system, which entailed state subsidies for urban dwellers, was also intended to accelerate city-based industrialization. Extending these subsidies to rural people would have bankrupted the state coffers, and thus controlling rural-urban migration became a necessity. Paradoxically, the state limited the growth of cities—interpreted by some as anti-urbanism—but its policy, in essence, privileged urban people and disadvantaged rural people.

The PRC inherited a spatial pattern of urban and industrial development that favored the eastern, coastal region. Not only did coastal cities enjoy geographical advantages such as good accessibility, but many had benefited in terms of trade and industrial development from their experience as treaty ports from the mid-nineteenth century onward. Policies and programs during the Maoist period, however, sought to undermine urban growth, especially the growth of cities in the eastern region. For example, the majority of state industrial investment during the First Five-Year Plan (1953–1957) went to the inland region. Convinced that the coastal area would be vulnerable if China were attacked, the state launched the Third

“Fully engage in the movement to increase production and to practice economy to set off a new upsurge in industrial production” propaganda poster from 1965, created by artist Yang Wenxiu. During the Maoist period, cities were defined more by production than consumption. COLLECTION STEFAN LANDSBERGER.
Front program (1965–1971), which involved moving factories and industrial workers from the coastal regions to remote and mountainous areas inland. Finally, justified on ideological grounds, the rustication movement during the Cultural Revolution (1966–1976) sent millions of urban youths, cadres, and intellectuals “up to the mountains and down to the countryside” to learn from the peasants. Some stayed in those remote locations for decades before finally returning to their urban homes.

Until the late 1970s, therefore, the pace of urbanization was kept slow and the size of cities was strictly controlled. The urban hierarchy—defined as the array of cities from largest to smallest—of China was rather flat, unlike most industrializing Third World countries, where one or two large cities (e.g., Jakarta, Mexico City) dominated the urban system. China’s development under Mao was therefore quite unique and has been aptly described as “industrialization without urbanization,” “industrialization with controlled urbanization” and “underurbanization,” in contrast with the “overurbanization” found in many developing countries, where massive rural-urban migration has given rise to acute problems of urban slums and unemployment.

Renewed Urbanization and Urbanism

Even after the economic reforms of 1978, China continued to adhere to a policy of controlling the size of large cities, moderately developing medium-sized cities, and actively promoting the growth of small cities and towns,
a policy inherited from the Maoist period. What is new in the first decade of the twenty-first century is that the Chinese state now sees urbanization as a powerful tool to modernize the nation and accelerate economic growth. But in order to avoid problems of overurbanization, the state pursues a strategy of steady, not speedy, urbanization. For example, the Eleventh Five-Year Plan (2006–2010) has as its target for increase of urbanization only 0.8 of a percentage point annually.

Chinese urbanization during the reform period has been pursued via two tracks: city-based urbanization and “urbanization from below.” City-based urbanization depends on the rationale that large cities and agglomerations are more efficient than smaller places. Thus cities, especially large cities, are repositioned as the nation’s economic nodes. Special economic zones such as Shenzhen have been transformed from rural places or small cities into full-fledged, globalizing urban centers. Large investment is pumped into “city-building” projects; often foreign elite architects are invited to design landmark districts and buildings, such as the Pudong New District and the “bird’s nest” Olympic stadium, in order to transform Shanghai, Beijing, and other large cities into truly international metropolitan centers.

The economic bases of these cities, meanwhile, are shifting from industries to services. Western-style malls, promenades, and business districts have mushroomed across Chinese cities, a clear indication of rapidly increasing urban consumption. The internal structure of cities has changed as well. While the center of Beijing, with Tiananmen Square and other monuments and structures, still symbolizes a political and historical hub of power, the rest of the city is rapidly expanding outward and vertically. Work-unit (danwei) compounds used to be where most urbanites lived, but today new high-rise condominium buildings and gated complexes are proliferating in the city and its fringes, thanks to the housing reform of the late 1980s that boosted the housing market and promoted home ownership. Rapid urban transformation, however, has jeopardized historical and cultural landscapes such as Beijing’s hutongs, the narrow alleys between traditional courtyard residences, and the associated neighborhoods.

“Urbanization from below” describes urban development that is driven by industrialization of small cities and towns and often based on local entrepreneurship and resources rather than state investment or initiatives. Related concepts such as “rural urbanization” and desakota (combining the Indonesian terms desa for village and kota for town) have been used to describe the juxtaposition of agricultural and industrial activities in rural spaces and on urban margins. The Pearl River Delta in south China, for example, is characterized by a large number of industrial enterprises in small and medium-sized cities, towns, and even villages, that are supported by foreign investment, social networks with overseas Chinese, and a large influx of rural migrants. By connecting to the world market and global commodity chains, some rural places in China are industrializing and urbanizing rapidly and as a result enjoying remarkable economic growth.

Challenges

The recent path of urbanization in China has given rise to new challenges of national and global significance. China’s rural-urban income gap has widened since the economic reforms and is larger than that in most other developing countries. In 2005, real rural income per capita was only 39 percent of real urban income per capita. Inequality within urban areas has increased as well, with the urban poor comprising mainly laid-off workers (from state-owned enterprises), the elderly, and the disabled. Social stratification has intensified, and residential segregation and heterogeneity is increasingly seen in Chinese cities. Migrant enclaves, for example, can be found not far from secluded complexes of mansions for the newly rich. Social, economic, and rural-urban polarization is a major reason for the surge in protests across China in recent years.

Increase in urban consumption, in conjunction with a growing middle class, is exerting severe pressure on China’s energy supply and urban infrastructure. Ownership of passenger vehicles more than doubled between 2001 and 2005, and in 2006 China surpassed the United States as the leading emitter of carbon dioxide. Water scarcity, waste management, and urban transport are among the pressing problems facing Chinese cities. Finally, urban sprawl is taking place at the expense of rural land and the environment. Loss of arable land is most serious at urban margins and in rural areas that are urbanizing. These are also the places where the border between urban and rural jurisdictions tends to be blurry and where environmental
regulations may not be strictly enforced, thus permitting sustained pollution. Addressing the challenges of urbanization in China, therefore, requires commitments not only from urban governments but also from authorities at various levels from the countryside to the city and from the local to the national.

U.S.-China Business Council

Měi-Zhōng Mào'yì Quánguó Wěiyuánhuì
美中贸易全国委员会

The U.S.-China Business Council is a non-profit trade association representing over 250 major U.S. corporations. It has promoted economic engagement since its founding, as the National Council for United States–China Trade, Inc., in 1973.

The U.S.-China Business Council (USCBC) is a private, nonprofit organization of more than 250 major U.S. corporations that do business with China. Founded in 1973 as the National Council for United States–China Trade, Inc., USCBC has offices in Washington, D.C., Beijing, and Shanghai. It provides information, advisory, and advocacy services to its membership; working with its counterpart organization, the China Council for the Promotion of International Trade (CCPIT 中国国际贸易促进委员会), USCBC’s mission is to develop commercial relations with China to the benefit of members and, more broadly, the U.S. economy. The council focuses on rules-based trade, investment, and competition, and on developing a commercial environment in China that is predictable and transparent to all parties.

Member companies include American Express, Anheuser-Busch, Apple, AT&T, Coca-Cola, Walt Disney Company, Time Warner, and more than two hundred others. USCBC is governed by a board of directors composed of corporate leaders; its 2007–2008 chair was W. James McNerney Jr., chairman, president, and chief executive officer of Boeing, a company at the forefront U.S.-China relations after President Richard Nixon’s historic trip to China in 1972, when trade with China resumed and the United States sold 10 Boeing 707 aircraft to China. Andrew N. Liveris, chairman and chief operation officer of Dow Chemical Company, took office as board chair on 1 June 2008.

USCBC History

The concept of turning to a private U.S. organization to encourage the development of trade relations through initiatives such as commercial missions and trade exhibitions arose from a report to Congress by House Majority Leader Hale Boggs and Minority Leader Gerald Ford. Reporting on their June–July 1972 China trip, Impressions of the New China, Boggs told the House that “until we have normal state relations with China, a quasi-public body” could lay a basis for U.S. trade with the PRC. Boggs urged private efforts to enlarge trade and business with China, and identified the China Council for the Promotion of International Trade (CCPIT) as the PRC’s channel for fostering trade relations “where lack of diplomatic relations might otherwise be a barrier to international contact.” Ten members of the board of the newly founded National Council for U.S. China Trade, which would become known as the UCSBC in 1988, traveled to Beijing in early November 1973 as the first formal U.S. trade mission to China since the People’s Republic of China was founded in 1949. Board members included the leaders of John Deere & Co.; JC Penney Co., Inc.; Manufacturers Hanover Trust Co.; and Westinghouse Electric Corp.
USCBC Today

USCBC hosts events featuring senior officials from the U.S. and Chinese governments. USCBC has received the following Chinese officials: President Hu Jintao, Premier Wen Jiabao, Vice Premier Wu Yi, and others from central and provincial governments. Recent U.S. public figures to meet with USCBC members in the United States and China have included Treasury Secretary Henry M. Paulson Jr., Commerce Secretary Carlos M. Gutierrez, former U.S. secretary of state James A. Baker III, Lieutenant General Brent Scowcroft, and numerous specialists on U.S.-China affairs from the executive branch of government. Other USCBC events include forums on green business practices and meetings on labor issues.

The council produces the China Business Review and China Market Intelligence in addition to books and reports aimed at helping business people understand China and facilitating business with Chinese companies. USCBC also produces policy reports and advocacy statements regarding labor, economy, trade, human rights, and politics. The council collaborates on programs and events with other organizations such as the National Committee on U.S.-China Relations, which, for example, cosponsored a luncheon held in New York in September 2008 for Premier Wen Jiabao, who, while in the United States, also addressed the United Nations and was interviewed on television by U.S. journalist Fared Zakaria.

The USCBC has been criticized for a pro-business, free-trade perspective that is insufficiently attentive to issues such as human rights, product safety, and child
America’s First Trade Mission to “the New China”

China’s market has been a magnet for U.S. merchants since the 1784 voyage of the U.S. ship, Empress of China. That vessel left New York and sailed east around the southern tip of Africa, across the Indian Ocean, into the Pacific, and up the Pearl River to Canton (Guangzhou), one of the Middle Kingdom’s thriving southern ports. The venture launched a trade that would grow and flourish until World War II.

In his report to U.S. Secretary of Foreign Affairs John Jay in 1785, Major Samuel Shaw, soon to be the U.S. Consul at Canton, explained how he got the Chinese interested in commerce with the United States: “By the map,” he related, “we conveyed to them an idea of the extent of our country, with its present and increasing population,” adding that the Chinese “were highly pleased at the prospect of so considerable a market for the production of their own empire.” And how “considerable” a market it would become—the two countries recorded $386.7 billion in bilateral trade in 2007 alone!

labor, and for government lobbying that focuses on the requirements of multinational corporations rather than small and medium-sized enterprises. As an established trade association it must continue to meet the needs of traditional members while attracting fast-growing, cutting-edge new businesses; it must also provide leadership in the midst of continued debate about trade restrictions, currency valuation, and cooperation as businesses and countries alike face the global economic challenges that began in 2008.

The U.S.-China Education Trust provides China’s future leaders with resources to learn about U.S. society in the context of the political, cultural, and economic forces that have given rise to the United States and its values.

The U.S.-China Education Trust (USCET) is a program of the F. Y. Chang Foundation, a private, nonprofit organization founded in 1998 by Ambassador Julia Chang Bloch, the first Asian-American to be appointed U.S. ambassador to Nepal (in 1989). The foundation, established to commemorate Chang Fu-yun, the first Chinese graduate of Harvard Law School (1917), supports subsequent generations of China’s Harvard Law graduates. USCET, the foundation’s largest program, supports activities in China and in the United States designed to promote U.S.-China relations.

USCET provides China’s scholars, professionals, and future leaders with resources to understand U.S. society in the context of the political, cultural, and economic forces that have given rise to the United States and its values. USCET projects are aimed at building confidence, basic understanding, and trust between China and the United States through support for U.S. studies programs at academic and policy institutions in China. Thirty-three Chinese institutions are affiliated with USCET through its American Studies Network (ASN), which provides a platform for members in China to communicate and share ideas.

The trust sponsors the Congressional Practicum, its first initiative in China, which includes elections seminars, training sessions, and lectures focused on teaching Chinese professionals, officials, and students about the U.S. legislative and political process through the use of hands-on-training, case studies, and interactive exchanges between Chinese and U.S. experts. USCET also runs media programs that explore the role of a free press and free speech in a free society and provides resources so that media professionals and students from both the United States and China might learn from each other. Its flagship Journalist-in-Residence program sends Pulitzer Prize winners to campuses across China. Other endeavors include the Financial Media Institute, a certificate program for undergraduate and graduate journalism students; symposia on international economics; fellowship programs; and the Greenberg/Starr Scholarships, which provide funding for poor Chinese students to attend universities in China.

USCET is a nonprofit organization founded with funding from the Starr Foundation, established in 1955 by Cornelius Vander Starr, an insurance entrepreneur and philanthropist, and with contributions from other organizations.

USCET successfully completed its inaugural session of the All China Summer Institute for the Study of the United States. From 5 July 5 to 2 August 2008 twelve Chinese professors from ten universities in China were invited to attend the institute to study American history and politics (in Washington D.C.) and American society and culture (with travels to Kansas City; Reno, Nevada; and San Francisco). And in October 2008 the USCET, in partnership with its American Studies Network and supported by
the Henry Luce Foundation, published for the first time in English the *All-China American Studies Directory: An Overview of American Studies in China*, edited by the USCET founder Julia Bloch. The directory lists over thirty institutions offering American studies in China and provides detailed information about each institution’s programs, resources, faculty, course work, and mission.

Uygurs are a Turkic group in Xinjiang Uygur Autonomous Region. During most of the past ten centuries they lived under the control of Mongolian peoples. After the Uygur rebellion of 1931–1934 the Chinese government granted the Uygurs the status of a minority people.

Uygurs are the largest of the Turkic groups who live in Xinjiang Uygur Autonomous Region, with an estimated modern population of 8 to 15 million in 1997. Uygurs account for almost half of the population of the area, with an additional third represented by the Han Chinese and members of other minority ethnicities accounting for the rest. During most of the past ten centuries these people lived under the control of Mongolian peoples. The Uygurs live in the Tian Shan range as nomads (although the nomadic population is decreasing). They herd sheep, cows, horses, goats, and camels. In oases near the Taklimakan Desert they farm with the help of irrigation canals or underground waterways to run meltwater. Popular crops are wheat, cotton, corn, and fruit (grapes, watermelons, and muskmelons). Trade is conducted across borders in the southwestern cities, where people weave traditional carpets.

The Uygurs today are Sunni Muslims, but earlier in their history they inclined to Manichaeanism (since the eighth century) and then Buddhism (since the tenth century). Before that they practiced shamanism and believed that heaven (tengri) gives order, power, and wisdom to people. Archaeologists have uncovered fragments of many kinds of texts on Manichaeanism, Buddhism, and Nestorian Christianity at archaeological sites in Uygur areas. Islam came to Uygur territory along the Silk Roads, and almost all Uygurs had become Muslims by the end of the fifteenth century, replaced Manichaeanism and Buddhism.

The Chinese government during the reform era (since 1978) has maintained an appeasement policy regarding religious expression, supporting the revival of religious activities, including reconstruction of mosques and religious schools and supporting publication of books in Uygur in an effort to promote reform and an open-door policy. This policy is an attempt to mend the damage done by the Cultural Revolution (1966–1976), when much of the culture of the pre-Communist period was destroyed. Muslim Uygurs hope that this policy will lead to a resurgence of religious and ethnic autonomy, but their optimism is cautious. They fear that their cultural and ethnic sovereignty will be overwhelmed by the region’s burgeoning Han Chinese population. China, for its part, is sensitive about issues affecting its sovereignty over the Xinjiang Uygur Autonomous Region.

Early History

The term Uyghur originally was the name of one of the Nine Tribes (Tokuz Oghuz), a confederation of Turkic nomads that first appeared in the annals of Chinese history in the early seventh century. A clan of the Uyghur tribe,
the Yaghlakar, founded a state (744–840 CE) in what is now Mongolia. This state’s most noteworthy contribution was the military rescue of the Chinese Tang dynasty (618–907 CE) from the crises created by the rebellion of General An Lushan (703–757). In return, the Chinese emperor gave the Uygur state a large monetary award each year. The Uygurs strengthened their relationship with the Sogdian merchants (Sogdians were a people who lived in Transoxiana, now Uzbekistan), who traded horses from the Uygur state for silk from China. In 763 the Uygurs allowed the Sogdians to perform Manichaean missionary work. The city of Ordubalik (Town of the Palace), located on the Orkhon riverside and later named “Kara-balghasun,” enjoyed its greatest era during this time. The Sogdians traded with their colonies along the Silk Roads leading to China and the Uygur state.

The ruling classes of the Uygurs attempted to strengthen economic and social relations with the Sogdians, an attempt that caused unrest among nomadic Uygurs, who were suffering from famine and pestilence, and, in 839, from heavy snowfall. Probably recognizing the chance to take advantage of the situation, a large number of Kyrgyz—a Turkic tribe in the upper Yenisey Valley—allied with a discontented Uygur general and invaded and burned Ordubalik, bringing down the Uygur government in 840. Both Uygur nomads and nobles of the ruling classes emigrated, settling eventually in the area from the Tian Shan range to Gansu Province in northwestern China. Immigrant Uygurs established at least two new states—the Uygur kingdom of Ganzhou (890–1028) and the West Uygur kingdom (early tenth century–1284). Descendants of the Ganzhou Uygurs may be the Yugur in Gansu, traditionally known as the “Yellow Uygurs.”

**Chinggis Khan**

The Tangut people (herders from the Ordos Desert area of northern China) absorbed the Uygur kingdom of Ganzhou into their Xi Xia kingdom in 1028. In the 1130s the West Uygur kingdom fell under the control of the Kara Khitan. In 1209, unable to bear the tyranny of the local Kara Khitan magistrate, the king of the Uygurs had him killed. The king no doubt was emboldened by the promise of protection from a new and more powerful overlord: the Mongol conqueror Chinggis Khan (often spelled Genghis Khan). The king surrendered the West Uygur kingdom to Chinggis Khan in that same year; it survived as a Mongol vassal state until 1284. The Uygurs originally were supposed to provide military service for the Mongol empire but ended up holding higher positions in government.
At the end of the thirteenth century a dispute over succession among the Mongol khans turned the Uygur lands into a battlefield, and by the early fourteenth century the castle towns in the Turfan Basin were devastated by war. The Uygur royal family and its subordinates found refuge in Gansu in 1284, and the Uygur lands came to be ruled by the descendants of Chagatai Khan, son of Chinggis Khan. When the Kashgar Khojas, Islamic nobles, gained power in the seventeenth and eighteenth centuries, Islam and Islamic culture—for example, the Naqshbandiya order of sufi (Islamic mystics)—spread among the Uygur people. Galdan Khan (1645–1697), leader of the Oirats of western Mongolia, occupied the land of the Uygurs for seventy years after an invasion in 1679. During the first half of the eighteenth century under Galdan’s successors, many Uygur farmers (later called “Taranchis”) of southern Xinjiang were forcibly relocated to the Ili Valley on the northern border.

Chinese Rule

In 1760 the Uygur territory was conquered by military expeditions of the Chinese Qing dynasty (1644–1912). In 1881 approximately forty-five thousand Uygurs relocated to Semirechie in Kazakhstan. The Uygur people in the oases around the Taklimakan Desert came under Chinese rule in 1884 when Xinjiang Province was established there. After the Uygur rebellion of 1931–1934 the Chinese government granted the Uygurs the status of a minority people at last, which provided them with national recognition, various rights to promote their own culture, and, in the modern era, the right to disregard China’s one-child policy.

The Uygurs, with China’s Kazakh minority, founded a state (the East Turkistan Republic) in northern Xinjiang in 1944–1949, but the newly founded People’s Republic of China absorbed it in October 1949.
In 1955 the Chinese opened an administrative office in the Xinjiang Uygur Autonomous Region at Urumchi. About sixty thousand people, including Uygurs and Kazakhs, emigrated to Kazakhstan in 1962. Today more than two hundred thousand Uygurs are citizens of Kazakhstan.

Uygurs gained a certain amount of international attention in 2008 due to several violent incidents in western China by Uygur nationalists on ethnic Han Chinese, resulting in fatalities. While the Uighurs have had nationalist movements since the establishment of the PRC in 1949, it is since the attacks of September 11, 2001 that the government of the People’s Republic of China has used new techniques to encourage harmonious relationships between the Uygur minority population and the rest of China, and has focused on promoting all minority groups in the new face of China’s ethnic milieu.

吃水不忘挖井人

Chī shuǐ bù wàng wā jǐng rén
One of a number of Jesuit missionaries who were sent to China from Rome in the seventeenth century, Father Ferdinand Verbiest was befriended by the K’ang-shi emperor and became one of the foremost astronomers and scientists in China.

Father Ferdinand Verbiest was born in Pittem, a small town in what is now Belgium, and from an early age he studied at the institutions of the Jesuits in Belgium and in Seville, Spain. He excelled at mathematics, science, and astronomy, as well as languages: He was fluent in Flemish, Latin, German, Italian, and Spanish. At the age of eighteen, he joined the Society of Jesus in the hope of going to work in the missions in Central and South America. But the Jesuits had other plans for him; word had come from the Far East, calling for more priests to carry on missionary work in China. Father Ferdinand at once set about to learn Manchu, gaining much fluency by the time he left for China in 1658. He was one of about thirty-five missionaries sent by the Jesuits.

The subsequent years were difficult ones. The missionaries faced varying degrees of persecution and privations, since their fates were closely tied with Chinese politics. When the Shunzhi emperor died at a young age, the affairs of the state fell into the hands of four co-regents who governed on behalf of his seven-year-old successor, K’ang-shi. The regents looked unfavorably on the influence of the Jesuits, and sought to discredit them by an old custom in which they pitted them against renowned shamans of the court. The Jesuits, led by Father Johann Adam Schall von Bell, lost the competition to a Muslim shaman, Yang Guangxian. Schall and the others were imprisoned on the charge of spreading Christianity (labeled an evil religion), and sentenced to death. They were saved by an earthquake, however, which was interpreted as a sign of heavenly displeasure. All the inmates in the prison were released, including the Jesuits. A few years later, Father Verbiest underwent a similar competition, again against Yang, but this time the Jesuits won.

In 1699 the heir to the throne came of age and took power as the K’ang-shi emperor. He, like his father, favored the Jesuits, and within the year, Father Ferdinand was placed in charge of the royal observatory and was made the overseer of the dissemination of mathematical knowledge in the kingdom.

One of his first tasks was to complete a calendar that would reform an inaccurate lunar calendar, devised by a Muslim rival of the Jesuits, which had included an extra month. The new calendar that Father Ferdinand made used solar rather than lunar calculations and was personally approved by the emperor, thus becoming the new standard across China. Thereafter he and Father Ferdinand became close friends, and the Jesuit taught the young emperor mathematics and geometry, music, and philosophy. As a result, Father Ferdinand’s stature grew, and he became one of the most influential men of his time in China.

Among the things he devised for the emperor were star charts, a cannon, and even a steam-driven toy cart, which some say is the first automobile. The star charts, which became a great aid to navigation, clearly identified...
the various constellations and celestial bodies and located their exact position in the sky. The cannons that were cast were far superior to the ones then in use in the Chinese army, in that they could withstand prolonged use without fear of explosion from overheating. In addition, he designed and had cast six astronomical instruments in 1673, which were housed in a newly built observatory in Beijing. Replicas of these instruments may still be seen at the observatory; the original instruments were removed during the Boxer Rebellion and taken to Prussia by the Germans. Among the instruments that would prove the most beneficial were the sextant, which one could use to determine latitude; the ecliptic armilla, which was used to calculate ecliptical longitude and latitude of the stars and planets; and the equatorial armilla, which allowed for the computation of true solar time.

Father Ferdinand also wrote more than forty books on science, mechanics, astronomy, and theology. As special gifts for the emperor, he created a world map and a table of all lunar and solar eclipses for the coming two thousand years. This world map included the latest details available, and was the most complete of its time. Its impact was immeasurable in that it sought to chart the entire world from the Chinese point of view. China was the locus, from which the various points of longitude and latitude radiated.

Father Ferdinand died in 1688 after falling from his horse. He was buried in Beijing near equally renowned fellow Jesuits: Fathers Matteo Ricci and Johann Adam Schall von Bell. The emperor bestowed upon him a posthumous name; he was the only European to have been given such a royal honor. Through his work in mathematics, physics, engineering, astrology, mechanics, cartography, philosophy, and theology, Father Verbiest provided a wide-ranging and comprehensive view of Western scientific traditions to the Chinese intellectual tradition.

Vernacular Language Movement

Báihuàwén Yùndòng 白话文运动

The Vernacular Language Movement, which fostered a radical change in the writing style of Chinese composition, developed from century-long usage of a northern dialect in literature and gained momentum during the student and intellectual-led New Culture Movement (1917–1923). It won nation-wide acceptance in the 1920s and has made a lasting impact on education, communication, and literary research.

The Vernacular Language Movement began with efforts of the radical wing of the educated elite in the early twentieth century. The efforts to replace classical Chinese (wenyan) with spoken language (baihua) in nearly all written works were stimulated by a sense of national crisis in the late nineteenth century. After sporadic, short-lived attempts at the turn of the twentieth century, the movement acquired momentum in the mid-1910s when using the vernacular in writing became a major agenda in the New Culture Movement (1917–1923), a period of student and intellectual protests. By the early 1920s vernacular in written Chinese finally gained nationwide acceptance as a reputable style in prose, poetry, and fiction and was officially designated the style for school textbooks.

The vernacular that became a national language in the 1920s was originally a northern dialect, spoken with varied local accents by people living in areas north of the Huai River. It acquired broader usage within officialdom, hence the name “Mandarin” (guanhua). National mobility in warfare, social advancement, and economic activities had contributed to wider usage of Mandarin Chinese since the Song dynasty (960–1279). Fiction, which came to maturity during the Song dynasty and drew inspirations from Tang dynasty (618–907 CE) bianwen (stories of Buddha and his disciples written in vernacular) and Tang chuanqi (short stories, or romance), as well as storytelling and stage performance, were written in Mandarin Chinese. By the end of the nineteenth century, fiction written in the vernacular and often intended for social criticism had national circulation. Although it was a noticeable force in literature, the vernacular remained heterodox because wenyan Chinese received institutional support as the normative style in the official Civil Service Examinations.

Several forces converged to propel the Vernacular Language Movement at the turn of the twentieth century. First among these, ironically, was awareness among the literati that wenyan Chinese restrained China’s progress. Wu Rulun (1840–1903), a leading member of the Tongcheng School known for its elegant style in wenyan prose, was among the first who viewed wenyan as contributing to China’s backwardness in comparison with the West. He considered a standardized form of Mandarin Chinese to be necessary for providing mass education. Huang Zunxian (1848–1905), a diplomat to Japan and an activist in political reforms, advocated the vernacular and experimented in using it to compose poetry in classical form.

Awareness of the need for a national language in the
vernacular was sustained by the growing forces of nationalism and modern mass media at the turn of the twentieth century. Liang Qichao (1873–1929), the energetic political reformer and journalist, had a lasting impact on the generations after him through his promotion of “new fictions” as a means to enlightenment and national strength. Liang also wrote fiction and poetry in the vernacular that were read by many. His passionate appeal and innovative experiments inspired further attempts.

Magazines that published “new fictions” written in spoken language—as well as newspapers such as Chinese Vernacular Newspaper, Hangzhou Vernacular Newspaper, Newspaper of Anhui Dialect, Anhui Vernacular Newspaper, Ningbo Vernacular Newspaper, Chaozhou Vernacular Newspaper, and Citizens’ Vernacular Daily—appeared in cities along the southeast coast. These publications, however, did not last long.

In 1905 wenyan Chinese lost its institutional ground when the Civil Service Examinations were abolished. The reform in education gave rise to a new generation of Chinese leaders whose education in Western-style schools in China or in the West gained social legitimacy. The most vocal advocates for the vernacular then were those who were well versed in both Chinese and Western traditions. Thus, it was not accidental that the most passionate discussion of language reform first took place among Chinese students abroad, who led the Vernacular Language Movement in the 1910s.

Language Reform

Between 1915 and 1917 a small group of Chinese students pursuing graduate degrees at Cornell, Columbia, and Harvard universities engaged in an informal but serious discussion of Chinese language reform. They all supported the ongoing New Culture Movement and saw language reform as necessary for a revolution in literature. Yet, some vehemently opposed introducing the vernacular into poetry. Ren Hongjun (1886–1961) and Mei Guangdi (1890–1945) held the deepest doubt about the feasibility of the vernacular in poetry, which they viewed as ill-matched for rhythm and elegance, the key elements in the form. Hu Shi (1891–1962), however, was determined to bring the vernacular into all forms of Chinese literature and composed verses in the vernacular as a means of debate with his friends. In 1917 he published an article entitled “A Preliminary Discussion on Literature Reform” in the New Youth, a magazine founded by Chen Duxiu, another advocate for literature in the vernacular.

The debate about literature in the vernacular instantly became a focus of the New Culture Movement, which

These members of the New Culture Movement advocated literature written in the vernacular language of the masses. Clockwise from left: Chen Duxiu, Hu Shi, Lu Xun, Cai Yuanpei, and Li Dazhao.
made *New Youth* its major forum. Qian Xuantong and Liu Bannong, two professors at Beijing University and major leaders in the New Culture Movement, engaged in a mock debate to promote vernacular literature. It caught national attention and became a memorable episode in the movement. In 1918 the Vernacular Language Movement established yet another landmark in publishing “A Madman’s Diary” by Lu Xun in *New Youth*. Other proponents, such as Zhou Zuoren, Liu Bannong, and Sheng Yinmo, also composed and published works in prose or poetry in the vernacular. By the end of the 1910s using the vernacular in written Chinese had gained acceptance beyond a small group of advocates and became a national phenomenon.

In the final phase of the vernacular’s rise, defenders of classical Chinese fought three rounds of battle before giving up. The first battle, ironically, came from Lin Shu and Yan Fu, who would otherwise be viewed as pioneers in modern Chinese literature and harbingers of the New Culture Movement through the influence of their translated works from Western literature and thought. Between 1917 and 1919 Lin Shu took a public stand against the vernacular by publishing three articles and two short stories. He attacked the Vernacular Language Movement by insinuating, through his fictional characters, that Chen, Hu, and Cai Yuanpei, their supporter and chancellor of Beijing University, were three “demons.” Yan Fu viewed Lin’s attack as “laughable” and refrained from making public statements. But Yan did express his disdain for the advocates of the vernacular as “spring birds and autumn insects” that would go away with the season. The second battle came from some scholars gathered around *Xueheng* magazine, who were mostly U.S.-educated scholars, while some, such as Ren Hongjun and Mei Guangdi, were friends of Hu Shi. The most active opponent of the vernacular among this group was Hu Xiansu (1893–1968), who wrote articles in debate with Hu Shi. Interestingly, the *Xueheng* group did not oppose a revolution in literature but warned against the radical tendency to abandon classical literature, a significant part of Chinese cultural heritage they cherished. The final attack came from Zhang Shizhao through the *Tiger Weekly* in 1925. By then the vernacular had been a “national language” for four years, since elementary school textbooks had been written in the vernacular in accord with an order from the Ministry of Education in 1920.

**Mass Communication**

The Vernacular Language Movement succeeded in incorporating the language of the masses into written works yet remained a movement of the elite. Its long-term impact can be found in education, in national communication, in writing style, and in research on Chinese literature. Using the vernacular in textbooks made education more accessible to ordinary people. The vernacular further developed and reinforced the historical practice of using Mandarin Chinese as the national language of communication. As the strict rules of composition in classical Chinese were abandoned when written Chinese took the form of the vernacular, it opened the way to importing more foreign (Japanese and Western) elements into the Chinese lexicon, grammar, and composition. In 1927 Hu Shi published *A History of Vernacular Literature*. The work provided the Vernacular Language Movement with historical justification in the Chinese context and encouraged further studies of Chinese vernacular literature in the premodern period.

Hu Shi. (1923). Wushi nian lai Zhongguo zhi wenxue [Chinese literature in the past fifty years]. In *Shenbao Guan, Shenbao wushi zhounian jiniance* [A volume in commemoration of the 50th anniversary of Shenbao]. Shanghai: Shenbao.

The Treaty of Versailles marking the end of World War I did little to resolve issues of China’s national sovereignty. Japan, which fought on the side of the Allies, occupied German holdings in Asia during the war, including China’s Shandong Peninsula. The treaty condoned Japan’s actions, sparking Chinese nationalist protests.

The Treaty of Versailles, signed on 28 June 1919, marked the end of World War I for Europeans but did little to resolve fundamental disputes related to China’s national sovereignty. Talks between world leaders began in January 1919. The most important participants were the United States, Japan, Great Britain, France, and Italy. Russia had undergone Communist revolution in 1917 and did not participate. China was represented by delegates from Duan Qirui’s Beijing government, a warlord regime that actually controlled little of China. Asia was not the focus of talks, and China’s concerns were not paramount.

Tokyo had been determined to use World War I to increase its influence in East Asia. Shortly after fighting broke out in Europe, Japan joined the Allies and occupied German holdings in Asia, including China’s Shandong Peninsula. In early 1915 Japan presented the Twenty-One Demands to China. The demands were to give the Japanese privileges and power greater than what they had obtained through the unequal treaties, a series of agreements forced upon China by the imperialist powers since the 1840s. Yuan Shikai, leader of China until early 1916, attempted to weaken the demands and hoped to find a way to restore Chinese control in Shandong.

China entered World War I on the side of the Allies in 1917. Duan Qirui’s government sought to obtain foreign loans, international legitimacy, and a voice at the postwar peace settlement. To many Chinese, joining the Allies was a way to remove Japanese influence in Shandong Province. U.S. president Woodrow Wilson’s Fourteen Points, first articulated in January 1918, offered hope to Chinese Nationalists because the president called for open diplomacy, self-determination, and the creation of an organization “for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike” (Wilson, 1918).

Japan’s effective great power diplomacy and support for the Allied cause ensured that the Europeans acquiesced to Tokyo’s demands. The Lansing-Ishii Agreement of 1917 had given the Japanese confidence that the United States would not interfere with Japan’s “special interests in China,” while the United States assumed that Japan accepted the Open Door principle and China’s territorial integrity. Weak protests from the U.S. delegation at Versailles, France, had little effect, and Wilson placed priority on enticing the European powers and Japan to support the League of Nations. Article 156 of the Treaty of Versailles ratified Japanese control of Germany’s concessions in the Shandong Peninsula. Japan also obtained control over German possessions in the southwest Pacific as one of the treaty’s “mandates.” In short, the treaty ratified Japan’s wartime imperialism.

In China and among overseas Chinese communities
around the world, the Treaty of Versailles sparked outrage at the Japanese, China’s warlords, and imperialism in general. The protests and strikes that resulted were known as the “May Fourth Movement.” Although no longer in power, Duan was accused of being a puppet of the Japanese, as were the Chinese representatives at the peace conference. The Beijing government repudiated the Treaty of Versailles but was unable to modify Article 156 or other parts of the treaty. Many students and intellectuals were bitterly disappointed at the United States and Wilsonianism. Some of those people moved to political action by the treaty would go on to establish the Chinese Communist Party in 1921.

Video Games
Diànzi yóuxì 电子游戏

Video games began to appear in China more than thirty years ago and are now ubiquitous. While this new form of entertainment has become a popular pleasure activity, especially among youths, it has also caused serious concerns among the public.

Historians generally agree that the U.S. physicist Willy Higinbotham invented the video game in 1958 when, to entertain visitors at Brookhaven National Laboratory in Long Island, New York, he demonstrated the interactive game Tennis for Two on an oscilloscope. One year later he improved this invention and displayed it on a 38-centimeter (15-inch) monitor.

Video game players use an interface device such as a paddle, joystick, mouse, or computer keys to manipulate images on a video display or television screen, and have changed quite dramatically from Higinbotham’s first version. In 1971 the first video arcade games appeared. In 1972 Magnavox marketed the first home television video game. In 1973 Pong was the first commercially available video game, marketed by Atari. The Atari Video Computer System (VCS) was released in 1977 with an introductory price of $199.95. It was the most popular video game console of its day and was available until 1990, being on the market longer than any other system in history. Several hundred games were developed for it. Atari software and hardware rights were sold to Hasbro for only $5 million in 1998.

Development in China

Video games in China developed more than thirty years ago, evolving from TVs and PCs to mobile phones, and from single PCs to networks to mobile games as developers made hardware and software innovations. In the early 1980s arcade video games appeared in some children’s entertainment places and adolescents’ activity centers in China. By the middle of the 1980s or so, electronic video games arrived in China. In the 1990s a new type of family computer quietly entered China—Family Computer (FC) of Nintendo in Japan. With the price gradually going down, FC went into more and more homes and became an indispensable part of the recreational facilities of many families. Around 1993 a new kind of game computer—the sixteen-bit Sega MD—was introduced in China. It had brighter colors and richer game content. Sega MD and the sixteen-bit Nintendo SFC have brought Chinese game players closer to the video world.

With the popularization of the Internet in China, online games also have become more accessible to Chinese players. In June 1998 the website OurGame was established as the first website specializing in online games in China. It provides such online games as Encirclement, Chinese chess, and Chinese checkers for registered users. By May 2001 OurGame had the most game players in the world. Later companies in Taiwan and South Korea began to promote games in China. In 2001 Shanghai Shanda Interactive Entertainment Limited, an agent of the Korean online game Legend, began amassing a legendary Internet fortune in China and has become the largest...
online game enterprise in China. At present video games in China concentrate on these media platforms: screen machines, palm screens, home televisions, Internet bar computers, mobile phones, and home computers. With the development of technology the last two platforms may become the most popular.

**Market for Online Video Games**

China has a large online game market. In 2002 players of online games outnumbered players of single computer games and arcade games. According to the 21st Report on China’s Internet Development by the China Internet Network Information Center (CNNIC), 120 million Netizens (active participants in the online community of the Internet) play online games; adolescents are the main players; 73.7 percent of Netizens under eighteen years of age have online game experience. Low age, low income, and low educational level are the three significant characteristics of online game players.

According to a 2007 survey of the Chinese game market, the scale of the Chinese electronic game industry increased considerably in 2006, and the industry’s overall income in 2006 increased 68 percent over that of 2005. Online games, other types of video games, handheld game consoles, mobile phones, and the like enable players to play games at any place without any limitation. The market for mobile phone games is also large, and it is expected to reach a total value of five billion Chinese yuan in 2008, which is about 714 million U.S. dollars. The video game market in China is rapidly growing and is reinforcing the development of local original software as domestically made games increase and dominate the market in China.

**The Future**

The central government has placed many regulations on video games, especially for young students playing in Internet bars. On the other hand, with the popularization of the personal computer, people will tend to play video games mostly in the home. The number of younger players is also likely to increase. To cater to the tastes of those younger people, the research and development departments of video game companies will focus on content and design. In China new college curriculums attract majors in animation, art design, and creation, reflecting societal needs and desires and also the potential of the consumption of video games.

Vietnam–China Relations
Yuè-Zhōng wàijiāo guānxi 越中外交关系

China and Vietnam share a complicated history. Their relationship has been characterized by long periods of collaboration and shorter periods of conflicts. Currently relations and collaboration are expanding and the two countries are addressing their territorial disputes through negotiations.

Vietnam was a part of the Chinese empire for more than a thousand years before gaining independence in the tenth century CE. However, the independent Vietnam remained under Chinese cultural and political influence, and a tributary relationship developed. The period of French colonial rule in Vietnam during the second half of the nineteenth century and the first half of the twentieth ended this close relationship.

After Vietnam regained independence from France in 1954, relations between China and Vietnam were officially closed until the end of the Vietnam War in 1975. Thereafter, relations deteriorated further into open hostilities in early 1979, and tensions remained high for most of the 1980s. During the late 1980s relations started to improve, leading to full normalization in November 1991. The 1990s were characterized by two contradictory trends: expanding and improving relations in most fields on the one hand and recurring periods of tension relating to border disputes on the other hand. Both countries are trying to manage and eventually settle the border disputes. The early 2000s have been characterized by less tension compared with the 1990s relating to territorial issues and by expanding political and economic relations.

Background

Relations between the countries were close during the 1950s and for two decades China provided the Democratic Republic of Vietnam with extensive economic and military assistance. China sent thousands of advisers to assist in various fields. China also provided considerable assistance during the Vietnam War. However, differences between the two nations developed during the 1960s and into the first half of the 1970s because of varying perceptions of the Soviet Union and divergent views on relations with the United States. After the 1973 Paris agreement, which led to the withdrawal of U.S. troops from Vietnam and established a cease-fire in the Vietnam War, the Vietnamese claimed that Chinese leaders had advised them to diminish the level of the fighting in the south for a few years, advice perceived as aimed at keeping Vietnam divided. China rejected this claim.

Sino-Vietnamese Relations, 1975–1991

In 1975 China’s allies emerged victorious in the war in Vietnam, and experts expected that relations between China and Vietnam would continue to be very close. However, relations between China and Vietnam dramatically declined from seemingly good in 1975 to war in
1979. Relations deteriorated over several issues. First were differences in opinion concerning the Soviet Union and China’s uneasiness about Vietnam’s relations with that country. Second were conflicting interests in Cambodia and China’s gradually increasing support for Cambodia in the conflict between Vietnam and Cambodia. Third, territorial disputes between China and Vietnam caused tension. Fourth, the way in which the ethnic Chinese in Vietnam were treated became an issue. In fact, the mass migration of ethnic Chinese from Vietnam in the spring of 1978 officially led to the public deterioration of bilateral relations between the two countries.

The overall deterioration of relations led to a militarized conflict that escalated into China’s attack on Vietnam in February and March 1979. China declared that the attack was a response to Vietnamese attacks on China. China claimed to have captured three of six provincial capitals in the bordering provinces of Cao Bang, Lang Son, and Lao Cai as well as seventeen cities and counties before announcing a withdrawal on 5 March. China
announced that the withdrawal was completed by 16 March.

The normalization process between China and Vietnam began with low-level contacts in the mid-1980s and expanded to high-level meetings in early 1989. In early September 1990 a (then-secret) high-level meeting was held in China. Despite this meeting the normalization process lacked momentum on the political front. This situation prevailed until mid-1991, when the normalization process gained momentum. The increased diplomatic interaction paved the way for a high-level summit in early November 1991, when bilateral relations were officially fully normalized.

The full normalization of relations between China and Vietnam was made possible by the removal of the differences between the two countries regarding relations with the Soviet Union with the Sino-Soviet normalization of 1989 and by the formal resolution of the Cambodian conflict through the Paris agreements in October 1991, which removed two deeply dividing factors from the agenda.

**Relations since 1991**

After full normalization the relationship between China and Vietnam was characterized by two contradictory trends in the 1990s: expanding contacts and cooperation in many fields but tension relating to territorial disputes. The early 2000s have been characterized by continued expansion of relations and collaboration and by less tension relating to the territorial disputes as compared with the 1990s.

The positive trend in bilateral relations can be seen in the expanding political, cultural, economic, and military contacts between the two countries. Official delegations from one country regularly visit the other country to discuss ways of expanding relations in various fields. Increased economic ties since 1991 can be seen in bilateral trade, which grew from $32 million in 1991 to $1 billion in 1996 and from $10.42 billion in 2006 to $15.85 billion in 2007. The bilateral trade displays a steadily growing trade surplus for China. China has also provided loans and assistance to upgrade Chinese-built factories in northern Vietnam. In the political field the close relationship between the two ruling parties—the Chinese Communist Party (CCP) and the Communist Party of Vietnam (CPV)—expanded through a steady stream of exchange visits at various levels. The contacts between the armed forces of the two countries have also expanded through regular exchange visits.

Sharp differences relating to all the territorial disputes (that is, overlapping claims to the Paracel and Spratly archipelagos, to water and continental shelf areas in the South China Sea and in the Gulf of Tonkin, and to areas along the land border) were prevalent from May to November 1992. Differences relating to oil exploration in the South China Sea and the signing of contracts with foreign companies for exploration were prevalent during parts of 1994, 1996, and 1997. During 1998 shorter periods of tension relating to the disputes occurred.

During 1999 talks focused on reaching a settlement of the land border dispute and resulted in the Land Border Treaty on 30 December 1999. This treaty was ratified in 2000, and the demarcation process is expected to be completed before the end of 2008. The border disputes created no significant tension during 1999. During 2000 the focus was on resolving the Gulf of Tonkin dispute and led to the Agreement on the Demarcation of Waters, Exclusive Economic Zones, and Continental Shelves in the Gulf of Tonkin on 25 December 2000. On the same day the two countries signed the Agreement on Fishery Cooperation in the Tonkin Gulf and the Regulations on Preservation and Management of the Living Resources in the Common Fishery Zone in the Gulf of Tonkin. The agreement on demarcation was ratified and entered into force in 2004 after the completion of additional talks on supplementary protocol of the fishery agreement had been completed. The trend of no significant tension caused by the remaining border disputes in 1999 continued to prevail in 2000.

Since 2001 tensions relating to the disputes in the South China Sea have mainly been contained through talks at government and expert levels. However, official protests have been issued in response to a limited number of actions carried out in or in relation to the South China Sea area.

**The Future**

The future of relations between China and Vietnam will be determined by how successfully the two sides handle disputes. Deepening bilateral cooperation in different fields and expanding economic interaction have
Vietnam–China Relations

contributed to building a more stable bilateral relationship. The progress in managing the territorial disputes has also improved the prospect of long-term stability in the bilateral relationship.

Despite these positive developments the disputes in the South China Sea area remain a threat to a stable relationship both through the overlapping sovereignty claims to the Paracel and Spratly archipelagoes and the disputes over resources in maritime areas. Potential future challenges to bilateral relations include risks associated with economic competition and uneven trade relations as well as risks associated with developments affecting the Mekong River.

Wang Fuzhi (1619–1692) was one of the most important scholars of the Ming–Qing period whose pragmatic philosophies of statecraft challenged long-standing traditions, and his writings influence cultural ideas of Chinese nationalism even today.

Wang Fuzhi was one of the most important Chinese thinkers and scholars of the Ming–Qing period (1368–1912), and his philosophies influence cultural ideas of Chinese nationalism even today. He wrote more than one hundred books during his lifetime and fought against the Manchu invaders during their campaign establishing the Qing dynasty (1644–1912).

A native of Hengyang in Hunan, Wang Fuzhi passed the provincial examinations in 1642, but his political career was quickly ended by nationwide peasant rebellions and the Manchu invasion. Devoting the rest of his life to reading and writing, Wang completely withdrew from politics in 1650 after his anti-Manchu military activities failed. Wang’s scholarly interests included Confucian classics, philosophy, history, textual criticism, literature, military strategies, medicine, astronomy, calendar, numerology, astrology, and Western science introduced by the Jesuits. Most of Wang’s writings were unknown to the wider audience of readers before they were edited and printed beginning in the late 1830s. His most cited philosophical works include Outer Commentary to the Book of Change, Commentary on Zhang Zai’s Correction of Youthful Ignorance, and Record of Thoughts and Questions: Inner and Outer Sections. Wang’s main ideas on history and politics can be found in his On Reading Comprehensive Mirror and On the History of the Song Dynasty.

Wang was obsessed with rectifying the flaws he saw in Song–Ming neo-Confucian, Daoist, and Buddhist teachings and with reforming political and economic institutions, drawing lessons from history, and preserving and carrying forward Chinese culture while the alien Manchus ruled China.

Wang firmly rejected Daoism and Buddhism: He disapproved that these teachings advocated a denial of the real world in order to achieve absolute emptiness and quiescence of the mind. He criticized the Song neo-Confucian studies of *li* (理) for paying too much attention to abstract principles while overlooking human society and the material world from which these principles were derived. Wang also attacked the neo-Confucian studies of *xin* (心) (mind) for equating the concepts of the human mind (*neng* 能) with the outside world (*suo* 所), and knowledge (*zhi* 知) with practice and action (*xing* 行).

To rectify these empty and impractical teachings, Wang returned to Zhang Zai (1020–1077) and further advanced his materialistic philosophy. Wang stated that no materials can be added to or reduced from the universe and that no materials can be created from nothing; all materials follow their own *dao* (道), to be transformed from their original form, *qi* (material force), to what they are now. Wang discarded the idea that human nature is completely innate and never changes. To Wang, although human nature bears some innate qualities, which are the ultimate source of moral goodness, it reflects the mind’s (*xin*) experiences in real human life.
Wang laid down a philosophical foundation for Qing pragmatic statecraft. Whereas his philosophical focus was on the material world, his political focus was on specific political and socioeconomic problems. In Wang’s view, human society faces different problems in different times, and people of different historical periods should try hard to find specific solutions for their own problems. While denouncing those Song philosophers who put abstract principles above substance, Wang strongly rejected those who put general rules, particularly the ones set up by ancient statesmen, above specific institutions created for solving contemporary problems. In this regard, Wang pointed out that a specific problem that caused the Ming (1368–1644) to fall was the imbalance between the monarch and scholar-officials headed by a prime minister. Wang also vigorously defended Chinese culture against barbarism of non-Chinese nomads, causing his writings to become a cultural source of modern Chinese nationalism. The most prominent modern Chinese intellectuals and statesmen, such as Zeng Guofan, Tan Sitong, Liang Qichao, and Mao Zedong, who intensely searched for solutions for problems faced by China, were all inspired by Wang and his works.

Yamin XU
An early and fervent supporter of Sun Zhongshan’s Chinese Nationalist revolutionary cause, Wang Jingwei became a leading rival to the Nationalist Army commander Chiang Kai-shek after Sun’s death in 1925. Wang led the left wing of the Nationalist Party, but proved no match for Chiang. After war broke out with Japan in 1937 Wang lost all hope for Chiang’s government in Chongqing and agreed to lead a pro-Japanese government in Nanjing.

Wang Jingwei began his political career in 1905 associated with the Tongmenghui leader Sun Zhongshan and died in 1944 as a Japanese collaborator. In between he aligned with various Nationalist Party (Guomindang) factions on both the left and right in his unsuccessful pursuit of power. The main theme of his life after 1925 became his rivalry with Nationalist Army Commander Chiang Kai-shek, who regularly bested Wang Jingwei’s challenges.

Wang Jingwei was born into a poor but well-educated family in Guangdong Province. In his early twenties he studied in Japan on a Qing dynasty (1644–1912) government scholarship. In Japan he joined Sun Zhongshan’s fledgling revolutionary movement, Tongmenghui (Revolutionary Alliance), aimed at ending the Qing dynasty. Wang became widely known through his writings and public speaking on behalf of the Tongmenghui. In 1910 he led a plot to assassinate the Qing dynasty’s Prince Regent Caifeng by means of a roadside bomb. Authorities discovered the plot; Wang was imprisoned but not executed.

The end of the Manchu-ruled Qing dynasty did not make Sun Zhongshan and his associates leaders of the new Chinese Republic. Rather, the former Qing dynasty general Yuan Shikai became president of the new Chinese Republic and suppressed Sun Zhongshan’s political supporters. In 1912 Wang Jingwei withdrew from Chinese domestic politics and married Chen Bijun, daughter of a wealthy Chinese merchant from Penang, the British-ruled island in the Malaya States. For the next few years Wang devoted himself primarily to Chinese literati pursuits.

In 1917 he rejoined Sun Zhongshan in Guangzhou (Canton), where Sun was raising forces to overthrow the northern warlords. Over the next seven years Wang became ever closer to Sun Zhongshan. Wang Jingwei followed Sun in moving toward stronger anti-imperialist views and practical cooperation with the Soviet Union. When Sun died of cancer in Beijing in 1925, Wang Jingwei was at his side.

After Sun’s death Wang Jingwei advocated continued radicalization of the Nationalist Party along Soviet lines. Chiang Kai-shek, head of the Nationalist military, became a powerful opponent for leadership of the Nationalist Party. By 1929 the two men had reached open confrontation. Chiang Kai-shek, who possessed a wide range of factional supporters, repeatedly bested Wang Jingwei, who relied primarily on his personal leadership strengths. After several of these contests Wang Jingwei withdrew temporarily to Europe, only to return to China with renewed but futile hopes of gaining power. Wang
remained a prominent Nationalist Party figure but increasingly isolated and disgruntled.

By the 1930s three Chinese positions emerged for dealing with Japan. One position, most strongly associated with the rural revolutionary leader Mao Zedong and the Chinese Communists, called for armed resistance to Japan. Chiang Kai-shek argued for grudging appeasement of Japan until the Nationalist government became strong enough to thwart Japanese aggression. Wang Jingwei, in a major shift from his position in the 1920s, became spokesperson for a third position. He now accepted Japanese leadership and Japan’s dream of a new pan-Asian order from which Western capitalist colonialism would be excluded. This vision of an Asian-led anti-imperialist strategy fit with Wang’s views from the 1920s. It also had considerable appeal to many Asian nationalists until the realities of World War II made Japan’s own imperialist nature clear. Wang Jingwei’s pro-Japanese stance had raised fierce patriotic Chinese opposition even in the mid-1930s. In 1935 an assassin seriously wounded Wang, and in 1939 while he was in Hanoi, Vietnam, another attempt on his life was made.

In 1940 Wang Jingwei left Chiang Kai-shek’s Nationalist government in Chongqing and accepted leadership of a Japanese-sponsored Chinese regime at Nanjing (Nanking) that claimed the Nationalist Party mantle. Wang’s government reached agreements with Japan that restored some of China’s compromised sovereignty, but his government clearly served as a Japanese puppet. Wang Jingwei’s health continued to decline from injuries suffered in the 1935 assassination attempt. When in November 1944 he went to Japan for treatment and died there, his reputation as a Japanese puppet and traitor to the Chinese nation already had been fixed.

Further Reading
Wang Mian was a Yuan dynasty (1279–1368) painter most renowned for his momei (ink plum) paintings on silk and paper. In his compositions he integrated pictures and words by framing his calligraphic inscriptions with images of flowering plum branches.

Wang Mian was a Yuan dynasty (1279–1368) artist noted for his momei (ink plum) paintings. He also composed poetry. He was born into a farmer’s family in Zhuji, Zhejiang Province, and received his Confucian education and mastered classics. But Wang failed the civil service examinations, and he later rejected several civil appointments. After spending one year in Beijing Wang retreated to his hometown in the Guiji Mountains, where he made a living by selling his paintings.

Wang Mian’s poetry, recorded in Zhuzhai shiji (Poetry Collection of the Bamboo Studio), conveyed his awareness of the danger and uncertainty of late Yuan society, expressed his concern for the suffering of the people, and criticized the failure of the government to protect them. During his later years Wang witnessed ethnic Han Chinese rebellions against the Mongolian court and probably even offered his advice to the rebels.

Wang painted plums on both silk and paper. He juxtaposed image and inscriptions in such a way that the image framed the inscriptions, his calligraphy enhancing the beauty of flowering plums. The organic forms and elegant, S-curved plum boughs contrast with the square, rustic, poetic or prose inscriptions and characterize the radiant beauty, self-assurance, and reclusion of Wang’s plum world.

Wang’s extant dated works span the period of 1346–1355. He painted the plums either in a plain style, with S-curved bough, or in a more ambitious style. In the plain style he used smooth, even brushstrokes to portray the rhythm and grace of the gentle main plum branch. The round petals of the blossoms were often rendered in several overlapping ink washes to symbolize the purity and virtual transparency of the flower. In the ambitious style the plum bough is painted in an S-curve, forming the backbone of the composition, which is often counterbalanced by blossom-bearing branchlets. Thick and thin applications of ink create varied tones that suggest the uneven texture of the branches. The main bough also defines the space where inscriptions are placed, although the inscriptions sometimes overlap with the plums. In the ambitious style massive old plum trunks and boughs meander through the painting space. The main bough gradually tapers toward the top, with secondary branches growing from the bough. The balance between the monumental old branch and the graceful, snowy petals is remarkable. The inscriptions never compete with the image in the ambitious style. Surely Wang Mian was associating himself with the old plum tree that lives a tough life but still grows younger branches with blossoming flowers. He took pride in his own perseverance, confidence, heroism, and ultimate triumph over harsh conditions. By using stylized forms and masterfully contrasted petals and boughs, Wang Mian created an idealized world of
flowering plums as emblematic of the gentleman’s endurance and resilience.

Wang Mian’s influence on later ink plum specialists cannot be overestimated. They expanded the aesthetic scope of the ink plum genre and set a new standard that brought grandeur, intensity, scale, and visual power to later practice.

A scroll painting of a blossoming plum branch by Wang Mian, who inscribed six poems on the painting. Four of his contemporaries also added their own poems; calligraphy often served as a frame for the images or became an integral part of the composition.
WANG Wei

Wáng Wéi 王维

701–761  Tang poet and painter

Wang Wei earned himself an enduring reputation in both poetry and painting. His greatest works in both art forms involve themes of reclusion or subtly portrayed political and natural landscapes.

Wang Wei earned himself an enduring reputation in both poetry and painting. His pen name, "Mojie," was adopted from the Buddhist sutra (one of the discourses of the Buddha that constitute the basic text of Buddhist scripture) Weimojie jing (Vimalakīrti-nirdesa-sūtra) and is emblematic of his belief in Buddhism. The synthetic Buddho-Confucian philosophy informed the style of his artwork.

Wang composed his first poem at the age of nine. When he was twenty-one he passed the national jinshi (advanced scholar) examination. Upon the political demise of his patron Zhang Jiuling (678–740), a result of corruption of the time, the disappointed poet began to express in verse his intention to retreat from political life. Thereafter he lived a half-reclusive life while enjoying high official positions. In 756 the rebels of An Lushan’s (d. 757) stormed the Tang capital Chang’an (modern Xi’an), from where Emperor Xuanzong (reigned 712–756) fled the bloodshed to Shu (modern Sichuan Province). Wang was captured and forced to serve the rebel government. He was convicted of treason and given the death penalty when the new Tang emperor, Suzong (reigned 756–762), recovered the capital. Evidence of his loyalty to the Tang dynasty was found in a poem composed in captivity, and his life was pardoned, but he was demoted. This peril facilitated Wang’s conversion to Buddhism. Indeed, the vicissitudes in Wang’s life seemed to parallel those of the high Tang dynasty (618–907 CE) in the eighth century.

Wang Wei’s greatest works of painting and poetry involve themes of reclusion or subtly portrayed political and natural landscapes. In some of his early poetry he presents himself as a knight-errant or a brave soldier. His wife’s premature death and his political setbacks led Wang’s poetic style to a radical change, and he began to load his poetic imagery with philosophical messages. The natural scenes in his later works became more serene, and this serenity of imagery was often employed as a metaphorical presentation of meditation. In the interplay between the scene and the poet’s mind lay the quintessence of his poetry.

The setting for many of Wang’s most famous poems was a villa that Wang acquired in the early 740s that once belonged to the early Tang poet Song Zhiwen (d. 712). Located in the Zhongnan Mountain area in the countryside surrounding the capital, the villa provided a resort with wonderful scenery for his reclusive and artistically productive life. Anthology of the Wang River, a collection of poems by Wang and his friend Pei Di, was based on their excursions in the extensive villa gardens and vicinity.

Not much is known about Wang Wei’s paintings because only imitations have survived. Although The Snowy Brooks has been regarded as representative of Wang’s work, a false attribution to Wang makes no guarantee that it is at all indicative of Wang’s painting style.
Su Shi’s (1037–1101) famous evaluation of Wang Wei—“If one savours Mojie’s [Wang Wei’s] poetry, there is painting in it; if one gazes at Mojie’s painting, there is poetry in it” (Yang 2007, 191)—guides us in appreciating Wang’s work and provides at the highest level of Chinese poetry and painting.

Wang Xianzhi

Wáng Xiànzhī 王献之

344–388 CE  Calligrapher

Wang Xianzhi 王献之, the youngest of Wang Xizhi’s 王羲之 seven sons, was the only male in the family to follow in his father’s footsteps as a calligrapher. But the style Xianzhi created, called yibishu 一笔书, or one-stroke writing, was unique and difficult to match, and it eventually elevated him beyond his father’s fame.

Wang Xianzhi (also known as “Wang Zijing”) was the seventh and youngest son of the master calligrapher Wang Xizhi (303?–379? CE); father and son are called the “two Wangs” of Chinese calligraphy. Xianzhi’s ancestors lived in Shandong Province until his grandfather relocated to Shaoxing in Zhejiang Province, where Xianzhi was born. Unlike his father, who was adept in almost all calligraphic styles, such as standard (kai), running (xing), and cursive (cao), the junior Wang excelled at first only in cursive script.

Xianzhi was born when his father was forty-one. When his father died, Xianzhi was seventeen. Xianzhi then followed Zhangzhi (?–361 CE) as his teacher in the art of calligraphy. By combining running and cursive scripts Xianzhi created a style for which he became famous—later critics called it yibishu 一笔书, or one-stroke writing—in which characters connect in one brushstroke in a freeflowing style. The yibishu 一笔书 became a model for calligraphic connoisseurs and practitioners who revered Wang Xianzhi’s accomplishments more than those of his father. Some of Wang Xianzhi’s famous works are available to us through traced copies, stone engravings, ink rubbings, and handwritten copies. Zhao Mengfu (1254–1322 CE), a later calligrapher, described Wang’s “Luoshenfu” (Song to the Goddess of the Riven Luo) in the standard script as “spirited and untrammeled, the tonality flows in motion” (Ecke, 1971). The thirteen-line fragment that survived shows a certain casualness and is less compact than the writing by Wang Xizhi.

Wang Xianzhi’s “Duck Head Pill Note” (yatouwantie, fifteen characters reproduced on silk in the Tang dynasty [618–907 CE]) and “Mid-Autumn Note” (zhongqiutie, twenty-two characters), both in the cursive-running style, were described by Mi Fu (1051–1107), the famous Song calligrapher, as “natural, true, transcendental, and untrammeled” (Harriet and Fong, 1999, 51). The Qing emperor Qianlong (reigned 1736–1795) included Wang’s works in his imperial collection and considered them a national treasure. The “Mad Cursive Script” (Kuangao) school, with Zhang Xu (flourished 713–740 CE) and Huaisu (737–798 CE) as its representatives, was also influenced by the work of Wang Xianzhi.

Wang Xianzhi served as secretary-general of the imperial court. Known for righteousness and integrity, Wang once refused an order by Xie An, the grand councilor, to write an inscription for a new hall. His reason was that the hall was built against the will of the people.

Legend tells that Wang had two wives and a concubine. His first wife was the daughter of his maternal uncle. They had a harmonious relationship until the Jin emperor selected Wang as his son-in-law; Wang was then compelled to divorce his wife and marry Princess Xinan. In
Wang Xianzhi created a unique style of calligraphy, yibishu, in which the characters were connected in one flowing brushstroke.

his later years he took in a concubine, Taoye, with whom he had a meaningful relationship. Their love was the subject of a song he wrote for her entitled “Song of Taoye.”

WANG Xizhi

Wang Xizhi 王義之
303?–379? CE  Calligrapher

Wang Xizhi, referred to as the “Saint of Calligraphy” in China, was the author of the famous Lantingjixu 兰亭集序 or Preface to the Orchid Pavilion Gathering. A rare talent who was adept to almost all calligraphic styles, Wang was an inspiration to past and present calligraphers and connoisseurs.

Wang Xizhi (also known as “Wang Shaoyi”) was born during the politically chaotic Jin dynasty, (265–420 CE) part of the North and South dynasties period (220–589 CE). During this unsettled period members of the Wang family of calligraphers and literati moved from their native area in Shandong Province and relocated to Zhejiang Province in the south. Wang’s father, who came from a line of respected calligraphers, was a minor court official and the first calligraphy teacher of his son.

As Wang grew he proved to be a man of character. One anecdote tells of how he was chosen to be the son-in-law of Commander Shi. The latter announced that an interview would be conducted in the prime minister’s residence to select the right man for his daughter. Young men of letters flocked to the palace dressed in their best clothes. Wang, not anxious to please, arrived late in casual clothing. He managed to find a seat near a bed. Because of the heat, he untied his belt and bared his abdomen. Such behavior marked him as different from the rest, and he left an impression of spontaneity on those who were present.

When Shi heard this report, he decided to give Wang his daughter’s hand.

Following the Confucian tradition, Wang received a military position at court as general of the right. However, his real interest lay in art, especially the calligraphy by which he was known. When young, he had practiced calligraphy with a female master named Madam Wei (272–349 CE). Later he perfected nearly all calligraphic styles, such as standard (kai), running (xing), and cursive (cao), and became known as the “the saint of calligraphy.” His most famous work was the “Preface to the Orchid Pavilion Gathering” (Lantingji Xu), done on the third day of the third month in 353 CE when he and about forty scholar friends met together in the Orchid Pavilion in Shaoxing, Zhejiang Province, to celebrate the Spring Festival. After most of his friends wrote poems for the occasion, Wang, intoxicated by alcohol, added a preface written in the running script. The calligraphy he did that day was outstanding, and the brushstrokes were often described as “longwo hutiao” or “Leaning Dragon and Leaping Tiger.” Wang tried to copy it afterward, but he could never achieve that ease and style again. This particular work was such a treasure to connoisseurs that the Tang dynasty (618–907 CE) emperor, Li Shimin (Taizong, reigned 626–649 CE), who obtained the original after much difficulty, ordered it to be buried with him at death.

Other famous pieces by Wang include “Essay on Yue I,” dated 348 CE in standard script, and “Three Passages of Calligraphy: Pingan, Heta and Fengju” and “Short Note of a Sunny Day after a Pleasant Snow,” both in running script. Out of the thousands of Wang’s calligraphic pieces, only a small fraction survived, thanks to the traced copies, stone engravings, ink rubbings, and hand copies by later calligraphy masters. For more than a thousand years Wang’s
Calligraphy has been used as the example for all who practice this art. He and his son, Wang Xianzhi (344–388 CE), are called the “two Wangs” in Chinese calligraphy.

Wang, disillusioned by the political upheaval of his era, retired early at the age of forty-nine and switched to neo-Daoism to pursue a life of simplicity and peace. Three stories of his death are told. The first is that he died of an illness at age fifty-nine. Another claims that Wang was executed by the emperor when he refused to come to court. The last one, which most critics feel is valid, tells of Wang’s pursuit of immortality by way of alchemy and his subsequent death by poison.

Wang Yangming School

Wang Yángmíng Xuéxiào 王阳明学校

Neo-Confucianism combined principles from the three major ancient philosophies of China—Daoism, Buddhism, and Confucianism—and the Wang Yangming school was one of its dominant and most influential movements.

The Wang Yangming School was named after the philosopher Wang Yangming (1472–1529), who began to critique the Confucian concept that material things alone are worthy of investigation. Instead, Wang advocated broadening of the definition of the “thing” to include not only materiality, but also moral precepts and ideas or thoughts.

Neo-Confucianism

The need for Confucianism to address ideas that had become established in Chinese society, namely Daoism and Buddhism, led to a synthesis of sorts during the Song Dynasty (960–1279). The pragmatic approach of the Confucians, with its concern for the here-and-now and the betterment of the individual and society, was tempered first by the Daoist view that human beings were essentially good and required institutions and a society that would permit this goodness to exert itself; and second, by the Buddhist notion that the world was both illusory and filled with suffering, and one’s concern should be on being rid of this pain. These three dominant philosophies amalgamated to fashion what is commonly known as neo-Confucianism.

One of the hallmarks of neo-Confucian thought was the explication of unity within duality, that is, a thing possesses two opposing elements, which in their dissimilarity unite as one in order to give the thing its being. Neo-Confucianism also maintained that the self can be morally constructed by way of educating and contemplating human intuition, which was innate to all people.

Neo-Confucianism focused on the investigation of material things by seeking to place the individual within his/her social context. This could only be done by cultivating the mind in order to affect change for the better upon those things that surrounded and influenced the individual, namely, society and government. A fulfilled life was one which sought to perfect the self in order to perfect society and the state.

Wang Yangming

In contrast to the contemporary neo-Confucian thought, Wang Yangming theorized that material things were in truth comprised of three elements: material reality; the idea of that reality, that is, its intellectual expression; and the moral import of the thing. For example, a friend is a person, a word, and a moral relationship (Is the friend good or bad?). Wang sought to combine materialism and idealism in order to arrive at a moral understanding of human actions. In this way, he was very much grounded in the Confucian notion that people must continually strive for betterment. But he wanted to know how to achieve
this betterment; it could not be attained by merely following ancient sages and one’s ancestors as Confucians would have it. Rather, Wang placed the onus on the individual: It is up to each person to construct mental moral principles, intellectual moral things that may be used as guides to a better life. Such an understanding further led Wang to define what the actions of the mind may be. He said that the life of the mind involves not only cold, hard facts, but also deep human emotions, such as joy, sadness, and empathy. The mind becomes that location where dissimilarities unite and intellectual activity merges with the emotions. The resultant unity is the surest guide to truth and a truthful life. Wang stressed the necessity of knowing the mind and the self by educating the intuition; this means that it is the moral responsibility of the individual to educate the mind so that she or he will intuitively choose the morally right action for his or her own and the good of the world.

Wang, of course, did not ignore the importance given by Confucians to right actions. But he suggested that such actions must be guided by the mind. He linked action to both knowledge and morality. Indeed, one cannot have action without knowledge, nor can one have knowledge without action; by extension, all knowledge is morality because the chief end of knowledge is to better the self, society and the state. Betterment requires a principle of morality, in that the lesser is raised to a higher level. This is more than mere tautology (needless repetition of an idea), for Wang pointed to a larger precept: the unity of all things. By this principle, humans and their actions are part of materiality, which is both action and idea, and it is through action (or the manifestation of ideas) that humans become part of the world around them and even part of the universe. Thus, that which is good for the individual is also good for society, the world at large, and the cosmos. Each component must work harmoniously within its larger context to bring about an essential unity of all creation, because all things, in fact, are one body. Each thing shares a pattern (the li), or a way of being, with another thing, just as we eat living things in order to live. For example, theoretical physics states that all things in the universe are constructed from an elementary particle, called the Higgs boson, or what Wang would call a pattern.

The concept that all things are united by shared patterns is an important contribution of the Wang Yangming school. With this theory, it broke free from the Confucian valorization of the family: Confucian thinkers such as Mencius (371–289 BCE) said that society and the structures of the world were versions of the family. In the place of such an analogy, Wang suggested that the relationship between things is not a familial one at all; rather, it is a far more intimate harmony of similar patterns. The universe—all of creation and reality itself—is not a family, it is a single body.

In order to know and comprehend this harmony, Wang refined the concept of the mind. First there exists the mind of the Way—which may be defined as a state of calm and lucidity, which permits the mind to apprehend universality (the Principle); that is, universality and the individual become one so that individual begins to carry out the will of heaven (the Principle)—and second there exists the human mind. The former is the mind in its purest primordial state. This is the mind in itself, while the
human mind is that which has lost its purity by becoming ensnared in selfish desires. The object of education and of contemplation is to once again purify the mind and return it to its original state, free from all selfish entanglements, so that it might realize its essential role in, and its implicit bond with, the moral order of the self and of the universe. For Wang, such a liberated mind alone could successfully guide the individual to the good. As is obvious, Wang’s debt to Buddhism was apparent in this explanation; however, he entirely negated the Buddhist self-centered ideal of purifying the soul in order to gain freedom from pain and suffering by nullifying individuality, leading the soul to escape into nothingness. For Wang, purification of the mind was not an end in itself, nor was it selfish to flee from the world. Instead, Wang described a more inclusive approach because he did not neglect the Confucian demand for a pragmatic view of action. A pure mind is the only possible guarantor of morality, because to see all things as one body is also to care for that body fully and completely. In brief, the school of thought that he established may be summarized thus: Personal morality alone saves the world and the universe. The influence of the Wang Yangming school reached its apex during the late Ming and the Qing periods. In present-day China, the influence of the school has waned, although its stress on education as a way of bettering the self and society remains as a dominant mindset.

The Words of Wang Yangming

There can be little doubt that among the new trends in the Ming dynasty (1368–1644) the teachings and personal example of Wang Yangming were to have the most explosive effect.

Whenever I think of people’s degeneration and difficulties I pity them and have a pain in my heart. I overlook my own unworthiness and wish to save them by this teaching. And I do not know the limits of my ability. When people see me trying to do this, they join one another in ridiculing, insulting, and cursing me as insane . . . Of course, there are cases when people see their fathers, sons, or brothers falling into a deep abyss and getting drowned. They cry, crawl, go naked and barefooted, stumble, and fall. They hang on to dangerous cliffs and go down to save them. Some gentlemen who see them behave like this . . . consider them insane because they cry, stumble, and fall as they do. Now to stand aside and make no attempt to save the drowning, while mocking those who do, is possible only for strangers who have no natural feelings of kinship, but even then they will be considered to have no sense of pity and to be no longer human beings. In the case of a father, son, or brother, because of love he will surely feel an ache in his head and a pain in his heart, run desperately until he has lost his breath, and crawl to save them. He will even risk drowning himself. How much less will he worry about whether people believe him or not?

WANG Yiting

Wáng Yìting 王一亭

1867–1938 Painter and businessman

Wang Yiting was a businessman, painter, patron, and devout Buddhist who helped found numerous art societies throughout Shanghai and was active in the relief efforts of a disastrous 1923 earthquake in Japan.

Wang Yiting was born in Shanghai and began work as an apprentice in a picture-mounting shop, later becoming a comprador (intermediary) for a Japanese company. He was successful in his business career and served as chairman of the Shanghai Chamber of Commerce.

Wang Yiting was also a generous supporter of artists and helped to found many art societies in Shanghai. He was proficient in painting historical figures, folk legends, birds with flowers, animals, and landscapes and was renowned for his Buddhist figures and dragons.

In addition to his skill and participation in China’s artistic scene, Wang Yiting also volunteered his services when an earthquake on 1 September 1923 struck the region of Kanto on the Japanese island of Honshu and devastated the city of Tokyo. Leading a relief effort that involved shipping much needed materials and organizing Buddhist prayer services, Wang was a huge asset to the Japanese during the tragic event and strengthened his connections with Japan.

In later life Wang became a devout Buddhist and once was president of the Chinese Buddhist Association.

The tumultuous Warring States period led to the unification of China under the Qin dynasty in 221 BCE. The period also was the foundational era of Chinese philosophy.

The Warring States (Zhanguo) period (475–221 BCE) was a period of Chinese history that ended with the unification of China under the first emperor of the Qin dynasty (221–206 BCE) in 221 BCE. Although scholars agree that the Warring States period ended in 221, the date of its beginning is a matter of contention: Some place it in 481, when the chronicle known as Chunqiu (Springs and Autumns) draws to a close; others in 453, when the state of Jin was divided into three territories; still others in 403, when each of these three new states was formally recognized by the Zhou king. For the purposes of this discussion, the Warring States period begins in 475 BCE, the first year of the reign of Viscount Xiang of Zhao, one of the three states that supplanted Jin. The Warring States period constitutes the second half of the Eastern Zhou dynasty (770–221 BCE), whereas the first half of the Eastern Zhou dynasty is known as the “Spring and Autumn period” (770–476 BCE), after the chronicle of the same name.

The Eastern Zhou kings were recognized as the heaven-ordained rulers of the terrestrial world, but they were forced over the centuries to cede more and more power to the feudal lords occupying the lands around them. During this time the most powerful of the semi-independent statelets gradually conquered and annexed their neighbors, so that by the Warring States period, only eight contenders remained: Zhou, Qin, Qi, Chu, Zhao, Wei, Han, and Yan. In 256 BCE the last Zhou king, who was by this time nothing more than a figurehead, was finally deposed, and the Chinese world awaited the final victory of the state of Qin.

Political Changes

The political landscape of the Warring States period was determined by the intensification of several interrelated geopolitical processes that began in the Spring and Autumn period: the ongoing decline of centralized power, the rise of warlike and expansionist states with their own domestic and foreign policies, and the continual diminution in the number of autonomous states as the weakest were annihilated by the strongest. By Warring States times these underlying historical forces had brought about pervasive political, economic, social, and intellectual changes that radically transformed the character of Chinese life.

“Agriculture and war” became a popular slogan as states recognized the substantial benefits of a healthy economy and a mighty army. As the stakes of battle rose, the conception of war necessarily changed from a ritualized competition between educated aristocrats (as in the Spring and Autumn period) to a lawless and bloody struggle between infantry armies as large as could be mustered.

The logistical problems associated with raising, training, and supplying a massive army induced rulers to rethink their approach to governing their territories. Those
rulers who could most fully exploit their resources gained a sizable advantage in the theater of war. Thus, the demands of battle led to the restructuring of the state as a vast production ground of people and munitions, maintained by an efficient and organized administration and serving a single king, to whom the entire population owed unquestioning allegiance. Kinship ties, ritual obligations, and traditional practice, which had been significant considerations guiding human action in earlier times, were now subordinated to the material requirements of the “warring state.” In this manner the imperial model of Chinese statecraft was being forged even before the establishment of the empire itself. The governments of the Qin and Han (206 BCE–220 CE) dynasties were largely based on the precedents of the Warring States.

Birth of Chinese Philosophy

The Warring States period is celebrated as the foundational era of Chinese philosophy. Historians sometimes ask why such a tumultuous and perilous time provided the context for some of the most sophisticated philosophers in Chinese history, but the reasons for this intellectual burgeoning are not obscure. The competing lords valued any resource that might aid them in their quest for world dominion, and so they were willing to listen to new ideas. The old ways, after all, were leading the Zhou dynasty to assured extinction. The demand for original thinkers resulted in the growth of a new profession: “wandering persuaders” (youshui), who traveled freely from state to state in search of landed patrons, earning their bread alongside diplomats, generals, diviners, and other educated specialists.

The two foremost philosophical schools in Warring States times were those of the Confucians and the Mohists. The former were followers of the ethical worldview laid down by Confucius (551–479 BCE); the latter group was founded by Mozi, or Master Mo (Mo Di, c. 480–c. 390 BCE), who preached a philosophy of “universal love” (jian’ai). The Confucians and Mohists were irreconcilable enemies—Confucians could never accept the Mohist tenet that one should love the father of one’s neighbor as one loves one’s own father—but they were alike in that their doctrines did not always coincide with the desires of the lords whom they served. Confucians, for example, believed that loyal advisers should remonstrate (jian) with their lord when he is in error, and their outspoken criticism often alienated their superiors. Mohists, for their part, believed that human acquisitiveness is at the root of all suffering in the world, and they actively disrupted campaigns of conquest in the hope of deterring warlords from preying on their neighbors.

Other philosophical orientations were more amenable to the aspirations of rulers. Political philosophers such as Shan Buhai (flourished 354–340 BCE), Shen Dao (b. c. 360 BCE), and Han Fei (d. 233 BCE) formulated an ideal of statecraft (often misleadingly called “legalism”) that relied on standardized laws, proto-bureaucratic administrative systems, and unfailing adherence to the protocols of reward and punishment. The political aspect of philosophy was so important that even the Laozi (or Daode
jing), a text whose primary purpose is to elucidate the benign cosmological notion (an idea based on a branch of metaphysics that deals with the nature of the universe) of the “way” (dao), takes pains to point out the political applications of its teachings.

The term Warring States is usually said to derive from Stratagems of the Warring States (Zhanguo ce), a collection of anecdotes about the period compiled by Liu Xiang (79–78 BCE). But the term zhanguo was already used in an essay by the statesman Jia Yi (201–169 BCE); this suggests that the era was known as the “Warring States” almost as soon as it had ended.

Chinese practices for regulating the water supply, known as water conservation (shuili), are as old as China’s civilization. The three major objectives of water conservation are irrigation, flood control, and transportation. The commitment to intensive water management has shaped Chinese history.

Access to fresh water is essential to human life. Domesticated plants also require water to survive, ideally in precisely regulated amounts. But the location, quantity, and timing of the water supply are highly variable. China’s monsoon climate, its location amid the watersheds for much of the eastern Himalaya snowpack, and its ecological diversity guarantee a water supply that fluctuates dramatically from place to place and from season to season. Control of water is at the heart of farming and, indeed, civilization itself, and water engineering is one of the areas in which humans have struggled most vigorously to free themselves from constraints imposed by nature.

Turning Water to Advantage

Water conservation is known in Chinese as shuili, which literally means, “turning water to advantage.” The objective of water conservation is to reduce the risk of flood and drought. The wet-rice agriculture of south China requires fields to be drained and flooded at different times in the life cycle of the crop. Water conservation for rice requires methods for ensuring the availability of water when needed and for letting it in and out of the fields when necessary. Historically, both drought and flood were concerns of the Chinese. Archaeologists have excavated drainage canals at the late Neolithic village of Banpo, which flourished around 7,000 years ago in the vicinity of modern-day Xi’an. And queries about rainfall and flooding are a preoccupation of the oracle bones, China’s first written documents, produced from the thirteenth to the eleventh century BCE. From the emergence of their civilizations, people in China devoted substantial energy to regulating the flow of water in riverbeds and to moving water out of its natural courses and into new channels and pools that met their needs for farming, transportation, and settlement. These activities have profoundly shaped Chinese history.

Irrigation and Drainage

Irrigation is the name for the set of technologies devoted to bringing water to places where it is needed for growing crops, while drainage systems channel excess water out of fields. In China irrigation and drainage were practiced widely, beginning in the Neolithic era. By the time of the Song dynasty (960–1279), the world’s most intensive and highly engineered agricultural economy, irrigation and drainage allowed people to grow crops where it would otherwise have been impossible, particularly in the Yangzi (Chang) delta. Irrigated and drained agriculture
supported the commercial revolution of the Song and the population growth of that and subsequent eras.

Irrigation systems include an intake, where water enters an engineered system from its natural course, and a series of branch canals that bring water directly to fields. Many systems also include gates that control the flow of water through the branch canals. Drainage systems rely on pipes or canals that move water downhill and frequently also involve piling up earth to create fields that are raised above the water table and isolated from the surrounding marshes by bunds (embankments) and polders.

The use of polders (low-elevation fields protected by earthen dikes) appears in Chinese texts dating to the Spring and Autumn period (770–476 BCE), a millennium before their emergence in Northern Europe. During the Song dynasty, the introduction of new strains of early ripening rice made double cropping possible, and there were many important improvements in fertilization and cultivation techniques. Water conservation was an essential element of the new intensive rice agriculture of the Song; in turn the promise of high yields rewarded the massive labor that water conservation demanded. During the Northern Song (960–1126), an expansionist state directly sponsored projects to drain wetlands, fill lakes, and irrigate dry lands. By the Southern Song (1127–1279), the government and large landowners collaborated on polder construction on a massive scale that transformed the Yangzi delta into the most populous and wealthy region of the empire and permitted intensive rice farming and commercial agriculture on the rich alluvial soil of former wetlands. The largest polders, which measured several square miles, were subdivided into smaller diked fields, demarcated by networks of natural streams and irrigation and drainage canals, and controlled by locks. Homes were situated on dikes and clustered around embankments. Boat traffic linked villages to the outside. Dikes also served as overland routes. Breaches in the earthen and stone walls would flood the villages as well as the fields. Hillsides were also leveled and diked to conserve soil, regulate water, and create terraces for wet-rice agriculture.

Water conservation initiatives often coordinated political, economic, and engineering challenges at a regional scale. Engineers had to regulate the speed, location, and timing of water flows throughout entire complex systems. It was often difficult to balance competing priorities, and individual water control projects were seldom effectively integrated. In the Yangzi delta, for instance, Song polders to the north of Lake Tai interfered with the lake’s drainage, which resulted in flooding along the Grand Canal. When the canal managers drained excess water, they inundated adjacent fields, to the wrath of landowners, who built embankments to block the water. Until the fossil fuel era, irrigation systems were created and maintained by human and animal labor. According to Song History, one instance of restoring thirty-six silt-clogged canals around the city of Suzhou in 1158 CE required 3.3 million
man-days, an equal number of strings of cash, and more than 100,000 bushels of grain. Some 6,000–7,000 farmers-soldiers were resettled in Suzhou to maintain the system and prevent flooding. Water engineering on the Chinese scale required abundant labor.

Coastal land reclamation deserves special mention. The Pearl River delta around modern Guangzhou and Hong Kong is a human creation, engineered by coastal farmers who learned to capture alluvial silt to create fertile agricultural land. Seawalls, which create barriers between ocean water and fresh water, have been an important feature of Chinese water conservation. The seawall that began to extend south of the Yangzi to the southern side of Hangzhou Bay in the Tang allowed a region of China larger than the Netherlands to be transformed from a land of shallow inlets, salt marshes, sandbars, and brackish creeks into a world of drained polders and navigable canals that supported population densities that were among the world’s highest. Inside seawalls water becomes gradually less brackish, farmers can capture fertile sediments, and agriculture gradually overtakes salt production, fishing, and other coastal pursuits. However, like other massive waterworks, seawalls required constant attention to avert flooding and salinization. According to a 1347 description, rebuilding approximately 6 kilometers of seawall (out of a total length of 400 kilometers) required 63,000 tree trunks and close to a million cubic feet of stone.

Along with canals and polders, irrigation and drainage systems included reservoirs, pools that stored water for future use. In central and south China, where rainfall was abundant, water-storage ponds were ubiquitous from an early date. Han dynasty (206 BCE–220 CE) grave offerings, dating as early as the first century CE, include clay models that depict irrigation ponds separated from adjacent rice fields by dikes or bunds. By the Later Han (25–220 CE), some historical Chinese reservoirs had become large collectively maintained structures that occupied more than 50 hectares. The Peony Dam, built under sponsorship by the state of Chu between 608 and 586 BCE, produced a great reservoir of nearly 100 kilometers in circumference that was maintained until the Tang dynasty (618–907 CE). Small reservoirs were dug by individuals who farmed fish and turtles and grew lotuses and water chestnuts at the same time that they irrigated their own rice fields. Dams and sluice gates built into watercourses controlled the flow of water in and out of reservoirs.

Flood Control

All rivers carry some load of silt, or sediment suspended in water. While silt is naturally washed into rivers through processes of erosion, its quantity is exacerbated by farming and deforestation. When rivers descend quickly, their flow is turbulent and rapid, and silt remains in suspension. But when they pass slowly across flat plains, silt is deposited on riverbeds. In the absence of human settlement, rivers periodically readjust their courses across broad alluvial plains—with fertile soils and broad, shallow waters.

Song Ching-Chang’s reconstruction of the earlier survey by Chin Chiu-Shao, paying closer attention to the reality of the geography, and adding more detail, such as the sluice-gate at the entrance to the parallel canal. The main canal runs along ½ li away from the river and takes 2½ li to reach that position. Source: Needham, Joseph, (1959). Science and Civilisation in China.
also optimized for agriculture—as their beds become full of silt and rise. The Huang (Yellow) River is the most sediment laden waterway in the world, carrying an average 1.6 billion tons of silt annually. It is an amount so great that the coastal plain at its mouth grew at a rate of 6 square kilometers per year by the 1200s and even more rapidly thereafter. Agrarian civilization emerged in the fertile loess sediment that the Huang River deposited in north China, and along with it came efforts to confine the river to a predictable course. Nevertheless, its levees, the earthen embankments that paralleled the river’s course, failed more than 1,500 times beginning in the sixth century BCE. Indeed, they were sometimes breached intentionally as the court sacrificed people to the floods in order to stop invading troops or mitigate flooding elsewhere in the system. There have also been eighteen major changes of course. Death tolls from Huang River floods are among the highest associated with any natural disasters in human history. Other rivers, such as the Miju in Yunnan, also began to flood more frequently by the mid-Ming as sedimentation followed from land clearance and deforestation, and increasingly urgent regimes of dredging and levee construction thereafter, along with conflicts over property rights and land use. As the sediment-filled riverbeds rose, people constructed ever-higher levees, which eventually towered 20 feet or more over the landscape and raised the stakes of flooding as well.

When the Huang burst its dikes in the late twelfth century, it split into multiple branch streams that ran both north and south of the Shandong peninsula. Hydrologists decided to encourage this state of affairs by removing many levees to create a broader delta and a slower watercourse. While this solution reduced the likelihood of disastrous floods, it increased total sediment buildup and the overall cost of water management. In the late sixteenth century, Pan Jixun engineered the course of the river around its confluence with the Huai and the Grand Canal to eliminate the multiple channels, force the river into a single route, and constrict the channel that remained. His activities—building 1,200,000 million feet of earthen embankment, 30,000 feet of stone embankment, and four stone spillways; dredging 115,000 feet of riverbed; stopping 139 breaches; and planting 830,000 willow trees to stabilize the tops of the dikes—served to increase the velocity of the water flow and scour out silt at this most important junction. Even after Pan Jixun’s accomplishments, the maintenance work of dredging and diking in this vicinity required half a million workers and 800,000 ounces of silver annually; and sediment, simply deposited further downstream, remained a challenge.

Transportation Canals

Water transportation was about twenty times cheaper than overland transportation before the age of fossil fuels. In the lower Yangzi, natural watercourses and drainage and irrigation canals required few alterations to be used as transportation routes. But elsewhere massive earth-moving projects and innovations in hydrological engineering were required to create navigable waterways. The lure of long-distance commerce and travel made the outlay of labor that this involved a worthy investment. All of China’s great natural waterways flow from west to east, and canals were the lifeline linking the distinct physiographic and cultural regions of north and south China into a single, integrated empire. In 809 an imperial official named Li Ao, traveling with his pregnant wife, conducted a nine-month trip from Luoyang to Guangzhou almost entirely by water. Canals were used for transportation, drainage, sewage, mechanical power, defense, and irrigation, aims that were sometimes in competition with one another.

Transportation canals in China have a long history. The Wild Goose Canal linked the states of Song, Zhang, Chen, Cai, Cao, and Wei during the Warring States period (475–221 BCE). By 130 BCE a 124-kilometer canal terminating in the Han capital facilitated grain shipments and was used for irrigation. But the Grand Canal was the single achievement in Chinese canal building. More than 1,000 miles long, the Grand Canal allowed rice and other products of the wealthy south to support the opulent courts of the north and the vast northern armies that confronted nomad power on the steppes. It integrated all of China into a single economy, empire, and culture. To this day it is the longest canal in the world. The Grand Canal is closely associated with Emperor Sui Yangdi, who unified China in 589 after more than 300 years of warfare. Between 605 and 609, he directed efforts to link and straighten existing canals into a single system that connected the Huai,...
Transportation canals of all sizes have a long history in China.

to the Huang River. The Grand Canal was extended and improved during the Tang dynasty, as the court turned increasingly to the south for its supplies. When the Mongol Yuan dynasty (1279–1368) moved the capital north and east to Beijing, the canal was extended yet again. From the thirteenth to the nineteenth centuries, it remained a significant route for trade and communication, particularly the transport of the annual grain tribute from south to north. In 1793 Britain’s Macartney Embassy traveled the canal to Beijing with a crew of artists and naturalists who left a vivid record of this extraordinary waterway. Nevertheless, ecological decline set in by the turn of the nineteenth century. The system collapsed altogether by the 1820s, and in 1832 troops were needed to quell an uprising of peasants who had rallied against flooding along its disintegrating course.

Maintaining the Grand Canal inspired hydrological innovation throughout the imperial era. During the Tang, Liu Yan discovered how to manage currents and earthworks to permit the Grand Canal to meet the Huang River. Pan Jixun’s efforts to reduce silt buildup in the Huang were also directed at maintaining the Grand Canal, though some other efforts to stabilize the Canal produced unintended hydrological consequences, such as sediment buildup along tributary streams. In the early 1700s, Zhang Pengge improved the canal’s lock mechanisms and dredging regimes to mitigate the massive floods that plagued agricultural lands along the southern part of the canal’s path.

Water Conservation and the History of China

The study of water conservation in Chinese history, at least in Western languages, is closely associated with the theories of the German-born historian and sinologist Karl Wittvogel (1896–1988), who argued that flood control was the formative activity that fostered a strong—in his words “despotic”—imperial state in China. Wittvogel
overlooked many details that have become apparent to subsequent scholars. Water-control systems come in all sizes. Sometimes even the most heavily engineered of agricultural environments arose organically through centuries of small-scale collective activity with no state intervention. A great deal of water engineering was orchestrated according to local collective action, not by an authoritarian state. For instance, at the Dujiangyan waterworks in Sichuan, and at the Sangyuan polder in Guangdong, customary village associations and publicly selected representatives apportioned irrigation water among the various fields. Likewise, many constituencies needed to come together to allow the construction of Yangzi delta polders during the Song. An ambitious state in search of tax revenues, land owners seeking to increase property values, local officials seeking fame, and a growing population of civilians and military colonists eager for public works employment all played a role in water management in imperial China. All of these interests needed to be aligned for water conservation initiatives to succeed. By the Southern Song, water conservation in the lower Yangzi was funded jointly by the state and private investors, and labor was often voluntary and paid for in cash. Even the spectacular projects orchestrated from the court proceeded by trial and error, grand initiatives in one place producing unintended consequences in another.

An engineered water regime truly required not a despotic state so much as a perpetual, consultative, expensive and backbreaking commitment to the everyday maintenance of an inherently unstable and entirely artificial environment. It also required social and technological solutions for managing conflicts over priorities. The tension between the objectives of flood control, transportation, and irrigation were acute. For instance, the Huang River dikes were often breached intentionally by farmers seeking to irrigate their wheat fields. Finally, once any system was in place, it was only by dredging channels and building up earthworks that people could forestall disastrous, fatal floods. Once dense populations depended upon intensive agriculture that required water management, there was no going back.

Bracketing this critique, Wittvogel deserves credit for pioneering work on the primal role of water engineering in the development of China’s empire and civilization. He and his successors have ensured that understanding the complex systems that human intervention has brought to bear on the movement of water remains a topic at the forefront of the study of imperial China. Water conservation is crucial for exploring many topics in Chinese history, including agriculture and its intensification, labor, technology, the commercial economy, environmental history, and state power.

One of the four Chinese classic novels of the Ming and Qing dynasties, *Shui hú zhuan* (Biographies of Water Margin) is based on historical events, but its authorship is in dispute. The complex story involves a group of 108 rebels who plot against the royal government. Some of the rebels are so vividly presented that they have since become heroes of the Chinese.

*Shui hú zhuan* (Biographies of Water Margin), also called *Zhongyi Shui hú zhuan* (Faithful and Just Men of Water Margin), is one of the four classic novels of the Ming and Qing dynasties (1368–1644)—the others being *Dream of the Red Chamber*, *Journey to the West*, and *Romance of the Three Kingdoms*. Originally named *Jiānghú huoke zhuan* (Robbers of Rivers and Lakes) and *Shuí hú* (Water Margin) for short, this novel was translated into English as *All Men Are Brothers* by Pearl S. Buck (later a Nobel laureate) in the late 1920s and as *Outlaws of the Marsh* by Sidney Shapiro in the 1970s. *Shuí hú* literally means “waterside,” a reference to Mount Liang at today’s Dongping Lake, the alleged base of operations for the rebel heroes depicted in the novel.

*Water Margin*’s authorship is disputed. Some ascribe it to Shi Nai'an, some to Luo Guanzhong, and others to both. The most accepted theory is that Shi Nai’an wrote it and Luo Guanzhong rearranged it later. The biographies of the coauthors are largely speculative; the only known fact about them is that they lived some time during the Yuan (1279–1368) or Ming (1368–1644) dynasties.

The novel tells a tragic story about 108 people of different backgrounds who were forced to become rebel leaders on the lakeside Mount Liang. The book begins with treacherous officials of the Song court (960–1279) bullying their subordinates and their families, driving them into the camp of the Mount Liang rebels led by Song Jiang. Meanwhile others join the rebels for various reasons. After many a successful battle against the government army, Song Jiang and his men surrender after the emperor made them believe that they were being offered amnesty. The emperor then dispatches them to repulse the invasion of Liao, a kingdom established by the Nuchens north of Song, and to put down a series of peasant uprisings; many of the 108 rebels die. The rest are then killed with poisoned wine “gifted” them by the emperor.

*Water Margin* is based on a true event that took place from 1119 to 1121, when Song Jiang led his thirty-five fellow rebels in fighting the government. Stories about the event later found their way into compilations such as *Zuìwēng tānlu* (Tales of a Drunken Man) and *Dasong Xuanhe yishi* (Incidents of the Xuanhe Era of the Great Song). By the Yuan dynasty, all the 108 rebels of *Water Margin* had appeared in popular dramas of the time known as *zaju* (miscellaneous plays). Apparently the novel *Water Margin* was a re-creation based upon all the above creative efforts predating it.

The original text of *Water Margin* is long lost, but
different block-printed editions, both simplified and detailed, remain. The detailed editions are more popular, and better known among them are the 120-chapter edition compiled and supplemented by Yang Dingjian around 1614, the 70-chapter edition edited by Jin Shengtan (1608-1661), and the 100-chapter edition published by Guo Xun during the reign of the Jiajing Emperor (1522-1566).

Water Margin is of great literary value, being the first Chinese chapter novel written in vernacular Chinese. It seamlessly weaves multiple individual lives into an organic whole and yet manages to create distinct personalities with characters such as Lin Chong, Lu Zhishen, Li Kun, and Wu Song. Its intriguing plots are full of twists and turns and packed with action.

Water Margin has been interpreted differently by different people in different times. It has been either dismissed as advocating banditry or welcomed as singing the praises of heroism. In the 1950s the book was regarded as an ode to peasant uprisings. In the 1970s, however, Mao Zedong condemned it for setting a negative example, even though it had been one of his favorite childhood books.

The stories from Water Margin are so popular that many efforts have been made to adapt them into dramas, movies, and TV series. The 43-episode TV series Shui hu zhuang, directed by Zhang Shaolin in 2003, is the most popular, and inspired by its success a new, 120-episode TV series is in production.

Water Resources

Shuǐlǐ zíyuán 水利资源

With the advent of frequent water-pollution incidents such as algae blooms that make the water unusable for millions, the necessity of irrigation for more than 70 percent of its grain and cash crops, and a perennial water shortage, China’s water resources are at the center of one of the most important legal reforms in modern Chinese governance.

More and more people in China, including Chinese officials, are beginning to approach their country’s water supply as a vulnerable resource—one that is inexorably linked to their future—rather than a free natural resource to be used without restraint and consideration. In the first decade of the twenty-first century problems contributing to China’s water sustainability can be generalized in three categories: shortage, pollution, and abuse.

Shortage

With a total volume of freshwater resources of 2.8 trillion cubic meters, trailing only Brazil, Russia, and Canada, China’s water resources equate to 2,220 cubic meters per capita—just one-fourth of the world’s average.

These limited water resources are unevenly distributed both spatially and temporally. Some 80.5 percent of China’s water resources are concentrated south of the Yangzi (Chang) River, where only 40.5 percent of the population lives on only 35.2 percent of the country’s total arable farmland. The remaining 53.5 percent of the population is in the north, living on 64.6 percent of the arable farmland, and, by contrast, they have access to merely 19.5 percent of the water resources. Because about 71 percent of the volume of water in China relies on direct recharge by precipitation, waterfalls are vital to replenishing and sustaining China’s water supply. Yet the average annual precipitation in China is 618 millimeters, 19 percent less than the world average of 800 millimeters (over land). While the precipitation is mostly concentrated in the four months from June to September during the flood season, which may amount to 70 percent of the annual total, this volume ranges in magnitude from more than 2,000 millimeters in the southeastern coastal areas to less than 200 millimeters in the northwestern hinterlands. In Ningxia Hui Autonomous Region, for example, annual precipitation is around 305 millimeters, while annual evaporation is as much as 2,000 millimeters. The precipitation drops further to 50 millimeters in the Tarim and Turpan basins in Xinjiang and Chaidamu Basin in Qinghai. For comparison, average annual precipitation in the central Sahara Desert is less than 25 millimeters, while that of Scotland is approximately 1,500 millimeters.

Similarly uneven distribution is seen in groundwater, which constitutes about one-third of China’s freshwater resources. Southern China claims 67.7 percent of the total groundwater, leaving merely 32.3 percent to the arid north. Because groundwater accounts for 70 percent of the drinking water supply and 40 percent of agricultural irrigation, the uneven distribution aggravates the water shortage in northern China.
With rapid economic growth and urbanization, the water shortage has become even more acute. China’s absolute urban population increased from 172 million in 1978 to 562 million—or 43 percent of the total—in 2005, and the demand for water is growing accordingly. According to the Ministry of Water Resources, China has an annual shortage of water totaling 40 billion cubic meters, while 2 to 2.6 million square meters of land area suffer draught. The water shortage costs 15 to 20 billion kilograms of grain production and more than 200 billion yuan of industrial output value every year. Meanwhile, over 70 million people across China have difficulty accessing safe drinking water.

Pollution

While northern China thirsts for water, the water-affluent south has suffered ever more frequent water shortages due to pollution, although pollution is not unique to the south. Of the five-hundred sections of China’s nine major river systems that are monitored for water quality, only 28 percent have water suitable for drinking, while 31 percent have water quality of limited or no functional use. The Haihe, Liaohe, Huang (Yellow), and Huaihe river systems are the worst polluted all in the north, although all the rest of China’s river systems have also had high nitrogen or other pollutant concentrations to various degrees as well. In addition, more than 75 percent of China’s lakes have been polluted. A sample survey reveals that 97 percent of the 118 cities investigated have groundwater that is polluted to varying degrees; 64 percent have seriously polluted groundwater (Ministry of Water Resources 2005). Lake Baiyangdian, China’s largest natural lake, is a source of food and drinking water for people who live around it. Sometimes called the “kidney” of north China, the lake has had an historical role in filtering the waters of nine rivers that flow through it. It has been polluted by arsenic and mercury from sources such as coal emissions, agricultural runoff, and sewage discharge.

Water pollution is caused by increasing discharge of domestic, industrial, and agricultural wastes that often receive little treatment. Unreasonable industrial layout has seated many old, heavily polluting or toxically dangerous industries along rivers. A survey conducted by the State Environmental Protection Administration (2004) shows that, among the 7,555 chemical or petroleum projects in China, 81 percent are located in environmentally sensitive areas such as water networks or densely populated habitats. Of the 1,441 environmental incidents reported in 2004, half were related to water pollution.

Until 2000, only 24 percent of the total 62 billion tons of sewage and wastewater annually discharged in China were treated at the national standard. Along the Yangzi River, China’s longest river, which meanders through eighteen provinces, municipalities, and autonomous regions, a number of pollution belts have formed out of industrial and domestic wastes discharged short of the treatment standard. These belts run 600 kilometers in total length. Pollutants include micro-organisms, oils, volatile phenols, cyanides, sulfides, mercury, cadmium, lead, chromium, and arsenic. Projects designed for flood control and alleviation of arid areas also have an detrimental impact on the quality of water in the Yangzi. The Three Gorges Dam exacerbates water pollution in the Yangzi by impounding water and reducing the velocity of the river. Impounded water submerges parts of the existing sewer system and wastewater treatment facilities. Plans to divert water from the Yangzi to arid north China will reduce the volume of the water flowing through the Yangzi and thus reduce its ability to dilute and flush toxins.

Pollution has aggravated the shortage of water in the water-scarce north, and it has caused water famines in the water-affluent south. According to the State Environmental Protection Administration, China now faces intensive
outbreaks of water pollution incidents as a consequence of neglecting environmental protection over the past decades; reports of a water pollution incidents have been as frequent as every two or three days on average since the end of 2005. A sudden burst of foul algae blanketed the Taihu Lake in southern Jiangsu in late May 2007, cutting the drinking-water supply to more than 2 million people in Wuxi city, a leading economic engine house of the country, for a week. In the Pearl River delta in Guangdong, where the volume of freshwater resources averages at 330 billion cubic meters a year, rapid economic growth since the 1980s has coupled with pollution to nearly every river course in the urban areas. The pollution has resulted in a water shortage affecting 16 million people in the province (Ministry of Water Resources 2005). Nationwide, the safety of the drinking water more than 300 million people is in question.

**Abuse**

The Ministry of Water Resources maintains that the exploitation of water resources in China in general is not very high, at about 19.5 percent in 2000, although some experts have warned about abuses of water resources.

A traditional farming country, China’s agriculture depends on irrigation: Some 90 percent of cash crops and 70 percent of grain crops are irrigated. In the nine provinces and autonomous regions along the Huang River alone, irrigated farmland increased from 1.4 million hectares in the early 1950s to nearly 5 million hectares in the late 1990s, while the water consumption by agricultural, industrial, and domestic users increased from 1 billion cubic meters a year to well over 30 billion cubic meters. Scientists believe the use of the Huang River water is excessive and beyond the capacity of China’s second largest river, a river that provides water to nearly half of the nation and that cradled the origins of Chinese civilization. This excessive use was identified as one of the causes for the river running dry in its lower reaches for 226 days in 1997. That year the Huang River carried only 1.8 billion cubic meters of water into the sea, compare to an average of 20 billion cubic meters.

Groundwater is also excessively exploited at a volume of more than 9 billion cubic meters per year. This has led to ground subsidence or clefts in many areas, especially in the north, forming seventy-two depression cones across the whole country. According to the Ministry of Land and Resources, about fifty cities in China have reported sinking ground, with the worst occurring in Shanghai, Tianjin, and Taiyuan, where sinking has averaged more than two meters per year since the early 1990s.

The pressure from population growth and economic development has affected wetlands as well. In the fifty-seven years since 1950, China’s total lake area has shrunk by 16,585.36 square kilometers; an average of twenty lakes vanish each year (2007). For example, Qinghai Lake, China’s largest inland saltwater lake at 4,300 square kilometers, lost more than 380 square kilometers between 1959 and 2006. Government plans to address the problems at Qinghai Lake include moving hotels, restaurants, and other tourist facilities to an area at least 3 kilometers from the bank. The Yangzi River valley alone lost 3,000 square kilometers of lake surface area during this period. The surface areas of Dongting Hu and Poyang Hu lakes, two of the major detention basins for Yangzi floods, have shrunk by 46 percent and 40 percent respectively, with their stored volume decreasing from more than 30 billion cubic meters to around 17 billion cubic meters. Hubei, once dubbed as “the province of a thousand lakes,” had 1,066 lakes in the late 1950s. Now only 182 lakes are left.

In contrast to the withering of natural lakes is the construction of eighty-five thousand reservoirs of various sizes, with a total storage volume of 520 billion cubic meters (2000). The controversial Three Gorges Dam...
Rafts on the Yangzi River, 1980, now the source of water power at the Three Gorges Dam. Photo by Joan Lebold Cohen.

tops this list: it is the world’s largest hydropower project, and more than 1.2 million people were displaced before it began to generate electricity in 2003. Despite the criticisms of opponents about the environmental and social impacts of the reservoirs (i.e., threats to living conditions of aquatic species, hazards to local vegetation and biodiversity, sedimentation, and induction of geological havocs), hydropower is prioritized as part of China’s pursuit of new and clean energy. Figures from the Ministry of Water Resources, the leading dam builder, show that China has over 500 million kilowatts of exploitable water power, while the installed hydroelectric capacity by the end of 2005 was 117 million kilowatts, about 24 percent of the potential. The target is to boost the capacity to 180 million kilowatts by 2010 and to 300 million kilowatts in 2020. That means more river sections will be dammed for hydropower projects. Measures to meet these goals include construction of large hydroelectric power stations, such as the Xiaowan Dam on the Lancang River. Second in size to the Three Gorges Dam, this power station will be capable of generating 4.2 million kilowatts by 2013. China is also investing in small hydroelectric power stations that generate 25 megawatts or less.

Although agriculture accounts for 70 percent of the total water consumption in China, the efficiency of irrigation trails other countries. The average efficiency of irrigation water nationwide is 0.43 (2000 estimate), meaning that 57 percent of the water fails to reach the end crops; this figure is 0.7 in advanced countries elsewhere. The reuse rate of industrial water is 55 percent compared with 75 to 85 percent in other advanced countries.

Lessons

China has enacted at least four laws concerning water, namely the Water Law, the Law on Flood Control, the Law on Water and Soil Conservation, and the Law on Water Pollution Prevention. This legislation has institutionalized the water-drawing permit, the utilization of water resources upon payment, the economic use of water resources, and has placed a penalty on polluters.
Programs have been created to conserve headwaters; to prevent and control water pollution; to make comprehensive use of various water resources including surface water, groundwater and flood water; to reduce water consumption; and to improve water efficiency. Meanwhile, surveillance of water quality has been enhanced, involving both government and nongovernmental organizations (NGOs).

Enforcement of the laws and regulations poses the largest question. While there has been much talk about enhancing modern water management, so far the chief administrator of water resources, the Ministry of Water Resources, is seen as being keener on tapping rather than protecting the water resources. Water pollution inspections are often conducted by environmental protection agencies, yet they lack the authority to really execute effective punishment because the polluters are usually protected by local governments by virtue of their “contributions” to the local revenue.

Perhaps incidents like the outbreak of foul algae in the Taihu Lake is teaching decision makers to manage pollution more effectively and is driving home the idea of protecting the water environment more immediately. The pollution control of the Taihu Lake had been conducted for more than ten years prior to the incident, but to no avail. Following the outbreak, however, the provincial government of Jiangsu recognized that controlling lake pollution is an urgent priority and began to treat it as a debt that had to be paid to nature. The Jiangsu government decided to shut down more than 2,000 small chemical plants around Taihu Lake by 2008 and to build a green shelter around the lake 1 kilometer wide. In this area some 660 hectares of cropland will be restored and replanted with trees and grass in order to reduce the discharge of agricultural waste to the lake. According to the local media, this plan is unprecedented. The provincial government pledged to clean the lake even if it is causes a 15 percent downturn in the province’s GDP.

Numerous lessons have shown that it is essential to strike a harmonious relationship with nature rather than conquer it. More and more people in China, including officials at the Ministry of Water Resources, have come to see that water is not inexhaustible, but rather that it is a limited and vulnerable resource. It is not a free natural resource, but it is valuable and strategically significant. Therefore water resources cannot be developed and used unboundedly without consideration of their sustainability. Authorities have also adopted the idea that it is more important to ration the use of water resources with high efficiency than to simply harness the water. This notion is regarded as the hope for the sustainability of water resources in China. Whatever the future in China holds, it is certain that the management of water resources is inextricably intertwined with its direction.

Wen Jiabao, who began his second five-year term as premier in 2008, is a respected leader because of his managerial abilities and a popular figure because of his common-man approach to political and social issues. Following the deadly Sichuan earthquake of 2008, he emerged as the compassionate face of the Chinese government.

Wen Jiabao was born of Han parentage on 15 September 1942 in Beichen, Tianjin Municipality, in northeast China. The people of Tianjin are said to be eloquent, humorous, and open, which in many ways fits Wen. He is known as the people’s premier and has a common touch that has earned him the nickname “Grandpa Wen.”

Wen attended Nankai High School, the same school from which Zhou Enlai (China’s first premier) graduated. From 1960 to 1968, Wen studied at the Beijing Institute of Geology, where he earned a baccalaureate degree in geological surveying and a postgraduate degree in geological structure. He joined the Chinese Communist Party (CCP) in 1965.

His training and political enthusiasm helped him secure government posts. Between 1968 and 1985 he held such positions as technician and political instructor of the geomechanics team of the Gansu Provincial Geological Bureau; deputy director general of Gansu Provincial Geological Bureau; and vice minister of the Policy and Law Research Office of the Ministry of Geology and Mineral Resources. During this time Wen built his powerbase and gained standing as a strong administrator and dedicated technocrat.

In 1985 Wen was named deputy director of the General Office of the CCP Central Committee. In 1986 he was elevated to director, an office he held until 1992. During this time he held a number of other party positions, including chief of staff to general secretaries of the CCP Hu Yaobang, Zhao Ziyang, and Jiang Zemin.

Wen’s career nearly ended in disgrace in 1989. A photograph of him alongside the then general secretary Zhao Ziyang visiting student demonstrators in Tiananmen Square on 19 May 1989 appeared on the front page of the People’s Daily. To many party leaders, the photo signified their support of the students. Zhao was purged for his actions, but Wen somehow managed to escape persecution and continued to rise in power.

In 1993 Wen became a full member of the Secretariat of the CCP Central Committee. In 1997 he became a member of the Politburo. In 1998 he was appointed one of China’s four vice premiers. The pinnacle of his career, to this point, came in 2003 when he was appointed to his first term as premier of the People’s Republic of China. His second five-year term began on 16 March 2008.

Wen is a popular and, by most accounts, effective leader. His premiership is marked by his “people-first” policy. He has launched programs aimed at revitalizing the rural economy, restructuring the banking system, and reforming state-owned enterprises. He has held impromptu news conferences (an unheard of practice in a country with a state-controlled press), championed the
2008 Beijing Olympics, and shed tears in public, especially following the 2008 Sichuan earthquake.

The quake, which struck on 12 May 2008, was one of the deadliest disasters in China’s history. More than 69,000 people were killed, and more than 5 million were left homeless. Along with other structures, thousands of schools were destroyed. The total economic loss is estimated to be more then $75 billion.

A few hours after the quake hit, Wen headed for the quake zone to take charge of rescue operations. As a trained geologist, he understood the magnitude of the disaster. He was immediately named the executive director of the Earthquake Relief Efforts Committee. Media and amateur videos showed him directing rescue crews and comforting victims. In one instance, at the site of a collapsed elementary school, he introduced himself as Grandpa Wen (unwittingly earning himself a nickname) to a child pinned under debris and said, “Hang on child. We’ll rescue you.” His unusually sympathetic face of the Chinese government solidified his popularity and respect.

Wen’s reputation and his face are now well known to the world. He appears often, in action, on Chinese television. He is seen as a man for his times. He has a profile on Facebook, the Internet social-networking site. The author of the page is unknown, but Wen and the Chinese press have welcomed the exposure. During Wen’s trip to Europe in early 2009, when the world was focused on global economic woes, the prime minister garnered some attention for mentioning that he carried in his suitcase a copy of Adam Smith’s *The Theory of Moral Sentiments*. Wen explained his view of the book’s message, telling reporters that it is morally unsound—and a threat to stable society—if the fruits of economic development are not shared by all. The view is bound to resonate among those in China who suffer from the uneven distribution of wealth resulting from the country’s own rapid growth. By emphasizing this aspect of Smith’s philosophy, the *Economist* reported in March 2009, “Wen is trying to show he cares.”

Further Reading

Princess Wencheng was the niece of the Chinese emperor Tang Taizong; she was sent to Lhasa to marry the Tibetan king Songzan Gambo. In contemporary China, she is famous as a symbol of “the unity of the nationalities” (minzu tuanjie) and credited with the spread of Chinese culture among the Tibetans. She is also the subject of many Tibetan artistic and literary works.

Princess Wencheng was a Chinese princess who married a Tibetan king and became a symbol of intercultural exchange and of the unity of the two nationalities (minzu tuanjie). The Tibetan king Songzan Gambo (reigned 639–650 CE) is the most famous monarch of the ancient kingdom, credited with consolidating royal authority and expanding his territory. He developed a Tibetan script that survives to this day. He introduced Buddhism to Tibet, and the great Jokhang Monastery, which still stands at the center of the capital, Lhasa, dates from his reign.

King Songzan Gambo sent an envoy to the court of Li Shimin (599–649), who reigned as emperor in China from 627 to 649 under the title Tang Taizong, requesting a diplomatic marriage. In 640 Tang Taizong adopted his niece, Princess Wencheng, as his daughter and sent her to Lhasa, where she arrived early the next year.

Like an Nepalese wife whom Songzan Gambo had already married, Princess Wencheng bore him no children (he had offspring by Tibetan wives). But legend claims that a place in the great Potala Palace in Lhasa was their bridal chamber.

Princess Wencheng was a devout Buddhist and probably exerted considerable religious influence on the king. In the holiest innermost part of the Jokhang Monastery stands a statue of Sakyamuni Buddha that is said to be the only surviving Buddha statue dating from the time of Buddha himself and consecrated by him. According to tradition, Princess Wencheng brought this statue from China to Tibet.

Princess Wencheng was reputed to be talented, cultured, well mannered, and versed in divination and other branches of learning. She introduced Tibet to Chinese skills, such as those of the medical doctor and miller, calendar calculation, weaving, pottery, and paper and wine production. Her retinue from China also included thousands of craftsmen. She remained in Tibet after the king died, teaching weaving and embroidery to Tibetan women.

After her death Princess Wencheng was deified in Tibet, and statues of her are still found in Tibetan temples. She became the subject of wall paintings, folksongs, and legends. One of the eight great dramas in the Tibetan tradition is entitled A-lea-rgya-za (Princess Wencheng). Two Tibetan works, one dated to 1388, the other to 1643, record the story in some detail, the latter being closer to the version performed nowadays. Actually this drama is set in the Chinese capital and concerns the successful attempts of the Tibetan envoy in winning a competition for her hand against royals from elsewhere and in overcoming resistance from Tang Taizong to grant the marriage of Princess Wencheng to the Tibetan king. At the end Tang
Taizong encourages her to spread Buddhism in Tibet as she leaves for Lhasa at the head of a mighty convoy.

In contemporary Chinese historiography (the writing of history) Princess Wencheng is given an important role in spreading Chinese culture to Tibet. By enhancing the close relationship between Chinese and Tibetans she symbolizes “the unity of the nationalities.” Her marriage with the Tibetan king is considered by some as evidence that Tibet belongs to China.

WEN Tingyun

Wèn Tíngyùn 温庭筠

c. 812–866 CE  Tang lyric poet

Wen Tingyun was a lyric poet during the Tang dynasty (618–907 CE) whose innovations had a wide-ranging influence on Chinese poetry, especially during the Song dynasty (960–1279).

As with most things concerning the life of the poet Wen Tingyun, it is difficult to say exactly where he was born. Some scholars say he was a native of Taiyuan, in Shanxi. Others state that he was likely born in the Yangzi area. But there is little doubt that he was among the first to master the ci form, verses set to specific and well-known tunes and melodies. His poems are often concerned with themes unconventional for their time, such as anger, sexuality, and hatred. He also excelled in singing and playing the flute.

Wen was born into a family of minor court officials. He sought to become a scholar-official but to little avail, as he could never pass the civil service examinations. Many accounts attribute this failure to his self-indulgent life. One requirement of a scholar-official was high moral integrity; another, literary talent. Perhaps embittered, he began to criticize many of the court officials in his verses and songs. Even those who sought to help him were subject to his attacks.

After failing the examinations Wen set about to find a rich patron. But his attempts proved fruitless since there were not many powerful people whom he had not offended. Around 839 he was likely married and then had two children, a son named Wen Xian and a daughter. No further details about his family life are known. For the next ten years, he sought again and again to achieve a position at court, failing each time.

In 853 Wen was finally given a post far from the capital. Perhaps this was an effort to remove him from the inner circle of the court in a kindly fashion. Despite his slanderous and unpopular actions, and perhaps because of them, he was a highly recognized public figure, and his poems and songs were widely read.

In 863 he had made his way back to the capital of Yangzhou, where he had hopes of being granted a more worthwhile position. But that was not to be, and he continued in his old ways. Before long, he was severely beaten by a soldier because he had violated a curfew. He lodged a complaint, but the soldier’s actions were upheld.

This incident infuriated Wen further, and he continued to attack in verse the various officials he deemed responsible for his humiliation. The result was that he was exiled once again. He would never return to Yangzhou. It is likely that he died in exile sometime after 866.

In Chinese literary tradition, Wen’s poetry has been neglected because of his moral failings. Many are the anecdotes that relate his exploits in brothels. But such an approach is unfair to Wen’s rather prodigious talent. Although his verses appear deceptively simple, their primary concern is the exploration of those emotions that hover around the individual in his or her interaction with the world, and with those who love him or her. Thus Wen seeks to find a balance between pleasure and the
emotional cost of winning such enjoyment. This allows him to delve into those very things that mark and underscore life: love, suffering, pain, but also hope for better things to come.

The Poetry of Wen Tingyun

*NEWS SO Seldom COMES*

Blue tail-feathers and markings of gold
on a pair of mandarin ducks,
And tiny ripples of water stirring the blue
of a pond in spring;
Beside the pond there stands a crabapple
tree,
Its branches filled with pink after the
rain.
Her figured sleeve covers a dimpled smile
As a flying butterfly lights on the mistlike
grass.
Her window gives on all this loveliness—
And news so seldom comes from the
Jade Pass!

Wen Tingyun, a Tang dynasty lyric poet whose themes were unconventional for his time—and whose verses and songs were often critical of court officials.
Weng Wenhao was a leading figure in China’s development of geological studies—as a student, researcher, teacher and administrator. As director of the National Resources Commission in the mid-1930s he oversaw the planning of heavy industrial reconstruction and the creation of state-run national defense industries; after the outbreak of war in 1937 he became one of China’s leading statesman.

Weng Wenhao was among China’s first geologists and a leading statesman during the War of Resistance against Japan (1937–1945, known outside of China as the Second Sino-Japanese War, and fought in the context of World War II) and the Civil War (1945–1949). He was also the principal architect of China’s state enterprise system.

Weng was born in Qin County of Zhejiang Province. In 1903, at the age of fourteen, he passed the traditional civil service examination at the prefectural level and became a “received talent” (xiucai). In 1909 he went to Belgium to study physics and geology at Louvain University, where he received a doctorate in 1913. Upon returning to China the same year Weng Wenhao joined the Geological Research Institute, which was an institution of education designed to train future geologists. After the Geological Research Institute was forced to close in 1916, he transferred to the Geological Investigation Institute, which was China’s first veritable research institute in geological science. During the late 1910s and the 1920s he published several comprehensive studies that described China’s mineral resources and their distribution, as well as the conditions of the Chinese mining industry. He served as the acting director of the Geological Investigation Institute from 1921 to 1926. He became the institute’s director in 1926 and continued to serve in that position until 1938. Between 1928 and 1930 he was invited by the president of Qinghua University to establish a department of geography that would teach the subjects of geography, geology, and meteorology and to serve simultaneously as department chair. He also held the positions of acting president of Qinghua University in 1931.

From November 1932 to April 1935 he served as secretary-general of the newly created National Defense Planning Commission and coordinated the investigation of China’s natural and human resources and the preparation of plans for national defense. After the National Defense Planning Commission was renamed National Resources Commission in April 1935, he became its director. During his tenure as director from 1935 to 1946 he oversaw the planning of heavy industrial reconstruction and the creation of national defense industries. Under his leadership the National Resources Commission established roughly 130 enterprises in energy, petroleum, iron and steel, machinery, alcohol, and electric industries and the management of those state-owned enterprises.

After the outbreak of war in 1937 and the reorganization of the central government, Weng in January 1938 became minister of the Ministry of Economic Affairs
Weng Wenhao's National Resource Commission

The Harvard scholar William C. Kirby writing on the twentieth century geologist/statesman Weng Wenhao:

The new industrial strategy. The basic goals of the plan arrived at by Weng Wenhao's commission in the years 1932–35 may be summed up as follows: the development of the state-run heavy industries and mines in a new “economic center” in central China. These would primarily serve national defense needs and be run by trained specialists according to a comprehensive plan as the initial step toward a fully “planned economy.” Heavy industrialization was linked to the exploitation of raw materials and the development of new power-generating capacity, for all of which foreign investment and assistance were essential. A state monopoly on the export of certain raw materials would provide the necessary foreign exchange.

“Heavy industries constitute the main pillar of national defense,” wrote Weng in 1940. “This is why progressive nations the world over have spared neither time nor effort in expanding and developing heavy industries.”

under the jurisdiction of the Executive Yuan; he assumed responsibility for directing the administration of the national economy while he continued to serve as director of the National Resources Commission. Under his watch the Ministry of Economic Affairs oversaw industry, mining, commerce, agriculture, forestry, and water conservancy. After May 1940 the Executive Yuan delegated new responsibilities of administering industrial regulation and business enterprises to the Ministry of Economic Affairs but removed agriculture, forestry, and water conservancy. Weng remained head of the Ministry of Economic Affairs until 1946. After the war he served as vice president of the Executive Yuan from June 1945 to April 1947 and president of the Executive Yuan from May to November 1948. The imminent Communist victory led Weng to travel to France and England from late 1949 to 1950. In 1951 he returned to China and joined the Communist government, serving three times as a member of the National Political Consultative Conference. He died in January 1971.

Wenzhou Model ▶
Wenzhou Model

Since the 1980s, business activity in and around the city of Wenzhou in Jiangsu Province has served as national model for economic development in China. The success of the model is due in large part to the traditions and spirit of the local people.

During the early stages of China’s economic reforms (from 1979 to the mid-1980s), two distinctive regional development models emerged: the Wenzhou model and the Sunan model. The former is based on Wenzhou, a medium-sized coastal city in Zhejiang Province, where a market economy led by rapidly growing and vigorous private enterprises has helped the Wenzhou region to flourish economically. The latter is centered in Suzhou, a cultural and business center in the rich and populous Jiangsu Province, where collectively owned township enterprises with strong government backing has successfully generated business development.

Socialism versus Capitalism

The term Wenzhou model was first adopted in a special report by the Jiefang Daily, 12 May 1985, on Wenzhou’s family industries. The report praised the Wenzhou model as an “eye-catching economic miracle” and “a model that leads to the prosperity of vast rural areas.” However, from the beginning, this model attracted severe criticism from many Communist Party and government leaders at the national and provincial levels. As such, it became a focal point of a heated political debate. According to these critics, the Sunan model followed the socialist development road, whereas the Wenzhou model tried to restore capitalism, which the government then tried to repress. The socialism versus capitalism (xing she or xing zi) dispute between these two models echoed the broader debate between continuing the state-planned economy or permitting market economy and private enterprises.

One of the main elements of this debate, as demonstrated in Wenzhou, was the problem of managing and regulating private enterprises. Wenzhou people refer to the 1980s and even the early 1990s as the period of primitive accumulation of capital. During this period Wenzhou businesses would do almost anything to turn a profit, leaving quality by the wayside. The lack of sufficient supervision and regulation of private businesses led to chaotic, fraudulent practices and suicidal competition, resulting in devastating damage to the private economy. For a long time, Wenzhou was synonymous with forgery and poor quality (jia, mao, wei, lue). At the same time, the government worried about social control and the political consequences of a flourishing private economy. The debate lasted until Deng Xiaoping’s famous tour to several southern cities in 1992, which brought a new momentum to Wenzhou’s private businesses.
Entrepreneurial Roots

Unlike other regions where the collectively owned village and township economy boomed before private enterprises developed, Wenzhou’s economic development grew immediately in the late 1970s from an explosion of private enterprises. These small family-based operations, in small towns in the Wenzhou region, became the foundation of Wenzhou businesses. Around the late 1970s, Wenzhou had only 6,477 businesses: 302 state owned, 4,801 collectively owned, and 1,372 private enterprises (or 21 percent) at the village and township levels. By 1996 the total number had increased to 117,829 and, of these, 112,232 (or 95 percent) were private businesses. From 1979 to 2000, Wenzhou’s economy grew at an average rate of 15 percent a year, and the total industrial output increased from ¥1.12 billion (about $164 million) in 1978 to ¥203 billion (about $20 billion) in 2001. By 2007 the private sector made up 99.5 percent of Wenzhou’s total number of firms, 95.5 percent of its industrial value, 95 percent of its foreign trade revenue, and 80 percent of its tax revenue.

The distinctiveness of the Wenzhou model owes much to its unique historical tradition and to more recent economic developments that shaped its culture and the traits of its people. Today, Wenzhou spans over 11,784 square kilometers (about 4,550 square miles, slightly smaller than Connecticut) and is home to 7.7 million people (2007 estimate). Surrounded by mountains, it has very limited arable land. In 1978 one-third of the land was agricultural, and the per capita land tenure was only 0.53 mu (one-tenth of an acre). As a result, on the eve of Deng Xiaoping’s reforms Wenzhou had a surplus of more than a million agricultural laborers. In addition, as Wenzhou is situated on the Taiwan Straits, the prereform government considered it a military front against Taiwan and thus too risky for infrastructural investments. Between 1949 and 1978, total state investment in building Wenzhou’s infrastructure was less than ¥60 million (about $9 million), only 15 percent the average national state investment in comparable cities. Thus, before 1978, the state-owned economy contributed only 36 percent to Wenzhou’s industrial output value, far below the national average of 78 percent.

Wenzhou was called an ocean culture. Frequent migrations since ancient times, its dependence on ocean trade, and the lack of strong ties to any inland cultural centers nurtured an independent, diligent, creative, practical, and adventurous society. Its cultural uniqueness dates back as early as the Tang (618–907 CE) and Song (960–1279) dynasties, when Wenzhou—then known as Ou or Yongjia—was a prosperous manufacturing and commercial port in southeast China. Far from the capitals of imperial dynasties, Wenzhou enjoyed a relatively isolated cultural environment. Against the mainstream of Confucianism, the Yongjia School during the Southern Song (1127–1279) and the Three Scholars of East Ou during the late Qing (1644–1912) were well known for their advocacy of business and economic development.

Since the late 1980s, the Wenzhou model has been characterized by family-operated, low-tech, low-capital, and labor-intensive enterprises. Products have been heavily concentrated in light industries, such as lighters, glasses, garments, shoes, and small electrical appliances. The products of these hundreds and thousands of crude workshops go on to national and international markets. The phrase “small products, big market” has become the trademark of the Wenzhou model. Millions of surplus agriculture laborers entered the nonagricultural production market, and the economic conditions of their families and the region as a whole have improved profoundly. In 1980 the average income of Wenzhou villagers was 15 percent below the national level. By the beginning of the twenty-first century, the average income of Wenzhou villagers had risen to twice that of the national level. During the early stages of China’s economic reforms, the Wenzhou model helped break down old conceptions of economic development and demonstrated to other regions, especially lower Yangzi (Chang) delta regions, the potential gains of a market economy. Through the Wenzhou model, Zhejiang Province has become the “headquarters of the private economy” in China. In 2007 the total industrial output, retail value, and income from foreign trade of its private businesses ranked first in the nation.

Future Challenges

Yet this model faces serious challenges from economic globalization and China’s membership in the World Trade Organization. Certain innate weaknesses of family-operated businesses, from leadership to managerial mechanisms, have hindered the model’s advantages. Since the late 1990s, to thrive in the increasingly
competitive domestic and international markets, Wenzhou’s private enterprises have reorganized swiftly into large limited liability corporations and shareholding corporations. The size of individual enterprises has enlarged significantly, and the industrial structure, capital composition, and managerial model have been substantially transformed.

The question arises whether these new developments, as promoted by the corporations and valued at ¥1 billion (about $146 million), still represent the Wenzhou model. Wenzhou people believe it should. They consider the true spirit of the Wenzhou model to be people’s creativity, sense of adventure and independence, diligence, and vision.

Further Reading

The Chinese Nationalist Party’s campaign of violence in Shanghai—the “White Terror”—was aimed at Communists and labor union members in 1927. The White Terror suppressed Communist activity in the city and influenced the later strategy of the Chinese Communist Party.

The White Terror was the regime of violence established by the Chinese Nationalist Party (CNP or Guomindang) after its capture of Shanghai in 1927. The violence, which drove a permanent wedge between the Nationalists (the White Party) and the Communists (the Red Party), was directed at labor unions and their leaders but evolved into extortion of Shanghai’s privileged classes.

Fragmented Politics

From the time of the collapse of China’s last imperial dynasty (Qing, 1644–1912) in 1911 and the establishment of Republican China (1912–1949), China’s political landscape had been fragmented; by the early 1920s revolutionary leader Sun Yat-sen (1866–1925) led the CNP from its main base in Guangzhou (Canton), while Chen Duxiu (1879–1942) founded the Chinese Communist Party (CCP) in Shanghai in 1921. In 1923 Sun Yat-sen’s favorable impression of the Bolshevik revolution in Russia and the Communist belief that a socialist revolution would follow a nationalist revolution led to the Chinese Communists and the Nationalists forming an uneasy alliance against the local warlords who held large parts of China. Michael Borodin (originally named “Mikhail Gruzenberg,” 1884–1931), who was a Comintern (the Communist International established in 1919 and dissolved in 1943) agent in China from 1923 to 1927 and who was one of the architects of the alliance between the CCP and CNP, became one of Sun Yat-sen’s special advisers. At a CNP conference in January 1924 Communist delegates accounted for fewer than 20 percent of those present, but two years later Communists and their supporters in the CNP were the majority of delegates at a conference in Guangzhou. After the death of Sun Yat-sen in 1925 Chiang Kai-shek (1887–1975), commander of the Whampoa Military Academy south of Guangzhou, soon emerged as the new leader of the CNP.

Although Guangzhou had become a Communist stronghold, powerful anti-Communist factions of the CNP existed all over China, and the pro-Soviet line was abandoned under the new CNP leadership. The tensions between the CCP and the CNP surfaced in March 1926 when Chiang Kai-shek felt provoked by the presence of a gunboat commanded by a Communist; Chiang imposed martial law in Guangzhou. Soviet advisers were arrested, and workers and Communists were disarmed. Martial law was lifted after some days, and after negotiations involving Borodin, the CNP-CCP alliance continued but with a weakened Communist position. By the end of 1926 the armies controlled by the CNP and Chiang Kai-shek had conquered most of southern China and established headquarters in Nanchang in Jiangxi Province, while the CCP and its supporters were based in Wuhan in Hubei Province.
Shanghai in 1927

The central area of Shanghai in the 1920s was divided into a number of foreign settlements surrounded by Chinese neighborhoods. The foreign concessions were administratively and legislatively independent of China, and they could even overrule the legal system of the Chinese government. The city was booming—a center of industry and trade—and Communist leaders had been successful in organizing workers on the docks and in the factories into labor unions. In May 1925 strikes involving several hundreds of thousands of workers in Shanghai spread to the rest of China, and the riots were stopped only when Japanese and British troops opened fire and killed numerous Chinese workers.

In February 1927, as Chiang Kai-shek was contemplating a move on Shanghai, the Communist leaders in the city—Zhou Enlai (1899–1976) and Li Lisan (1899–1967)—organized a general strike that paralyzed the busy port and the city’s industry. Numerous workers again were arrested and executed, but in March the strike turned into an armed rebellion against the CNP and the authorities in the Chinese part of Shanghai, and police stations and other key buildings were occupied. Chiang Kai-shek delayed his advance on Shanghai, hoping that foreign troops or Shanghai’s local Chinese commander would crush the Communists, but when that hope was dashed, the CNP armies arrived on 26 March.

The Green Gang

One of Chiang Kai-shek’s main goals in taking over the wealthy city of Shanghai was to gain financial support for his campaign to defeat the northern provinces, which were controlled by independent warlords. At the same time he wanted to curb the influence of the CCP headquarters in Wuhan and the strong Communist organization in Shanghai. The city’s powerful businessmen, industrial leaders, foreign concessions, and underworld entrepreneurs occupied with prostitution, gambling, kidnapping, and opium trade shared Chiang’s opposition to
the Communists. A secret society known as the “Green Gang” (Qingbang) controlled the illegal activities in Shanghai. The Green Gang was led by Huang Jinrong, a senior officer in the French police. The exact nature of Chiang Kai-shek’s relationship with the Green Gang remains unclear, but historians generally agree that an alliance was formed between the Nationalist occupying forces and the Green Gang to strike against labor unions and the Communists.

At 4 a.m. on 12 April, while Chiang was away trying to establish his capital in Nanjing in Jiangsu Province, a militia led by associates of Huang carried out a well-organized attack on union headquarters around Shanghai. The militia was made up of approximately one thousand men who were heavily armed and wore plain blue clothes and white armbands with the Chinese character for labor (gong). In several instances they were assisted by Nationalist troops. They were allowed to pass freely through the foreign settlements. Hundreds of labor unionists and Communists were shot or arrested and turned over to the Nationalist troops, who executed them. A few leaders, such as Zhou Enlai, narrowly escaped. The next day the labor unions responded with strikes and demonstrations, which were dispersed with machine guns, swords, and bayonets.

The White Terror spread to other cities controlled by the CNP, and several Communist attempts to establish city communes were suppressed. Having ended Communist activities in Shanghai, Chiang Kai-shek began to collect payment from the privileged classes for his services. Assisted by criminals of the Green Gang, the CNP forced the rich to donate money or to extend “loans” to finance its armies. Those who refused to comply were imprisoned and released only in return for huge sums of money or had their property confiscated or their children kidnapped.

The White Terror in Shanghai and other urban Communist strongholds had a large influence on the development of Communist strategy in China. Having lost its influence in the cities, the CCP concentrated its efforts on the rural areas and based its revolution on peasants rather than on industrial workers.

Wine Culture

The use of alcoholic beverages in China has been continuous throughout its history. Today, with traditional customs of hospitality supplemented by the obligations of modern business practices, the ways in which beer, liquor, and wine are consumed reveal an important aspect of Chinese life—and producing these beverages has become a thriving sub-economy.

Evidence of the use of alcoholic beverages in China dates to the discovery and analysis of sediment found in nine-thousand-year-old crockery dug from cave-tombs in Henan Province. Archaeologists have documented that Chinese farmers produced grain, the basis of many alcoholic spirits, as early as seven thousand years ago. Alcoholic beverages have had a place in traditional customs and rituals throughout China’s history, and do so increasingly in modern times as an important part of social and business life.

The alcoholic beverages the Chinese drink include baijiu (Chinese liquor), putaojiu (wine), huangjiu (rice wine), and pijiu (beer). Of the four, baijiu and huangjiu are indigenous and appeal to the most consumers.

Baijiu, literally “white liquor,” is a colorless spirit distilled from sorghum, rice, wheat, corn, peas, or dried yams, or from a mixture of some of the grains aided by sacchariferous starters like yeast and mold. Baijiu has different types of bouquets and may or may not have flavoring added. Ranging from 40 to 65 percent alcohol (i.e., 80 to 130 proof), baijiu’s appearance is similar to that of vodka, yet its taste is distinctive and unique and perhaps a little too strong for some Western palates. Some of the most famous brands are Maotai, Fenjiu, Wuliangye, Jiannanchun, Yanghedaqu, Gujinggong, and Dongjiu. A bottle of low-quality baijiu may cost less than one U.S. dollar, but a bottle of Maotai that has been aged for many years can cost a few thousand.

Huangjiu (rice wine) is fermented like wine and beer but is made primarily of glutinous rice. Other grains can be used, like indica rice, black rice, millet, sorghum, buckwheat, or highland barley, and sometimes dried yams are used. Each gives huangjiu a unique flavor. Before modern technology huangjiu was manually produced in a process that soaked, steamed, and cooled the rice before fermenting it twice and sterilizing the extraction using heat. The Shaoxing huangjiu of Zhejiang Province, the millet huangjiu of Shandong Province, and the monascus (mold-fermented) huangjiu of Fujian Province are among the best of the country. Their prices are comparable to those of higher-end baijiu.

As their standard of living has improved, the Chinese have become health-conscious and concerned about their drinking habits, now preferring liquor of lower alcohol percentage. Baijiu, still the dominant “national drink,” is being challenged by wine and beer, whose consumption is growing rapidly. While leading the world in the increase of beer drinking, China imports great volumes of top-grade wines and spirits each year. Favored in luxury hotels, bars, and nightclubs, and as fads of the newly rich, they also targeted to appeal to the average Chinese drinker.
History

In 2005 an American brewery, Dogfish Head, made headlines when it produced a new beer based on a biochemical analysis of dregs found in shards of crockery unearthed in a 9,000-year-old cave-tomb in Jiahu, Henan Province. Archaeologists learned that early Chinese were already farming grains, the major component of wine, in the Yangshao culture six to seven thousand years ago. The excavation of a great variety of five-thousand-year-old drinking vessels from the Longshan culture (c. 3000–1900 BCE) testifies to the popularity of huangjiu at that time. The Chinese were able to produce a dozen types of yeast starters in the fourth century CE, and they understood the natural use of monascus mold for fermentation a thousand years ago.

Baijiu came later. A bronze distiller was discovered in a tomb of the Eastern Han period (25–220 CE), and records of the sixth or seventh century mention shaojiu, namely baijiu, but historians would rather place the time of its mass production in the Yuan dynasty (1279–1368). Grape wines and their fermenting techniques were imported from Central Asia during the Han (202 BCE–220 CE) or Tang (618–907 CE) dynasties. The first Chinese brewery, though, was not built until 1892 in Zhangyu, Hebei Province, which first produced beer and then wine. Tsingtao, the only Chinese beer known to Westerners today, was first manufactured in 1903 in a brewery of German propriety in Qingdao, Shandong Province.

Today China is a major liquor producer. In 2007, it produced 500,000 kiloliters of baijiu; 66,500,000 metric tons of putaojiu; 2,000,000 metric tons of huangjiu; and 39,313,700 kiloliters of piju. The majority of this volume was consumed domestically. In the same year, China imported more than 150,000 kiloliters of wine and 205,700 kiloliters of beer. China has become the third largest consumer of Martell cognac, following only Great Britain and the United States (Wang, 2008).

Customs

It is difficult to describe the customs of drinking in China because they vary from region to region, from ethnicity to ethnicity, and from occasion to occasion. They also vary among people of different tastes and occupations. Traditionally, women did not drink alcohol. Today most women in China still shun liquor and choose non-alcoholic beverages. However, because business deals in China are closed more often at dinner tables than in meeting rooms, a growing number of enterprises and government agencies require that their public relations officers, mostly young women, develop a great capacity for drinking, much to the chagrin of the public. In general, older people choose baijiu; younger ones prefer beer; and people of middle age are fond of both. White-collar workers drink wine more than anything else.

Urging someone to drink is an important part of the Chinese tradition at large. To do so, people resort to various strategies and tactics. They may look for (or invent) a reason to make a toast. While Han Chinese use eloquent speech, ethnic minorities mostly sing their quanjiu (songs that urge drinking) or jingjiu (songs of toast). The idea is to show hospitality and to make sure guests are “drinking well.” The Chinese, seeing straightforwardness as impolite, often take “no” for a euphemistic way of saying “yes.” The only way to get a guest to drink to his heart’s content, they reason, is to urge him repeatedly. In such a culture, the avoidance of overdrinking is equally important. This is usually achieved by pacing the amount one drinks over the course of a gathering or dinner. Cheating may be committed as a necessary evil by either stealthily substituting water for liquor or by covertly spitting liquor out into a napkin. Spilling some liquor “unintentionally” also does the trick. This custom of “offense” and “defense” over a drink can sometimes get out of hand and become a very annoying tug-of-war, which happens often at family and friendly gatherings in rural areas of eastern China.

Drinking can become unruly at home and in small eateries, where people play a caiquan (finger-guessing) game, something like the Italian morra. Each round involves two players. They stretch out a number of fingers from one or both hands at the same time that they shout out a number from 2 to 20. The one who shouts out a number equal to the total number of extended fingers will win. Whoever loses the game has to suffer the penalty of draining a glass full of alcohol. After guessing the number of fingers, the contestants also shout out a series of rhymes, known as xingjiuling, to pun on the numbers, such as “one respectful heart” for the number 1, “two brotherly friends” for 2, “three shining stars” for 3 and so on. As excitement builds, each tries to shout down the other. Upscale restaurants always ban the game.

Drinking etiquette can also require subtlety. When toasting, one has to make certain of the pecking order between guests who are present.上下级关系的主次关系应根据具体场合而定。
higher than a senior does. The most polite way to toast, particularly to a guest or senior, is to say, “I’ll drink it up [meaning one glass], but you can drink as much as you can.” At the table, one can never drink alone without initiating a toast or inviting others to drink. Otherwise people may think it rude. People often stand up to toast one another and clink their cups or glasses. When less excited, they may just sit and toast. As they cannot reach each other at a large table, they may instead gently tap the lazy Susan with the edge of the bottom of their cup or glass.

Ethnic Chinese usually observe their diverse time-honored rituals. When guests come to visit Mongolians, for example, they are invited into the yurt, presented with kha-btags (silk scarves of good wishes), and offered an alcoholic beverage made with horse milk. According to another Mongolian tradition, the guests must bless the earth, the heaven, and themselves before drinking by dipping a little finger in the liquor and tossing it in the air, snapping it to the ground, and daubing it on their foreheads.

To the Chinese, drinking without good food is unthinkable, so each formal dinner has at least two courses. The first, consisting of lighter dishes, is geared primarily to facilitate drinking, and is followed by the second course of heavier dishes. Today, however, Western-style bars or pubs that serve drinks without the accompaniment of a “proper” meal are mushrooming in big cities like Beijing and Shanghai, catering to foreigners and locals alike.

The popular Chinese saying “He jiu he hou le; du bo du bo le (Drinking brings people closer, but gambling sets people apart)” vividly signifies the role drinking plays in human relations in China. Drinking is not only an integral part of social life but is increasingly becoming a ritual in business culture. A lot of business deals are sealed at dinner tables amongst boisterous toasting and the clinking of cups and glasses.

Wokou

Wōkōu 倭寇

The Wokou, meaning “Japanese pirates,” (although some of them were actually renegade Chinese), plagued the coasts of China and Korea from about 1200 to sometime after 1600. Their activities were brought to an end by wider permission of legal trade on the coast of China and by Japanese prohibitions of foreign voyages by their own people.

Wokou (Chinese) or wakō (Japanese) meaning “Japanese pirates,” plagued the coasts of China and Korea from the 1200s to the end of Japanese seafaring in the 1600s. Their depredations shaped Chinese and Korean negative images of Japan and limited the possibilities for peaceful interaction among the three countries. Many of them were in fact Chinese, sometimes basing themselves in the Japanese islands, allying themselves with Japanese marauders or trade-and-predation-oriented daimyo (territorial warlords) even using Japanese names or adopting Japanese dress. One of the earliest uses of the term is on a Korean stela dated 414 CE. An outbreak of piracy around the Japanese Inland Sea is recorded in the 930s. References to the Matsuura family and their associates, who would be prominent in piracy and maritime trade until their end in the early 1600s, marauding off the coast of Korea are found in texts from the 1200s.

Japanese piracy off the coasts of the continent reached its first peak in the 1300s. The struggle between the Northern and Southern Courts in Japan unleashed samurai predation and search for plunder in all directions. Raids reached down to the coasts of Shandong and other parts of northern China, but Korea bore the brunt of the pillage. Korean sources record 174 raids between 1376 and 1385, some of them mini-invasions that reached the outskirts of the capital. Some Japanese pirates reportedly were allied with maritime rivals of Zhu Yuanzhang, the Ming dynasty (1368–1644) founder, who responded with drastic measures, building up forces and fortifications and forbidding all but the smallest maritime voyages from the coasts of China. Japanese and other foreign rulers could trade with China only by sending tribute embassies to the imperial court. Several powerful figures in Japan responded to this disincentive by attempting to prevent the departure of pirates from their bases. These measures, China’s improved maritime defenses, and agrarian and anti-commercial strategies for economic revival from the chaos of the Yuan-Ming wars were sufficient to reduce the numbers of pirate attacks on China in the 1400s. Illegal trade from the Fujian port of Yuegang and the vast legal loophole of the flourishing tribute trade of the kings of the Ryukyu Islands were other safety valves for trade that reduced maritime violence.

Treaty of 1443

The Koreans mounted stiff resistance to Japanese raids along their southern coast and negotiated with the Ashikaga shogunate and, more importantly, with local power-holders like the Ōuchi of western Kyushu and the Sō of
Tsushima Island. A treaty in 1443 confirmed a regime of ship-permit quotas for various Japanese maritime powers and a very special position for the Sō; all Japanese ships were required to stop at Tsushima to have their permits checked. In 1461 Sō Shigemoto was appointed governor of Tsushima by the king of Korea. Three ports in Korea became substantial enclaves of Japanese settlement. The Japanese continually pushed the boundaries of what they were permitted under the treaty; violence declined but did not entirely cease.

Both the Chinese and the Korean solutions dissolved after 1500, as officials responded to growing volumes of trade and some increase in piracy by attempting to thoroughly enforce all the bureaucratic quotas and restrictions that had been enacted in the 1400s. Riots by Japanese in the Korean ports in 1510 were suppressed, order was restored with the cooperation of the Sō of Tsushima, and trade soon resumed. Another large-scale Japanese attack on Korea occurred in 1555, but by that time the pirates’ momentum had shifted to the lower Yanzi (Chang) region. The Japanese returned to attack Korea from 1592 until 1598, employing the large and well-organized armies of Hideyoshi and his allies; their defeat owed much to Korean experience in defensive naval warfare against pirates during the preceding centuries.
Resurgence

Between 1440 and 1550 Chinese sources list only twenty-five wokou raids; between 1550 and 1570 they record 542. Trouble began with the strict enforcement of restrictions on foreign trade after the succession of the Jiajing emperor in 1524. A base of smugglers and pirates at the Shuangyu anchorage in the Zhoushan Archipelago off the Zhejiang coast is reported as early as 1526. Enforcement measures simply pushed well-armed Chinese maritime traders into collusion with Japanese traders, less and less under control as the chaos of Japan’s Warring States period (1467–1600, Sengoku jidai) reached its peak. Historians differ with regard to the numbers of Chinese and Japanese involved in these wokou raids, and the total has remained inestimable in view of (1) the numbers of Chinese gangsters who took Japanese names or donned Japanese breechclouts to scare their countrymen, (2) the multiple aliases used by many, and (3) the prevalence of adoption, sworn brotherhood, and other pseudo-kinship ties from Japan to Vietnam and beyond. In 1547 Zhu Wan was appointed as a special Grand Coordinator with wide authority to stamp out smuggling and piracy on the Zhejiang and Fujian coasts. In the spring of 1548 his forces occupied and devastated the Shuangyu anchorage. The number of captives taken was not large; the attack came in the season when winds favored voyages to Japan, and any sensible smuggler/pirate would have seen it coming and would have assembled his cargoes and gotten away to Japan. The maritime interests counterattacked; their gentry allies secured the execution of Zhu Wan for judicial irregularities, and their armed bands pillaged coastal areas and even made amazing thrusts inland, camping outside the gates of Wuxi and of Nanjing. The wokou had excellent bases in western Japan, especially in the Goto Islands, and much support from the Matsuura,

Fierce Japanese pirate raids ceased sometime around 1630, but southern coast grandmothers continued to threaten Chinese toddlers with the folklore that “the wokou would come get them” well into the nineteenth century.
the Shimazu, and other warrior factions. Ming forces sent in pursuit of them were no less predatory than the wokou toward merchants and common people. In the 1550s some astute negotiation by Ming high officials turned some of the pirates against each other and secured the surrender and execution of such important leaders as Wang Zhi. Well-trained government militias emerged under leaders like the famous Qi Jiguang. When the Portuguese were permitted to settle at Macao in 1557, they provided a growing channel for trade with Japan without legalizing either the presence of Japanese in Chinese ports or Chinese voyages to Japan. In 1567 the Ming court approved a system of legal foreign trade in Chinese shipping to all destinations except Japan; harbors on Taiwan emerged as entrepots (intermediate centers) for Sino-Japanese trade. This legalization in 1567 did more than all the military efforts had done to end the menace of the wokou, who went legal or far offshore into Southeast Asian waters.

**Twilight of the Wokou**

The wokou phenomenon had a long and eventful decline from 1567 until the drastic prohibitions of Japanese sea voyaging by the Tokugawa shogunate in the 1630s. Hideyoshi channeled samurai valor and pirate predation into his hugely ill-conceived invasion of Korea from 1592 until 1598. The Shimazu of Satsuma conquered the Ryukyus in 1609. From 1606 to 1608 Japanese ships heading for Southeast Asia caused rumor and panic among the Chinese people when they stopped at Macao. In the 1620s the Dutch began to settle on southern Taiwan and got into a very dangerous conflict with Japanese traders who had been there before them. The Tokugawa shogunate prohibited foreign voyages by their own people, largely in response to the dangers of Christian subversion. The Japanese were gone, but southern coast grandmothers continued to threaten Chinese toddlers with the folklore that "the wokou would come get them" well into the nineteenth century. Some of the wokou would have been peaceful traders if they had had the chance; others wanted nothing but loot and killing. They were a central aggravation, an unsolved problem in relations among Japan, Korea, and China for over four hundred years.

Women, Role of

Nữ nữ de diwēi 女人的地位

Chinese women, as wives, mothers, and workers, have been central to the functioning of both state and society. In recent years they have contributed to Chinese state-building and commerce in the professions and also as soldiers and scholars, cadre commanders, and political leaders.

The Chinese expression, “women hold up half the sky,” describes the important role of women throughout China's history. Confucius (551–479 BCE) believed that strong family relationships were the key to a moral society and, in turn, a moral state. Women thus contributed to state-building. In the upper-class mansions of traditional China, women managed the household and educated the young. In peasant households women worked alongside the men to shape family economies, however meager, that maintained the state.

China changed dramatically during the twentieth century. Women's roles changed as well. No longer only domestic managers and family caregivers, women were now workers and professionals, soldiers and scholars, cadre commanders and political leaders. In the twenty-first century, women remain critical to China's future economic growth and social stability.

Confucian China

Until the twentieth century, Confucianism prescribed the roles of women from birth to death through three sets of principles. The earliest set of principles was the “four womanly virtues,” set forth in Lessons for Women.

Historical illustration of women at work. The Chinese saying, “Women hold up half the sky,” reflects the importance of women’s roles through history—in the family, the field, and the factory.
by the woman scholar Ban Zhao during the Han dynasty (206 BCE–220 CE). The four virtues were proper virtue, proper speech, proper countenance, and proper conduct. The next important set of principles was that of the “three obediences”: obedience to one’s father before marriage, to one’s husband when married, and to one’s son if widowed. Finally, there was the principle of bie (separateness). Women and men held different roles in distinct spheres. Women stayed at home. Elite men ran the state and commerce in the public realm. Peasant men worked the fields. Although separate in many respects, the lives of both women and men were a public matter. Because the family was the basic political unit in the Confucian system, the state had a vested interest in the lives of women and men alike.

The Confucian moral code applied equally to women and men. One of the five basic Confucian relationships was that between wife and husband. While husbands were placed over their wives, the principle of reciprocity (shu) required that husbands treat their wives with respect if they expected to be obeyed. The very important Confucian virtue of filial piety (xiao) required sons to honor and serve both their fathers and their mothers.

Aspects of the imperial bureaucracy also provided elite women with status and power in the family. Elite boys and men spent much time studying for civil service examinations. Passing these exams qualified a man for an official position and most likely a privileged life. As a way to curtail corruption, Chinese officials were not allowed to hold office in their home province. Once a man received an official appointment, he was assigned to a post far away. In their absence wives and mothers managed the household and often the entire family estate.

Foot Binding

No discussion of women in traditional China would be complete without mentioning the custom of foot binding. Foot binding was the painful practice of wrapping young girls’ feet so they would not grow. The practice has led to the stereotyping of Chinese women as victims of male subjugation and ornaments for male amusement. Yet foot binding was not condoned in orthodox Confucian literature. In actuality foot binding was an aesthetic fashion that was part of female culture. Foot binding began during the Song dynasty (960–1279) as a fashion among courtesans. It was soon adapted by women in court circles. Tiny feet became a point of status and a mark of beauty for women in elite society. Because it was the custom in China for men to marry women of lower social standing, foot binding eventually spread across the social strata and became a means of upward mobility—or aspiration—for some families, as they would

In the twentieth century Chinese women began to take on a more prominent role in community leadership, politics, and the military.
have their daughters’ feet bound to make them more desirable to prospective husbands of a higher social status.

Foot binding was a private female ritual. Mothers bound the feet of their daughters. Young girls embroidered intricate slippers as part of their trousseau and wrote poems about their tiny feet. Bathing and rebinding feet became a lifelong part of women’s daily toilet. Except for her husband, no man ever saw a woman’s feet, and even he never saw his wife’s feet unbound.

Women in Traditional China

The adage “men till, women weave” described gender roles in traditional China. Originally, it also described women’s economic contributions to the state. In early and middle imperial China (221 BCE–1279 CE), taxes were paid in rice and woven cotton cloth; thus, women were responsible for a portion of the family tax levy. Gradually, however, the adage referred to the differentiation of men’s and women’s work. Elite men served in public office; peasant men labored in the fields. Both elite and peasant women worked in the domestic household.

Women’s social status was based on their roles as wives and especially mothers. Producing children, especially boys, was highly valued in China’s patrilineal society. The custom of revering one’s ancestors made a male heir indispensable because only he could conduct these family rituals. The virtue of filial piety required sons to care for parents in their old age. Sons brought honor, prestige, and wealth to their families if they passed their civil service examinations and were appointed to government positions. Even the lowest bureaucratic position elevated the entire family to scholar-gentry status with its many class privileges.

Even with so much emphasis on boys, girls were equally necessary for a strong society because they were the ones to produce the next generation of male heirs. From earliest childhood girls were groomed for their future roles as wives, mothers, and daughters-in-law. Marriage was a social contract between families. A bride and groom never saw each other before their wedding day. An emotional attachment may or may not have developed between a wife and husband.

A wife’s primary relationship was with her mother-in-law, the ruler of the household. A woman’s status within her husband’s family was complicated, especially in a large extended family with many other women. Status for a woman was determined by her own age, the position of her husband in the family, and whether she produced a male heir. Her beauty, womanly virtues, and domestic skills also contributed to status, although in a minor way.

Concubines were “secondary” wives who were not legal wives; they also had little or no social standing. If a
man’s first wife failed to produce a male heir, law and custom allowed him to bring a second woman into the household to father his son. The son was considered legitimate, but the first wife—not the concubine—was recognized as the child’s mother. While the practice of concubinage was officially condoned only as a means to secure a male heir, the practice of taking more than one concubine became a mark of wealth among the affluent.

**Women in Modern China**

China faced tremendous challenges over the last century and a half. Every aspect of Chinese life—social, political, and economic—changed during this time. This especially included the roles of women, who emerged from the domestic household to take an active and public role in building modern China.

Education was the key to women’s transformation. At the beginning of the twentieth century, women received educations outside of the home in missionary schools and private academies. Beginning in 1907 government-run schools began to accept women. Some women continued their studies in Japan or the United States. With the growth of higher education for women in China—through Christian union colleges for women founded between 1905 and 1915 and government-sponsored universities after 1919—women leaders were more likely to have been educated entirely in China.

Women’s modern transformation was very gradual, and there were setbacks. Professions only slowly opened to women. In the 1920s women worked as doctors and educators, and in many “white-collar” jobs in stores and businesses. Gradually women entered government service. Political rights were even more elusive. Both the Nationalist and the Communist parties were essentially patriarchal. The New Life Movement, an ideological campaign launched by General Chiang Kai-shek in the early 1930s, actually emphasized the four womanly virtues and sought to curtail women’s new public roles by promoting domesticity. But also in the 1930s a civil law code was finally passed that granted women many civil rights, such as the right to inheritance and property ownership.

Most of the progress women made in the first half of the twentieth century affected only women in the urban centers. In the rural countryside, where most of China’s population lived, life changed slowly, if at all. Wars, rebellions, famines, floods, and a growing population drove most of China’s rural populations into poverty. Infanticide, especially of girls, and the selling of girls into slavery, prostitution, and indentured servitude in factories and mills were common. The Chinese Communist Party (CCP) finally put an end to these practices when it came to power in 1949.

The creation of the People’s Republic of China brought other significant changes to women. In 1949 women from various women’s organizations formed the All-China Women’s Federation (ACWF). A quasi-official organization, the ACWF provided Chinese women their first real opportunity to have a voice in their own affairs and those of their country. Although ideologically bound to the CCP, the ACWF is exclusively a women’s organization.
that lobbies the government on behalf of women and helps enforce policy at the regional and local levels. In 1950 the government also enacted a series of marriage laws that, at least theoretically, made women and men equal under the law. The laws also legalized divorce and banned concubinage and the sale of brides. But women have also endured much. Political purges, ill-conceived economic reforms, and the disastrous Cultural Revolution (1966-1976) compromised or destroyed the lives of thousands if not millions.

China's rise as a world power has opened up even more possibilities for women. Educated, trained, and skilled women are helping drive China's burgeoning economy. For the first time in history, many women are delaying marriage, finding financial success, and enjoying independent lives. However, as has been true throughout Chinese history, these educated, urban professionals represent only a small fraction of Chinese women. The majority of women living in the rural areas receive only middle school educations at best and, for most, marriage remains their only option. But even women from the rural areas are testing the waters in the new industrial centers springing up across China. Whether veteran party members or young urban elites or laborers, Chinese women still hold up half the sky.

Chinese word radicals are the building blocks of most of Chinese words. Each radical conveys a certain message, be it an object or an abstract notion. Understanding of the Chinese word radicals is crucial to the appreciation of Chinese language.

A Chinese word radical (bùshóu, 部首) is a semantic marker that links certain core ideas with a word. Written Chinese words are expressed in pictograms, which are made up of certain elements, including radicals. Each element has a specific meaning. The elements collectively mold a specific object or idea into the pictogram.

The Chinese system of word radicals is the world’s earliest large-scale, across-the-board classification of knowledge at the fundamental level. The system is unique in its capacity to associate a range of objects or ideas under a single umbrella. It contributes to the notion that complex matters are made up of simpler components. The system also reinforces lateral thinking and the notion of association: An object or notion should somehow be classified under a category or grouping.

Some of the word radicals exist only as components of words and have no meaning by themselves. For example, the radical 心 (xīn) alone means nothing though it implies something related to “textile.” Similarly, the radical 亻 (rén) is not a word in its own right though it is used for words related to “people” or “human.”

Most radicals, however, have semantic importance; that is, they carry specific meaning, as the following examples show. Words related to sentiments or emotions normally have 心 or 宀 (xin, heart) as the radical. These include angry, bored, forget, loyal, tolerance, fear, feeling, love, sad, and thought. Most objects or concepts related to water—words such as cool, river, stream, swamp, sweat, flow, ocean, flush, gush, soup, tears—incorporate 氵 or 气 (shui, water) as the word radical. Most words for metals and minerals have the radical ⾦ (metal). The radical 食 (shi, food) is used in words related to eating and to certain types of foods. Some of the word radicals are more easily understood than others.

The number of radicals included in a particular dictionary might vary, depending on how many Chinese words that dictionary accepts. The first Chinese dictionary, shuōwénjìézì, 説文解字, compiled around 100 CE, collected 9,353 characters. The most comprehensive dictionary, the Kangxi Dictionary, Kāngxizìdīn, 康熙字典, lists about 40,000 characters although, as with the entries in the Oxford English Dictionary, many are archaic or obsolete.

Examples of some of the 190 to 214 radicals commonly used are as follows:

- **Speech (言)** found in speech 话; remember 记; permission 许; and promise 诺
- **Knife (刀)** found in cut 切; distribute 分; and fight 斗
- **Strength (力)** found in add 加; work 功; and effort 努
Three dotted drops of water ᵃ, found in full 满; river 江; soup 汤; sprinkle, pour water over 浇; wave 浪; sea 海; and ocean 洋

Upright heart ᴴ, found in remembrance 忆; busy 忙; worry 忧; faint hearted 悽; and anger 愤

Movement ᵃ, found in passing by 由; reach 达; near 近; and enter, advance 进

Grass ᴵ, found in grass 草; flower 花; and fragrance 芳

Hand ᵃ, found in hit 打; search 找; bend 折; and shift 搬

Mouth 口, found in call 叫; and animal cry 鸣

Mountain 山, found in peak 峰; and collapse 崩

Food ᵄ, found in hungry 饥; drink 饮; and rice 饭

Bow 弓, found in draw 引; extend 张; and weak 弱

Female 女, found in mother 妈; elder sister 姐; younger sister 妹; and woman 妇

Child 子; found in grandchild 孙; and learn 学

Horse 马, found in drive 驾; proud 骄; and tame 驯

Fire 火, found in heat treatment 炼; heat 炎; cigarette, smoke 煙; and beacon 烽

Heart 心, found in thoughts 思; tolerate 忍; loyal 忠; and love 恋

Wood 木, found in forest 林; jungle 森; tree 树; plank 板; and material 材

The character 中 (zhong) refers to “middle,” “central,” or “center.” The character depicts a line drawn through the center of a rectangle. The character 心 (xin) refers to “the heart.” When these two characters are combined as radicals, they form the word loyalty 忠, the scenario whereby the heart remains central, not swayed by circumstances, giving rise to the notion of loyalty.

The word nation 國 comprises a well defined boundary or territory, as shown by the outer frame 口. Within the territory a straight line at the bottom 一字 depicts land on which people, represented by mouth 口, reside. Within the framework there is spear 戈, signifying defense of the territory. The notion of “nation” is, therefore, a territory with its land and its people who defend the associated assets and values.

The word love 愛 incorporates the radical heart 心 at the core, representing emotion, feeling, or sentiment. The closest character that lies beneath the heart is friend 友, indicating that there are strong emotional links between friends. The sentiment and emotion is capped 一 (enclosure above the heart), confirming that the relationship is exclusive, not open to anyone else. Finally, there is the claw component 爪 on top, implying a powerful grip, emotional or physical, on the people concerned. Such are the power and emotions involved in love.

The importance of word radicals cannot be overestimated. Radicals form an integral part of written Chinese. Until the development of phonetics, the radical was the main tool to search for words in Chinese dictionaries. An understanding of word radicals is fundamental to the study of the Chinese language.

World’s fairs have always been a reflection of their times. Expo 2010 Shanghai China, also known as World Expo 2010, is no exception. The theme of the fair, scheduled to run 1 May to 31 October, is “Better City, Better Life.” The world will converge on Shanghai to see products and to hear ideas designed to improve urban living in the twenty-first century.

Riding the success of the 2008 Beijing Olympics, China again opens its doors to the world in 2010 with Expo 2010 Shanghai China. The international event runs from 1 May to 31 October along the waterfront of the Huangpu River in downtown Shanghai. More than two hundred nations, business, and international organizations are participating, and up to 70 million visitors from around the world are expected. (If the United States participates, it will take funding from the private sector, not the government. Legislation prohibits official government funding.) The expo features exhibits, demonstrations, and symposiums centered on the theme “Better City, Better Life.” Officials say the purpose of the expo is to encourage innovation for sustainable and harmonious urban living. The expo, or fair, is the first registered world exposition in a developing country and only China’s second world’s fair (the first was in Nanking in 1910). World’s fairs and expositions have a long history in the rest of the world.

Brief History of Fairs

Fairs date back more than 2,500 years in human history. Fairs have always been a mix of cultural or religious festival and trade show. Some fairs are localized—like county fairs in the United States—and some are international. The goals of world’s fairs are commercial and cultural. Besides offering products for sale, world’s fairs provide an opportunity for both host and participating countries to display their capabilities, ideals, and culture. Expositions are also grand venues for amusement and entertainment: giant carnivals, essentially. As times change, expositions change to fit those times.

One of the first modern trade show expositions took place in London in 1760. The Royal Society for the Encouragement of Arts, Manufacture, and Commerce organized exhibitions and offered prizes for improvements in the manufacture of tapestries, carpets, and porcelain. The first true world’s fair was also held in London in 1851, the Great Exhibition of the Works of Industry of All Nations.

Between 1870 and 1940, an international exposition of some kind was held every year, mostly in Europe and North America. In 1928 the International Exhibitions Bureau was established in Paris to regulate the frequency and quality of expositions. Since the 1950s, however, the frequency and popularity of world’s fairs has declined.

The first international fair in China was the Nan- yang Industrial Exhibition in Nanking in 1910. Plans were laid for an American-Chinese exposition in 1920 in Shanghai, but it was never mounted. In 1957 the first
Canton Fair was held in Guangzhou. This trade fair has been held every spring and autumn since then. In 2007 it was renamed the China Import and Export Fair; it is the largest trade fair in China. The Shanghai Expo is expected to far surpass the Guangzhou trade show in attendance and the number of products displayed and business deals made.

**Shanghai, the City**

Shanghai, which literally means the “City on the Sea,” lies in the Yangzi (Chang) River Delta. It is called in Chinese Hu for short and Shen as a nickname. The city proper covers 6,340 square kilometers (2,448 square miles). Eighteen districts and one county are under its jurisdiction. Its estimated 2007 population is nearly 19 million. Shanghai has been undergoing one of the fastest economic expansions in history and is becoming East Asia’s leading business city.

Construction on infrastructure—mostly transportation—within the city and on the expo site itself began in earnest in 2007. The Shanghai Expo Park is the largest single construction project in the history of Shanghai.

**Expo Park**

The expo park covers 5.28 square kilometers (2 square miles). The site is divided into five zones, each averaging about 60 hectares (148 acres). Another area is a large public amusement park of about 10 hectares (25 acres). There are twenty-six clusters of pavilions. The average floor area of each pavilion cluster can accommodate forty-five exhibition areas, each covering up to 25,000 square meters (269,000 square feet). Each pavilion cluster contains cafes, shops, toilets, communication centers, nursing services, and other public facilities.

The pavilions house the main exhibits. The China Pavilion, the Expo Center, and the Performance Center are the principal structures. Other buildings include pavilions for participating countries, international organizations, corporations, and theme pavilions, including the Urban Civilization Pavilion, the Urban Exploration Pavilion, and the Urban Best Practices area. All the pavilions and exhibits reflect the expo’s theme, “Better City, Better Life.”

**Urban Theme**

Organizers of Expo 2010 Shanghai China chose the theme to represent the common wish of humankind for better living in urban environments, recognizing the trend toward urban living in China and throughout the world. The concept of the theme is meant to stimulate innovation and exploration of the full potential of urban life in the twenty-first century. This includes creating an ecofriendly society and maintaining the sustainable development of human beings, according to the organizers. The theme plays out in exhibits that display urban civilization—habitat, lifestyles, working conditions—as it is and as how it can be with progressive thinking and global cooperation. The expo’s logo depicts three people representing “me, you, and him or her” holding hands to symbolize the family of humankind. Most of the events at the expo also reflect the theme.

**Expo Events**

Expo organizers have arranged for more than one hundred cultural and entertainment events each day during the expo’s 184-day run at some thirty-five venues. Official events include the opening and closing ceremonies and China National Day. Special events include symposiums on urban issues and meetings of international organizations. Certain days, weeks, and months have been set aside to spotlight China’s provinces, autonomous regions, and municipalities, as well as private and state-run enterprises.

International participants are also staging events. Along with the commercial presentations, there are designated national pavilion days on which individual countries will put on special shows highlighting their cultures. United States Day is scheduled for some time in July, if the United States participates.

Many of the national and theme pavilions will remain after the expo as part of the Huangpu Riverside
Regeneration program, a project to redevelop a run-down industrial area.

**After the Expo**

Plans for use of the site after the expo were designed early on. Permanent buildings that will add to the skyline of Shanghai include The China Pavilion, which will serve as a cultural center; the Expo Boulevard, a semiopen structure that will serve as a large transportation and commercial center; and the Performance Center, which can be configured to accommodate between 4,000 and 18,000 audience members. In addition, for the expo Shanghai built a new tunnel under the Huangpu River, increased the number of subway trains, and generally improved the city’s infrastructure. The impact of Expo 2010 Shanghai China is sure to last for many years.

World Heritage Sites
Shìjiè yíchǎn 世界遗产

The concept of linking nature conservation and cultural preservation was adopted in 1972 by the United Nations Educational, Scientific and Cultural Organization (UNESCO). Consequently, the World Heritage Convention authorized the designation of World Heritage sites by the World Heritage Committee.

With a history of some five thousand years, China has a rich legacy of art, architecture, literature, and religion. Not until 1987, however, was China’s application for its first World Heritage site, the Great Wall, granted by the United Nations Educational, Scientific and Cultural Organization (UNESCO), which has been actively engaged in endeavors to combine nature conservation with cultural preservation since 1972.

Early Enlistees
The Great Wall (enlisted in 1987) was constructed during the Qin dynasty (221–206 BCE) to defend against invaders from the north and has been renovated throughout history. Connecting Shandongguan Pass in the east and Jianyuguan Pass in the west, the Great Wall stretches across Liaoning, Hebei, Shanxi, Shaanxi, Ningxia, and Gansu provinces. It is one of the seven wonders of the world and an icon of Chinese national identity.

The Peking Man Site at Zhoukoudian (enlisted in 1987) near Beijing, site of the discovery of a skullcap and teeth from a species dated broadly to 640,000–230,000 years ago engenders archaeological value in the theory of prehistoric human and evolution. The Mausoleum of the First Qin Emperor (enlisted in 1987) holds the key to the mysteries of an ancient kingdom. Complex arrays of terracotta warriors with horses, chariots, and weapons found in the excavated tombs, each differing in outfit and pose, bear great historical and cultural significance. The Tombs of the Ming and Qing Dynasties (enlisted in 2000 and 2003) signify the art of burial ingenuity, revealing traditional Chinese cosmology (a branch of metaphysics that deals with the nature of the universe), feng shui theory (involving a Chinese geomantic practice in which a structure or site is chosen or configured so as to harmonize with the spiritual forces that inhabit it), and geomancy (divination by means of figures or lines or geographic features).

Palaces and Temples
The Imperial Palace of the Ming and Qing dynasties (enlisted in 1987) in Beijing and Shenyang, the Mountain Resort in Chengde City (enlisted in 1994), the Temple of Heaven (an imperial sacrificial altar) in Beijing (enlisted in 1998), and the Imperial Summer Palace in Beijing (enlisted in 1998) are pinnacles of royal architectural art and the theory of traditional Chinese belief systems.

The Temple of Confucius, the Cemetery of Confucius, and the Kong Family Mansion in Qufu (enlisted in 1994) in Shandong Province commemorate the educator,
philosopher, and politician Confucius (551–479 BCE). The cemetery containing the remains of Confucius and 100,000 of his descendants and the complex of monuments within invoke his legacy.

Potala Palace (enlisted in 1994) in Lhasa, Tibet, is a landmark atop Red Hill. The palace consists of two sections—the outer and larger White Palace, built between 1645 and 1653 as the secular administrative center and the winter residential quarters, and the sacred Red Palace of temples and spiritual buildings, built between 1690 and 1693. The complex symbolizes the central role of Buddhism in administering Tibet. Together with Jokhang Temple Monastery and the summer palace Norbulingka, the Potala Palace typifies a sanctuary of Tibetan art and architecture.

Façade of St. Paul’s Cathedral, Macao. Originally built by Jesuits in the seventeenth century, St. Paul’s was the largest Catholic cathedral in Asia. All but the façade was destroyed by fire during a typhoon in 1835. It remains as Macao’s most famous landmark and has been designated a UNESCO World Heritage Site. PHOTO BY JOAN LEBOLD COHEN.
The ancient building complex in the Wudang Mountains (enlisted in 1994) in Hubei Province celebrates the secular and religious architectural achievements of the Yuan (1279–1368), Ming (1368–1644), and Qing (1644–1912) dynasties. The Ancient City of Pingyao (enlisted in 1997) in Shanxi Province, founded in the fourteenth century, exemplifies a well-preserved Han Chinese city with the development of its architectural style (especially of banking) and urban planning. Old Town of Lijiang (enlisted in 1997) in Yunnan Province features the blending of ethnic cultural elements through the ages with a working ancient water-supply system. The Ancient Villages in Southern Anhui Province (Xidi and Hongcun) (enlisted in 2000) embody Anhui/Huizhou architectural style of a Ming dynasty rural settlement.

Gardens and Caves

The Classical Gardens of Suzhou (enlisted in 1997) in Jiangsu Province, consisting of nine gardens dating from the eleventh to the nineteenth century, represent the best in garden design of landscape miniatures that integrate philosophical thinking into natural beauty, while Mount Qingcheng and the Dujiangyan Irrigation System (enlisted in 2000) in Sichuan Province, the birthplace of Daoism and a water-control system built in the third century BCE, bear witness to religious legacy and the ingenuity of ancient water management.

The Mogao Caves (enlisted in 1987), strategically located along the Silk Roads in Gansu Province, is also known as “Cave of Thousand Buddhas” and was carved out of sandstone cliffs over a period of eight dynasties. The caves and attached monasteries, decorated with paintings and silk wall hangings, were once a sanctuary of Buddhist art. The Longmen Grottoes (enlisted in 2000) in Henan Province feature thousands of Buddhist shrines carved on marble surfaces dating from 495 CE, after the first peak of Buddhist cave art of the Yungang Grottoes (enlisted in 2001) in Shanxi Province, with 252 caves and 51,000 statues carved out of sandstone rocks in the fifth and sixth centuries. The Dazu Rock Carvings (enlisted in 1999) of both Buddhist and secular subject matter in the city of Chongqing in Sichuan Province, dating between the ninth and the thirteenth century, culminated in the most developed Chinese art of rock carving, manifesting the spiritual harmony between Indian Buddhism and Chinese Daoist and Confucian beliefs.

Mountains

Also inscribed as World Historical sites are Mount Taishan (enlisted in 1987) in Shandong Province, Mount Huangshan (enlisted in 1990) in Anhui Province, Wulingyuan Scenic & Historic Interest Area (enlisted in 1992) in Hunan Province, Jiuzhaigou Valley Scenic & Historic Interest Area (enlisted in 1992) in Sichuan Province, Huanglong Scenic & Historic Interest Area (enlisted in 1992) in Sichuan Province, Mt. Emei Scenic Area (including Leshan Giant Buddha Scenic Area) (enlisted in 1996) in Sichuan Province, and Mount Wuyi (enlisted in 1999) in Fujian Province. Lushan National Park (enlisted in 1996) is a renowned summer resort. Many of these sites are National Natural Preservation Zones famous either for their natural beauty, historical cultural significance, or habitat for rare and endangered wildlife and plant species.

Three Parallel Rivers

Three Parallel Rivers of Yunnan Protected Areas (enlisted in 2003) host the richest biodiversity of a temperate region in China. Including the upper reaches of the three great rivers in Asia—Yangzi (Chang), Mekong, and Salween, running parallel from north to south—the areas present geological spectacles and natural beauty. The Sichuan Giant Panda Sanctuaries (enlisted in 2006), botanically the richest site in the world outside of rain forests, consist of nine scenic parks and seven nature reserves among which Wolong is the most famous. Hosting more than 30 percent of the world’s endangered giant panda population, the sanctuary is also home to other endangered species, including the red panda, the snow leopard, and the clouded leopard.

Architectural Wonders

The Capital Cities and Tombs of the Ancient Koguryo Kingdom (enlisted in 2004) are tombs of three cities of the Koguryo Kingdom (37 BCE–668 CE), which ruled part of northern China and Korea. They bear witness to the kingdom’s artistic and architectural ingenuity.

The Historic Centre of Macao (enlisted in 2005), a port of international trade, is an example of the fusion of Chinese and Western architectural styles and the port’s
colonial history after the return of its sovereignty to the Chinese government from Portugal in 1999.

Yin Xu (enlisted in 2006) in Henan Province is an archaeological site that preserves the ruins of the ancient capital city of Shang dynasty (1766–1045 BCE). It is the most culturally and historically valuable of all the royal tombs and palaces excavated. The script present on oracle bones there offers a sample of the earliest known form of written Chinese.

Kaiping Diaolou (watch tower) and Villages (enlisted in 2007) in Guangdong Province integrates defense and residence with a fusion of vernacular Chinese and Western architectural styles. It bears witness to the influence of a rich population of overseas Chinese during the Ming dynasty. Built of brick, stone, and pisé or concrete, the multistoried Diaolou has the common defensive characteristics of narrow metal doors and windows, thick walls with gun holes, and a watch tower on the top floor equipped with defensive devices against local banditry.

The South China Karst (enlisted in 2007) has the common characteristics of a karst (an irregular limestone region with sinkholes, underground streams, and caverns) geological formation across Yunnan, Guizhou, and Guangxi provinces in south China. The karst landscape in each province, however, is different. The Shilin (Stone Forest) in Yunnan Province, for instance, presents a mountain range of exposed pinnacles with more varieties of shapes, whereas the karst landscape in Guangxi centered around Guilin typifies independent verdant hills with caves and (underground) rivers punctuated by flat pastoral fields.

As one of the world’s earliest civilizations, China is endowed with more qualifying cultural and historical legacies than with the number of sites currently inscribed by the World Heritage Center. Thus the list of China’s World Heritage sites seems destined to grow.

China joined the World Trade Organization in 2001 after years of negotiation. The country had been keen to join the WTO given that China’s economy is now highly dependent on foreign resources and markets. Joining the WTO is also a mechanism for forcing change on outdated state-owned enterprises in China.

China joined the World Trade Organization (WTO) on 11 December 2001 after years of vigorous lobbying for membership. The WTO is an international organization devoted to the reduction of trade barriers across the globe, with a view that free trade means greater overall benefit for all parties concerned. While not everyone agrees with this premise, it is widely accepted, especially in the major global economies. With the dramatic growth in international trade since World War II, the WTO is the organization primarily responsible for supporting such growth, reducing trade barriers, and helping to regulate the growth. In effect it provides the structure within which international trade can take place efficiently. As of July 2008, 153 countries were members of the WTO.

Chinese officials realized that, to make their economy grow rapidly, they needed access to foreign investment for building up industries quickly and to international markets for selling the products of these industries. In this respect joining the WTO was a logical extension of China’s decision, taken in the late 1970s, to create a capitalist economy. These officials were aware that if they did not shift their economic structure away from Communism they could not modernize and regain the power they had lost during years of political and economic chaos.

China’s Economy—1912–1979

China had been a great power through most of recorded history, though by the early nineteenth century the Manchu-ruled Qing dynasty (1644–1912) was beginning to fail. In the nineteenth century China failed to modernize and fell prey to Western countries that established enclaves along the East coast of China. In 1911 the Republic of China was founded, the dynasty fell (although the Qing emperor did not abdicate until 1912), and the next fifty years were characterized by political and economic chaos. Out of this chaos the Communist Party finally consolidated power in 1949 and proclaimed the creation of the People’s Republic of China.

Unfortunately, China’s economic policies were not effective. The Great Leap Forward of the 1950s was an attempt to rapidly catch up with the West. It was a dismal failure and led to widespread famine in China as well as the political upheaval of the Cultural Revolution (1966–1976). Mao’s death in 1976 signaled the end of unworkable economic policies and the beginning of a shift to capitalism under the leadership of Deng Xiao Ping.

WTO History

The WTO has a long pedigree, even though its name dates only from 1 January 1995. The organization actually began to evolve toward the end of World War II, when world leaders acknowledged they needed an economic system to replace the insularity that had led to the Great Depression
of the 1930s: When major economies had faced difficulties, they turned inward with a “beggar thy neighbor” policy, imposing high tariffs, or taxes, on foreign goods to protect domestic agriculture and industry; in reality, however, they only spread and prolonged the Depression.

This situation led to the 1944 Bretton Woods Conference, at which forty-four countries produced key imperatives for postwar global economic development. Most of these Bretton Woods instruments still exist today—for example, the World Bank and the International Monetary Fund. A few years later another international meeting created the General Agreement on Tariffs and Trade (GATT), the forerunner of the WTO. GATT was rooted in compromise: On the one hand was an understanding that countries often must protect particular industries for the national good (as long as tariffs are applied multilaterally—that is, as long as there are no preferential tariffs); and on the other hand was broad support for an open trading system that would both stimulate free trade, thereby ensuring the greatest possible level of economic growth, and link economies. The underlying assumption was the belief that greater economic cooperation would mean greater political cooperation and reduce the possibility of war. The memory of Nazi Germany was strong—an insular country and economic depression had created the conditions for the rise of a totalitarian government, resulting in a terrible world war—and the signatories to the Bretton Woods agreement and GATT wanted to reduce the chances that such a government would surface again.

The Bretton Woods agreement and GATT created the conditions for the longest sustained economic boom in world history, one that lasted from the mid-1940s to the early 1970s. The members of GATT met regularly from 1948 to 1994 (eight rounds in total), in different cities. The last round of GATT talks took place in Uruguay from 1986 to 1994; at the conclusion of this round, the members decided to replace GATT by creating the WTO, essentially a more formal structure for international trade.

**China and International Trade**

China has the key ingredients for economic success on the international stage—a large population that includes substantial numbers of well-educated people; a reasonably good infrastructure; relatively high levels of technology, at least in the main cities; and, above all, low-cost labor. To take advantage of these factors, as well as to gain foreign access to one of the world’s biggest markets, foreign investment poured into China in the 1990s, and the result was dramatic economic growth for the country.

It came as no surprise, therefore, that the Chinese government was eager to join the WTO. Joining would ensure access to world markets, especially to the markets of developed countries with so many wealthy consumers—and, therefore, would keep the economy of China booming.

The fundamental reality was that China needed international connections in order to continue rapid economic growth. Only one other country—Japan—similarly depended on international markets, and it was Japan that sponsored China’s entry into the WTO. The main opposition came from the United States. In part this resistance stemmed from competitiveness: The United States was wary of letting China become too strong. In part the resistance was a matter of philosophical differences: The United States questioned whether China’s political system should be supported given its view on human rights. But the major U.S. resistance concerned intellectual property. Increasingly the U.S. economy depends on its ability to create and innovate, especially in areas such as software development, biotechnology, medicine, and entertainment. After years of American research and development expenses, Chinese companies have demonstrated a predilection to copy these products, to sell them far below the cost of the American products, and to pocket the profits. Hence charges of intellectual copyright violations, or piracy as it is more commonly called, delayed China’s entry into the WTO.

On the other side of the coin, the U.S. economy greatly benefited from China’s entry into the WTO. One reason the American economy grew so quickly in the first years of the twenty-first century was that the flow of low-cost Chinese products into the U.S. market allowed American consumers to pay less for some products so that they could theoretically save money or spend more domestically, thereby stimulating the U.S. retail sector. Trading with China also allowed U.S. industries to source lower-cost parts. Moreover, a good number of the factories in China resulted from U.S.-China joint ventures, so the exports were actually made in part by American companies, and some of the profits from the ventures went back to the parent companies in the United States. Finally, China has
replaced Japan as the greatest purchaser of U.S. Treasury Bonds, thus allowing the U.S. government to operate at a deficit while avoiding tax increases.

The WTO and Domestic Problems in China

Not all sectors of the Chinese economy benefited right away from this open trading system. One of the main victims was the state sector—state-owned enterprises, or SOEs. These large, usually inefficient producers resisted China's entry to the WTO. But it is clear that the Chinese government used the mechanism of joining the WTO to force the SOEs to change. SOEs had to initiate more efficient management, shed surplus labor and institute more effective production processes. Without this external pressure it would have been politically difficult to carry out domestic economic reform. One advantage of an authoritarian government is its power to initiate more painful economic adjustments than a democracy. That said, it is by no means easy to move China's economy into the modern era, and there have been, and continue to be, many pressures in China, such as unemployment and price increases, working against the rapid pace of economic change.

China also faces the emerging issue of becoming Asia's workshop for only less sophisticated products instead of moving up to high technology exports. This is in part because its exports are dominated by foreign companies (Wholly Foreign Owned Enterprises, or WFOEs, are permitted to register in China in cases where at least half their annual output is exported). Indeed, approximately 60 percent of China's exports overall and 80 percent of its high-tech exports, are produced by foreign companies, which are not eager to share the secrets of their success with the Chinese.

Other Challenges for the WTO and China

One of the fundamental challenges for the WTO is to address the domestic interests of its participating countries yet promote multilateral trade. For example, in Country A local representatives may not favor free trade for fear that foreign companies with lower production costs will export lower-priced versions of Country A's products to Country A, putting companies in the politicians' districts out of business. Of course, if companies in Country A are very efficient and can compete on the international scene, its politicians may support free trade. But in that case Country B's government may balk at importing products from Country A. Clearly, both political and economic factors influence international trade, making the job of the WTO complex. Demands for “level playing fields” and “free and fair” trade along with direct and indirect subsidies to producers bring the concept of free trade into question, yet it is the role of the WTO to deal with these issues and to promote the growth of international trade.

The state of a country's economy affects whether or not it wants to join the WTO. Typically a country that produces commodities inefficiently or faces many international competitors that produce the same commodities, would not support an open trading system. National prestige also affects a country's interest in the WTO. For example, the automobile industry can confer pride, even when that industry can exist only behind high tariffs—as in Australia and Malaysia. The Chinese automobile industry is posing a substantial challenge to these long-standing barriers. As barriers to trade come down the Chinese car industry will certainly be a major player in the international market. In Malaysia's case, if it dropped tariffs then Malaysia's car industry would certainly have major problems.

Most countries face yet another challenge when opening their economies to international trade. There are winners and losers in any free-trading system. Inefficient producers will see their businesses fail while efficient ones will thrive. This so-called structural adjustment can produce substantial pain as the changes take place. Workers may have to retrain and move to other economic sectors, but doing so is much easier for some (generally the younger and better educated) than for others. Hence, free trade will be more welcomed by some sectors of the community than others in any particular country, and these divisions are clearly apparent in China. There is a clear employment/wealth gap between younger, more educated Chinese and older, less educated Chinese.

A concept underpinning open trade is comparative advantage. In short this means that each country will
produce the goods that it is most efficient at producing. Inefficient producers will go under, and, painful though failure is, the result will be a more efficient global production system, which will, in turn, generate the highest overall global output. The argument put forward by the WTO is that there is a net gain, even though there will be losses in sectors in each country.

The charge leveled by some countries, including China, is that they are the victims of more powerful countries, typically developed countries, that have much greater resources, including a highly educated workforce, well-developed transportation and communication systems, and existing multinational companies. Therefore, meetings of the WTO often incite demonstrations, reflecting for the most part the voice of the developing world. One of the most visible anti-WTO riots took place in Seattle, Washington, on 30 November 1999.

The WTO is faced with a massive challenge—supporting free trade across the globe. The differing interests of different countries and the multiple interest groups in each country make this goal very difficult to achieve. In fact, the WTO is having problems that are reflected in the rapid growth in Free Trade Agreements (FTAs) over the past decade. Countries that strongly favor free trade are not prepared to wait for the WTO to accept them; they are striking out on their own. While this approach does promote free trade in part, it leaves behind those countries that desire a slower entry into the global trading system.

China is an important part of the global economy. It has the fourth largest economy in the world, a growth rate of about 10 percent, the world’s largest current account surplus ($180 billion). It is therefore one of the great challenges of the WTO to help manage China’s global trade.

World War II in Asia was very different from World War II in Europe. The Asian war included Japanese colonial expansion into the Asian mainland, which preceded the involvement of European and North American nations, and it was also complicated by civil war in China. For some Asian nations the worldwide aspect of the war was secondary to their own conflicts with Japan.

World War II did not begin in a single place or on a single date. While the European war can be dated to the German invasion of Poland in September 1939, Germany had already annexed Austria in 1938. In Asia, the beginning of the war is said to be July 1937, when Japan took military action following the Marco Polo Bridge incident. But Japan had invaded Manchuria six years before. Other aspects of conflict in Asia include the Soviet Union’s forced relocation of ethnic Koreans (who had fled from Japanese-occupied Korea into eastern Siberia) to Uzbekistan. In this case 190,000 Koreans were relocated to the west. Although many ethnic Russians had been relocated to the central Asian republics beginning in the 1880s, as a way to counter growing Islamic influence there, such relocations were not part of Soviet wartime relocation policy.

Expansionism by Japan

The conflict which Americans refer to as the War in the Pacific or the Second Sino-Japanese War, which the Chinese call the War of Resistance against Japan, and which the Japanese call the Japan-China War, began at different times, according to which countries were involved. To Americans, the war began with Japan’s attack on Pearl Harbor on 7 December 1941. The direct conflict between Japan and China began more than four years before that. But the colonial efforts and military actions that precipitated this period began with the termination of World War I. At the end of that war Japan had acquired territories in China and the Pacific that had formerly been held by Germany. Japan’s expansionist policy had begun even before World War I with acquisition of Taiwan after Japan’s victory in the First Sino-Japanese War (1894–1895) and annexation of Korea in 1910. Japan’s goal was strategic security, a “greater East Asia co-prosperity sphere” that stretched 1,600 kilometers from the Japanese islands and that would remove the Western powers from Asia. Western imperialism had undermined China, and Japan by the mid-1930s had begun to eliminate Western influence there by dividing China through the establishment of a puppet government in Manchuria. Armed conflict in China escalated in 1937, however, in what is known in China as the “War of Resistance against Japan.”

In July of that year Japanese forces attacked Beijing; they attacked Shanghai in August. At that time Japan was fighting the army of the Chinese Nationalist Party
(Guomindang) government; the Nationalists leaned more toward the West in matters of foreign policy and trade than did the Chinese Communists, the adversaries of the Nationalists. The Nationalists, unable to stop the Japanese, retreated westward to the city of Nanking (modern Nanjing), where in December Japanese forces captured the city and massacred 300,000 civilians. The Rape of Nanking, more than any other event, created international condemnation of Japan’s expansion into Asia and shaped the policies of Japan’s opponents.

In southern Asia World War II came to India as a result of British rule there. When Great Britain declared war on Germany, the Indian viceroy followed suit, but the Indian congress did not support him. While war raged in East Asia and Europe, India at first was little more than a supplier of men for the African front and for the British in Singapore as well as a supply base for operations in the Middle East.

India’s circumstances changed with Japanese attacks in the Pacific and on the Asian mainland. Indian soldiers who had been sent to reinforce British territories in East Asia were killed or captured by the Japanese after fighting began, causing India to return to British allegiance, at least for a short while.

**Entry by the United States**

The United States was still formally neutral at this time and was selling Japan oil and steel—materials that Japan needed for its military expansion. The United States had accepted Japan’s annexation of the Korean peninsula, and ethnic Koreans in the United States were considered to be Japanese. The U.S. interest was on the growing war in Europe, not on Asia. While the United States provided some aid to the Nationalist Chinese, the Soviet Union provided China more operational support with aircraft and pilots until 1939, when those planes and men were recalled to fight Germany. The main U.S. support to China after that was the effort to construct the Burma Road from Lashio, Burma (Myanmar), to Kunming, China, begun in 1938 to provide a western route into China for military supplies. U.S. policy at the time was to avoid conflict in the Pacific because conflict there would divert assets from the Atlantic. Only in 1940, responding to further Japanese expansion in China, did the United States begin an economic embargo of steel and oil against Japan. This embargo was expanded in mid-1941 to a complete end of all trade with Japan; after that Japan had to seize the sources of materials necessary for its strategic survival.

Japan had continued its strategy of replacing Western influence with its own in Southeast Asia. The French colonial government in Indochina (Laos, Vietnam, and Cambodia) capitulated to Japan in 1940 after France fell to Germany. Thailand accepted Japan’s presence in the region as a means of recovering territory lost to Laos, Cambodia, and Malaya (Malaysia). The outbreak of war with Western forces in December 1941 led to the occupation of Burma, Malaya, and the Dutch East Indies (Indonesia) and began the conquest of the Philippines.

Although most U.S. residents view the Japanese attack on Pearl Harbor on 7 December 1941 as the beginning of World War II in Asia, this event occurred thirty-one years after the annexation of Korea, ten years after the establishment of Japanese rule in northern China, four years
after the massacre at Nanking (Nanjing), and one year after much of Southeast Asia had come under Japanese domination. But to Japan the initiation of war against the United States was in response to the undeclared war that the United States had begun with its embargo of critical materials.

**Early Successes by Japan**

Japan’s attack on Western holdings in Asia and the Pacific led to impressive early successes. U.S. military power in Hawaii was dealt a severe blow, Hong Kong fell, the Philippines and Burma were taken, and at the outer reaches of Japanese power, the Solomon Islands, the Gilbert Islands, and islands in Alaska’s Aleutian chain were captured. The Solomon and Gilbert islands consolidated Japan’s holdings acquired by a League of Nations mandate after World War I. By mid-1942 the Western powers were near defeat in Asia and the Pacific. But the same technological forces that had permitted Japan’s quick military expansion began to work in favor of the Allies, in part because of what must be considered a stroke of luck that occurred before the attack on Pearl Harbor.

**Change in Naval Strategy by the United States**

U.S. naval strategy before December 1941 had been based on the use of battleships in naval combat, but after the Pearl Harbor attack, the aircraft carrier became the mainstay of U.S. naval strategy. The aircraft carrier had been an untested experiment until it was used with great success by the Japanese navy. At the time of the Japanese attack on Pearl Harbor, the U.S. Navy’s three aircraft carriers were out of port, but its battleships were in port at Pearl Harbor, where they were destroyed. This circumstance forced the U.S. Navy to adopt a strategy based on the aircraft carrier for the Pacific theater of operations because the main focus of the war was still Europe, and replacements for U.S. battleships would not be available for some time. The new U.S. strategy would have to counter the advances that Japan had already made in the Pacific and would rely on U.S. industrial capacity (after it was mobilized), technological advantage, and innovative tactics.

But Japan’s strategy had been one of rapid successes that would give it the advantage in establishing dominance over East Asia before the United States and other Western
powers could retaliate. General Tojo Hideki (1884–1948), Japan’s prime minister, had no misperceptions about U.S. capacity; even he recognized that a long war would work against Japan’s long-term goals. As the Allies became capable of maintaining their holdings and then advancing toward the Japanese home islands, the resources available to the Allies (and denied to the Japanese), tactics, and technology swung in favor of the Allies.

Internal Battle for China

Yet on the Asian mainland Japan remained the dominant force. In China the Communists under Mao Zedong (1893–1976) and the Nationalists under Chiang Kai-shek (1887–1975) had been at odds since 1926, and at times this competition undermined Chinese efforts to defeat the Japanese. While Chinese forces avoided total defeat at Shanghai in 1932, Japan was able to establish a puppet government in Manchuria (called Manchuguo). Chiang spent the next five years strengthening his Nationalist army, while the Communists withdrew to northwest China on the Long March (1934–1935) from Jiangxi Province to Shaanxi Province—approximately 9,600 kilometers. Mao rebuilt his forces during the next year and sought a united effort of Communists and Nationalists against the Japanese. However, Chiang wanted to defeat the Communists first, then deal with the Japanese. In late 1936 one of his own generals kidnapped Chiang while on a visit to Xi’an, and as a condition of Chiang’s release he had work with the Communists to fight the Japanese. Japanese forces subsequently dramatically increased their
efforts, leading to the Nanking Massacre and to victories at Guangzhou (Canton) and Wuhan in 1938.

Even as both Chinese factions—the Communists and the Nationalists—worked against the Japanese, each saw their efforts as a means to dominate the other. Chiang Kai-shek believed that Japan would wear down the Communists so that he would be able to deal with them after the Japanese were defeated, and Mao believed that Nationalist action against the Japanese was an opportunity for his Communist forces to rest. Both sides expanded their forces in preparation for civil war after Japan was defeated.

The United States began to support China only after years of fighting by Chinese forces, but in March 1941 the U.S. Lend-Lease Program (which had been used to support European nations fighting against German Nazi leader Adolph Hitler since 1939) was extended to China. This program and other aid were significantly increased after Japan attacked Pearl Harbor eight months later.

**Expansion of the War**

The Japanese attack on the U.S. naval base at Pearl Harbor dramatically changed the war for Japan. Despite Japan’s early successes in late 1941 and 1942, Japan lacked the resources necessary for a protracted war. An attack on Tokyo by U.S. bombers launched from an aircraft carrier in April 1942 unsettled Japan. This raid, led by Lieutenant Colonel James Doolittle, was launched mainly for psychological reasons. For the United States the raid provided some good news after a string of defeats; for Japan the raid showed that not even Tokyo was safe.

The new U.S. aircraft carrier–based strategy, instead of being oriented exclusively against Japanese naval
forces, used “island-hopping” to advance on the Japanese home islands. After the United States defeated Japanese naval forces at the Battle of Midway and the Battle of Guadalcanal in 1942, Allied forces moved through the Gilbert Islands and New Guinea in 1943 and then on to the Marianas Islands and the Philippines in 1944. The Allies, by attacking Japanese strong points that might threaten Allied operations and by seizing those islands necessary for operations while bypassing others, were able to prepare for what would have been the final assault on Japan in 1945.

Farther west the Japanese army had opened a front to invade Burma to counter British and U.S. efforts there. This front expanded in mid-1944 to an attempt to defeat the British and Indian forces in eastern India, resulting in an overextension of Japanese supply lines and the eventual destruction of the Japanese Fifteenth Army.

Also in 1944 the Flying Tigers, a volunteer corps of U.S. fliers in China, began to attack Japanese forces there. Although the Flying Tigers diverted Japanese attention from the war with Chinese forces, Chiang Kai-shek did not capitalize on the diversion, much to the anger of the senior U.S. official in China, Brigadier General Joseph Stillwell. The friction between Stillwell and Chiang soon caused President Franklin D. Roosevelt (1882–1945) to recall Stillwell to the United States.

By 1945 a campaign of strategic bombing of Japanese cities was being waged by the United States from island bases in the Pacific. Attacks by the U.S. Air Corps targeted both Japanese cities and military forces and resulted in tens of thousands of civilian casualties and massive destruction (as had the Allied attacks on cities in Germany). For example, the firebombing of Tokyo on 9 March 1945 killed as many as 120,000 Japanese. At the time the U.S. policy was one of “total war” against the Japanese population in preparation for a final Allied push against Japan, which was to be a massive amphibious assault against the islands of Kyushu (Operation Olympic) in December 1945 and Honshu (Operation Coronet) in March 1946. For these two assaults the United States had planned to use forces made available by the defeat of Germany—forces that in many cases already were in transit to the Pacific. As many as 5 million soldiers, primarily U.S., would have taken part. The Soviet Union also would take part in the invasion of Japan.

Planning for Operation Olympic had begun in 1944 as Allied forces had moved toward Japan. By early 1945 an estimated 300,000 Japanese soldiers were on the Japanese
home islands of Kyushu and Honshu; by August this estimate had risen to more than a half-million, including a considerable number of combat units. The U.S. experience in attacking islands held by the Japanese was that Japanese soldiers and civilians would fight to the death to avoid capture, leading to heavy casualties among U.S. forces. Estimates for the invasion were as high as 1 million Allied casualties and possibly three times that for Japan. The losses for Japan would include both military and civilian personnel and could have resulted in the end of Japan as a country.

**The War Ends**

In February 1945 at Yalta in the Crimea the leaders of the United States, the Soviet Union, and Great Britain held discussions for the Allied focus on Japan. The Yalta Conference resulted in an agreement that the Soviet Union would enter the war against Japan after Germany was defeated and that upon Japan’s defeat those areas in China formerly held by Russia but captured by Japan in 1904 would be ceded to the Soviet Union. President Roosevelt kept the agreement secret from even Vice President Harry Truman (1884–1972) on his return from Yalta, but Roosevelt died within two months. The decision to proceed with the plans made earlier then fell to Truman.

President Truman met with British prime minister Winston Churchill (1875–1975) and Soviet premier Joseph Stalin (1879–1953) at Potsdam, Germany, in July 1945 to discuss further the treatment and disarmament of Japan after it had been defeated. While he was at Potsdam Truman learned of the successful test of a new weapon that might shorten the war. That weapon, of course, was the atomic bomb. Truman informed Churchill, but not Stalin, of the weapon.

The atomic bomb used against Japan eliminated the need for an invasion of Japan. A single U.S. aircraft dropped a single ten-thousand-pound (4,536-kilogram) bomb on the Japanese city of Hiroshima on 6 August 1945, resulting in an explosion equal to approximately twenty thousand metric tons of conventional explosives. Hiroshima was chosen because it was an industrial target that had not been damaged by earlier attacks, a fact that would allow estimations of the bomb’s effectiveness. The bomb instantly killed 130,000 people, injured as many, and destroyed four-fifths of the buildings in Hiroshima. Three days later the United States dropped a second atomic bomb, this time on the Japanese city of Nagasaki. By that time the Soviet Union had declared war on Japan and had invaded Manchuria.

Although the two bombs dropped on Hiroshima and Nagasaki instantly killed approximately 200,000 people, and thousands subsequently died from injuries and radiation poisoning, these attacks were not as damaging as the combined earlier attacks on other major cities. The atomic bomb, for President Truman, was simply a weapon of war, not an element of a greater strategy. It was successful: On 14 August 1945 the Japanese government accepted the guidelines of the Potsdam Declaration. The Soviet Union refused to accept the Japanese proposal because it
did not contain an order to the Japanese military to surrender; the Soviet Union accepted the official signing of the documents on 2 September 1945.

World War II cost more than 2.5 million Japanese and 11 million Chinese lives plus countless others in the occupied nations of the region. Casualties among Allied forces—the United States, Great Britain, Canada, New Zealand, Australia, and India—were relatively light; approximately 200,000 were killed in Asia, the majority of them U.S. troops.

Wound Literature
Shānghén Wénxué 伤痕文学

Wound literature, a genre appearing after the end of the Cultural Revolution, focuses on psychological and emotional damage to individuals, especially youth, from the depredations of that era. Criticized as subversive or embraced as cathartic when it first appeared, later analysis of the genre tends to focus on its literary weaknesses, including simplistic narrative and representation of character.

“Wound literature” (also known as “scar literature”) refers to a body of literature that erupted onto the Chinese literary scene in the immediate wake of the Cultural Revolution (1966–1976). Representative writers of this camp include Liu Xinwu, Lu Xinhua, Wang Meng, Gu Hua, and Zhang Xianliang, among others. Two stories in particular are commonly referred to as the inaugurating pieces of this new literary phenomenon: “Scar” (“Shanggan”伤痕) by Lu Xinhua (August 1978) and “The Head Teacher” (“Banzhuren”班主任) by Liu Xinwu (November 1977). Both stories deal with the devastation of youth caused by leftist policy and practice, but each has its own valence.

Two Examples

Authored by a then little-known freshman in the Chinese department at Fudan University and appearing first on the campus bulletin board, “Scar” tells the story of Xiahua, who renounces her own mother after she was officially declared a “traitor.” Never doubting for a second the truthfulness of the verdict, Xiahua voluntarily and resolutely turns her back on her mother out of a sense.

Woodcut depicting the smashing of the “Gang of Four.” Liu Xinwu’s story “The Head Teacher” (1977) stresses the psychological damage suffered by China’s youth as the result of the Cultural Revolution and the notorious “Gang of Four.”
of loyalty to the party and a sense of abhorrence of her mother’s shameful past. But her sincere embrace of the party—which takes the form of emotional and behavioral alignment with the party ideology in every aspect of her life—is never reciprocated. The stigma of being a “traitor’s daughter” follows her wherever she goes, not only denying her any chance for recognition and advancement during her years of reeducation in the countryside, but also threatening to ruin the lives of those who care about her. As she retreats further into her loneliness, disillusioned and disheartened, the news of her mother’s innocence unexpectedly arrives, prompting Xiaohua to embark on a personal journey in search of reconciliation and redemption. But she is to be denied yet again: her mother dies shortly before she shows up at the hospital.

If Lu Xinhua’s story highlights the deprivation of even the most basic interpersonal relationship—the mother-daughter tie in this case—visited on the politically naïve young generation, Liu Xinwu’s story foregrounds the destitution of the youthful spirit as the result of the havoc wreaked on the nation by the notorious “Gang of Four.” Two students occupying opposite ends of the ideological spectrum are portrayed as equal victims of the Cultural Revolution. While one is a youth league secretary with an extremely rigid mind-set, the other is a street hooligan whose mental landscape is marked largely by blankness, and occasionally by the presence of a mishmash of “feudalist” and “capitalist” ideas. In the story’s narrative, only the street hooligan constitutes a problem for the head teacher, but the reader is made aware of a more urgent and daunting task on a national scale awaiting the attention of the wise educator.

**Initial Motivation and Critical Reaction**

As the name of this new literary genre suggests, the thematic topography of these stories focuses on the wounds inflicted by the Cultural Revolution on the individual, not so much at the physical as at the psychological level. Wound literature is therefore also sometimes referred to as “exposure literature” or “sentimental literature.” Emerging from the frenzy of the Cultural Revolution but still haunted by fresh memories of its atrocities and absurdities, the writers who eagerly embraced this genre filled a deep emotional need for collective remembering and catharsis. To a certain extent, wound literature is like “a wreath on the ruin”—it provided a platform for public airing of personal and collective grievances, so that the nation could unload the burden of its traumatic past and start the healing process. In that regard, it is analogous to a form of therapy.

When wound literature made its first appearance, the critical establishment greeted it with a great deal of caution, if not suspicion, on grounds of its perceived departure from established literary standards. Though the prestigious journal *People’s Literature* did publish Liu Xinwu’s “The Head Teacher,” the editors were by no means unanimous about the decision. When Lu Xinhua submitted his work to the same journal, he received only a typed letter of rejection in return. To the mainstream literary critics, then, political correctness, social significance, and didactic function were still necessary ingredients of “good literature.” Measured by these standards, wound literature, in its thematic insistence on exposing “dark problems” at both individual and societal levels, could only appear ideologically suspect, if not outright subversive.

**Twenty-First-Century Perspectives**

Today, the critical opinion concerning wound literature is rather mixed. Some critics contend that wound literature transcends the overly politicized narrative model of the Cultural Revolution era by bringing humanism back to the heart of literary imagination. As such, it is a narrative of emancipation and enlightenment heralding the reawakening of subjectivity. On the other hand, however, even those who are more generous in their evaluation of this literary genre recognize its inherent flaws and inevitable limits. A common criticism is that practitioners of wound literature tell an anti–Cultural Revolution story while they continue to rely on the narrative model of the Cultural Revolution era. The literary merit of wound literature is also dubious according to the genre’s detractors;
not only are these works populated by characters that are heavily codified and flat, they have little to recommend for themselves in terms of narrative technique, artistic form, and aesthetic value.

Moreover, the mode of thinking that infuses wound literature is considered by some critics to be simplistic and mechanical. In their so-called indulgent and sentimental display of their wounds, writers of this genre collectively adopt a victim mentality, never bothering to explore their complex relationship—such as their own complicity—to the power system they now condemn. To the extent that the sentiments expressed in these works, from sorrow to indignation, are seen without exception as politically correct under the party’s new directives in the post–Cultural Revolution period, wound literature constitutes for some not the voice of reflection and critique but ironically a device of legitimation. One critic even goes so far as to caricature writers of wound literature as “pouting children who crave their mother’s attention and affection above anything else.”

Wu
Wúyǔ 吴语

Wu is one of the sublanguages of China, spoken primarily in the eastern provinces of Zhejiang and Jiangsu and metropolitan Shanghai. It is the second most populous language in China, after Mandarin.

An estimated 85 million people, concentrated in the provincial-level municipality of Shanghai and neighboring Zhejiang and Jiangsu provinces in China, speak the various dialects of Wu. The Wu speakers in Jiangsu Province predominantly live south of the Yangzi (Chang) River; a few enclaves of people speaking Wu reside to the north of the mouth of this river.

The Wu region is different in several ways from the other regions where the major Sinitic sublanguages are dominant. In the Wu region, there are several culture centers, whereas in the other sublanguage groups, there is one major “local” capital; this is a populous location that sets the cultural as well as linguistic pattern for the rest of the group. For example, the Yue have Guangzhou, while the Minnan of Fujian Province have Xiamen. The scattered Hakka also look to Meixian as their geographic, cultural, and linguistic center.

In comparison, the Wu people are far more diverse. Shanghai, the sublanguage’s largest population center, does not really assume the role of the hub for the Wu people, because it is a new city, relatively speaking, and is subject to Western influences. Furthermore, the population in Shanghai has come from various Wu-speaking districts as well as from Nanjing and beyond. Cities such as Suzhou, Hangzhou, and Shaoxing have all played prominently in the history of the Wu, but none can truly be said to be its center.

The Wu people are also different from other Chinese because they usually do not characterize their subethnic identities in terms of their province of origin. This is because only the southern third of Jiangsu Province is Wu speaking. There is also great diversity in Zhejiang Province itself, and the people are not all Wu speakers. The Wu people of Zhejiang instead identify themselves by their native prefectures, which are subprovincial political units. The Wu people did not join the modern migration of Chinese abroad on any major scale, unlike the Yue, Hakka, and Min people to the south, and Wu speakers have only a minor representation in the overseas Chinese population.

The Wu language had its origin in Suzhou (Jiangsu Province), one of the cultural centers of the imperial period. The sociolinguistic evolution of the Wu region, however, is not well documented. From Suzhou, the language spread to regions south of the lower Yangzi River. It is a language that has gained importance because of the rise of Shanghai as an international metropolitan center and one of the treaty ports that was ceded to the Western powers—Britain, France, and Germany—in the nineteenth century.

Origins of Wu

The Chinese character for wu was possibly first applied to people living around the mouth of the Yangzi River who
spoke a non-Sinitic language that was largely unintelligible to those speaking the various Sinitic sublanguages.

The other meaning given to the word *wu*, rarely, is “clamorous” or “yelling,” which might be a reference to the rather forceful and boisterous manner of the Wu people’s way of speaking. To many early Han Chinese, the language also might have sounded loud and guttural. The first mention of the Wu kingdom appeared in Chinese annals around the seventh century BCE. Historical linguists have been uncertain how to classify the ancient Wu dialect, which could not be considered a Sinitic sublanguage at that time. There is a widespread assumption that the language is related to the Tai languages (of Southeast Asia), but the probability is that it is more of a Sino-Tibetan language. The kingdom of Wu began to adopt aspects of the evolving Chinese culture during the Zhou dynasty (1045–256 BCE); subsequent warfare led to the complete assimilation of the kingdom into the Sinitic political world.

Sinitic Wu culture is thought to have reached its peak during the Southern Song period (1127–1279). This would have been the time when the Wu region was at the geographical center of what was then considered to be the most highly cultured state in China, if not in the world. The Wu-speaking people left a major legacy for human civilization: The Southern Song, with its capital at present-day Hangzhou, played a significant role in disseminating Buddhism and other cultural and artistic values to neighboring countries.

**Distinguishing Features of the Wu Sublanguage**

Many of the archaic features found in the Wu sublanguage keenly differentiate it from modern Mandarin. Foremost among these is the continuing use in Wu of the series of voiced initial consonants that have been lost in other Sinitic sublanguages. Most forms of Wu will have *b*, *d*, *dz*, *g*, *p*, and *z* as initial sounds. Another feature in Wu is a special voiced *h* (a bit like the guttural German *r*), which contrasts with the normal, or unvoiced, *h*, according to the linguist Leo Moser.

There are fewer diphthongs in Wu than in most other Sinitic sublanguages, and the phonetics are thought to be somewhat closer to the Old Xiang, or Laoxianghua, of Hunan Province. Wu is different from other sublanguages like the Yue, Minnan, Gan, and Hakka, particularly in the simplified endings of its syllables. While Mandarin has also simplified its endings, it has done this differently from Wu, with varying results. Hence, the ancient final syllables such as, *p*, *t*, and *k* appear in neither Mandarin nor Wu.

Final consonants of Wu dialects typically include only one or two nasal endings with perhaps the glottal stop. It is a pattern that more closely resembles the dialects of Minbei and some forms of Eastern Mandarin. The Wu vernaculars are characterized by complex patterns of tone sandhi in which the tone of one syllable is modified in speech by that of the syllable that falls next to it; “sandhi” is a linguistic term meaning the modification of the sound of a morpheme in certain phonetic situations or contexts. While tone sandhi in the Min-speaking areas has been deemed to be complex, it is even more so among the Wu dialects.

Wu also differs from other Sinitic sublanguages in grammatical and structural ways. In particular, the Wu dialects differ from Mandarin by putting the direct object before the indirect object when both appear in a sentence. This characteristic makes Wu similar to Cantonese, but different from the intervening Min vernacular tongues, which tend to have an ordering that more resembles that of Mandarin.

The Wu dialect tends to vary by stages over the larger region mainly as a consequence of the pluralism of standards in the sublanguage. The isoglosses (geographical boundaries that delimit the area within which a linguistic feature is found) overlap in what has been found to be a complex pattern. In spite of such variations within the region of Wu-speaking peoples, however, there is generally intercomprehensibility among the so-called Shanghai dialects, of which Suzhou Wu is one example.

One exception to the intercomprehensibility of the Wu dialects is the dialect spoken in the port city of Wenzhou, located in the south of Zhejiang Province. This Wenzhou dialect and some of the dialects spoken by people living inland from the port are considered extremely different from other Wu dialects. This has persuaded some linguists to suggest that the Wenzhou dialect should be treated and recognized as a Sinitic language that is separate from the rest of Wu.

The vernacular of Shanghai represents a fusion of various forms of Northern Wu and other dialectical influences, even including some Eastern Mandarin. Other Wu speakers have traditionally treated the Shanghai
vernacular somewhat contemptuously as a mixture of Suzhou and Ningbo dialects. Shanghainese have been portrayed as strategic, smart thinkers who are interested in both new ideas and new words to add to their language. But the Shanghainese people have long resisted the Communist government’s efforts to make them speak the universally accepted Mandarin dialect.

WU Changshi

Wú Chāngshí 吴昌硕

1844–1927  Twentieth-century painter and calligrapher

Wu Changshi was best known for his calligraphy in the zhuan (seal) and shigu (stone drum) scripts. Despite his commercial appeal, the ultimate ideal of literati painting—to combine poetry, calligraphy, and painting—was realized in his work.

The career of Wu Changshi represents the process of evolution from the artistic patterns of late imperial China to those of the modern era. Born into a declining scholarly family in Anji, Zhejiang Province, he moved to Shanghai and became a professional painter. Wu was best known for his calligraphy in the zhuan (seal) and shigu (stone drum) scripts. His calligraphy and painting were famed for their jinshiqi, or antiquarian epigrapher’s taste.

In his youth Wu studied briefly with Ren Yi (1840–1895) but was mostly self-taught as a painter. Although his favorite themes were usually flowers and rocks, Wu’s pictures are to be seen not as images from nature but rather as arrangements of plants and rocks in an abstract space. Conventions of calligraphy and painting were brought together in his loosely brushed artwork. Thus, despite his commercial market, the ultimate ideal of literati painting—to combine poetry, calligraphy, and painting—was realized in his work.

Kuiyi SHEN
WU Zetian

Wǔ Zétiān 武則天

625–705 China’s only female emperor

Wu Zetian 武則天 was the only woman to rule China as an emperor in name, declaring herself emperor after deposing her sons. She changed the composition of the ruling class by removing entrenched aristocrats from the court and enlarging the civil service examination to recruit men of merit to serve.

Wu Zetian entered the Chinese imperial court at the age of thirteen as a low-ranked concubine to Emperor Taizong (reigned 626–649) of the Tang dynasty (618–907 CE). However, after he died she became concubine and later empress to her stepson, Emperor Gaozong (reigned 650–683). After Gaozong died, Wu declared herself emperor after deposing her sons and attempting to establish her own dynasty, sometimes referred to as the Second Zhou period 周, which lasted until 705.

Tang court ladies from the tomb painting of Princess Yongtai in the Qianling Mausoleum, near Xi’an in Shaanxi Province, from the year 706. Empress Wu Zetian would also later be buried at the Qiangling Mausoleum.
from 690 to 705. To legitimize her position as emperor she turned to the Buddhist establishment and also invented about a dozen characters with a new script.

The overall rule of Wu Zetian did not result in a radical break from Tang domestic prosperity and foreign prestige. However, Wu altered the composition of the ruling class by removing the entrenched aristocrats from the court and gradually enlarging the civil service examination to recruit men of merit to serve in the government. Although Wu gave political clout to some women, such as her secretary, she did not go as far as to challenge the Confucian tradition of excluding women from taking the civil service examinations. By 674 Wu had drafted twelve policy directives that ranged from encouraging agriculture to formulating social rules of conduct. She also maintained a stable economy and a moderate taxation system for the peasantry. The population increased to 60 million during her reign, and when she died her centralized bureaucracy was regulating the economic well-being and social life of her empire.

Wu Zetian was a capable ruler, but she was allegedly vicious in her personal life, murdering two sons, one daughter, and other relatives who opposed her. As a woman ruler, she challenged the traditional patriarchal dominance of power, state, monarchy, sovereignty, and political ideology. Her reign brought a reversal of the gender roles and restrictions that her society and government had constructed for her and other women. While succeeding in the male-ruled and power-focused realm, she showed traits usually attributed to men, including long-range vision, political ambition, talented organization, and hard work. Later historians have been less generous, describing her as a despotic usurper of the throne. These historians say that her reign ended in corruption and drinking, with the elderly ruler delighting in sexual relations with young men who enjoyed lavish favors. In 705 Wu Zetian was forced to abdicate, her son Zhongzong was again enthroned, and the Tang dynasty was restored.

Known as China’s Yellowstone, Wulingyuan Scenic Reserve in Hunan Province is one of the country’s most spectacular and popular national parks, featuring limestone gorges, sinkholes, underground streams, and caverns. It was designated a UNESCO World Heritage Site in 1992.

Wulingyuan Scenic Reserve, known as China’s Yellowstone, is a spectacular natural setting near Zhangjiajie City in northwestern Hunan Province in south central China. It also borders Guizhou Province and the province-level municipality of Chongqing. The climate of the region is subtropical, with moderate summers and mild winters with ample rainfall. Wulingyuan Scenic Reserve comprises four sections: Zhangjiajie National Forest Park, Suoxiyu Natural Resource Reserve, Tianzi Mountain Natural Resource Reserve, and the Yangjiajie Scenic Area, added in the 1990s. The reserve covers about 690 square kilometers (266 square miles), roughly the size of Zion National Park in Utah. (By comparison Yellowstone National Park covers some 8,980 square kilometers, or 3,470 square miles.)

The area is known for its karst topography, a type of terrain formed by the dissolving and collapse of irregular limestone, which produces gorges, fissures, sinkholes, underground streams, and caverns. The impressive sites of the reserve include more than 3,100 quartzite sandstone pillars that resemble deformed bamboo shoots, many over 200 meters (656 feet) high. There are also many ravines, streams, pools, and waterfalls; more than forty caves; and two natural bridges. The Zhoutian Dong cavern is thought to be the largest in Asia, and the Tianqia Shengkong natural bridge, the highest in the world.

The Zhangjiajie National Forest Park was established in 1982 as the first authorized forest national park in China. It covers 34 square kilometers (13 square miles). About 97 percent of the park is covered with both dense virgin forest and planted secondary growth. The forest is home to more than 3,000 species of plants, 35 of which are rare protected species. Native plants—such as the dove tree and the lobster flower, a perennial that can change color up to five times in a day—thrive in the park. A number of rare birds and animals also call the park home, including Chinese giant salamanders, Chinese water deer, Asiatic black bears, Asiatic wild dogs, and clouded leopards.

Wulingyuan is also home to a number of China’s ethnic minority groups, most prominent being the Tujia, Miao, and Bai peoples. The people in these groups maintain their traditional languages, arts and crafts, costumes, foods, festivals, and music and dance. A museum dedicated to Tujia culture is in Zhangjiajie Village within the reserve. The Yangjiajie Scenic Area is said to have been settled by the famous and venerable Yang family, who moved to the region during the Song Dynasty (960–1279) to escape from continuous warfare. The name of Yang is still important in the area.

Wulingyuan received a UNESCO (United Nations Educational, Scientific, and Cultural Organization) World Heritage listing in 1992 and is a popular destination for both Chinese and foreign tourists. An admission fee of 158 yuan (about $23), which includes transportation...
within the park, is charged for a two-day visit. Campfires and smoking are prohibited, just one of many restrictions designed to protect the reserve. There are no overnight facilities inside Wulingyuan. The nearest large town is Zhangjiajie City, a city of about 1.5 people about 33 kilometers (20 miles) from the entrance to Wulingyuan. Ample transportation is available from the city to destinations within the reserve.

Wulingyuan feng jing zhi [Wulingyuan Scenery]. Changsha, China: Hunan ren min chu ban she.
The Xia was the earliest Chinese dynasty (going back some two thousand years, although scholars debate the dates). Knowledge of the Xia comes from oral tradition, ancient historical records, and archaeological research. Scholars also debate the veracity of the legends of the founding of the dynasty.

The quasi-legendary Xia, or Hsia, dynasty of China is the oldest dynasty described in ancient historical records including the Records of the Grand Historian (covering the period c. 2600–91 BCE and written 109–91 BCE) and Bamboo Annals (documenting the period from legendary times, 2497–221 BCE). Mythologically, Chinese civilization began with Pan Gu, the creator of the universe, and a succession of legendary sage-emperors and culture heroes who instructed the ancient Chinese in communication and enabled them to find sustenance and to fabricate clothing and shelter. The name Xia was embodied in early oral traditions but also was documented in archaeological sites and artifacts discovered in 1928.

Western and Chinese scholars debate the veracity of the legends of the founding of the dynasty, particularly the accuracies of the chronologies expressed in written records such as the Records and Annals, which were composed 2,500 years after the supposed creation of the dynasty. In addition, the existing archaeological evidence does not appear to correlate with the historical records.

The Xia had villages and urban centers but were an agrarian people whose pottery and bronze implements have assisted prehistorians in developing more finite chronologies. During the Xia dynasty the major crafts included jade carving and casting bronze vessels, some of which were embellished with jade. The Xia also devised a calendar system that incorporated lunar and solar movements.

The Xia period—dating, as explained below, from the twenty-first to the sixteenth century BCE—defined a cultural stage between late neolithic cultures and the urban civilization of the Shang dynasty. Excavations in the city of Yanshi, Henan Province, uncovered what appears to have been a capital of the Xia dynasty. Although archaeological evidence (including radiocarbon dating) demonstrated that the inhabitants were the direct ancestors of the Longshan and were predecessors of the Shang, some Western scholars contend that the Xia were not a true dynasty. The two earliest of the three ancient dynasties of ancient China (Xia and Shang) are not directly known from contemporary written records, hence some scholars contend that these are mythical; however, there is agreement that the existence of the subsequent Zhou dynasty is based on historic documentation.

Xia Dates

A traditional chronology based on calculations by Liu Xin (c. 46 BCE–23 CE), an astronomer and historian, suggests that the Xia ruled from 2205 to 1766 BCE, but a chronology based on the Bamboo Annals dates the Xia dynasty from 1989 to 1558 BCE. The Skeptical School of early Chinese history, founded by Gu Jiegang in the 1920s, seriously questioned the traditional history, noting that through...
Xia Rulers

Traditional Chinese histories contend that the Xia dynasty was founded by Yu and ultimately had seventeen rulers. (See table 1.) According to the traditional history, the dynasty was founded when Shun, following the abdication system (which chose leaders according to their ability) ceded his throne to his minister Yu, whom Shun viewed as the “perfect civil servant.” Yu was esteemed by his people for eliminating devastating annual flooding by organizing the construction of canals and dikes along all the major rivers. But before his death Yu passed power to his son, Qi, setting the precedent for dynastic rule, or the hereditary system, which began a period of family and clan political and economic control. The rulers often performed as shamans, communicating with spirits for guidance, and the ruling families employed elaborate and dramatic rituals to confirm their political power.

Continuing with the hereditary system, fifteen descendants of Qi succeeded him after his death. Several, time the oral history had been embellished with elements added to the earlier periods. The Xia Shang Zhou Chronology Project, a multidisciplinary effort commissioned by the People’s Republic of China in 1996, involved two hundred scholars whose task was to determine precisely the chronology and geographic locations of the Xia, Shang, and Zhou dynasties. The report, published in 2000, determined that the Xia dynasty dated from 2070 to 1600 BCE. Scholars such as Sarah Allen contend that aspects of the Xia are the opposite of traits emblematic of the Shang, and she argues that the Zhou dynasty justified their conquest of the Shang by pointing out that the Shang had supplanted the Xia.

such as Shaokang and Huai, made important contributions to Chinese society, but three were tyrannical emperors: Taikang, Kongjia, and Jie. The Xia dynasty ended under the reign of Jie, whose dictatorial and extravagant ways caused a popular revolt under the leadership of T’ang (the leader of the Shang tribe), who overthrew the Xia and established the Shang dynasty. Liu Xin’s calculations give the Shang dynasty a reign of 1766–1122 BCE; the chronology from the Bamboo Annals dates it 1556–1046 BCE; and the Xia Shang Zhou Chronology Project places it 1600–1046 BCE.

Xi’an is the modern capital of Shaanxi Province, but the Xi’an area has a legacy dating back thousands of years—most notably as the capital of China’s first imperial dynasty, the Qin (221–206 BCE), as well as of the Han and Tang dynasties. The terracotta soldiers from the burial tomb of the Qin emperor Shi Huangdi are located about 30 kilometers from the city.

Xi’an is the capital of Shaanxi Province in central China. The city, which is the largest in the province, is situated in the central part of Shaanxi in the Wei River valley north of the Qinling range. The area around Xi’an has been inhabited for thousands of years; the remains of a well-established village from around 5000 BCE have been found at Banpo. The Xi’an area was also chosen as the capital of the Zhou dynasty (1045–256 BCE), of China’s first imperial dynasty, the Qin (221–206 BCE), and also of the Han (206 BCE–220 CE) and the Tang dynasties (618–907 CE). The city was then known as “Chang’ an.” The renowned terracotta soldiers—a life-size army of some 8,000 troops that was commissioned by the first emperor of the Qin dynasty (Shi Huangdi) as part of his tomb—are located about 30 kilometers east of the city.

Many other archaeological sites dot the area. For hundreds of years Xi’an was the gateway to the Silk Roads to central Asia, and during the Tang dynasty...
it was the largest and most cosmopolitan city in the world. The Big Wild Goose Pagoda, which was completed in 709, still stands 64 meters tall, and the old part of Xi’an, with the drum tower, the bell tower, and a mosque dating to the eighteenth century, is surrounded by one of the best-preserved city walls in China. The walls date to the fourteenth century and were originally 14 kilometers long and measured 12 meters in height and 18 meters in width. The modern city has a major textile industry and some electrical industries, and food processing factories are located in a rich agricultural region in the river valley. Tourism is a major source of income. Xi’an is also home to several important colleges.

Xi’an City Wall

The Xi’an City Wall is one of the last remaining ancient battlement sites of North China, and one of the largest military defense systems in the world.

The Xi’an City Wall is a major tourist site at the center of Xi’an, capital of Shaanxi Province in the northcentral part of the country. Xi’an is also the site of the famous terracotta entombed warriors, along with museums, pagodas, and other sites of historical interest. Xi’an has been referred to as China’s eternal city because of its ancient heritage. In the Xi’an area the capitals of the Chinese dynasties from Zhou (1045–256 BCE) to Tang (618–907 CE) were established.

The city wall was first built in the Sui dynasty (581–618 CE) and rebuilt in the third year of the reign of Zhu Yuanzhang, the first emperor of the Ming dynasty (1368–1644). It then went through three major renovations. The first took place in 1568 under the supervision of Zhang Zhi, then governor of Shaanxi. The second started in 1781 under the supervision of another Shaanxi governor, Bi Yuan. The last renovation was in 1983 when the Shaanxi government launched its ambitious project to renovate it and restore the parts that had been destroyed.
An attractive circular park has been built along the wall, with trees, shrubs, and flowers enhancing the beauty of the traditional Chinese architecture.

The Xi’an City Wall is an imposing presence around the city. Its north side is 3,241 meters (10,633 feet) long; its south side, 3,442 meters (11,291 feet); its east side, 2,590 meters (8,497 feet); and its west side, 2,631 meters (8,633 feet). The base is 18 meters (59 feet) wide, tapering to 15 meters (49 feet) at the top, which is as wide as a four-lane superhighway. The wall has a perimeter of 13.74 kilometers (8.5 miles). Originally built of rammed earth, it is now sided with large gray bricks.

A watchtower (jiaolou) sits at each corner of the wall. A rampart (ditai) projects from the top of the wall every 120 meters (394 feet). All together, there are ninety-eight ditai, each having a sentry (dilou) built upon it. A gate opens in each side: Far-Reaching Tranquility (Anyuan) in the north, Eternal Peace (Yongning) in the south, Everlasting Joy (Changle) in the east, and Security and Stability (Anding) in the west. Each gate consists of three gate towers. Central tower (zhenglou) is the inner tower sitting over the main entrance. Lock tower (zhalou) is the outer tower controlling the suspension bridge connecting to the entrance. Arrow tower (jianlou) is a watchtower lying between the other towers. Joining the three towers is an enclosure for defense known as jar city (wengcheng), where soldiers were stationed to guard the gate. From jar city to the top of the wall, there are passages with gradually ascending steps, which allowed war horses to travel up and down. There are altogether eleven horse passages on all sides.

The top of the city wall is paved with three layers of gray bricks. Battlements with a total of 5,984 crenels, or indentations, skirt the outer edge of the wall. Parapets (nü’erqiang) line the inner edge of the wall. While the battlements were used for defense, the parapets served as lookout posts.
“Build high walls and store up provisions” has been an important guiding principle of Chinese monarchs in history. Well known for the construction of the Great Wall, the ancient Chinese built walls around every city. When the People’s Republic of China was established in 1949, the Xi’an City Wall was one of many surviving city walls, but today it is the only one left in its entirety. The others were demolished to make way for modern traffic.

Now the Xi’an City Wall is not only the pride of the Xi’an citizens but also a mecca for Chinese and foreign tourists. Many festivities and reenactments happen at or on the wall. When President Clinton visited Xi’an in 1998 he was given a royal reception at the wall’s Yongning Gate. The Xi’an City Wall International Marathon has been held yearly since 1993. The wall is popular with hikers, bicyclists, and tai chi practitioners.

Xi’an Incident

Xi’an Shibian 西安事变

The Xi’an Incident of 1936 is often considered a turning point in Chinese history. As a result of the incident, in which two Nationalist generals, Zhang Xueliang and Yang Hucheng, arrested President Chiang Kai-shek, the Chinese Communist Party (CCP) won breathing room from the Nationalists who wanted to destroy the CCP and at the same time gained popular support for their strong opposition to Japanese aggression. The Japanese took the apparent Nationalist-Communists rapprochement as evidence that armed conflict was inevitable. The Japanese invasion of China took place a scant seven months after the Xi’an Incident.

Until the Xi’an Incident Chiang Kai-shek’s strategy against the Communists appeared to be succeeding. In October 1934 Nationalist armies had driven the Chinese Communists out of their base in Jiangxi, forcing the 100,000 Communists to undertake the fabled Long March. The Long March decimated the Communists and ended a year later in October 1935 in a remote and poor area of Shaanxi Province where a small base existed at Yan’an. From Yan’an Red Army leader Mao Zedong took up the new United Front policy against fascism of the Soviet Comintern (the Communist International established in 1919 and dissolved in 1943) and argued that Chinese should not be fighting one another but rather must resist the Japanese.

In 1936 Chiang Kai-shek had charged Yang Hucheng and Zhang Xueliang to carry out the final extermination of the weakened Communists at Yan’an. Yang Hucheng, a former bandit, led an army of questionable quality; Zhang Xueliang, the young cosmopolitan commander of the warlord army of Manchuria, commanded a stronger force. With Japanese encroachments in north China continuing, officers and men from both armies thought the threat from Japan was greater than from the Chinese Communists. Chiang Kai-shek, hoping to bolster the resolve of his armies, made two trips by airplane in late 1936 to Xi’an. His kidnapping occurred a few days after he began his second visit.
Initially the Communists urged Generals Yang and Zhang to kill Chiang Kai-shek but quickly altered their policy by sending Zhou Enlai to advocate the sparing of Chiang if he agreed to an anti-Japanese united front. Hoping to free Chiang, both his wife, Song Meiling, and his brother-in-law, Song Ziwen, flew to Xi’an to help negotiate a solution. After Chiang agreed with the terms he was released. The promised cooperation between the Chinese Nationalists and the Chinese Communists never could be realized. Their enmity proved so great that even all-out Japanese invasion in June 1937 could not bring them to a truly united resistance.

The fates of the two kidnappers are a fascinating side-light to the Xi’an Incident. When released at Xi’an Chiang
Kai-shek convinced Yang Hucheng and Zhang Xueliang to accompany him on his return to Nanjing. Once in Nanjing, Chiang had them placed under house arrest. Then, as the Nationalists retreated in 1949 to Taiwan, Chiang Kai-shek had Yang Hucheng executed. Zhang Xueliang was spared but remained under house arrest until 1991. After the deaths of both Chiang Kai-shek and his son, Chiang Ching-kuo (Jiang Jingguo), Zhang Xueliang was released. Zhang, who had become a devout Christian during his long imprisonment, moved to Hawaii and lived there until his death in 2001 at the age of one hundred.

The Xi’an Incident revealed Chiang Kai-shek’s questionable control over his supposedly allied Chinese armies while enhancing the Chinese Communists’ identification with patriotic national resistance to Japan. It marked a renewed but futile attempt at cooperation between the Chinese Nationalists and the Chinese Communists. By heightening the anti-Japanese sentiment in China, it set the stage for open but undeclared war between Japan and China in July 1937. The War of Resistance against Japan, 1937–1945, and known outside China as the Second Sino-Japanese War, was later fought in context of World War II in Asia.

**Xiang**

**Xīāng 湘**

**Xiang** is the name of the people and local sub-language of the central southeastern province of Hunan. The Xiang people are one of three subgroups of Han Chinese that settled south of Mandarin-speaking Chinese; their language is complex with many dialects.

The name Xiang is derived from the older literary name of Hunan. It is estimated that more than 34 million Chinese (most of them living in Hunan Province) speak Xiang today. Several early leaders of the Chinese Communist Party (most notably Mao Zedong) came from Hunan, and the linguistic influence of people thinking in Xiang or in Xiang-accented Mandarin appears to have influenced the forms chosen to simplify the characters used in the Chinese language.

Along with the Gan and Wannan, the Xiang are one of the three subgroups of Han Chinese who settled inland and to the south of the Mandarin-speaking people in China. The sublanguage (a division of the main language) spoken by the Xiang has not been regarded as significant as the Mandarin forms spoken in the north, and the Xiang have not contributed in a major way to Chinese migration overseas. The Xiang, like the Gan and Wannan, generally have been considered to be Chinese who speak Mandarin, but with very poor pronunciation.

Xiang is a complex language with many dialects. While it shares similarities with Mandarin, it differs from other sublanguages of Han Chinese mainly because of the way the dialects and subdialects relate to each other. The dialects that have similarities with Mandarin are grouped together as the New Xiang or the Xinxianghua. Local histories suggest that the complexity in the Xiang sublanguage may be due in part to the fact that most of the population now living in Hunan Province originated in other provinces. Migration has thus contributed greatly to the complex pattern of Xiang subgroups in Hunan Province.

Linguists find it easier to divide the sublanguage chronologically into New Xiang and Old Xiang, rather than describing the geographical distinctions of the various forms. Old Xiang, or Laoxianghua, has been described as a conservative form of the Xiang sublanguage and therefore much closer to the Middle Chinese of the Tang dynasty (618–907 CE) than New Xiang. Some linguists have suggested that there are ties between Old Xiang and the Wu dialects of the region around Shanghai. It is not surprising that Old Xiang is spoken only in the more isolated rural districts and some of the smaller cities of central Hunan Province. New Xiang, on the other hand, is spoken mainly in most of the larger cities and towns, where people from other regions and provinces have settled.

**New Xiang**

Linguists point out that New Xiang has evolved much further from the Middle Chinese norm than has Old Xiang. The development of New Xiang generally has paralleled that of southwestern Mandarin. Indeed, this form
of Mandarin is supposed to have been the strongest influence on New Xiang, partly because southwestern Mandarin is spoken in Hubei Province, which is located directly to the north of Hunan Province. New Xiang is therefore much closer phonetically to Standard Mandarin than is Old Xiang. Yet both Old and New Xiang have been in use together and coexist in many towns. Complicating the geographical distribution of the speakers of Old and New Xiang are generational divisions: Elderly speakers usually speak Old Xiang, while their younger family members speak New Xiang.

Speakers of New Xiang in Changsha, the capital of Hunan Province, typically do not pronounce the initial sounds b-, d-, dz-, dzh-, and gh-, as they do the other surrounding forms, sounds that are added or part of Han Chinese. Because these initials have been retained in the Old Xiang spoken in the smaller Hunanese city of Shuangfeng, linguists consider Old Xiang an island of linguistic conservatism. New Xiang is expected to change Old Xiang in time, bringing it more into conformity with Standard Mandarin and Mandarin-like speech forms.

The nature of spoken New Xiang can be examined in a list of words used in the provincial capital of Changsha. In New Xiang subdialects, the personal pronouns are similar to those used in Mandarin. Hence, “him” or “he” (t’a), is pronounced similarly in both New Xiang and Mandarin. Likewise, “you” (ni) is pronounced the same in New Xiang and Mandarin. According to scholar Leo Moser, the Changsha vernacular as described in the reference text Hanyu Fangyan Cihui can be compared with Standard Mandarin in several ways. First, it has no retroflex series of consonants. Second, there are no words ending in -ng, although some people in Changsha do use retroflex consonants as well as some syllables ending in -ng. Third, there are words beginning with -ng and z-. Fourth, there are six tones rather than four. Fifth, there are nasalized vowels and, sixth, a pattern of consonant liaison that may modify medial sounds in two-syllable phrases. Finally, there are different grammatical particles somewhat differently employed. Words in the Changsha subdialect can also start with an h- and an f-. These characteristics make the Changsha subdialect different from other forms of Xiang. (See table 1.)

In northern Hunan Province, the Yiyang subdialect is another form of New Xiang. It shares many characteristics with the Changsha subdialect but has five tones and words ending in -ng-. The subdialect has also developed a pattern of inserting l-like sounds in many words.

Linguists have concluded that the Xiang sublanguage differs from most other Sinitic sublanguages. Hunanese do not appear to take pride in their local dialect, since there does not seem to be uniform pronunciation of the name Changsha, for example, even within the city itself.

### Old Xiang

Linguists consider the Shuangfeng dialect a good example of Laoxianghua, or Old Xiang. The vernacular of Shuangfeng lacks the f- and the initial j-, although there are the initial consonants n-, ng-, and the voiced h or gh-. According to Wade-Giles Standard Chinese, the word liang (two, a couple), is niang in Shuangfeng, while jou (meat) becomes niu. The tendency to use old forms with voiced consonants and other ancient language habits has led to the comparison of Old Xiang and the Wu dialects.

Pronouns in Shuangfeng differ widely from Standard Chinese in both sound and formation. Several pronouns do not share the pluralizing element men in Standard Chinese. (See table 2.)

In the far south of Hunan Province, a zone of eleven counties, the Southern Xiang, or Xiangnan, dialect is spoken. Some have assumed that this dialect was influenced by Cantonese, the sublanguage spoken to the south, but in

Xiang Dialects

Xīāng fāngyán 湘方言

Mandarin 普通话 (putonghua, literally “commoner’s language”) is the standard Chinese language. Apart from Mandarin, there are other languages and dialects spoken in China. Xiang 湘 is one of the ten main Chinese Han 汉 dialects, and is spoken primarily throughout Hunan Province.

The Xiang dialect group is one of the recognized ten dialect groups of spoken Chinese. Some 34 million people throughout Hunan Province speak one of the Xiang dialects. Speakers are also found in Sichuan and Guangxi provinces.

The Xiang dialect group is further divided into New Xiang (spoken in the north) and Old Xiang (spoken in the south). Within these classifications are three further sub-dialect groups and an unclassified number of subgroups. There are some distinctive features between New Xiang and Old Xiang at the grammatical and sound levels. However, both the Old Xiang and New Xiang dialects have more features in common than differences. The representative of New Xiang is the Changsha dialect, which is spoken in the capital city of Hunan, and the representative of Old Xiang is the Shuangfeng dialect. Communications between speakers of New Xiang and Old Xiang are not always possible.

Origins of Xiang Dialects

The name Xiang comes from the major river in Hunan. Modern Xiang evolved from the language of the Chu kingdom, which was established in the third century CE, but it was greatly influenced by northern Chinese (Mandarin) at various times. The Chu kingdom occupied modern Hubei and Hunan provinces. Some records of the vocabulary used in the Chu kingdom areas can be found in Fangyan, compiled by Yang Xiong (53 BCE–18 CE), and Shuowen jiezi, compiled by Xu Shen in 100 CE. Both works give the impression that the dialect spoken in the Chu kingdom had some strong local features.

The dialects spoken in Chu were influenced strongly by northern Chinese migrants. The first group of migrants came into Hunan in 307–312 CE. Most of them came from Henan and Shanxi provinces and occupied Anxiang, Huarong, and Lixian in Hunan. In the mid-Tang dynasty, a large group of northern people came to Hunan following the Yuan River into western Hunan. The third wave of migrants arrived at the end of the Northern Song dynasty (960–1126). Most migrants came to areas in northern Hunan, such as Changde and Lixian. The Xiang dialects today are surrounded by Mandarin in the north, west, and south, and by Gan and Hakka in the east. The different dialects spoken by migrants have had a great effect on the Xiang dialects.

Official government policy since the 1920s, and especially since 1955, has encouraged the use of standard Mandarin (putonghua, literally “Commoner’s language”). All aspects of the Xiang dialects have felt the effects of this policy. For example, in Changsha, there are three speech codes: spoken Changsha, the local regional dialect used to communicate in everyday life; reading Changsha, a dialect system of literary pronunciation used solely for reading aloud, dictating newspapers or letters, and performing
local operas and plays; and suliao putonghua, or "plastic Mandarin," an expression used by people in Changsha to mock the fact that they are not native speakers of Mandarin and their Mandarin does not sound natural. Plastic Mandarin can be heard in schools and at some formal events, such as conferences. Generally speaking, the code of reading Changsha acts as a bridge for new sounds and new words from Mandarin into the Changsha dialect. In the twentieth century, the sound system of the Changsha dialect underwent a lot of changes because of the influence of Mandarin. For example, there are four tones in Mandarin but six in the Changsha dialect. The words dòng 冻 and dòng 冻 share the same sound in Mandarin but differ in the Changsha dialect: 冻 dòng has a high rising tone while 冻 dòng has a low falling tone. In the twentieth century, many words with a falling tone shifted to a rising tone. In other words, dòng 冻 and dòng 冻 have become homophones, as they are in Mandarin. It is possible that the Changsha dialect eventually will lose the low falling tone and go from six tones to five.

Sound System Features

Although different in some respects, in general, the Xiang dialects have some of the same phonological (speech system) features. For instance, most Xiang dialects possess five or six tones. The Middle Chinese (a term for historical
Chinese phonology, which refers to Chinese spoken from the sixth to tenth centuries) rù 入 tone is retained as one tonal category in the Xiang dialects. For example, the numbers yi 一 “one,” shí 十 “ten,” bāi 百 “hundred,” and liù 六 “six” belong to rù 入 tone category in Middle Chinese. In the Xiang dialect, these four words still share a falling tone, “ten” a rising tone, “hundred” a falling-rising tone, and “six” a falling tone.

The most significant feature of the Xiang dialects is the retention of the contrast between Middle Chinese voiced and voiceless consonants (just like the difference between the English /b/ and /p/ in “bet” and “pet”), since this contrast has been lost in most other Chinese dialects.

**Morphological Features**

Morphemes are the smallest meaningful units used to form words. In Xiang about 15 percent of morphemes have no correspondences in Mandarin. For example, in Mandarin the verb “to lie” is pian 骗 while in the Xiang dialect, it is [co] with a rising tone. Pian 骗 does not have a phonological correspondence with [co]. We don’t know its written form. We don’t know where the word [co] comes from. It might be a borrowed from some other language, or it might be an independent development of the Xiang dialect itself. Linguists have been trying to find the etymology of these words from early dictionaries and documents, but, so far, only a small proportion has been identified.

There are three main types of word formations for words of more than two morphemes in Chinese. They are compounds, such as fāmǔ 父母 (father + mother) “parents”; reduplications, such as māmā 妈妈 (mother + mother) “mother”; and affixations such as làohù 老虎 (prefix + tiger) “tiger”; or zhúzǐ 筊子 (table + suffix) “table.” In the Xiang dialects, affixation is much more common than it is in Mandarin, but reduplication is not commonly employed. In the twentieth century, some new morphemes were borrowed into Xiang. For example, the local kinship terms and Mandarin kinship terms coexist in the Changsha dialect: yé 爷 and niáng 娘 are local terms for father and mother; bāba 爸爸 and māmā 妈妈 are borrowed terms. The borrowed terms have brought not only new morphemes (words) into Xiang but also the reduplicative formation.

**Grammatical Features**

There are many features of grammar in the Xiang dialects that distinguish them from Mandarin and other Chinese dialects or languages.

In Mandarin, there is no distinction between the attributive particle and nominalized particle. For example, in the expressions wǒ de shū 我的书 “my book” (de = attributive particle) and shù shì wǒ de 书是我的, “the book belongs to me” (de = nominalized particle), both the attributive and nominalized particle is de 的. In New Xiang both particles are cognates of de 的 while in Old Xiang they are cognates with ge 个 (scholars are still debating the lexical source of ge个). In some localities of Old Xiang—such as Qiyang, Qidong, and Xinhua—however, there is a distinction between the two particles. In the Qiyang dialect, the attributive is [ke] while the nominalized is [kau]. That is to say, wǒ de shū 我的书, “my book,” in the Qiang dialect would be wǒ [ke] shù 我的书 while in Old Xiang they are cognates with ge 个, “the book belongs to me,” would be shù shì wǒ [kau] 我的书 (kau = nominalized particle). This type of distinction occurred before the Qin dynasty (221–206 BCE) but disappeared in Mandarin as well as in most Xiang localities.

In written language the passive construction first appeared before the Warring States period (475–221 BCE) while disposal constructions first appeared in the Tang dynasty (618–907 CE). In Mandarin the passive marker derived from a verb with a passive meaning (bèi 被), “to be covered, to suffer,” as used in Běizì bèi méimeī dài pò le 杯子被妹妹打破了 (glass + passive marker + younger sister + to hit + complement + aspectual marker) “The glass was broken by (my) sister”) or while the disposal marker derived from a verb with an active meaning (pā 把, “to hold,” as used in Méimeī bā běizi dài pò le 妹妹把杯子打破了 (younger sister + disposal marker + glass + to hit + complement + aspectual marker) “(My) sister broke the cup”). In Xiang, however, both passive markers and disposal markers derived from active verbs meaning “to give” or “to take,” such as pā 把, “to hold, to give”; dé 得, “to gain, to give”; or ná 拿, “to take.” More interestingly, there are even some localities such as Lengshuijiang, where both passive and disposal constructions share the same marker: ná 拿, “to take.” The sentence Zhang San na Lisi sa le 张三拿李四杀了 in the Lengshuijiang dialect can have two readings: Zhang San killed Lisi and Zhang San was killed by Lisi. In addition,
in Xiang dialects, these two constructions are not as active as they are in Mandarin. Instead of forming a request as in “to open the door,” (bā mén dà kā 把门打开 [disposal marker + door + to open + complement]), in Mandarin a direct order is more likely to be heard (kāi mén 开开门 [to open + complement + door] “open the door”). Now the Mandarin passive markers and disposal markers have come into the local system. In many localities, the local forms and the borrowed forms coexist.

Word order is very important to meaning in many languages. The most distinctive feature of Xiang word order is the position of the object. In Mandarin the word order for double objects is [verb + indirect object + direct object], for example gěi tâ shû 给他书 [to give + he + book] “give him a book”; but in Xiang it is [verb + direct object + indirect object] gěi shû tâ 给书他 [to give + book + he] “give a book to him.”

In Mandarin if a verb takes both an object and a complement, the word order is [verb + complement + object], such as in găn shàng chû le 赶上车了 [to catch + complement + bus + particle] “have caught up to the bus.” In Xiang positive sentences share the same order as Mandarin, but negative sentences have a different order [verb + object + complement]: găn bú shàng chû 赶不上车 [to catch + no + complement + bus] “unable to catch the bus” or găn chû bú dào 赶车不到 [to catch + bus + no + complement] “unable to catch the bus”. If a verb indicates a common action in everyday life, such as “wish to eat, wish to drink, or wish to sleep,” the construction in Mandarin is [xiāng 想 “to wish” + verb + object]. The word order in the Changsha dialect is [xiāng 想 “to wish” + object + verb]: xiāng chī fàn 想吃饭 [to wish + to eat + rice] “(I) want to eat (now)” in Mandarin but xiāng fàn chī 想饭吃 [to wish + rice + to eat] in the Xiang dialects. All of these Mandarin constructions have come into Xiang and coexist with the local constructions.

Studies of Xiang Dialects

There have been three general surveys of dialects spoken in Hunan. All three include the Xiang dialects. The first survey covered seventy-five localities and was conducted by a team under the leadership of Chao Yuenren in 1935. The results were not published until 1974, by Yang Shifeng. The second was conducted by the Chinese department of Hunan Normal University between 1956 and 1959 (and published in 1960) and covered eighty-one localities. The third survey started in 1987 and was conducted by a team led by Li Yongming and Bao Houxing. It covered 102 localities of which twenty-two were studied in detail. Since the late 1990s, much work has been done on different aspects of the Xiang dialects, especially grammar, which had been overlooked in the past.

A five-volume series with descriptions of phonology, vocabulary, and grammar of the Xiang dialects, edited by Bao Houxing, was launched at the first International Conference of the Xiang Dialects held in Changsha in 2006. Scholars working in the Xiang dialects are very active. More important, more and more postgraduate students are engaged in the research of the Xiang dialects.

Most research in the Xiang dialects so far has been descriptive work on contemporary dialects. More detailed descriptions of different localities of Xiang, especially the localities in the remote areas, are needed. But studies from historical and comparative points of view also are important. There is a need to put Xiang on the big map of universal linguistics, in the interests of linguistic studies in general.

近朱者赤，近墨者黑

Jinzhūzhěchì，jīnmòzhěhēi
One of the best-known Chinese film directors of the twentieth century, Xie Jin blended Confucian morality with melodrama into more than twenty films—from state-sanctioned evaluations of Chinese history or bleak portrayals of the Mao years to wildly popular features.

Xie Jin occupies a complex, vitally important position in the history of Chinese cinema. A director of celebrated talents, his *Stage Sisters* (1964) and *Hibiscus Town* (1986) have gained reputations as examples of some of the finest filmmaking to emerge from the People’s Republic of China during the twentieth century. At the same time, Xie’s cultural authority has become institutionalized through his close ties to state studios and artistic organizations. He served as a vice chairman of the national committee of the China Federation of Literary and Art Circles, and was a standing committee member of the Eighth and Ninth Chinese People’s Political Consultative Conferences, an advisory body to the PRC government. Nonetheless, the “Xie Jin school” of filmmaking, supposedly based on the melding of melodrama with Confucian morality, has been both emulated and challenged by Chinese filmmakers during the post-Mao era.

A native of Shangyu, Zhejiang Province, Xie’s directorial training began in Sichuan during the 1940s, when he attended a public dramatic arts institute near Chengdu. As a consequence of wartime migration, this institution boasted several cultural luminaries as teachers, including both dramatists (Cao Yu, Hong Shen) and directors (Huang Zuolin, Zhang Junxiang). Xie followed several of these mentors to Chongqing in 1943, essentially working as a fulltime understudy.

Xie Jin recommenced his studies at the Nanjing National Theater Institute in 1946, and began work as an assistant director for the Datong Film Company two years later. After another period of political training at the Huabei (North China) People’s Revolutionary University in 1950, he entered the Shanghai film world at a time when the transition to a state-run system left very few opportunities for new arrivals. Xie distinguished himself, however, and by 1954 was already directing his own films. *Woman Basketball Player No. 5* (1957), recognized at the Fourth World Youth Assembly in Moscow, constituted his first notable success. A series of cheaply made films promoting the state’s Great Leap Forward production-policies followed, after which Xie released a series of well-received features, including the wildly popular *Red Detachment of Women* (1961).

By this time, several patterns in Xie Jin’s filmmaking method had already emerged. First, he developed a reputation for directing films centered on female characters and for launching the careers of relatively unknown actresses such as Xiaoqing (now an infamous subject of tabloid gossip) and Siqin Gaowa (a recent recipient of the Hong Kong Film Award), with whom he often worked. Second, Xie’s films proved capable of attaining both domestic popularity and international acclaim—his masterpiece, *Two Stage Sisters* (1965), remains a classic of melodramatic social realism. Third, Xie was able to maintain this level of quality within a variety of political environments, as attested to by the fact that he was one of a handful of directors picked
to transform “model operas” (a mode of “proletarian” theater devised by Mao Zedong’s wife, Jiang Qing) into films during the Cultural Revolution (1966–1976).

Xie Jin’s popularity during the 1980s and 1990s was often overshadowed by the international success of Fifth Generation directors such as Zhang Yimou and Chen Kaige. (Xie, whose career began after World War II, belongs to the Third Generation.) Yet Xie proved as durable as any of his famous successors. Legend of Tianyun Mountain (1980) and Hibiscus Town (1986) earned him plaudits for bleakly realistic portrayals of the Mao years, while subsequent films such as The Opium War (1997) wedded big-budget aesthetics with an officially sanctioned take on China’s colonial past.

Xie was a member of numerous professional film associations in the PRC and abroad. While his final works were directed mainly toward domestic markets, during these years he also acted as the state’s official ambassador as vice-chairman of the China Federation of Literary and Art Circles to cinematic and scholarly communities worldwide. Xie died in Shangyu in 2008.

XIN Qiji

Xin Qiji 辛棄疾
1140–1270 Song dynasty lyric writer, poet, and military leader

Xin Qiji, the most prolific lyric writer of the Southern Song dynasty, devoted his life to seeing that the former Northern Song territories captured by Jurchen Jin forces would be returned to Chinese rule. Ultimately Xin’s heroic recovery mission failed; in his retirement he wrote unabashed lyrics that expressed the frustrations of his thwarted ambitions.

The conflict that raged within the heart of Xin Qiji, one of the most important lyric writers of the Southern Song dynasty (1127–1279), reflects the major political dilemma of his time—the division and competition between the reconstituted Song dynasty in the South and the conquering Jurchen Jin dynasty (1125–1234) in the north. He is known for his forthright and martial personality, and his song lyrics were characterized by the term “heroic and unrestrained” (haofang) during his own lifetime, even though the broad stylistic range in his lyrics often belies the simplicity of this label. Over 670 of his song lyrics have been preserved, making Xin Qiji the most prolific song lyric writer of the Song dynasty.

The central concern of his entire life, fueled by patriotism and reinforced by homesickness for a homeland unoccupied by alien invaders, was his determination to recover the Song empire’s lost territory. In 1126 the Northern Song dynasty (960–1126) capital of Kaifeng was sacked by the Jurchen Jin dynasty army, forcing the last heir to the throne to flee south of the Huai River and reestablish the capital in Hangzhou. Xin Qiji was born in the occupied north in the city of Licheng (modern Jinan in Shandong Province). In 1161, when Xin Qiji was twenty-one, he organized an uprising and joined forces with Geng Jing. On Geng Jing’s orders Xin Qiji led his forces to join the court in the south. He met Emperor Gaozong (reigned 1131–1162) in Jiankang (modern Nanjing) on an inspection tour and was granted an audience and an official title. Despite this promising reception, Xin Qiji received no support for his plans to retake captured northern territories. When Geng was murdered by a subordinate who had gone over to the Jurchen Jin, Xin rode into the enemy camp and returned with the traitor for execution. Afterward Xin relocated to the south for good. There he tirelessly advocated a policy of retaking the occupied northern territories, submitting to the throne his “Ten Discourses of an Ignorant Rustic” sometime between 1165 and 1168 and nine essays to a newly appointed pro-war grand councilor in 1170. Although Xin Qiji served ably in a series of provincial appointments in various parts of the Yangzi (Chang) River delta, he was frustrated by repeated misinterpretations of his actions and by downright slander from his political opponents. In 1182 Xin retired to a villa of eccentric design called “Ribbon Lake” in Jiangxi Province and, after this villa burned down, to a second villa called “Calabash Spring.” It was during his twenty years of retirement that he composed over nine-tenths of his song lyrics.

Xin Qiji failed in his ambition to become the heroic leader who recovered the northern half of his country. Instead he became the greatest songwriter of the Southern Song dynasty and poured his pent-up feelings into his lyrics. The lyrics of Xin Qiji have often been compared
with those of his literary predecessor Su Shi (1037–1101). In reality they are quite different in tone and technique. The late Qing dynasty (1644–1912) critic Wang Guo-wei (1877–1927) aptly distinguished the tone of the two writers, calling Su Shi’s lyrics “expansive” (kuang) and Xin Qiji’s “heroic” (hao). The one main similarity of the two poets is their interest in experimenting across genres. Like Su Shi, Xin Qiji further elevated the lyric by using it
to write about his public ambitions, a topic typically associated with shi poetry. In technique Xin surpassed Su Shi's efforts as well—by incorporating quotations from old-style prose and by combining classical prose with colloquial phrases from the spoken language.

**The Poetry of Xin Qiji**

**Sung to the tune**
**"The Partridge Sky"**

In my prime, beneath my flag were ten thousand warriors.
My horseman, in brocaded uniforms, burst across the river.
At night the northern soldiers held fast to their silver quivers.
At dawn our archers let fly their golden arrows.

Thinking back on those events,
I sigh over my present circumstances.
The spring wind will not darken my graying beard.
I've traded my ten-thousand word treatise on military strategy
For my neighbor's book on planting trees.

Established in 1931 as Red China News Agency, Xinhua News Agency, as it has been known since 1937, is the official state news agency of China and the largest news and information-gathering and distribution center in the country. Xinhua disseminates all information about government policies through its thirty-two branches in China, as well as its branches in more than one hundred countries.

As the official state news agency of China, and the country’s largest news organization, Xinhua News Agency is the primary source for information about government policies, resolutions, and viewpoints throughout the country. Established in 1931 as Red China News Agency and renamed “Xinhua” in 1937, the agency has undergone steady growth since the founding of the People’s Republic of China in 1949, and especially since China’s economic reforms and opening-up drive began in 1978. Xinhua today has more than seven thousand employees working in news coverage (domestic, international, and sports), management and operation, and technical support.

Xinhua operates a head office in Beijing; thirty-two domestic branches in China’s provinces and autonomous regions, including Hong Kong and Macao (but excluding Taiwan), as well as reporters substations in some fifty cities and overseas branches in more than one hundred countries. Five regional offices authorized to release news include: an Asia-Pacific regional office headquartered in Hong Kong, the Latin American regional office in Mexico City, the African regional office in Nairobi, the Middle East regional office in Cairo, and the French regional office in Paris.

Domestically the agency releases daily news to newspapers and radio and TV stations at the county, prefecture, and provincial levels. Overseas it releases news in Chinese, English, French, Spanish, Russian, Arabic, and Portuguese. It also releases economic information daily to Chinese and foreign clients. It offers special reports and news features to more than 130 countries. It has cooperation agreements on news exchange with news agencies or media organizations in nearly one hundred countries. The Xinhua Audio and Video Center, established in 1993, provides news and special programs for TV stations and audio and video customers.

Xinhua publishes nearly forty newspapers and magazines, including Xinhua Daily Telegraph, News Bulletin of the Xinhua News Agency (in English, French, Spanish, Arabic, and Russian), Reference News (daily), Economic Information Daily, China Securities (daily), Shanghai Securities (daily), Sports Express (weekly), Outlook (weekly), China Comment (fortnightly), Globe (monthly), Chinese Reporters (monthly), Photography World (monthly), Great Rural World (monthly), Securities Investment Weekly, China Photo (quarterly), and China Yearbook (in Chinese and English). The Xinhua Publishing House, an affiliate, annually publishes four hundred books titles on current affairs and politics.

In recent years Xinhua has established more business operations such as China News Development Co., China National United Advertising Corporation, China Photo Service, Global Public Relations Co., and Hangzhou International Public Relations Co. Xinhua also operates the

New China Agency to Handle Foreign and Financial News

BEIJING—China has named the State Council Information Office, a Cabinet-level agency, as the new regulator of foreign news agencies and financial information providers, replacing the official Xinhua news agency, Xinhua reported.

The announcement, which was issued Friday and took effect immediately, follows a complaint about new Xinhua regulations brought to the World Trade Organization by the U.S., the European Union and Canada last year.

The new rules would have required foreign financial information providers such as Thomson Reuters Corp., Bloomberg L. P., and Dow Jones & Co. to sell their products through an entity designated by Xinhua, and to disclose sensitive commercial information.

The complaint stated that the new rules constituted a conflict of interest since Xinhua was both a regulator and a market competitor.

In response to the complaint, China in November agreed to end Xinhua’s regulatory control, to allow foreign financial information providers to sell directly to customers and to appoint an independent regulator, which wouldn’t share proprietary information.

The previous Xinhua regulatory regime distinguished between foreign financial information providers, selling to financial professionals, and foreign news agencies such as the Associated Press and Agence France Presse, supplying a media market that includes newspapers, broadcasters and Web sites.

Friday’s announcement made clear that both groups would now be regulated by the State Council Information Office.

It isn’t clear how foreign news agencies will be allowed to conduct commercial activities under the new regulator. They are now required to distribute through Xinhua, which has long claimed a monopoly in this area.

Set up in 1991, the SCIO is a ministerial-level agency led by Minister Wang Chen.

According to its Web site, the agency’s chief role is to raise awareness and understanding of China and the country’s issues through media.

Xinjiang Uygur Autonomous Region

Wéiwú’ěrzú Zìzhìqū 维吾尔族自治区

20.95 million est. pop. 2007  1.6 million square km

Xinjiang Uygur Autonomous Region is the largest political unit in China but also one of the least populated. Muslim Uygurs make up Xinjiang’s largest ethnic population (although several other minorities reside there as well). CCP authorities have had a policy of settling Han (China’s majority ethnicity) in the region in an attempt to solidify government rule.

Xinjiang Uygur Autonomous Region, located in northwestern China, is bordered by Russia to the north, Mongolia to the northeast, the Chinese provinces of Gansu and Qinghai to the east, Tibet (Xizang) Autonomous Region to the southeast, Afghanistan and India to the south and southwest, and Kyrgyzstan, Kazakhstan, and Tajikistan to the west. Xinjiang Uygur Autonomous Region is the largest political unit in China, covering 1.6 million square kilometers: slightly smaller than Iran. However, despite its size, Xinjiang is one of the least-populated regions of China. Its geography and climate help explain its low population density: Much of the southern half of the region is covered by the vast Taklimakan Desert, whereas the center is dominated by the uninhabitable Tian Shan range.

Xinjiang has long been China’s gateway to central Asia. As far back as the Han (206 BCE–220 CE) and...
Tang (618–907 CE) dynasties, the oasis towns scattered throughout Xinjiang were the backbone of the great Silk Roads, a highway over which merchants carried luxury goods from the Chinese empire to the Arab empires of the Middle East and the kingdoms of central Asia. Despite its strategic location, Xinjiang retained considerable independence during much of its history. The region’s current name, which in Chinese means “new frontier,” can be traced to the conquest of the region by the Manchu armies of the Qing dynasty (1644–1912) during the mid-eighteenth century. Even after 250 years of Chinese control, however, Xinjiang retains much of its traditional culture. The region’s largest ethnic group continues to be the Muslim Uyghurs, although several other minority nationalities, including Uzbeks, Kazakhs, and Tajiks, also have sizable populations. The “minority” population of Xinjiang in 1997 was 10.58 million (61.6 percent of the region’s total population). This population figure is all the
more noteworthy because, since 1949 when the Chinese Communist Party took over the governance of Xinjiang, central authorities have had a policy of settling Han (ethnic Chinese) in the region in an attempt to solidify their rule.

This policy, together with the arrival of hundreds of thousands of Chinese economic migrants from the eastern provinces and the growth of Islamic fundamentalism in central Asia, has resulted in the development of a separatist movement among Xinjiang’s Muslims since the mid-1980s. During the 1990s movement extremists began a terrorist campaign against local authorities in Xinjiang’s capital city of Urumqi and symbols of the Chinese “occupation” throughout the region. The Chinese government, in an attempt to keep the separatists from acquiring external support, during the late 1990s negotiated a number of agreements with neighboring states to jointly develop the region’s natural resources and to promote trade. Authorities in Beijing hoped to suppress support for Uygur nationalists by promising economic prosperity to the Islamic nations of central Asia.

When world attention was on pro-Tibet protests along the Olympic torch relay route prior to the Summer Olympics in Beijing in 2008, Uygur separatist groups staged demonstrations in several countries. The East Turkestan Islamic Movement (ETIM) is an Uygur group that advocates creation of the Islamic state of East Turkestan in Xinjiang. On 4 August 2008, four days before the Olympics, suspected ETIM members rammed a dump truck into a patrol station in Xinjiang, killing or wounding thirty-two Chinese police officers.

Xinjiang Uygur Autonomous Region is to be a central element of China’s Developing the West program, which was announced by Premier Jiang Zemin in 2000.

Robert John PERRINS
Iron Discovery in Xinjiang

The China scholar Joseph Needham discusses the origins of iron-smelting technology in the Xinjiang region of China.

In Xinjiang, in the far northwest of modern China, some surprisingly early dates for iron have been published in recent years. Iron is found in graves which for the most part show no sign at all of Chinese influence and which have surprisingly early radiocarbon dates. The most important early iron artifact type appears to be a small knife....Archaeological material available...suggests that iron technology came to Xinjiang from the Chust culture of the Ferghana Valley, in modern Uzbekistan. Here iron appears at the beginning of the –1st millennium [BCE], and there is solid evidence of mutual influence between this culture and several cultures of southern Xinjiang.

Farther east, in the Russian Maritime Province, some scholars believe that the use of iron was much earlier, perhaps as early as the –12th century [BCE]. This claim seems to be based on a single radiocarbon date, and should therefore be treated with extreme caution until such a time as more solid evidence becomes available.

It seems reasonable to conclude that the technology of iron smelting came to Xinjiang from further west. Given the present state of Inner Eurasian archaeology, however, further speculation concerning the precise route by which this transmission took place would probably be unwise. On the other hand, transmission to the Central Plain from Xinjiang through Gansu seems uncontroversial.

Xixia

Xixia was a flourishing regional state in north-west China eventually destroyed by the Mongols. Before its downfall, Xixia was ruled by the Tanguts, a group of uncertain ethnic origin, although they were probably Sino-Tibetan.

Xixia (western Xia), named after an ancient Chinese dynastic name dating to 2100 BCE, existed in northwest China from the late tenth century until extinguished by the Mongols in 1227. The core population was composed of Tanguts, a culturally mixed group variously identified but most likely Sino-Tibetan, with many other elements present, including: the Altaic Tuoba, who had played a major role in northern China prior to the reunification of the Sui dynasty (581–618 CE); local Turkic speakers, in the Ordos; Chinese; and even a few Mongols. Considered the real founder of the state was Li Yixing (d. 967), whose surname was a gift for services rendered from the Tang (618–907 CE). He and his successors, ruling a small state—wedged at first between Khitan Liao Dynasty (960–1125) and Northern Song (960–1126), and later between the even more powerful Jurchen Jin dynasty (1125–1234) and Southern Song (1127–1279)—had to tread carefully to survive, taking full advantage of a remote position in the northwest surrounded by natural barriers and large, well-fortified cities in a relatively well-populated region. Nonetheless, thanks to a successful military, Xixia did survive and, by the eleventh century, occupied a substantial strip of territory, including the Ordos, the Alashan Desert, and the Gansu corridor, an area once well connected to China but, by the time of the Tang dynasty, heavily influenced by non-Chinese cultures. Contributing to Xixia’s survival was not only the power and skill of its military and leaders, but also its position as the third party in a balanced rivalry between the Chinese
north and south, one that was to persist for almost three hundred years. Neither the north nor the south was able to conquer the other and reunify China, and Xixia carefully positioned itself to upset the balance of forces at any one time, if one of its rivals grew too powerful.

**Mongol Invasions**

Xixia managed this quite successfully, and the end came for Xixia not due to an attack by one of its immediate rivals, but rather from an entirely new direction, the steppe, where the Mongol world had been united under the house of Chinggis Khan (often referred to as Genghis Khan, reigned 1206–1227). Even before his official rise, Chinggis Khan had sent some of his troops to raid Xixia domains in 1205. The raids continued until 1210, when, after a deep penetration to threaten the Xixia capital of Eriqaya (in what is now Ningxia Province), the then Xixia ruler, Li Anquan (reigned 1206–1211), agreed to submit to the Mongols. Making the Tangut position insecure was the Mongol acquisition of the realm of the White Tatar, or Ongud, positioned in the Ordos and inland toward Jurchen Jin domains and providing Mongol armies with easy access not only to the Jurchens themselves, but to Xixia. In any case, Xixia’s submission eased the Mongol military position by eliminating one potential enemy, on their left flank, allowing a concentration of forces to attack the Jin in a series of major advances between 1211 and 1214. In 1215, the Jin government abandoned much of its territory and fled to what was seen as more security south of the Huang (Yellow) River.

After the Mongols turned their attentions west, Xixia seemed secure, except that its government had gained

Members of a Tibetan minority traverse the hills once inhabited centuries ago by the Tanguts of the Xixia dynasty, a state that flourished in northwest China before being taken over by Mongols.
the enmity of Chinggis Khan by refusing to support his invasion of Turkistan. This invasion absorbed Mongol energies for a number of years thereafter, but on his return to Mongolia, Chinggis Khan began planning the complete subjugation and destruction of Xixia. After carefully mobilizing troops, the advance began in 1226, the Xixia strong points being reduced one after the other. By this time, the Mongols possessed a substantial siege train and substantial ability to reduce even the most heavily fortified cities. In the end, the last Xixia ruler, Li Xian (reigned 1226–1227), had no choice but to surrender his capital. The Mongols, enraged by his last-ditch resistance and by the death of Chinggis Khan probably weeks after the final Xixia submission, executed Li Xian and all of his family as well as large masses of his subjects.

Surviving Records of Xixia Culture

Despite the ferocity of the final war of conquest, and what seems to have been an intentional genocide, at least among the Tangut elite, the culture did survive, although the surviving Tanguts were not numerous enough to leave behind a recognizable society persisting until today. Some Tanguts were given to Mongol potentates as booty, and some Mongol groups may trace all or some of their origins back to them. Others were drafted into Mongol service and served in civil and even military capacities. Also surviving, for a short time at least, was the complex Tangut script. This script, based on Chinese characters but lacking their pictographic basis, provided a large number of complex symbols to write Tangut words, without any of the visual clues associated with the Chinese script. Long unreadable, this script is slowly being deciphered, and along with it, the Tangut language, but this work is still far from completion, and it will be decades before the existing corpus of documents can be understood to its fullest. Of course, Chinese was also in use in Tangut domains, and much of what we know about Xixia history comes from Chinese sources, principally those written by Xixia enemies.

The Tanguts, as far as can be determined, were devout Buddhists, and a good deal of their surviving literature, mostly manuscript fragments, but some nearly complete texts as well, is composed of Buddhist literature. Texts are not always the same as those circulating under the same names elsewhere, a fact having an adverse impact on reading them as Rosetta stones to decipher Tangut. Because of its Buddhism, Xixia maintained active connections with other Buddhist cultures, including with Tibetans, who established direct connections with Xixia from an early date and later used the Tangut domains as a jumping off point for converting Mongols.

XU Beihong
Xú Bēihóng 徐悲鴻
1895–1953 Artist and educator

Xu Beihong was an important figure in introducing Western ideas to modern Chinese painting. He trained and exhibited in Europe, and held important teaching posts in China. Xu’s work combined traditional Chinese heroic subjects with Western realism. He is best known for his monochrome ink paintings of galloping horses, which integrated Chinese brushwork with Western foreshortening and realism.

Xu Beihong was born in Yixing, Jiangsu Province. His father, a farmer and self-taught artist, was also Xu’s first teacher. Xu showed talent at an early age—he and his father made their livings as itinerant portrait painters—and at the age of seventeen he began to teach painting at a local school. In May 1917 Xu received financial support to study abroad in Tokyo. He returned at the end of the year and was given a position at the Society for the Study of Painting Technique at Beijing University by Cai Yuanpei (1868–1940), who was a strong advocate of the New Culture Movement that sought to rejuvenate China’s arts.

In 1919 Xu left to study art in Paris on a government scholarship at the École Nationale Supérieure des Beaux-Arts, where he also participated in salon exhibitions. In 1920 he met and studied under the French realist painter Pascal-Adolphe-Jean Dagnan-Bouveret (1852–1929), a strong antimodernist known for his meticulous attention

In his masterful paintings of galloping horses, Xu Beihong used principles of foreshortening introduced from Western art. PHOTO BY JOAN LEBOLD COHEN.
Xu Beihong returned to China in 1927 and taught at the Nanguo Art College before being appointed by Cai Yuanpei as the head of the art department of National Central University. He began painting his large canvases of heroic and patriotic subjects that united Chinese brushwork and themes with Western realism. At this time he began working with the horse as subject, first seen in *Jiujiang Gao* of 1930. This would lead to the large work, *Galloping Horse* (1941), a theme he used for the rest of his life and for which he became internationally known. Xu Beihong continued to exhibit in solo shows and group exhibitions. In 1933 he organized a successful exhibition of Chinese painting that traveled throughout Europe and the Soviet Union. After 1949 Xu Beihong was named president of the Central Academy of Fine Arts and president of the Chinese Association of Workers in the Arts. In 1951 a stroke paralyzed him, and he died in 1953. In 1954 the Xu Beihong Memorial House was established at his residence in Beijing.

In the end Xu Beihong’s importance lies not in his abilities as a painter but rather in his dedication and passion as an art educator. His interest in European academic realism and firm belief that strong technique and discipline are the necessary foundations for a painter shaped generations of Chinese artists in the twentieth century.

XU Guangqi

Xú Guāngqǐ 徐光启

1562–1633  Official and scholar

Xu Guangqi, with missionary Matteo Ricci, translated Western texts into Chinese during the Ming dynasty. Their translation of Euclid’s *Elements* exerted great influence on Chinese mathematics. Xu became a high official in the Ming court.

Xu Guangqi (1562–1633), born in Shanghai, was baptized by Italian Jesuit missionary Matteo Ricci in 1603, taking the name “Paul.” For the next three years Xu and Ricci collaborated in translating Western texts on astronomy, mathematics, and geography into Chinese. Their most famous translation was the Greek geometer Euclid’s *Elements*, which exerted a great influence on Chinese mathematics. Xu also wrote original works on trigonometry and agriculture, most notably the *Book of Agriculture*, which advocated the adoption of Western agricultural practices such as mapping, surveying, and irrigation. His interest in practical subjects was a departure from the dominance of neo-Confucian thought. After Xu became a high official in the Ming dynasty (1368–1644) court, he sponsored the Jesuit missionaries in China.

Xu believed that Western scholarship, particularly geometry, could complement Confucianism and replace Buddhism by undermining the tendency toward vague speculation. In 1629 Xu demonstrated the use of Western science in predicting solar eclipses and other astrological events. When the Manchus invaded China in 1630, Xu

The Italian Jesuit Matteo Ricci (left) and the Chinese mathematician Xu Guangqi (right) in an image from Athanasius Kircher’s *China Illustrata*, published in 1667. The Chinese edition of Euclid’s *Elements* (幾何原本) was printed in 1607.
Xu Guangqi’s “Preface” to the Chinese translations of Euclid’s Elements

During the times of the Tang and Yu there already were Xi and He who took care of the calendar, as well as the Minister of Works, the Minister of Agriculture, the Forester, and the Director of Ritual Music—if those five Offices would have been deprived of Measures and Numbers, it would have been impossible to fulfill their tasks. Mathematics is one of the Six Arts mentioned in the Offices of Zhou, and the (other) five could not have led to any results without the use of Measures and Numbers . . . Therefore I have said that far back, during the period of the Three Dynasties, those who applied themselves to this calling were immersed in a rock-solid tradition of learning that was passed on from master to pupil—but that has in the end perished in the flames of the Ancestral Dragon. Since the Han dynasty there have been many who haphazardly groped to find their way, like a blind man aiming at a target, vainly shooting in the air without effect; others followed their own judgments, based on outward appearances, like one who lights up an elephant with a candle, and, by the time he gets hold of its head has lost sight of its tail. That in our days the Way has completely disappeared, was that not unavoidable?! The Jihe Yuanben is the Ancestor of Measure and Numbers it is that by which one exhausts all the aspects of the square, the round, the plane, and the straight, and by which one completely covers the use of compasses, carpenter’s square, water-level and measuring rope . . . Starting from what is clearly perceptible, [this work] penetrates into what is most subtle; from what is doubtful certainly is obtained. Is not that utility of what is useless, the basis of all what is useful?! In truth it can be called “the pleasure-garden of the myriad forms, the Erudite Ocean of the Hundred Schools [of philosophy].” Although it actually has not yet been completed, yet, with it as a reference, it is already possible to discuss the other books . . .

XU Haifeng
Xǔ Hǎifēng 许海峰
b. 1957 Olympic sharpshooter and coach

Xu Haifeng was the first athlete to win an Olympic gold medal for the People’s Republic of China. After retiring from his career as a champion sharpshooter, during which he won a number of golds in international competition, Xu went on to become a dedicated coach.

In taking the first gold medal of the 1984 Summer Olympics in Los Angeles with a steely performance, sharpshooter Xu Haifeng also became a Chinese icon. He was not simply a winner, but the first winner of gold for his country since its return to the Olympic Games after a thirty-two-year absence due to controversy over the recognition of Taiwan. Hailed as a national hero upon his return for his timely victory in a sport demanding discipline and concentration, he went on to win many more titles and then to mentor younger champions, earning recognition not only as a top-tier athlete but also as a coach with a golden touch.

Xu was an unlikely Olympic hero; he’d been training in the sport for just two years, becoming a champion sharpshooter in Anhui Province in 1982 and winning his first national title in 1983. His only previous formal experience at shooting consisted of a week of military training in high school—although he reputedly was a crack shot with a slingshot during his childhood in Fujian Province.

Before joining the national shooting team (which was coached by Xu’s former high school teacher), Xu had been farming and selling chemical fertilizer in rural Anhui Province. Xu went to Los Angeles as the rookie on a team of six, expecting merely “to take part,” he later said. In the pistol events, attention gradually shifted from the Swedish world champion, Ragnar Skanaker, to the focused young man from China. Xu’s victory in the 50-meter free pistol shooting final, at age twenty-seven, changed his life.

Juan Antonio Samaranch, then president of the International Olympic Committee, called the occasion “a great day for China’s sports.” The absence of strong contenders from Eastern Europe due to the Eastern Bloc’s boycott of the Los Angeles Games certainly worked to the advantage of unknowns like Xu, but his win was no fluke, and he went on to prove his mettle in subsequent world competitions. In 1988, he won a bronze medal at the Summer Olympics in Seoul. Other wins accumulated over the years, including three golds at the 1986 Asian Games in Seoul, four golds at the 1990 Asian Games in Beijing, and five golds at the Seventh Asian Championships in 1991.

Xu Haifeng’s Los Angeles feat was commemorated in a Chinese television play, Shots over Prada—a reference to the name of the city’s Olympic shooting range. He donated that first Olympic gold medal to China’s National Museum. Retiring from competition in 1994, Xu became the coach of the Chinese national women’s shooting team; one of his charges, Li Duihong, won a gold in Atlanta in 1996, and another, Tao Luna, took a gold in Sydney in 2000. He was head coach of the shooting team at the Athens Games in 2004, which won golds in three men’s events and one women’s event. In anticipation of the 2008 Beijing Summer Games, Xu took over supervision of China’s modern pentathlon team. When the Games opened, Xu was listed as deputy team leader for pentathlon, at which Chinese
came in fifth and tenth among the women and fourth for the men—noteworthy in this European-dominated event. Xu’s most prominent role at the 2008 Olympics, however, was his appearance in the main stadium during the opening ceremony, carrying the Olympic torch as it neared the end of its journey from Athens.

China’s State Sports Commission awarded Xu a National Sports Medal of Honor in 1984, and he was named one of the nation’s top ten athletes twice, in 1984 and 1986. Newsweek magazine’s assertion that, “Posterity will forget that a Chinese fertilizer salesman won the first gold medal of the 1984 Summer Games” was wrong: A quarter century since the event that catapulted him to fame, Xu Haifeng remains a household name in China.

Further Reading

XU Zhimo was a modernist poet who actively sought to break Chinese poetry from its traditional roots and align it to Western poetic models, especially those found in the Romantic poets.

Xu Zhimo, the poet renowned for introducing Western poetic forms and techniques that allowed tradition-bound Chinese verse to acquire a freer form of expression, was born in the town of Xiashi, Sichuan Province, 15 January 1895. Xu was a precocious child who showed at an early age a delight in nature, a delight that would continue to hold sway in his poetry. His early education was in Hanzhou Secondary School, where he met and befriended Yu Da Fu, the future story writer and poet.

Shortly after graduating at the age of twenty in 1915, Xu entered an arranged marriage, according to the dictates of traditional Chinese society. His bride was Zhang Youyi. But the marriage was a failure from the outset, and, perhaps to escape it, Xu enrolled in Tianjin University, where he soon came under the influence of the reformer Liang Qichao, who encouraged Xu to continue his education in the West. Xu applied to Clark University in Worcester, Massachusetts, to study history and came to the United States in 1918. The next year he transferred to Columbia University, where he took up the study of economics. Before long, he came to feel that the United States was a place where he could not obtain the type of education that he wished to receive. He left for Great Britain in 1920, where he was accepted into the London School of Economics. Eventually he would enter Cambridge University, which at last suited his sensibilities, for it was there that he discovered the works of the English Romantics, as well as the French Symbolists. Xu felt an immediate affinity for their work.
His Cambridge years can be termed his transformative years, for he not only discovered a form of poetry to which he felt an innate attraction but also met and fell in love with Lin Huiyin, who was only sixteen at the time and a student at Saint Mary’s College in London. He quickly obtained a divorce from his wife so he could marry Lin. It was an effort in vain, however. Lin returned to China with her father in 1922. Distraught at the outcome of events, Xu also headed back home and tried to find Lin. But she had already married Liang Sicheng. Thereafter Xu devoted himself entirely to poetry and worked intensely to change Chinese poetry radically by aligning it with Western traditions.

His first collection, titled simply Zhimo’s Poems, appeared in 1925. The poems were heavily influenced by the English Romantics, especially Keats, Shelley, and Wordsworth. Xu soon befriended like-minded poets, also Western educated, such as Wen Yiduo, and became the founding member of the Crescent Moon Society, which was established in 1927. The society published the influential journal Xinyue (Crescent Moon). Xu’s next collections, A Night in Florence (1927), Fierce Tiger (1928), and Love’s Inspiration (1930) showed a further refinement of expression in which the Western elements become more thoroughly blended with his own sensibilities. The larger intention of his poetry was to reject the tradition-bound morality of old China so that a new China might be born, one in which the ideas of Western enlightenment would pervade. Xu’s poetic experimentations were tragically cut short when he died in an airplane crash on 19 November 1931.

Xuanzang

Xuánzàng 玄藏

602–664  Buddhist monk-scholar, pilgrim, translator

Xuanzang of the Tang dynasty was one of the most influential figures in the history of Chinese Buddhism. He is best known for his sixteen-year pilgrimage to India in search of the true Buddhist teachings, from which he brought back hundreds of scriptures. Xuanzang and his chief disciple, Kuiji, founded the Faxiang (Characteristics of the Dharmas) school.

Xuanzang 玄藏 was a Buddhist monk-scholar, pilgrim, and translator in the early Tang 唐 dynasty (618–907 CE). He traveled to India in search of the true dharma (divine law) and brought back with him hundreds of Buddhist texts. In addition to translating and commenting on the texts, he wrote Record of the Western Regions during the Great Tang (Datang xiyu ji) about his sixteen-year journey to India. His biography can be found in Zanning’s (919–1001) Song [Compiled] Biographies of Eminent Monks (Song gaoseng zhuan). He and his chief disciple, Kuiji 寂 基 (632–682), founded the Faxiang 法相 (Characteristics of the Dharmas) school, a Chinese version of the Indian Yogâcâra (Consciousness-only) school of thought.

Xuanzang, surnamed Chen (known as “Chen Yi”), was a native of Henan Province. His family for generations produced erudite Confucian scholar-officials. He was the youngest of four children. After the death of his father in 611, Xuanzang, under the influence of his elder brother, a Buddhist monk, joined the monastery at the age of thirteen. He became a fully ordained monk in 622.

Troubled by the discrepancies and contradictions in the Chinese translations of scriptures, he began to learn Sanskrit and decided to go to India to study Buddhism.

Xuanzang sneaked out of the Tang capital of Chang’an in 629 after the imperial court refused his petition to travel westward. He crossed the Gobi Desert and took the Silk Roads route via central Asia to India. Having endured numerous hardships and escaped from life-threatening
dangers, he eventually arrived in India, where he studied with many renowned masters and visited important Buddhist centers.

Xuanzang returned to Chang’an in 645. This time he received a warm welcome from the Tang imperial court. He declined the emperor’s offer of an official position, however; instead, assisted by a group of well-trained Buddhist scholars and linguistic experts, he spent the rest of his lifetime translating the texts that he had brought back from India.

Xuanzang is said to have brought back 657 items in 520 cases, and he himself translated 73 items in 1330 fascicles (divisions of a book published in parts) of scriptures into Chinese. His scholarly efforts not only made a great number of Mahayana scriptures and treatises available in Chinese but also contributed significantly to the Chinese understanding of Indian Buddhist doctrines and philosophies.

Xuanzang and his disciple, Kuiji, founded the Faxiang school on the basis of the Yogacara theory of the mind. It teaches that so-called reality is simply a result of how the mind functions; in particular, the storehouse consciousness (Sanskrit: Álayavijñāna) is the repository of all the mental projections and perceptions. Although the Faxiang school soon died out in China, it had a profound impact on Chinese Huayan and Chan Buddhism.

Xuanzang’s Record of the Western Regions during the Great Tang, completed in 646, has become a valuable
primary source of information about medieval central Asia and India. Based on Xuanzang’s pilgrimage, Wu Cheng’en (1500–1582) of the Ming dynasty (1368–1644) wrote the novel *Journey to the West*, which is one of the most popular classics in Chinese literature.

Painting of the traveling monk Xuanzang by a Japanese artist of the Kamakura period (fourteenth century).
Xunzi

Xúnzǐ 荀子

C. 300–230 BCE  philosopher

A key figure in Chinese philosophy, Xunzi is best known for his critique of Mencius’ concept of the essential goodness of humankind and for moving beyond Confucian ideals. For Xunzi, a rigid hierarchical social structure constrained by tradition, moral education, and threat of punishment is the necessary antidote for the naturally evil tendencies of humanity.

Xunzi is both the name of one of the most important Confucian thinkers and also the name of the book containing his teachings and his writings as compiled over the years. The significance of Xunzi, the man, lies in his thorough critique of Mencius, who upheld the basic and innate goodness of human beings. For Xunzi, there was little to laud in humankind; he held humankind to be inherently evil and therefore untrustworthy if not constrained by tradition, strict guidance, and the looming threat of punishment.

Very few details of Xunzi’s life are known. He lived during the Warring States Period (475–221 BCE), and he received his education in the city-state of Qi sometime in the third century BCE, after which he served in various courtly positions; he is thought to have died not long after the year 238 BCE.

Although Xunzi’s philosophy is thoroughly grounded in Confucianism, in so much as it recognizes the need for ritual and duty as taught by the sages of the past, it also seeks to fill an inherent insufficiency in the ideas of Confucius and Mencius concerning the human condition. Confucius is ambivalent; he states that there are people who are not interested in participating in the Way (the path to betterment, both of the self and the world), and such people are led into deeds of immorality. Mencius holds to the essential goodness of all people, who are only betrayed into immorality by a corrupted society. For Xunzi, both views are, at best, partial definitions of what constitutes the social makeup of the individual. If some people are not interested in following the Way, then the method of leading them is at fault because it abandons precisely those people that should be helped. Further, the Way becomes selective, picking and choosing who may follow and who may not, thereby becoming arbitrary. And if all people are inherently good, then there would not be any need for laws to govern people. But this is nowhere evident in human society; all people abide by rules and laws. This leads Xunzi to observe that human nature is evil and must be continually taught to become good, even if provisionally; the evidence for this evil is found in the manifestation of desire. People, if unchecked by regulations and prohibitions, would live solely to satisfy their desires, no matter what the cost to those around them or to society, and even the world. Hence the need for government, leaders, religion, rituals, rules and laws, all of which work in concert to retrain the natural, and therefore destructive, human tendencies. For this reason that which has been established by the ancient sages must be dutifully followed because such precepts have been put in place in order to guide the individual into correct social behavior. And these rules have been put in place by those who know better, namely, the ancient sages.
Traditions become important for Xunzi because he sees them as examples of the good which people must emulate; and this is the educational worth of tradition and ritual. Human beings need to follow examples; they need to see how they must behave and act in a moral fashion. This pedagogical turn in Xunzi’s philosophy points to a rather precise definition of people’s social behavior; they need good leaders. And just as examples educate men and women, so also must they be led by rulers who are learned in tradition, and therefore wise, who can explain to people the need for moral action. For Xunzi, a learned person is one that is fully adept in the tradition, so that he or she can teach those that need to be taught. And here Xunzi makes an important concession: people are inherently evil, but they have the capacity to be taught to be good and morally upright.

Thus, one of the central concepts for Xunzi is the need for education, which must continue until a person dies. Learning is not a natural process; it is not like taste or hearing, which one is born with; it is a very much an artificial process, and therefore a very human one. Learning does not lead to natural growth; rather, it leads to social and therefore moral growth. The ideal education for Xunzi consists of studying the canon, that is, books of poetry and history, as well as books dealing with rituals and observances; and he advocates the learning of music, which educates through inspiration and by providing evidence of harmony, order, and structure. And here the role of the wise teacher becomes much more essential; one cannot learn good music from a bad teacher. Only a wise teacher can lead one into the perfection that music demands.

Despite his insistence that the lowliest person from the street can be educated into wisdom, Xunzi does not abandon the need for punishment. Drawing upon the Confucian understanding that humans need to be continually perfected, Xunzi understands that this always brings about a fundamental division in society: the rulers and the ruled. Given this ongoing difference between people living within the same social structure, there must be the means available to the rulers to maintain order and negate chaos. Because human beings are forever seeking to fulfill their desires, they must be constrained by the threat of punishment, lest they willfully overthrow the fundamental structure of society, namely, its hierarchy. For Xunzi it is the structure of society that allows it to function harmoniously; and people need to be guided into being good, first through education, and then, failing that, through punishment.

One of the central shortcomings of Xunzi’s ideas is his inability to identify the role of practical reason. He does not delve into how the sages of long ago came up with traditions and rituals. What criteria of judgment did they use to say this ritual was good and that was not good? The question of individual judgment is indeed entirely lacking. In addition, he cannot explain why the sages were led to seek out morality, social order, and harmony, when they, like the rest of humanity, shared in an inherently evil nature. Why would they abandon their natural instincts to forever fulfill their desires and seek to impose restrictions upon themselves and upon others? In short, Xunzi does not explain what gives him the authority to understand human nature in the way that he does. Nor does he clarify why he holds his solution of education and punishment as being proper and good.

The importance of Xunzi lies in his ability to present Confucianism as the very best possible way of living a moral life—both for the individual and for society. The moral life may only be acquired, he maintains, through a moral education, which is a lifelong endeavor, for it is...
morality that ultimately refines the individual and makes of him or her a civilized human being.

Planning for the post–World War II world, Winston Churchill, Joseph Stalin, and Franklin Roosevelt met at Yalta, a resort town in the Ukraine, in 1945. The agreement restored imperialist privileges in Manchuria that Russia had enjoyed in the early 1900s. In exchange the Soviets signed a treaty of friendship with Chiang Kai-shek and entered the war against Japan.

At the February 1945 conference held in Yalta, a resort town in the Ukraine, British prime minister Winston Churchill, Soviet leader Joseph Stalin, and U.S. president Franklin Roosevelt sought to plan for the defeat of Germany and Japan and to shape the post–World War II world. The results of the conference proved that China was not going to be one of great powers of the postwar era. China was not represented at the conference, and Chiang Kai-shek, leader of the Nationalist (Guomindang) government, was informed of the Yalta Agreement by the United States only after the conference’s conclusion.

The final agreement concerning China, published 13 February 1945, declared that “The commercial port of Dairen shall be internationalized, the pre-eminent interests of the Soviet Union shall be safeguarded and that China shall retain sovereignty in Manchuria” (Tucker et al. 1738). These terms essentially restored the imperialist privileges in Manchuria that Russia had enjoyed immediately prior to the Russo-Japanese War of 1904–1905. In exchange the Soviets signed a treaty of friendship and alliance with Chiang’s government and entered the war against Japan in August 1945. The Yalta Agreement also contained plans for the disposition of other territories occupied by the Japanese, such as the temporary division of Korea.

Roosevelt hoped that tying the Soviets to the Nationalist regime would solidify two postwar relationships: cordial ties between Washington and Moscow and a coalition government in China led by the Nationalists with Communist participation. Under U.S. pressure Chiang grudgingly accepted the agreement, which he hoped would drive a wedge between Stalin and Mao Zedong’s Chinese Communist Party. Mao’s forces, at their own base at Yan’an in north-central China, had a shaky truce (often called the “Second United Front”) with Chiang’s Nationalist government during the War of Resistance against Japan. Few expected the truce to last after Japan’s surrender. Stalin’s actions, however, seemed to belie claims of Communist solidarity and illustrated his ambivalence toward the Chinese Communists.

The Yalta framework did not last to the end of the decade. The short-lived alliance between the Soviet Union and Nationalist China could not save Chiang’s regime or deter Stalin from supporting the Communists.
Soviets fulfilled their promise to withdraw from Manchuria in 1946, but they stripped the region of its industry and left behind Japanese weapons to assist the Communists. By early 1947 civil war began anew, and by 1948 the Nationalists were collapsing. Stalin threw his support behind Mao as it became evident who would win the civil war. The dream of Soviet-U.S. cooperation or a coalition government in China was dead.

Chiang would point to Yalta as an example of U.S. naiveté about Communist machinations. Within the United States Yalta became part of a heated debate over “who lost China” and a rallying cry for conservative supporters of Chiang’s regime, which had retreated to Taiwan. In fact, both Mao and Chiang were bitter that the United States and Soviet Union attempted to define the international order of northeast Asia with little attention to Chinese interests—or sovereignty.

YAN Zhenqing

Yán Zhēnqīng 颜真卿

709–785 CE  Court scholar and calligrapher

Yan Zhenqing was a court scholar and calligrapher of the Tang dynasty (618–907 CE). He was imprisoned and strangled to death during a rebellion.

Yan Zhenqing, also known as “Yan Qingchen,” lived in Shandong Province until he relocated to Xi’an in Shaanxi Province. His parents were descendants of clans whose members either held important official positions in court or were renowned scholars. For example, Yan Zhitui (531–c. 590 CE) was the author of *Home Instructions of the Yan Family* (*Yanshi Jiasun*). Yan Shigu (581–645 CE), Yan Zhenqing’s grandfather, was a famous calligrapher and historian during the end of the Sui dynasty (581–618 CE). Yan’s maternal grandfather, Yin Zhongrong, also skilled in calligraphy, was the head secretary to Empress Wu (624–705 CE).

Yan had a difficult childhood because his father passed away when Yan was only three years old. Working hard, he passed the civil exam and became a scholar (*jinshi*) in 734. In that year he was married to the daughter of a prince. Even with these advantages, Yan’s career in politics was tumultuous. Being a man of integrity and loyalty, Yan was constantly a target for his opponents in court. Every time Yan emerged from a conspiracy or slander, he was either demoted or transferred. According to historical records, Yan was instrumental in pacifying the An Lu Shan Rebellion in 755. Again, when the court faced another rebellion in 783, Yan volunteered to go into enemy territory to negotiate with the head rebel, Li Xilie, who incarcerated Yan when he refused to surrender. Li, on the verge of defeat by the Tang dynasty (618–907 CE) army, ordered a eunuch to strangle Yan to death. He was seventy-six.

Yan Zhenqing’s other love was calligraphy. When he was too poor to buy ink and brushes, he used a broom to write on the wall with yellow dirt. Beginning in 743 Yan deemed Zhang Xu (flourished 713–740), “the saint of cursive calligraphy,” as his teacher.

Another calligrapher, the monk Huaisu (737–798), was also Yan’s ally in calligraphy. Yan’s calligraphic achievements began rather late, around the age of sixty. His journey to artistic success can be divided into three stages: (1) the early stage before Yan was fifty, (2) the blooming...
stage of running and cursive (xing and cao) scripts before he was sixty, and (3) the final stage when his standard script (kai) reached full maturity. Famous cursive scripts done by Yan include “Begging for Rice Note” (764), “Mourning over My Nephew” (758), and “Fighting for a Seat Note” (764). After age sixty Yan became attracted to the standard script, which he wrote on big pieces of flat stone that were later engraved. “Ancestral Temple of the Guo Family Tablet,” done at age fifty-six, and “The Tablet of Songjing,” done at age sixty-four, were some of his prime examples in the standard script.

Yan’s unadorned calligraphic style breaks up the glamorous and formal style of the two Wangs (Wang Xizhi, 303–379 CE, and Wang Xianzhi, 344–388 CE) from the Jin dynasty (265–420 CE). (The Jin dynasty is a brief period during the North and South Dynasties in China.) His writings reflect the character of an honorable man who was righteous and magnanimous but true and simple. The imperfection and simplicity found in his works somehow manifest a form of aesthetics.

Yan’an Rectification Campaign
Yan’an Rectification Campaign

The Yan’an Rectification Campaign of 1942 established the *modus operandi* of subsequent ideological campaigns in the history of Chinese Communism. It signified the expansion of the power of the Communist leaders from political and economic realms into other spheres of life, with the result that no alternative bases existed from which political authorities could be challenged.

The Yan’an Rectification Campaign 延安整风运动 of 1942 was a significant event in the history of the Chinese Communist Party (CCP). The campaign’s success in quashing the first serious challenge to CCP leader Mao Zedong’s commanding position within the party, gradually acquired during the Long March, made it a prototype of later ideological campaigns; it also showed the aggressive reach of the CCP into intellectual life in Yan’an, a city in Shaanxi Province. No longer content to manage only political and economic affairs, CCP leaders would regard as their prerogative the total subjugation of literature and art to politics from this point on. As such, the campaign was a mass movement of a kind hitherto unseen in the history of the CCP, affecting not only the top echelon of the party’s leadership but also the lives of people from other social strata in Yan’an.

**Targets**

The late 1930s and early 1940s brought a fundamental change in CCP membership as more and more people...
from various places arrived in Yan’an, the last stronghold of Communism in China at the time. Unlike those who had endured the hardships of the Long March, many of the new arrivals were perhaps more anti-Japanese or anti-Guomindang (Nationalist Party) than pro-Communist. Moreover, coming mostly from cosmopolitan urban centers, they had an outlook quite at odds with the nativist bent of Mao’s brand of Communism, making it difficult for the party to maintain its iron discipline.

In a speech delivered on 1 February 1942, at the Central Party School at Yan’an, Mao highlighted three errors that he called upon “the masses” to correct: subjectivism, sectarianism, and party formalism. The scope of the Rectification Campaign at this stage was still rather limited, aimed as it was only at the general working style of party cadres. But when Mao’s call triggered vociferous complaints from students disgruntled with life in Yan’an, the nature of the campaign began to change. A number of prominent writers associated with the Jiefang Ribao (Liberation Daily) saw an opportunity to voice criticism of the party leadership, utilizing a form of intellectual essay called the zawen to highlight instances of inequality that exposed the party’s hypocrisy and pointedly questioning the legitimacy of the party to assume leadership in areas other than politics. Wang Shiwei, who would later become the prime target of the campaign, was particularly outspoken in asserting the role of writers and artists as social critics free from party interference. As these events unfolded, it became clear to party leaders that the campaign would have to rein in this group of wayward intellectuals and neutralize their destabilizing influence.

Modus Operandi

To lay down the ideological groundwork for the expanded scope of the Rectification Campaign, the party confronted head-on the question of art and literature in a socialist society. Mao’s keynote speech on 2 May, the first day of the Yan’an Forum on Literature and Art, served this purpose. Mao argued that literature and art transcending time and class did not exist and hence that the notion that the artist could be an objective critic of society was a myth. It behooved artists and writers to ally their interests with those of the workers, farmers, and soldiers under the guidance of the CCP, Mao asserted. Any public criticism of the party at this stage would be regarded as an act of betrayal of the larger cause of Communism and tantamount to heresies such as Trotskyism, with which Wang Shiwei was indeed later charged.

The campaign then moved to the next stage of bringing intellectuals to heel, proceeding through a number of phases that would be replicated in subsequent ideological struggles. First, a negative example was established, in this case, Wang Shiwei and people thought to be associated with him. Second, gentle pressure was applied on this group by means of private visits from leaders and friends to persuade them of the error of their ways. When this pressure failed to produce the desired results, public meetings were held at which Wang was put under hostile cross-examination. At the same time people throughout Yan’an society were instructed to study key Communist texts and documents related to Wang’s case so that they could participate in the denunciation of Wang. Transcripts of these public meetings, called “struggle sessions,” clearly indicate a willful distortion of Wang’s position by the CCP. Despite claims of fairness, the proceedings often degenerated into name calling and other forms of intimidation. Most of Wang’s associates, notably Ding Ling and Liu Xuewei, recanted at this point, but Wang remained intransigent, going so far as to threaten to withdraw from the party. Finally, trumped-up charges were brought against him for belonging to the Five-Member Anti-Party Clique, and what had begun as an ideological disagreement then turned into a punishable crime, and Wang was arrested. The goal of the campaign had been achieved at this point, even though it would be extended and would evolve into other political movements in 1943. Wang was executed in 1947 under circumstances that remain unclear to this day.

Repercussions

The Yan’an Rectification Campaign was one of the most successful attempts of the CCP to induce conformity among its ranks. The same strategies that were employed in bringing intellectuals to submission, especially the clever deployment of “the masses” against the target of the campaign, would be applied to nonparty members in later years as well and often in more thorough and violent ways.

The success of the campaign also marked an important ideological victory for Mao. With the suppression
of cosmopolitan elements in the party, Mao was able to continue with his project of “making Marxism concretely Chinese.” After the CCP’s role as the sole arbiter of what was right and wrong in all spheres of society was established, no alternative bases from which its authority could be challenged existed.

Further Reading

Yang Zhu is believed to have been a hermit philosopher who advocated the importance of self-esteem and self-protection. Because his teachings countered the common call for self-sacrifice, his ideas were misrepresented and criticized by others, especially the Confucian scholar, Mencius.

Discerning who Yang Zhu was or what his philosophy advocated is difficult because no documents that he authored have survived. Scholars date Yang Zhu’s life based on a passage in the Collection of Stories (Shuoyuan) by Liu Xiang (79–8 BCE), which claims that Yang had an audience with King Hui of Liang (370–319 BCE). The Annals of Lü Buwei (c. 238 BCE) state that Yang Zhu valued the self. Yang’s philosophy was well known because the Chinese philosopher Mencius (Mengzi, flourished 371–289 BCE) claimed that the teaching of Yang Zhu and Mo Di (flourished 479–438 BCE) were popular during his time. Mencius distorted and simplified Yang’s teachings, declaring that Yang would not remove one hair from his shin if he could benefit the people of the empire by doing so.

Because of the vagueness of the classical Chinese language, it is not clear whether Yang was an egoist and valued only his own person, or if he taught that each person should esteem himself. An egoist would not advocate that others should be egoists because that would not help the egoist benefit himself. Yang Zhu was not an egoist because he taught that all people should value and protect their own lives. A Daoist text, the Liezi (c. 300 CE), contains a chapter entitled “Yang Zhu,” which advocates seeking pleasure. It contains a reasonable explanation for why Yang Zhu would not pluck out a hair to benefit the empire because one hair will not be sufficient. One hair will lead to a pound of flesh, leading to a limb, then one’s life, and finally others’ lives. Someone who values life will not take this path. The eclectic Daoist text, the Huainanzi (c. 140 BCE), outlines three basic teachings of Yang’s philosophy: keeping a person’s human nature intact, protecting a person’s genuineness, and not allowing the body to become attached to material things. This individualistic, protect-your-life thinking began in the Spring and Autumn period (770–476 BCE) among hermits and recluses who withdrew from the dangers of public life, becoming popular during the Warring States period (475–221 BCE) for practical reasons. Through history it serves as a reminder that a person must keep the body intact to live a fulfilling life. Yang disagrees with the majority of ancient Chinese philosophies that call on the individual to sacrifice, even die, for the greater good. Five chapters in The Annals of Lü Buwei promote Yang’s philosophy. In that book Yang’s self-preservation approach is offered to the ruler for his own protection; it is not for the common people because they must be willing to die for the ruler. In the Daoist text, the Zhuangzi, at least four chapters advocate Yang’s philosophy. In the Zhuangzi Yang’s teachings are used to persuade any person from any social status to realize that self-preservation is the utmost principle.
Yangist Thought

Although the philosophies of Yang Zhu are often disputed and unclear, a few accounts do exist of his teaching and thought. In The Construction of Space in China the historian Mark Lewis discusses a passage from the Liezi that briefly captures Yang’s theory on the central role of the body.

The clearest demonstrations of the central role of the body in Yangist thought are assertions of the absurdity of exchanging bodily parts for external objects. One example of this, or rather a parody of it, was the passage from the Mencius... in which the willingness to sacrifice bodily hairs distinguished rival philosophical traditions. A more elaborate version couched in terms favorable to the Yangist teachings appears in the fourth-century A.D. Liezi:

Qin Guli asked Yang Zhu, “If you could save the whole world by giving up one hair, would you do it?” Master Yang replied, “The world could certainly not be saved by one hair.” Master Qin said, “If it would be saved, would you do it?” Master Qin went out and spoke to Mengsun Yang. Mengsun Yang said, “You have not understood Master Yang’s thoughts. Let me say them. If you could gain ten thousand in gold by having some of your skin peeled off, would you do it?” “I would.” “If you could obtain a state by having one limb cut off at a joint, would you do it?” Master Qin remained silent for a while. Mengsun Yang said, “A hair is less than some skin, and some skin is less than a limb. This is plain. But if you accumulate individual hairs it forms a patch of skin and if you accumulate skin if forms a limb. Even one hair is certainly a tiny part of the body, so how could you treat it lightly?”

The relation between body and things is worked out in a set of hypothetical exchanges that mark the higher value of the former.

Yangge

A style of folk song and dance from northern China, yangge developed into theater (yangge xi) and was adapted by artists of the Chinese Communist Party (CCP) to create a new and revolutionary form of art.

The term yangge literally means “rice-seedlings song,” suggesting its derivation from peasants’ harvest labor. As early as the twelfth or thirteenth centuries, monks or rural laborers of various kinds put on small-scale musical performances for the amusement of villagers. Over the course of time, these developed into communal song-and-dance shows and, by the eighteenth century, into small-scale folk dramas (yangge xi) with two or three performers, usually a female character (dan) and clown (chou), and sometimes a male character (sheng) also.

Performed from the Spring Festival (Chinese New Year, the first day of the first month in the lunar calendar) until the Lantern Festival (the fifteenth day of the first month), the plays were always associated with religious rituals, which is typical of rural regional theater. The structure consisted of three parts, with song-and-dance performances surrounding a light, comic play. The content reflected rural life, and a favorite theme was courtship among young people. These were sometimes offensive to authorities bent on preserving conservative social norms: Yangge usually showed young people themselves, not their parents, choosing their spouses, and the plays were often quite bawdy and sometimes pornographic.

Yangge and the CCP

From the end of 1942 until 1946 (and beyond), the CCP, then headquartered in Yan’an in northern Shaanxi Province,
sponsored its New Yangge Movement, which was a mass effort based on the local indigenous art form. Mao Zedong’s “Talks at the Yan’an Forum on Literature and Art” of May 1942 were a major spark for using this folk art as propaganda for the revolutionary and anti-Japanese cause.

The CCP censored and politicized the yangge performances. They secularized the social context, sponsoring their own troupes and performance sites, though they did not prevent folk troupes from visiting temples. They forbade the more explicit sexual material and created their own plays to reflect the CCP’s ideology. The most famous example, Brother and Sister Clear Wasteland (Xiongmei kaihuang), premiered in the spring of 1943 north of Yan’an; it boasted of the advantages of CCP government in a skit about peasant labor. There were two characters only, one male and one female, but the traditional sexual themes were replaced with those relevant to labor. The musical accompaniment included both traditional Chinese and Western instruments.

The increasing complexity and revolutionary nature of these CCP-inspired yangge plays climaxed in the large-scale opera The White-Haired Girl (Baimao nü). The opera’s story—about a girl who escapes her landlord’s oppression and undergoes privations serious enough to make her hair turn white but is then saved by the CCP’s soldiers—is focused very explicitly on class struggle and functions as CCP propaganda. Its music combined traditional folk songs and Western-style music, with Western instruments in the orchestra. Representing an original genre, this “new opera” (xin geju) premiered during the CCP’s Seventh Party Congress in 1945. It has retained some popularity since then and, in ballet form, became one of the “model dramas” (yangban xi) during the Cultural Revolution (1966–1976). While yangge was not generally performed outside of northern China, baimao nü became popular nationwide eventually. Baimao nü is still occasionally performed, but it is uncertain if yangge performances still occur. It is possible that they take place currently as folk performances in northern China.

Yangshao Culture

Well known for its painted red pottery and the high status it afforded its women, the Yangshao culture is one of the best known in Chinese history. Scholars have drawn many conclusions about this Neolithic culture based on remains found at archaeological excavations and Yangshao sites, although unanswered questions and theories remain.

The Yangshao culture, dated from about 5000 to 3000 BCE, is one of the best known Chinese Neolithic (8000–5500 BCE) cultures. It is named after the Yangshao village on the southern bank of the Huang (Yellow) River in Mianchi County, Henan Province. Discovered in 1920 by local farmers, the Yangshao site was excavated a year later by Swedish geologist Johan G. Andersson (1874–1960). The relative date of the Yangshao culture was established in 1931 when Chinese archaeologist Liang Siyong (1904–1954) identified material remains of Yangshao, Longshan, and Shang cultures in three successive layers of strata at the Hougang site in Anyang, Henan. This discovery proved that the Yangshao culture is a Neolithic culture and that it predated the Longshan and Shang cultures.

Yangshao Excavation Sites

Chinese archaeologists have found more than two thousand sites of the Yangshao culture, many of which have been excavated, presenting a comprehensive picture of this society. Experts think that the Yangshao culture developed from several of the Neolithic cultures in north China, including Peiligang, Cishan, Laoguantai, and
Lijiacun. Centered at three major tributaries of the Huang River (the Wei, Fen, and Luo rivers in the middle Huang River basin), the Yangshao culture expanded to the areas far beyond the reaches of its ancestral cultures. It reached Gansu and Qinghai provinces in the west, the area along the Great Wall in the northwest, and the northwestern part of Hubei Province in the south.

Material remains from Yangshao sites across several regions demonstrate great variations, challenging scholars to develop better approaches to characterize the temporal and spatial differences of the Yangshao culture. Scholars have proposed several theories to establish different regional types and phases of the Yangshao culture. The most widely accepted theory defines the Yangshao culture in Shaanxi, Henan, and Hebei provinces as seven distinctive regional types: Banpo, Miaodigou, Xiwangcun, Wangwan, Dahecun, Hougang, and Dasikongcun.

The Yangshao people lived in sedentary communities consisting of semisubterranean and above-ground houses built of wood and earth. The Yangshao society engaged in a millet-based agricultural economy, supplemented by hunting, gathering, and fishing. Pigs, dogs, and sheep were domesticated. Tools for economic activities were mostly polished stone axes, adzes, and knives, accompanied by a small number of bone arrowheads, fish forks, needles, and chisels.

**Burial Grounds**

Our understanding of the Yangshao culture also comes from its burials. In general, adults were buried in a community cemetery of the village near the residential area. The burial sites are mostly rectangular earthen pits containing no coffin. Single adult burials were common; composite burials of individuals of both males and females at different ages were also widely seen. Popular burial goods include painted pottery such as bo bowls, guan pots, pan basins, and other personal ornaments. Children were treated differently in burial. They were buried in ceramic urns, often near the house or in some cases in the community cemetery.

**Painted Red Pottery**

The Yangshao culture was best known for its painted red pottery featuring black geometric motifs. The pottery was handmade. The most popular objects were red and brown guan pots, pen basins, bo bowls, and small-mouthed, pointed-based vases with painted motifs. The vessel was shaped first and then painted before it was sent to the kiln for firing. Black designs on red pots were the most characteristic of the Yangshao painted pottery. Nevertheless, red motifs against white coating on red pottery are seen as well. The most intriguing designs on the painted vessels are those featuring fish, frogs, and human faces symmetrically displayed on the interior of the painted basin. Some basins were used as covers for children’s urn burials, implying that the motif might have some religious or social meanings. Some scholars hypothesize that distinctive marks found on the rim of some vessels are the precursors of Chinese writing.

**Society and Community**

The Yangshao society has long been regarded as an equalitarian matrilineal society in which females generally enjoyed a high social status and played significant roles in economic and political arenas. But an increasing number of scholars recently suggest that during the late period of the Yangshao culture the society was much more complex and can be defined as a patriarchal society in which males had dominant economic and political power.

Settlements at Banpo in the city of Xi’an and at Jiangzhai in the city of Lintong provide us the best insight into early Yangshao society. The Banpo site, mainly occupied between 4800 BCE and 4300 BCE, covered an area of about 30,000 square meters, which was further surrounded by trenches of 6 to 8 meters wide and 5 to 6 meters deep. Forty-six houses, mostly circular with a diameter of 4 to 6 meters, were found in two residential areas where storage pits, animal pens, and children’s burial sites were also scattered. In each residential area was a large house likely to be occupied by clan leaders and used for community activities. The largest house at Banpo covered an area of about 160 square meters. Remains of six pottery kilns were located east of the residential area. A cemetery of 174 burials, mostly individual adults, was located north of the residential area.

The Jiangzhai site was 15 kilometers east of the Banpo site. It provides another good example of detailed layout of a Yangshao village. The village consisted of three components: residential area, cemetery, and kilns. The residential area, dated from 4600 to 4400 BCE by calibrated
radiocarbon-14 analysis, covered an area of 50,000 square meters. It was surrounded by trenches on the east, north, and south and protected by a natural river on the southwest. A plaza situated at the center of the residential area was encircled by one hundred houses organized in five groups. Headed by a large house, each group was comprised of ten to twenty houses with their doors oriented to the central plaza. The layout of the houses at Jiangzhai indicated that several clans or families might inhabit the site. Like those at Banpo, the houses at Jiangzhai featured wattle-and-daub walls and thatched roof.

**Walled Settlement**

A settlement enclosed by walls appeared in a late phase of the Yangshao culture (3300–2800 BCE) at the Xishan site in Zhengzhou, Henan Province. The Xishan site covers 100,000 square meters, with a walled settlement in the northwestern section of the site. The layout of the walled settlement is roughly circular in shape, measuring 180 meters in diameter and 345,000 square meters in area. The walls, surrounded by a moat with a maximum width of 11 meters, were built with advanced banzhu technique, in which earth was pounded between wooden boards. Archaeological excavations have revealed lower sections of the western and northern gates of the settlement. The northern gate was furnished with two triangular platforms, possibly watchtowers, and a protecting wall outside the entrance. The appearance of a sophisticated defensive facility in the city, together with the increasing stratification of the burial treatment and the transition of the settlement patterns, indicates the increasing complexity of the late Yangshao society, which forecasts the emergence of regional political power in north China.

Yangzi (Chang) River

Cháng Jiāng 长江

The Yangzi (Chang) River is the third-longest river in the world at 6,276 kilometers and the longest river in Asia. It rises in the Kunlun mountain range on the border of Tibet and Qinghai Province and flows south until it empties into the East China Sea near Shanghai. The Yangzi derives its name from the ancient kingdom of Yang, which settled along its banks.

The Yangzi, known as the “Changjiang” (Long River) in Chinese, begins in the Kunlun Mountains and flows south through the high mountain valleys in Qinghai, Tibet, and Yunnan provinces before veering northeast at Shiigu. Thence the Yangzi flows through Sichuan Province before it enters the scenic Three Gorges region. Then it crosses central China through Hubei, Hunan, Jiangxi, Anhui, and Jiangsu provinces before emptying into the East China Sea at Chongming Island, 16 kilometers north of Shanghai. The Yangzi, stretching the length of the country, has been the unofficial boundary line between north and south China. In fact, no bridge was built over the eastern stretch of the river until 1969, when the Changjiang Daqiao Bridge was constructed at Nanjing.

The Yangzi has been prominent in the development of trade and culture throughout China’s history. As far back as the Neolithic period (8000–5500 BCE), settlements existed along the lower Yangzi. Qin dynasty (221–206 BCE) founder Qin Shi Huangdi constructed canals and waterways to facilitate trade from Yangzhou to Guangzhou, a distance of 1,931 kilometers. Since that time the Yangzi has been the main transportation route across central China as it flows through many of the nation's industrial and economic centers. Since the Tang dynasty (618–907 CE) the Yangzi River delta has become a center for cultivating and shipping rice.

Almost 2,900 kilometers of the Yangzi is navigable all year. In the early 1990s the Yangzi and its major tributaries drained an area of 1.8 million square kilometers—one-quarter of China’s cultivated land—in which 386 million people lived. Its network of rivers and canals carries 85 percent of China’s domestic waterborne traffic and passes through many of its major cities, including Kunmin, Chongqing, Wuhan, Chengdu, Shanghai, and Nanjing. The gross value of industrial products of the areas along the Yangzi is about 40 percent of China’s total.

Given its potential as an inexhaustible hydroelectric resource, the Chinese government began construction of the Three Gorges Dam in 1985 and completed it on 8 October 2008. Located in the Xilingxia gorge near Sandouping, Yichang, Hubei, the Three Gorges Dam is the largest hydroelectric power station in the world and is expected to help control the annual flooding of the Yangzi River valley. When fully operational the dam is expected to generate 22,500 megawatts of electricity that will provide 10 percent of electricity consumption in China.

The project is not without controversy. Construction of the Three Gorges Dam has displaced over 1.2 million
people, uprooted numerous villages and towns the length of the reservoir as well as flooded over important archaeological and historical sites. In addition, the project has been plagued by corruption, spiraling costs, technological problems, human rights violations and resettlement difficulties.

Keith LEITICH

Further Reading
The Yangzi (Chang) River Bridge at Nanjing is comprised of a 6.7-kilometer train deck topped by a 4.5-kilometer car deck. The bridge, completed in 1968, was a massive feat of engineering and the first to be built entirely by the Chinese; it has been a crucial element of north–south transportation as well as a source of national pride ever since.

Over the past two decades, engineers throughout the world have heralded China’s construction of daringly innovative bridges that seem to defy engineering principles. Old China hands recall the pride that accompanied the completion in 1968 of the first bridge to span the Yangzi (Chang) River at Nanjing. Not only had Western engineers doubted that a major bridge could span the river at this location, many believed that China was not capable of designing any large-scale bridge without the assistance of foreign engineers. In the 1950s, preliminary design efforts were carried out with the assistance of Soviet engineers to build a monumental bridge at Nanjing, but it appeared that the sudden withdrawal of Soviet technical experts in 1960 following the Sino-Soviet rift would abort any possibility of building such a bridge. Instead, Chinese engineers worked feverishly to overcome this perceived lack of confidence by reconceptualizing the project. Completed at the end of 1968, the Yangzi River Bridge at Nanjing became the first highway and railway bridge designed and constructed by the Chinese without outside engineering assistance. Until the completion of this bridge, it was necessary for trains and trucks to be ferried across the river, requiring some two hours of time and effort.

Among the challenges in building a bridge at this site were the fact that the bedrock in the river was some 72 meters below the surface and the river banks were low. High piers were necessary to lift the decks of the bridge so as not to impede boat traffic along China’s principal artery of water-borne transport. Although the river itself is only 1.5 kilometers wide in this area, the long and gradual approaches necessary for rail traffic along two lines necessitated a 6.7-kilometer structure, while the four-lane highway portion needed a 4.5-kilometers span. Nine piers embedded in the river’s channel support eighteen steel trusses, each of which is 160 meters long.

For more than forty years the bridge has been an important destination for tourists visiting Nanjing. At the base of the southern approaches is an extensive park with access via elevators to a high observation platform. Constructed during the Great Proletarian Cultural Revolution (1966–1976), the bridge was adorned with the slogans of Chairman Mao in his own calligraphy as well as oversized statues and relief carvings of peasants, workers, and soldiers. Mao Yisheng, one of China’s most prominent first-generation structural engineers and designer of bridges, stated that the building of the “Great Bridge... tested and advanced the skill of Chinese bridge builders, and stimulated the growth
of many industries connected with bridge building, including steel, cement, structural parts, and construction machinery.” Today, some fifty bridges span the Yangzi, but none symbolize the independence of spirit and accomplishment as clearly or as much as the Yangzi River Bridge at Nanjing.

Yangzi Delta Economic Region

The Yangzi Delta Economic Region has the largest regional economy in China as measured in gross regional product. The area also is the most attractive location for both domestic and international investment.

The Yangzi Delta Economic Region (YDER) is located in the central part of the east coast of China. It covers an area of 109,654.2 square kilometers, only 1.14 percent of China’s total area, and has a population of 83.24 million, which accounts for only 6.33 percent of China’s total population. It also contains sixteen major cities, which include one provincial-level municipality (Shanghai), three subprovincial-level cities (Nanjing in Jiangsu Province and Hangzhou and Ningbo in Zhejiang Province), and twelve prefecture-level cities (Suzhou, Wuxi, Changzhou, Zhenjiang, Nantong, Yangzhou, and Taizhou in Jiangsu Province and Jiaxing, Huzhou, Shaoxing, Zhumadian, and Taizhou in Zhejiang Province).

History of the Delta

The Yangzi (Chang) River delta is the triangular alluvial tract at the mouth of the river, enclosed or traversed by its diverging branches. It is the biggest river delta in China. Humans moved there in two large-scale migrations to hunt and farm after the delta was formed. The first migration occurred during the South and North Dynasties (220–589 CE), and the second one occurred during the Song dynasty (960–1279). The migrants built irrigation systems (from the tenth century onward) and vibrant cities and developed local industries. The Yangzi delta became the main cultural and economic center of China and enjoyed the reputation of being a “land flowing with milk and honey.” The key cities of the region in premodern times included Suzhou, Nanjing, Hangzhou, and Shaoxing. The silk manufacturing industry in this region, especially in Suzhou, became famous during the Tang (618–907 CE) and Song dynasties. Suzhou silk even made its way to Rome along the Silk Roads.

Shanghai is located near the point where the Yangzi River flows into the East China Sea. It is one of the top three seaports in the world now, the largest city in China, and the starting point of modern Chinese industry. Shanghai began to become the hub of the Yangzi delta region and even the economic center of the whole of China gradually after 1842, when China was forced to open Shanghai to British trade and residence. Many Chinese “firsts” occurred in Shanghai, such as the first textile factory, the first flour mill, the first medicine factory, and the first electric fan factory. By the 1930s Shanghai had become the center of all economic activity in Asia and the financial center of Asia, as Hong Kong later became.

After establishment of the People’s Republic of China in 1949, the country finally was able to stop wars on its own territory. China’s economy recovered and developed step by step, although China was still isolated from the Western world and suffered internal political troubles from time to time. Shanghai’s average GRP (gross
regional product) growth rate from 1952 to 1978 was 10.17 percent, higher than the country’s GDP (gross domestic product) growth level, which was 6.68 percent during the period. However, the growth rate of both Zhejiang and Jiangsu provinces was lower than China’s average at 6.08 percent and 5.48 percent, respectively. The total GRP created by Shanghai, Jiangsu, and Zhejiang was RMB65.68 billion (at current prices) in 1978, accounting for 17.82 percent of China’s total GDP in that year. And as the economic center of China, Shanghai had a GRP of RMB27.28 billion in 1978, accounting for 7.48 percent of China’s total GDP. The preceding figures reveal the delta’s, and especially Shanghai’s, significant position in China’s economy before China’s economic reform was launched in 1979.

The Pearl River delta in the southeast part of China was the most dazzling star in China in the 1980s. Benefiting from its superior geographic position (adjoining Hong Kong) and its reform and open policy, the Pearl River delta region achieved dramatic economic growth during the period and attracted the attention of the whole world. Capital and managerial experts moved into the Pearl River delta and made this region a famous business area. The average GRP growth rate of Fujian and Guangdong provinces from 1979 to 1990 was 11.61 percent and 12.83 percent, respectively, obviously higher than the country’s GDP growth level of 9.08 percent during the period. The situation in the Yangzi River delta was different from that in the Pearl River delta during this decade. The non-state-owned sector, especially the township and village enterprises (TVEs) in the Yangzi delta region achieved rapid growth, but Shanghai’s performance was relatively slow. Jiangsu and Zhejiang provinces grew faster than the whole country (at 11.14 percent and 11.87 percent, respectively), but Shanghai’s average GRP growth rate was only 7.49 percent from 1970 to 1990, only 58 percent of Guangdong’s growth level. And Shanghai’s GRP contribution to China’s total GDP dropped to 4.19 percent in 1990. Compared with its share of 7.48 percent in 1978, the figure reflects the relative decrease of Shanghai’s economic significance in China.

The Yangzi delta got its chance in the 1990s. With the deepening of China’s economic reform, the strategic emphasis of China’s economic development shifted, and the Yangzi delta region, especially Shanghai, became the focus again in the 1990s. After 1991, especially after the seminal visit of China’s leader, Deng Xiaoping (1904–1997), to Shanghai in 1992, the provincial and municipal governments in the Yangzi delta began to implement far-researching reforms, and the result has been economic growth rates higher than those of other major Chinese cities as well as of most Asian “tiger” economies since 1992. Statistics show that the average annual GDP growth rate was 10.13 percent for the whole of China from 1991 to 2006, but the rate for Shanghai was 12.03 percent, the rate for Zhejiang was 14.18 percent, and the rate for Jiangsu was 13.61 percent, more than two times the growth of the four tigers (Hong Kong 6.8 percent, Taiwan 4.9 percent, Korea 4.2 percent, and Singapore 7.9 percent) during this period.

Establishment of the Economic Region

To promote economic collaboration among the cities in the Yangzi River delta and to facilitate sustainable development of the region, the Fourteen Cities Collaboration Office Director Conference was launched in 1992, including the cities of Shanghai, Nanjing, Wuxi, Changzhou, Zhenjiang, Nantong, Yangzhou, Suzhou, Hangzhou, Ningbo, Jiaxing, Huzhou, Shaoxing, and Zhoushan. After negotiation among the municipal governments of these fourteen cities and Taizhou, a new prefecture-level city in Zhejiang Province, another prefecture-level city, Taizhou, a new prefecture-level city in Jiangsu Province, a new regional economic institution, the Coordinating Committee of Yangzi Delta Urban Economies, was set up in 1997. Members agreed that the standing committee chairman would come from Shanghai and that the executive committee chairman would come from one of the other fifteen cities (in turn). A formal session among the members is held every two years, and a standing office is set up in Shanghai as the liaison office to deal with day-to-day administration. During the fourth session of the committee, which was held in Nanjing in 2003, another prefecture-level city, Taizhou in Zhejiang Province, was accepted as a member of the committee. At the fifth session, which was held in Shanghai in 2004, members decided that a formal session would be held every year. Hence, clearly economic collaboration in the delta is seen as important to the region’s growth,
and the cities’ leaders are working to manage economic development together.

**Economic Importance in China**

The YDER is already the largest regional economy in China as measured in GRP. It and the Pearl River delta (PRD) and the Bohai-Rim Economic Circle (BREC) are China’s three major industrial belts. In 2006 the YDER’s GRP increased to RMB3,952.57 billion (about $503 billion), accounting for 18.88 percent of China’s total GDP and equal to 57.27 percent of South Korea’s GDP and more than four times the Philippines’ GDP.

The per capita GRP in China in 2006 was RMB16,165. All sixteen cities in the YDER surpassed that figure. Shanghai kept its top position among China’s thirty-one provinces (and provincial-level municipalities), and Zhejiang and Jiangsu ranked fourth and fifth. Among the sixteen cities in the YDER, two had a per capita GRP of more than RMB70,000, more than four times the country’s average.

The YDER is the most attractive location for both domestic and international investment, and Shanghai has regained its reputation as the most important international municipality in Asia. The YDER accounts for 16.83 percent of China’s total investment in fixed assets (seven of them more than RMB100 billion individually) and 47.17 percent of China’s total amount of foreign capital actually used (actually used foreign capital is the amount that is definitely invested in contrast to the amount that was promised to be invested). Its contribution to China’s total imports and exports was 35.55 percent in 2006. By the end of 2006, Shanghai had signed foreign direct investment contracts with foreign business people from 127 countries and regions, and the number of contracts reached 4,450,000 with a contracted value of $114.54 billion. More than 150 multinationals have set up their regional head offices in Shanghai, and there are 150 international investment companies and 196 foreign research and development centers. Shanghai is expected to have more multinational regional head offices than Hong Kong by 2010.

The YDER also has become an important international integrated circuits manufacturing base. China’s total microcomputer output was 93.36 million units in 2006. Out of every 1,000, about 742 came from Suzhou or Shanghai. In integrated circuits the YDER’s output accounted for 62.26 percent of China’s total, and most of them were made in Shanghai and Wuxi, accounting for 39.33 percent of China’s total output.

The automobile industry is another rising industry in the YDER. Eleven cities of the YDER have been involved in motor vehicle manufacturing and contributed 13.75 percent of China’s total output in 2006. The YDER is also famous for its electronics industry. Of China’s home washing machines, 61.42 percent were made in the YDER in 2006, and Ningbo’s contribution to China’s total output was more than 31.4 percent in that year.

Rapid economic growth has brought local people better lives. The average annual disposable income per capita of urban households in YDER in 2006 was RMB17,208 (about US$2,051), 46.34 percent higher than the country’s average level (RMB11,759).

**Reasons for Growth**

The largest contributor to the rapid GRP growth in the YDER has been the GRPS (gross regional product from secondary industry). In 2006’s GRP 3.7 percent came from primary industry, 55 percent from secondary industry, and 41.3 percent from tertiary industry. From 1990 to 2006 the average annual growth rate of industry value-added was 15.15 percent in the YDER. During the same period the average annual growth rate of its GRP was 13.48 percent.

Now the driving force for the YDER’s economic growth is shifting from traditional processing industries to modern manufacturing and service industries. The share of information technology increased from 4.5 percent in 1990 to 13.6 percent in 2005, and the share of the textile industry decreased from 20.1 percent to 8.8 percent during the same period. The tertiary industry’s share in the GRP of Shanghai is more than 50 percent. In the other fifteen cities service industries are growing rapidly, although the share in GRP is still less than 50 percent. The YDER is upgrading from a huge processing workshop of the world to one of the most important international manufacturing bases.

The economic growth in the YDER, however, has been highly dependent on the rapid growth of investment, both
domestic and international, in the area. Because of the limitation of land and other natural resources and industry duplication in many cities, this kind of growth is hard to sustain, and the increase in industry value-added and the domestic and international investment in the YDER have been going down in recent years.

The Future

In 2010 Shanghai will hold the World Exposition. The exposition will be a great chance not only for Shanghai but also the whole of the YDER. The exposition will benefit all the cities in the region as well and bring them into closer collaboration. Finally, with the improvement in the regional transportation system, the YDER is becoming a three-hour economic circle (it takes less than three hours to complete any travel from one city to another within the YDER), and more products bearing the “Made in China” label will go to the rest of the world from there.

The Yao are ethnic Chinese living mainly in high mountain valleys of the Guangxi Zhuang Autonomous Region of south China. Although the Yao are linguistically diverse and have a rich oral literary tradition, they had no formal written language until 1982. Yao today are known as expert weavers, dyers, and singers, and their population has doubled since 1949.

The Yao, an ethnic group numbering nearly 3 million in the 2000 Chinese census, live in humid, subtropical, densely wooded mountain valleys 1,000–2,000 meters high in south China. Historically these people were known by at least thirty names, but the name “Yao” was adopted after the founding of the People’s Republic of China (PRC) in 1949. Seventy percent of the Yao people live in Guangxi Zhuang Autonomous Region and the rest in seven autonomous counties and more than two hundred small autonomous townships established from 1952 to 1963 in the provinces of Hunan, Yunnan, Guangdong, Guizhou, and Jiangxi. Another 470,000 Yao live in northern Vietnam.

The Yao spoken language traditionally is categorized as a subgroup of the Sino-Tibetan language family and is similar to the Miao language, although some Western linguists put it into its own new family. Some Yao people speak only Miao or Dong. The Yao have so much linguistic diversity that Yao from different areas cannot easily communicate with each other. Until recently they had no written language but kept records by making notches on wood or bamboo slips. However, a subgroup of twenty thousand Yao women in southern Hunan Province developed a unique system of writing based on rhomboid characters called “Nv Shu” (ant writing). In 1982 a universal writing system based on the Latin alphabet was created for the Yao people by the Guangxi Nationality Institute, approved by the Chinese Academy of Sciences, and now is used extensively.

During the Han dynasty (206 BCE–220 CE) the Yao, called “Wuling” or “Wuxi” in Chinese histories, wove tree bark fabrics, lived around Changsha (today’s capital of Hunan Province), and began their migrations south into Vietnam and Thailand. Yao agriculture and distinctive handicrafts, such as iron knives and indigo-dyed cloth with delicate designs made in beeswax, developed during the Song dynasty (960–1279). Yao have been celebrated in history for their independent militancy. From 1316 to 1331 they participated in forty uprisings in the late Yuan dynasty (1279–1368). They revolted for one century against the Ming dynasty (1368–1644) and participated in the Taiping Rebellion in the second half of the 1800s during the Manchu Qing dynasty (1644–1912). Their communities were a base area for the Seventh Red Army commanded by politician Deng Xiaoping (1904–1997) in the 1930s during the Chinese civil war.

Today the Yao live in groups of ten to seventy households, ruled by hereditary headmen, in rectangular, reed thatch, peak-roofed huts. Usually the huts consist of three rooms, but some hillside houses are two-storied with the lower floor used to stable animals. The diverse Yao groups practice three types of mixed economies: hillside, irrigated agriculture and forestry; forestry-based hunting and gathering; and slash-and-burn agriculture based on
The Yao are noted for elaborately decorated turbans. Photo by Paul and Bernice Noll.

communes of twenty families or fewer. In all economies hunting of boars, bears, and monkeys is important. The Yao are famous for “singing while digging” during spring planting when a young man in the fields beats a drum and leads the workers in song. Staple crops are rice, corn, sweet potatoes, and taro, usually prepared stewed or roasted. Homemade sweet wine, teas flavored with ginger or cassia, and tobacco products are popular. Among well-known Yao foods are an oily tea with tea leaves fried and boiled into a thick salty soup mixed with puffed rice or soybeans, pickled birds, insect pupae, and bacon meats. They eat many fresh fruits and dried or pickled vegetables such as pumpkins and peppers.

The Yao people’s traditional religion included nature and ancestor worship and belief in Panhu, the dog tribal totem. Many of their sacrificial ceremonies are based on medieval Chinese Daoism. Some Yao converted to Buddhism and later Christianity. They are expert weavers, dyers, and embroiderers. Clothes of the Yao differ according to region but are mainly made of dyed blue or black cloth with various brocaded geometric and stylized animal and plant designs on the sleeve cuffs and trouser legs. Men curl their hair into a bun wound with red or black cloth and decorated with long pheasant feathers. They wear collarless shirts, belted jackets, and either trousers wrapped at the ankle or knickers. Women wear highly embroidered trousers, short skirts, or pleated skirts with decorative silver jewelry and silver hair ornaments in their buns or chignons. Both sexes wear black or red scarves on their heads, sometimes wrapped into fantastic turbans. Headgear for boys and girls changes in style to signal the onset of adulthood. Boys undergo trials to mark passage into full manhood, such as walking on hot coals or bricks, jumping from a 3-meter-high tower, climbing a ladder of knives, and retrieving objects from hot oil.

The Yao have a rich oral literary tradition and are famous for their romantic and historical songs. They celebrate many festivals monthly and offer sacrifices, including those dedicated to their founding ancestor and to their grandmothers. They play bamboo flutes and sing and dance with drums. Certain gongs, suona horns, and long waist drums are unique to the Yao. Antiphonal singing is important in courtship rituals, and bridegrooms pay bride prices in silver bars. Couples choose their own partners but obtain their parents’ consent. The Yao still practice marriage by bride capture.

Since 1949 schools have been established in all villages, and small factories have been created for timber, cement, farm machinery, and chemical production. With the elimination of smallpox and cholera epidemics, the population of the Yao has doubled under the Chinese government.

YAO Ming

Yáo Míng 姚明

b. 1980  Professional basketball player

A member of the Chinese men’s national basketball team, former player on China’s Shanghai Sharks, and number one pick of the U.S. National Basketball Association draft in 2002, Yao Ming became a popular center on the Houston Rockets and China’s first professional superstar athlete with global recognition.

Yao Ming may be deemed China’s first crossover superstar athlete. Although Yao was not the first Chinese basketball player to play professionally in the United States, his recruitment into the National Basketball Association (NBA) was attended by far more fanfare than his predecessors’. Most fans have forgotten Wang Zhizhi and Menk Bateer, intermittent players on NBA teams from 2001 on, and the even less-known Zheng Haixia, who played for the Women’s National Basketball Association Los Angeles Sparks in 1997–1998.

Son of a basketball-playing couple and groomed for the sport in state-run schools for future athletes, Yao approached his prime as a player at an opportune time. China’s state-managed sports system was opening up to commercial forces, North American sports leagues were searching the world for athletic talent, and transnational corporations sought boundary-crossing spokespersons. Yao led his hometown team, the Shanghai Sharks, to the Chinese Basketball Association finals three years in a row, culminating in a championship in 2002. This helped position the 7-foot 6-inch center to be the Number 1 pick in the 2002 NBA player draft and to land lucrative corporate contracts worldwide.

Drafted by the Houston Rockets, Yao performed ably on the court and gained an enthusiastic following among American, Asian American, and expatriate Chinese fans. In his rookie year, he averaged 13.5 points and 8.2 rebounds per game and was among the top twenty in the league in...
blocks, rebounds, and field-goal percentage. With a new influx from Chinese balloting, fans voted him to the NBA All Star team his first three seasons, and the Rockets signed him to a five-year extension lasting through the 2010–2011 season.

An ideal fit with the NBA’s strategy of expanding international markets, Yao was called China’s most valuable export. His appeal to multiple, multigenerational, and multinational audiences generated lucrative commercial sponsorships, negotiated by business advisers who call themselves Team Yao. He has represented the likes of Apple, Visa, Adidas, Gatorade, Pepsi, and McDonald’s, and partnered with a California-based chain to open fitness clubs in China. He also lent his image to the Special Olympics, campaigns against SARS and HIV/AIDS, and other charitable causes. Yao ranked Number 6 on Forbes magazine’s 2007 list of top-earning non–U.S. athletes, with an estimated income of nearly $27.5 million.

Along with his celebrity and wealth, Yao has retained popularity and respect among compatriots as a representative of Chinese achievement abroad with enduring loyalties to his native country. His every move became an item for the Chinese media, from setbacks due to a broken foot to plans to marry his longtime girlfriend Ye Li, a former player with China’s national women’s basketball team. As a member of the Chinese national team, Yao reported for training and competitions between NBA seasons, including Olympics practice and attendance. He was the obvious choice as China’s final runner in the torch relay for the 2004 Athens Olympics and China’s flag bearer at those games. At the 2008 Beijing Olympics he ran through the Tiananmen Gate, the ninth of 433 torch bearers, and was a logical figure in promotions for the Games.

**Yī bù dēng tiān**
The Yellow Sea (Huang Hai) is the overly exploited gulf that lies between China and Korea; it is known for its omnipresent fishing vessels and oil refineries. Its name comes from yellow silt deposited in its waters by the Huang (Yellow) River.

The Yellow Sea (Huang Hai), the shallow gulf between China and Korea, is 870 kilometers long from the south to the north and 556 kilometers wide from the east to the west and covers an area of 378,600 square kilometers. The northern part comprises the inlet of Bohai Bay in the northwest, which is almost enclosed by the Liaodong Peninsula in the northeast and the Shandong Peninsula in south, and the Korea Bay in the northeast. The southern part of the Yellow Sea borders on the Shandong Peninsula in the north and the Chinese mainland in the west and meets the East China Sea where the Yangzi (Chang) River flows into the sea. In the east, it borders on Korea and the Korea Strait. The Yellow Sea, which has received its name from the yellowish silt deposited mainly by the Huang (Yellow) River, has a warm temperate climate. With an average depth of about forty meters, it is one of China’s best fishing grounds.

The Battle of the Yellow Sea

The Battle of the Yellow Sea, which took place on 10 August 1904, is considered a critical moment of the Russo-Japanese War of 1904–1905.

The Battle of the Yellow Sea was the closest and, except for Tsushima, the most decisive naval engagement of the war. Encountering [Russian Admiral] Vitgeft’s squadron in the early afternoon, [Japanese Admiral] Togo’s first moves were designed to put himself between it and Port Arthur, so as to prevent its return and force a major fleet action. However when it had become clear that the Russians had no intention of going back but were making for Vladivostok, Togo was so far behind the Russian fleet that he had to waste hours in detouring around Vitgeft’s weaker vessels so as to catch up with the battleships at the head of the Russian line. It was 1743 hrs when he opened fire on the leading Russian ships. From then until dusk Togo’s First Division and the six Russian battleships banged away at each other on almost even terms, with Mikasa and Tsarevich sharing the brunt of the punishment.

Peninsula in Liaoning Province. Bohai Bay in the northwest has been the traditional location for salt works. Large offshore petroleum deposits have been discovered there, and a number of oil refineries have been set up.

Yen, Y. C. James
James Yen led the Mass Education Movement (MEM) of the May Fourth period, which coordinated local basic literacy programs for an estimated five million people. The MEM then moved to the countryside in 1926 to develop the “Ding Xian Experiment,” a program of economic, political, social, and cultural village reforms that sought to pose a non-Communist alternative to revolution.

C. James Yen (Yan Yangchu 晏阳初), known to his many U.S. friends as “Jimmy,” represented a patriotic Chinese liberalism that pragmatically addressed mass education and rural reconstruction. Born in the mountains of Sichuan, the young Yen was sent to mission schools, where he became, in his later words, not a “Christian” (implying membership in a foreign institution) but rather “a follower of Christ.” After studying at Hong Kong University Yen graduated in 1918 from Yale University and worked under the International YMCA with the Chinese Labor Corps in France; he wrote a widely copied literacy primer that used one thousand basic characters.

Yen returned to China in 1921 to head a national mass literacy campaign under the Chinese National YMCA and to marry Alice Huie, a U.S.-born Chinese with whom he had three sons and two daughters. He wrote that “China can never become a truly representative government if the greatest masses of the people are illiterate and ignorant…[or] expect to put a stop or check to the present prevailing corrupt and unscrupulous officialdom if there is not a public opinion formed to battle against it” (Hayford 1990). He adapted the publicity and organization techniques of the YMCA’s science education campaigns and, using non-professionalized teachers in neighborhood classes...
scheduled with the flexibility of the traditional village school, produced a campaign (yundong) model used in hundreds of localities that attracted more than 5 million students (Chinese Communist Party leader Mao Zedong taught in a 1922 campaign). In 1923 Yen and leading intellectuals formed the National Association of Mass Education Movements (MEM).

For the illiterates who lived in villages, illiteracy was not their fundamental problem. In 1926 the MEM set up a village campaign in Ding Xian 定縣河北, a county some 321 kilometers south of Beijing. Rejecting the radical approach, Yen saw “farmers” in need of education and support, not “peasants” in need of class war. In 1928 Yen received an honorary graduate degree from Yale, raised a substantial endowment in the United States, and then enlisted socially conscious specialists to develop the Four Fold Program in rural reconstruction. The Ting Hsien (Ding Xian) Experiment, a kind of commune based on family farming, sponsored People’s Schools, coordinated innovations ranging from breeding hybrid pigs to setting up economic cooperatives, and incorporated existing aspects of village life, like industry and the expertise of local health workers, to further benefit its residents.

By 1931 these successes excited nationwide public and government interest. Yen joined Liang Shuming and other independent reformers to form the National Rural Reconstruction Movement 鄉村建設運動 (Xiangcun jianshe yundong) comprising hundreds of organizations. The 1937 Japanese invasion drove MEM operations first to Hunan, then to Sichuan, but Yen spent much of the war in Washington, D.C. After 1945 Yen found himself increasingly at odds with the Nationalist (Guomindang) government’s military preoccupation; in 1948 he persuaded the U.S. Congress to fund the independent Joint Commission on Rural Reconstruction, of which he became one of the commissioners. After 1949 Yen led the Philippines Rural Reconstruction Movement and founded the International Rural Reconstruction Movement, which he headed until his death in New York City in the autumn of 1990.

As a minority nationality living in mountainous southwest China and with rich history and distinctive culture and language, the Yi people in modern times have abolished slavery and made progress in agricultural economy, education, health care, and social development.

The Yi people live in southwest China, in the mountainous regions of Yunnan, Sichuan, Guizhou, and Guangxi provinces. With 7,762,286 people (2000 census), the Yi are the fourth-largest minority nationality in China. Yi groups in various areas described themselves with a variety of names until the 1950s, when the Chinese government redefined all Yi groups under one common name, the Yi.

**History**

Scholars have different views about the origins of the Yi. Some believe that the Yi originated from the ancient nomadic Qiang peoples who had lived in northwest China. Others argue that the Yi people developed from the original inhabitants of Yunnan, as early as 10,000 years ago.
In either case scholars agree that starting from the early second millennium BCE, the people in central Yunnan, whether they were the original inhabitants or Qiang immigrants, migrated out of their homeland and mixed with the Han Chinese (the ethnic Chinese majority) and other minority groups. As a result the Yi are a mixed group with diverse origins.

Their migration extended along the watersheds of the six rivers in the Sichuan-Yunnan region and the Yunnan-Guizhou plateau and divided the Yi into six branches. These six branches are the origins of the six branches of the modern Yi nationality: Southern Nisu Yi, Southeastern Sani Yi, Eastern Nasu Yi, Northern Nuosu Yi, Central Yi, and Western Yi. According to a Yi legend, the Yi people originated from an ancient ceremony of tribal division, the division of six ancestors (liu zu).

During the Han dynasty (206 BCE–220 CE), the ethnic minority peoples inhabiting the mountainous border region of Yunnan, Sichuan, and Guizhou were first referred to as yi (barbarians) in Chinese records. The Yi people were part of this group. The Han government established an administrative prefecture in the region and appointed a Yi chief to rule the region with the title King of Dian. During and after this time, large clans emerged in the Yi tribes. A caste system, which not only established various social statuses in the Yi communities but also defined a large number of common people as slaves, started to dominate Yi societies.

From the Sui (581–618 CE) to the Song dynasty (960–1279), the Yi people were generally referred to in the Chinese records as wuman (black barbarians) and baiman (white barbarians). While the former exclusively designated the Yi groups in central Yunnan, the latter referred to the minority groups inhabiting the border region of Yunnan, Sichuan, and Guizhou, including some of the Yi tribes. During these centuries two independent kingdoms, Nanzhao (739–902 CE) and Dali (902–1253), ruled Yunnan, organized by the Yi and other minority peoples. Under the reign of these authorities, a distinct Yi culture—including music, dance, ancestral worship, and architectural, culinary, and clothing styles—developed from Yi tribal traditions and from contact with the cultures of neighboring groups.

The Mongols invaded southern China in 1253 and destroyed the Dali kingdom. After conquering the region, the Mongol Yuan dynasty (1279–1368) extended its administration to the Yi areas through a system of tuji (local chiefs). By pledging loyalty to the central government, the Yi local chiefs were allowed to govern their realms. During the Mongol period, the Yi people were referred to as luoluo (barbarians). Malaria and other epidemic diseases spread to the Yi areas and led to a loss of population and a setback to Yi socioeconomic development.

To consolidate its political control of Yunnan, the Ming dynasty (1368–1644) in the late fifteenth century decided to substitute for the tuji system a new policy whereby locals were replaced by Han Chinese officials. The process of replacing locals was not completed until the 1730s during the reign of the emperor Yongzheng of the Qing dynasty (1644–1912), and in most areas the Yi chiefs were powerful enough to maintain their rule and
defy the penetration of the Chinese central government at least until the end of Republican China (1949).

The Modern Era

During the early period of the People’s Republic of China, the government made efforts to redefine Yi nationality. After bringing the six branches of the Yi peoples together, the government changed their name from the barbarian termyi to Yi, a different Chinese word, with connotations of respect. Beginning with the founding of the Liangshan Yi Autonomous Prefecture in 1952, the government established a total of fifteen Yi independent prefectures and counties. Viewing the Yi as the only existing slave society in the world, the government implemented democratic reforms in the Yi areas between 1956 and 1958 and abolished slavery. Under the policy of the equality of all nationalities, the government trained many Yi cadres and extended its political administration into the Yi areas through these cadres. But the Cultural Revolution (1966–1976) brought chaos to all the Yi communities. Traditional Yi customs and religion became the targets of political campaigns, and former local chiefs and priests were scorned or even prosecuted.

With the beginning of reform in 1979, the government reassured the Yi of their rights and privileges as a minority nationality and promoted their equality more in terms of economic development. Since then, the Yi communities have made progress in agricultural economy, education, and health care, and many of the Yi people have become modern workers employed in the tin and coal mines in Yunnan and Guizhou. Yi trade with the outside world has developed, and modern railroads, highways, and communications have been extended through the Yi areas. Despite these developments the Yi societies, disadvantaged by their geographic locations in remote mountains, are still poor in economic terms and are far behind the Han Chinese areas.

Culture

The Yi have a long and rich cultural history. Much traditional literature is written in the distinctive script used for the old Yi language. Folk tales, epics, and songs have also been passed down orally. Yi traditional medicine has a rich variety of resources—such as baiyao, a white medical powder for treating hemorrhage, wounds, bruises, and similar ailments—which are widely used by all Chinese. Yi religion, based on ancestor worship and a belief in many gods, has been revived in recent years after its practices were prohibited in the 1960s and 1970s.

Yi people speak the Yi language, a linguistic branch of the Chinese-Tibetan language family, which has six sets of major dialects and many more local dialects that are not always mutually intelligible. One million members of the Yi nationality do not speak the Yi language at all. In 1975 the Chinese government attempted to formalize a unified Yi language by defining 819 standard Yi words, but the effort has not been as successful as hoped, as isolation and language barriers have prevented the Yi from establishing a commonly shared ethnic identity. The development of their independent power and the modernization of their economy and society await the future.

Yin and Yang

Yin-Yáng 阴阳

Representing the Chinese philosophy of duality, yin and yang have a deeply rooted history in China. Developing into the School of Yin and Yang, thinkers of this concept seek to define the relationship between human and natural phenomena.

Probably no aspect of Chinese philosophy is more widely recognized in the West than the concept of yin and yang. People rightly see the two terms yin and yang as symbolic of the dualistic nature of the phenomenal world, but some incorrectly see this duality as hostile, like the moral opposition between good and evil. In the Chinese conception duality is complementary, not conflicting. Furthermore, the categories are not static but rather dynamic. Although yang may eventually overcome yin, at the point of triumph its power will immediately begin to wane. The alternation of yin and yang is thus the most indicative quality of this philosophical concept.

One of the earliest textual references to the two terms in the Chinese tradition occurs in a poem from the Book of Songs that recounts the founding of the Zhou dynasty (1045–256 BCE). This excerpt shows the venerable ancestor surveying the realm:

Blessed was Chief Liu.
He measured the breadth and length of the land;
He measured the shadow and noted the hills,
Observing the sunshine (yang) and shade (yin).
(Mao Shi no. 250; Legge 1861, 487)

Chief Liu was measuring the shadow of the gnomon, or sundial, to determine the cardinal directions. Yang hillsides (the south slopes) and river banks (the north sides) were appropriate for human habitation because houses built there would receive the most sunshine during the winter.

Yin and Yang in Ancient Cosmology

By the time the two terms reappeared in the textual tradition, they had acquired cosmological connotations (associations relating to a branch of metaphysics that deals with the nature of the universe). In the Zuo Commentary to the Spring and Autumn Annals (written c. fifth century BCE) a passage that mentions yin and yang concerns astrological prognostication. The failure of ice to appear at the beginning of the year was blamed on Jupiter (the Year Star), whose “licentious” (retrograde) movement caused “the yin not to cover the yang” (Legge 1861, 540). Normally, the annual dominance of yin would have allowed ice to form. But Jupiter’s licentious behavior (lodging in the inappropriate constellation) increased the influence of yang in the corresponding earthly realm.

During the mid-Warring States period (475–221 BCE) the function of yin and yang in literary contexts continued to have cosmological import, but now the terms were elevated to cosmogonic status (related to a theory of the origin of the universe). The opening to the poem “Heaven Questions” from the Songs of Chu describes how the world came about.
In the beginning of old,  
All is yet formless, no up or down.  
Dark and light are a blur,  
The only image is a whir.  
Bright gets brighter, dark gets darker,  
The yin couples with the yang—  
Then is the round pattern manifold.  
(Trans. S. Field, in Major 1993, 63)

The process being narrated here is birth and generation. The whirling image is inchoate matter, what might be called “chaos” in Western mythology. In cosmogonies appearing later in the Chinese tradition, such matter would be given the term qi. In this poem form and light spawn from the motion of embryonic qi as yin and yang materialize. At that point they couple and generate roundness, the shape of the phenomenal world.

In the mid-second century BCE, when the philosophical treatise Huainanzi was compiled, the sexual connotations surrounding the cosmological terms became even more overt: “When yin and yang gather together their interaction produces thunder. Aroused, they produce lightning” (Major 1993, 65). In the mythical version of this passage, instead of abstract yin and yang interacting in a vacuum the coupling of two dragons is visualized, one male and one female, who leave their winter refuge, mount up to heaven, and cause the spring rains to fall. The Huainanzi version may simply be the philosophical refinement of vestiges of folk tradition that had always recognized in nature the same sexual groupings that govern society. Scholars therefore speculate that the original impulse for positing a yin/yang duality in the cosmos may have been the spring mating ritual in ancient China. In that ceremony sexual communion among the young people of neighboring villages was the central rite, but that union subsequently guaranteed the fecundity of all of nature: The rains arrived, the rainbow appeared, seeds sprouted, and winter gave way to spring (Granet 1975, 46–50).

School of Yin and Yang

By the end of the Warring States period, at the time of the great flowering of Chinese philosophy, the School of Yin and Yang arose, led by the thinker Zou Yan (350–270 BCE). The Han dynasty (206 BCE–220 CE) Records of the Grand Historian had this to say about Zou:

He examined deeply into the phenomena of the increase and decrease of yin and yang, and wrote essays totaling more than a hundred thousand words about their strange permutations. (Needham 1956, 232)

None of his works survives, but he is credited with proposing five categories of qi as a further elaboration of the original two forces of yin and yang. This is the concept of wuxing, or the “five elements” of wood, fire, earth, metal, and water. The “strange permutations” mentioned earlier are the so-called enumeration orders whereby the elements successively conquer (or produce) each other. Thus, earth dams water, water quenches fire, fire melts metal, metal cuts wood, and wood saps earth, and so forth. Such thinking, based as it was on the empirical observation of nature, was an early attempt at a scientific view of the world. Zou Yan and his followers subsequently built a correlative universe based on these categories and their orders. For example, when the five internal organs (spleen, lungs, heart, kidney, liver) are correlated with

The yin and yang symbol from Daoism, which represents a complementary, rather than a hostile, duality.
the five elements, wood governs the liver. When the five grains (rice, millet, barley, wheat, legumes) are correlated with the five elements, legumes belong to the element water. In the production order of the elements water nourishes wood, so a diet rich in soybeans can be beneficial to the liver.

In seeking proto-scientific correspondences between human and natural phenomena the thinkers of the School of Yin and Yang sought to control human civilization by aligning it with natural cycles and patterns. Their theories inspired great thinkers in the Han dynasty and continued to influence Chinese philosophy until the Song dynasty (960–1279). At that time the cosmology of Zou Yan was integrated with Confucian metaphysics by Zhou Dunyi (1017–1073), who composed the treatise, “Explanation of the Diagram of the Supreme Ultimate.” That diagram, the taiji, is considered to be the precursor of the familiar circular symbol of yin and yang.

The structures and artifacts excavated from Yinxu reveal much about the religion, social organization, and technology of the last phase of the Shang dynasty (1766–1045 BCE). The square architectural design of royal tombs reflects an image of the cosmos as having four corners, for example, and the number and quality of bronze vessels indicates an advanced technology and artistic vision.

The Shang dynasty (1766–1045 BCE) was the second dynastic period of China (although some scholars consider the Xia dynasty [2100–1766 BCE] to be only legendary, thus making the Shang the first) and the first central power of East Asia. Yinxu, located near the modern city of Anyang in Henan Province, was the site of the last capital of the Shang dynasty (sometimes known as the Yin dynasty). Occupied from about 1300 to 1045 BCE, the city was abandoned right after the Zhou people conquered the Shang. Excavation of the Yin Ruins, ongoing since 1928, reveals that it was the greatest of the Bronze Age cultures of China.

The archaeological excavations have uncovered 300,000 square meters of this site, which measure about 6 kilometers from east to west and 5 kilometers from north to south. However, its original boundary has not been defined. Architectural remains, cemeteries, and workshops have been mapped, and thousands of ritual bronze artifacts, mostly vessels, along with jades, stones, carved bones, inscribed oracle bones, and a great amount of pottery have been found. These materials have informed modern onlookers about the social organization, belief system, religious practice, science and technology, artistic invention, life styles of the people, and natural environment of the time.

Discovery and Excavation

The early period of archaeological excavation, from 1928 to 1937, was led by archaeologists Li Chi, Liang Siyong, Dong Zuobin, Shi Zhangru, and Gao Quxun of the Institute of Philology and Histology, Central Academia Sinica. They performed fifteen excavations of around 46,000 square meters and discovered the core of this site: the temple-palace complex at Xiaotun village and the royal cemetery at Houjiazhuang, along with their respective oracle inscriptions and ritual bronzes.

Excavation was resumed in 1950, and the archaeological findings continue to update our knowledge of this civilization. In 1976, the first undisturbed royal tomb, the tomb of Lady Hao, was excavated. It contained more than one thousand ritual bronzes, some seven hundred jade artifacts, and five hundred bone artifacts. Lady Hao can be clearly identified as the third queen of King Wu Ding; about two hundred pieces of oracle inscriptions talk about her as a military commander, mother, and a wife. There were rare goods and tribute goods in her tombs, which came through long-distance trade or from other nations and groups.

The bronze castings of the ritual vessels indicate the advanced technology and social organization of Lady...
Hao’s time. From mining to casting of ores and artifacts, and from design to distribution and usage, no other nation or people at the time in East Asia or nearby regions reached such an advanced level in the making and use of bronze as the Yin/Shang.

Cosmology of the Shang

With the exception of the tomb of the Lady Hao, all the large royal tombs were looted in antiquity, but the architectural form revealed by the scale and design of the tombs discloses much about the image of the cosmos as conceived by the Shang people. The tombs of eleven of the royals were about 40 square meters each. More than one thousand human sacrificial pits were well arranged in rows next to these tombs. The ramps were not functional but rather were ritualistic in their construction and in their numbers; the number of ramps indicated the social and political rank of the royals buried there. All pits contained four corners that indicated the four directions of the square-shaped universe. The design of the tombs formed a three-dimensional image that some scholars believed was the Shang people’s image of the cosmos. These spatial arrangements are consistent with square-shaped universes with upper and lower worlds that have characterized Chinese belief throughout history.

Human Sacrifice

The way human bodies were treated in the royal tombs reveals the hierarchical nature of the Shang society: gods, king, elites, commoners, slaves, and captives, in that order, from top to bottom. A thousand human sacrificial pits in a neat pattern were located next to the royal tombs. Each pit contained a group of human remains; some had only bodies while their heads were in the royal tombs. Inside the royal tombs (e.g., in tomb HPKM1001), there were remains of more than 100 human sacrifices even after the looting of the tombs. Six lacquered coffins were buried in tomb HPKM1550. These sacrifices were consorts of the king and were elaborately decorated with jade, bone hairpins, and had ritual bronzes buried with them.

An entire army with foot soldiers and chariots was buried in the southwest area of the complex, displayed as in a battlefield with center with left and right wings. Individual human sacrificial pits and sites have been excavated as well. The oracle inscriptions record activities of offerings of human sacrifice, sometimes in great numbers. Most of the human victims were healthy and handsome young men.

The Shang’s ancestors enjoyed offerings along with the gods who decided all matters of the nation, from war to harvest, from giving birth to tooth pain. The living king was a medium between the supernatural and the living worlds, and he reigned above all.

Gender Roles

The choice of sacrificial victims in Yinxu shows that gender was a complicated issue in the Shang dynasty. Both elite and common women could be buried with weapons, and men could be buried with weaving tools or even make-up. Queen Lady Hao had led the Shang army and had conquered some nations. The elite females were in charge of important rituals such as preparing oracle materials, the ceremony of harvesting, and they joined in hunting expeditions. Yet the king had many consorts, and the queens had to wait their turn to receive their offerings in death after their husbands had passed on. Women and children were not used for sacrifices until the last fifty years of Yinxu, indicating that the choice of sacrificial gifts for the gods and the ancestors was a highly selective process in the Shang dynasty.

Perspectives on Shang Culture

The Yin Ruins disclose the nature of the Shang culture, which was one of the most advanced in East Asia. Its complicated social structure, sophisticated religion, innovative art, science, and technology present a level of civilization with well-developed ideology and thought and richness of material production. Yet the ruins also hint at a dictatorial and hierarchical system with strict social, political, economic, and even spiritual boundaries.

Yin–Yang Theory

Yin–yang theory, embodying the most basic forces in nature, is an important component of Chinese philosophy, medicine, divination, and feng shui. It unites the Confucian emphasis on virtue with the Daoist emphasis on harmony with nature.

Yin–yang theory, originally referring to the shady and sunny parts of gorges and mountains, is integral to Chinese philosophy, medicine, divination, and geomancy (feng shui). The term came to embody the most basic forces in nature, such as male/female, night/day, and old/young.

First used in the fourteenth century BCE, yin–yang theory was able to unite the Confucian focus on virtue and the Daoist concern for living in harmony with nature within its naturalistic philosophy. The character yin referred to the shady, northern side of a mountain or the southern side of a gorge, and yang to the sunny, southern side of a mountain or the northern side of a gorge.

By the Spring and Autumn period (770–476 BCE) yin and yang were beginning to take on cosmological significance as two of the six forms of material force (qi), namely, shady-yin, sunny-yang, wind, rain, dark, and light. It was believed that success/health and disaster/illnesses are related to an excess or deficiency of shady-yin and sunny-yang. During the Warring States period (475–221 BCE) yin and yang began to take on a more encompassing philosophical meaning as the most basic forces and, by extension, the most general categories for classifying all things in existence. The concepts yin and yang are used as philosophical categories in the naturalistic philosophies of the Daoist texts Laozi and Zhuangzi and the Confucian book Xunzi. As philosophical categories yin and yang are understood to be two opposing yet interconnected forces; they are not a duality. Yin contains yang, and yang contains yin. When one extreme is exhausted the other force comes into play. They are similar to the negative and positive charges in the electro-magnetic spectrum. The following list depicts some of the major correlations associated with them:

Zou Yan (c. 305–240 BCE) was the founder of the yin–yang five-phases school. He associated yin and yang with the five phases (wuxing), namely, wood, fire, earth, metal, and water, creating a more dynamic explanation for the processes of change. Wood and fire are associated with yang; metal, earth, and water are yin. The five phases first appeared in the “Grand Norm” chapter of the Classic of Documents, a book comprising fifty-eight chapters with documents and records related to the ancient history of China. Rubin
Yin–Yang Theory

argues that Zou Yan transformed the static categories of the five phases into a dynamic and temporal system by connecting it to the undulating pulsations of yin and yang. Scholars debate whether Zou and his school should be classified as a naturalist philosophy or as diviners and geomancers. The yin–yang philosophy is closely related to both natural philosophy and divination because by being aware of the natural processes of change a person is in a better position to predict the future. The Annals of Lü Buwei (c. 240 BCE) contains the following passage that describes the application of the five phases theory in political philosophy.

When ever an emperor or king is about to arise, Heaven is certain to manifest good omens to the people below. At the time of the Yellow Emperor, Heaven first caused giant mole crickets and earthworms to appear. The Yellow Emperor announced, “The ethers of Earth are in ascendance.” Since the ethers of Earth were ascendant, he honored the color yellow and modeled his affairs on Earth. When it came to the time of Tang, Heaven first caused metal blades to appear coming froth from Water. Tang proclaimed, “The ethers of Metal are in ascendance.” Since the ethers of Metal were ascendant, he honored the color white and modeled his affairs on Metal. When it came to the time of King Wen, Heaven first caused a fiery-red crow to appear and alight on the altars of Zhou, holding in its beak a document written in cinnabar. King Wen proclaimed, “The ethers of Fire are in ascendance.” Since the ethers of Fire were ascendant, he honored the color vermilion and modeled his affairs on Fire. (modifying Knoblock & Riegel 2000, 283)

The preceding passage depicts the rise and fall of dynasties according to the conquest cycle of the five phases, in which water extinguishes fire, fire melts metal, metal cuts wood, wood breaks up earth, and earth obstructs water. A ruler could influence state affairs with this model by advocating that his form of government was aligned with the cosmic forces. For example, the state of Qin vanquished the house of Zhou in 256 BCE, but not until the unification of the empire, in 221 BCE, did the first emperor of Qin adopt the color black and model his affairs on water. He justified his rule by adopting the five phases theory. During the Han dynasty (206 BCE–220 CE) court officials continued to debate which one of the five phases was ascending and what color and emblem the state should institute as its model. If the natural cycles of yin, yang, and the five phases could be used to determine the rise and fall of states, then they should have application to all sorts of endeavors. During the Han dynasty yin–yang theory was used to explain natural phenomena, human activities, health, and wealth.

Besides the conquest cycle for the five phases, there is a cycle of generation in which earth grows wood, wood fuels fire, fire’s ash produces earth, earth produces metal, and metal precipitates water. During the early Han dynasty (206 BCE–220 CE) the yin–yang and five phases were expanded into a comprehensive classification system such that everything was classified as being predominantly yin or yang and further linked to one of the five phases. This comprehensive approach paved the way for yin–yang theory to influence the practice of traditional Chinese medicine, divination, and geomancy. For example, the following chart links the phases to the five colors, directions, seasons, internal organs, and numbers.
The Five Phases

Each of the five phases also correlates with any number of natural phenomena. By understanding the relationships between the five phases and other natural phenomena and whether or not the generation or destruction cycle is at work, a person can predict what phenomena will arise next. The alleged diagnostic and predictive powers of the yin–yang five phases theory naturally influenced the practice of Chinese medicine and divination.

Medicine

Traditional Chinese medicine pays close attention to environmental influences on people's health. It has always been concerned about the influences of cold/heat, damp/dry climate, and light/dark on a person's health. By the beginning of the Han dynasty when yin–yang theory was taking shape, traditional Chinese medicine was being formalized. Yin–yang theory's influence on traditional Chinese medicine is seen in the early medical texts, namely, The Spiritual Pivot and The Yellow Emperor's Classic of Internal Medicine. All health-related phenomena are associated with yin, yang, and the five phases. At conception each individual is bestowed an allotment of prenatal-energy qi, composed of yin and yang. When yin, yang, and the five phases operate in harmony there is health. Illness develops when they are imbalanced. The physiology, pathology, diagnosis, and treatment of illness in Chinese medicine are described in terms of yin–yang theory. All symptoms and physiological processes are analyzed according to the yin–yang five phases theory. There are basically four treatment modalities: to tonify yin or yang and to eliminate excess yin or yang. Chinese medicine employs the dynamic transformations of yin and yang in accounting for the processes of health and illness. As opposites yin and yang are interdependent, contain each other, and mutually consume each other. Bodily parts and structures are assigned yin–yang associations. Yin is associated with structure and yang with function. The lower extremities, interior, and front are yin. The upper extremities, exterior, and back are yang. So all of the yang channels flow through the back and begin or end at the head. The yin channels flow through the abdomen and chest and begin or end below the waist. Likewise, pathogenic factors follow the yin–yang pattern. So the upper body is affected by yang factors such as wind and summer heat. The lower body is affected by dampness and cold.

Bodily organs are also classified according to yin and yang. The yin organs store energy; the yang organs digest and excrete food to generate energy. Through the bodily openings the yang organs such as the stomach, intestines, and bladder are in contact with the exterior. Like the yang force, the yang organs are active constantly filling, emptying, and digesting food. The yin organs are tranquil and store the energy and vital substances, such as qi, blood, and other bodily fluids within the body. Because yin and yang are never separated, all organs have them. Yin correlates to an organ's structure and yang to its function. Like yin and yang, structure and function are interconnected and codependent. For example, the spleen's yang function is to transform food into blood, which is the yin structure of the spleen. Blood-and-energy qi form a bipolar relationship: Blood nourishes and moistens, like yin; energy qi is warming, protecting, and transforming, like yang. Defensive and nutritive energy follow the paradigm. Defensive energy circulates in the skin and muscles and is yang. Nutritive energy is yin, circulating in the internal organs.

Yin–yang theory forms the basic character of all symptoms and signs in Chinese medicine. The basic qualities that direct clinical practice are assigned the following correlations:

<table>
<thead>
<tr>
<th>Yin</th>
<th>Yang</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water</td>
<td>Fire</td>
</tr>
<tr>
<td>Cold</td>
<td>Hot</td>
</tr>
<tr>
<td>Quiet</td>
<td>Restless</td>
</tr>
<tr>
<td>Wet</td>
<td>Dry</td>
</tr>
<tr>
<td>Soft</td>
<td>Hard</td>
</tr>
<tr>
<td>Inhibited</td>
<td>Excited</td>
</tr>
<tr>
<td>Slow</td>
<td>Rapid</td>
</tr>
</tbody>
</table>

Water is associated with the kidneys; fire with the heart. Maintaining a balance between water and fire is most important for health. Water moistens and nourishes the body; fire heats the body and fuels the metabolic...
processes. Fire in the heart helps maintain emotional well-being. Its warming energy allows the spleen to produce blood, facilitating the small intestine's digestion and the bladder's ability to excrete fluids. The major clinical manifestations correlate as follows:

<table>
<thead>
<tr>
<th>Yin</th>
<th>Yang</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chronic disease</td>
<td>Acute disease</td>
</tr>
<tr>
<td>Gradual onset</td>
<td>Rapid onset</td>
</tr>
<tr>
<td>Lingering disease</td>
<td>Rapid changes</td>
</tr>
<tr>
<td>Cold</td>
<td>Hot</td>
</tr>
<tr>
<td>Sleepy</td>
<td>Insomnia</td>
</tr>
<tr>
<td>Likes bed covers</td>
<td>Throws off covers</td>
</tr>
<tr>
<td>Curls up</td>
<td>Lies stretched out</td>
</tr>
<tr>
<td>Pale face</td>
<td>Red face</td>
</tr>
<tr>
<td>Prefers hot drinks</td>
<td>Prefers cold drinks</td>
</tr>
<tr>
<td>Weak voice</td>
<td>Loud voice</td>
</tr>
<tr>

<td>Coarse breathing</td>
</tr>
<tr>
<td>No thirst</td>
<td>Thirst</td>
</tr>
<tr>
<td>Profuse, pale urine</td>
<td>Scanty, dark urine</td>
</tr>
<tr>
<td>Loose stools</td>
<td>Constipated</td>
</tr>
<tr>
<td>Pale tongue</td>
<td>Red tongue</td>
</tr>
<tr>
<td>Empty pulse</td>
<td>Full pulse</td>
</tr>
</tbody>
</table>

Yin–yang theory forms the foundation for an understanding of the clinical manifestations of symptoms. The yin–yang correlations must be integrated with the eight principles and the theory of internal organ patterns to be used successfully in diagnosing illnesses.

**Divination**

Divination has always played a role in Chinese culture. In the Shang dynasty (1766–1045 BCE) oracle bones were employed for this purpose. The bones were prepared and heated, and when the bone cracked, the lines were “read” for divination. The *I Ching* (*Yijing, Classic of Changes*), the Confucian text of divination, is dated to the early Zhou dynasty (1045–256 BCE). Although the terms yin and yang to do not appear within the main body of the *Classic of Changes*, the text has been interpreted according to those categories. The appendix to the *Changes* defines the dao as one yin and one yang. The method of divination developed in the *Changes* is based on symbolic images depicted by solid and broken lines. The broken line is associated with yin and the solid line with yang. The following figures depict the progression.

![Four Stages of Yin Yang](image)

The first chapter of the *Changes* is “Qian,” represented by three solid lines arranged vertically. It is associated with pure yang, heaven, and light. The second chapter of the *Changes* is “Kun,” represented by three broken lines. Kun is associated with pure yin, earth, and darkness. There are eight different possible permutations combining solid and broken lines. These are known as the “Eight Trigrams” (*Bagua*). They are combined into the sixty-four hexagrams that comprise the chapters of the *Changes*. The Eight Trigrams are typically arranged around the eight compass points, giving them a spatial orientation. The trigrams especially represent temporal changes and are correlated with the seasons, the phases of the moon, the days of the week, and the hours of the day. The traditional Chinese calendar is a hybrid of both lunar and solar calendars. The four seasons are subdivided into three moons or months consisting of three ten-day weeks. The day is divided into twelve two-hour periods. Yin and yang are associated with the year, month, week, day, and hour. These time periods are also associated with a hexagram. The time of day or the day of the week can be used to find a hexagram to determine whether that time is auspicious or not. Because yin–yang theory and the principles of divination both focus on the process of change, it is natural that the two systems merged together.

**Feng Shui: The Art of Placement**

Feng shui literally means “wind and water.” It is the ancient art, science, and magic of geomancy. It is employed in both
ancient and modern architecture. Because wind and water are two of the most powerful natural forces that shape the landscape and pose a threat to human habitation, the art of living in harmony with the forces of nature came to be referred to as feng shui. Until recently feng shui was dismissed as mere superstition and an appeal to magic. In part feng shui practices are concerned with promoting good luck and avoiding bad luck, but they also have a practical and an aesthetic aspect. Some feng shui practices have artistic appeal and are based on sound observations. Feng shui is the art of placement that promotes both aesthetic and ecological values. Modern people recognize the aesthetic value of feng shui practices, especially in arranging a Chinese-, Korean-, or Japanese-style garden. Feng shui practices promote building homes and other structures in such a manner that they take advantage of the natural surrounding, allowing natural light and heat to enter the building in the winter and cool breezes in the summer. The aesthetic and ecological advantages of feng shui have revitalized people's interest in it.

Yin–yang theory plays an important role in the ancient art of placement. Any human structure, whether it is a farm, a garden, a building, a home, or a grave, will impose itself on the natural surrounding. It will have to withstand the forces of nature and adjust to the changes of the seasons and climate, so it will have to be in harmony with those forces, which are governed by yin and yang. Daoist priests are traditionally the master practitioners of feng shui. They use a loban, or feng shui compass. The compass has a magnetic north-south needle in the center, which is surrounded by concentric circles containing other information such as the seventy-two dragon veins, the twenty-eight constellations, the 360 degrees of the compass, the sixty points of good and bad luck, the eight trigrams, the auspicious river directions, and good and bad burial positions. The eight major compass points are associated with the eight treasures as follows: Fame is associated with the south; wealth with the southeast; education with the east; children with the northeast; relationships with the north; friends with the northwest; pleasure with the west; and health with the southwest. The direction the front door of a person's home faces will determine which one of the eight treasures is most benefited in that person's life. For example, if someone seeks to improve her relationships, then she should move into a house with a front door that faces north, so that her comings and goings take her through the relationship area. Because feng shui assists people in determining the aesthetic and practical value of the art of placing objects in the home and within the natural environment, feng shui continues to inspire architects and common people.

Yin–yang theory has its roots in ancient political philosophy. Through the syncretic approach of Han dynasty philosophy, the yin–yang five phases theory was integrated into other aspects of natural philosophy, medicine, divination, and the art of placement.

Further Reading
The Yokohama Specie Bank Limited originally was a private commercial bank which became a Japanese official overseas bank in the 1890s. The bank issued and circulated Japanese military notes during Sino-Japanese war periods, and was closed in 1945 after World War II.

The Yokohama Specie Bank was established on 28 February 1880 in Yokohama, Japan, to engage in foreign trade and discount trade bills. The bank was originally private but soon became the quasi-official bank of Japan because of the capital that the Meiji (1868–1912) government had injected into the bank during its financial crisis in early years. The government also granted the Yokohama bank a charter to handle foreign exchange reserves and to issue government notes. To expand foreign trade and share the sphere of influence in China, the bank opened its first China branch in Shanghai in 1893.

In the later nineteenth century Japan used a mult-metallic currency system based on gold, silver, and copper cash. This complex currency system contributed to fluctuations in transactions of foreign trade and foreign exchange. As a result of China’s loss in the Sino-Japanese War in 1895, Japan received a large quantity of gold as war
indemnity from China and used it as reserves to establish a gold standard in 1897. As the first Japanese national overseas bank, the Yokohama Specie Bank handled transactions involving the indemnity and also used part of the gold as reserves to issue bank notes in China.

Since many Japanese firms in China conducted their business with other countries solely through the Yokohama Specie Bank, the bank gained a strong national prestige within Japan. With its privileged relationship with most Japanese trading firms and benefits from government, which included being granted a deep discount rate and low tariffs, the Yokohama Specie Bank became a strong competitor of other foreign banks in China. From 1880 to 1926 the bank’s capital increased from an initial ¥3 million to ¥100 million.

From 1893 to 1945 the Yokohama Specie Bank opened thirty-four branches in China and built a large banking and financial network, especially in northeast China. During this period the Yokohama bank acted as the Japanese central bank in issuing banknotes, which were linked with Japanese yen in the currency circulation of northeast China. In addition, this bank gained a special right to finance the construction of Manchou railways, controlled regional foreign trade, and acted as the de facto Japanese treasury to receive Maritime Customs revenue in northeast China. After the outbreak of the World War II in the Pacific in December 1941 the Yokohama Specie Bank replaced the British Hong Kong and Shanghai Banking Corporation in handling China’s Maritime Customs revenue. The bank’s major wartime financial activity was issuing military notes to finance Japanese military activities in China.

After Japan’s unconditional surrender in August 1945 the Yokohama Specie Bank was closed. It was reorganized into the Bank of Tokyo in 1947.

Yongle Dadian

Yǒnglè Dà Diǎn 永乐大典

Yongle dadian 永乐大典 is a massive, imperially-commissioned encyclopedia compiled in 1408 and composed of thousands of excerpts from all across the Chinese textual tradition. Most of the encyclopedia was destroyed in the wars of the nineteenth and early twentieth centuries.

The Yongle dadian, or Great Compendium of the Yongle Reign, was a massive literary encyclopedia completed in 1408. The work had 22,877 chapters in 11,095 volumes. The table of contents alone was sixty chapters long. In 1900 most of the last known copy of the Yongle dadian was largely destroyed in a fire started during the suppression of the Boxer Rebellion, an uprising of a Chinese secret society called Righteous and Harmonious Fists against foreign influence in trade, politics, religion, and technology. The New York Times mourned the loss as “perhaps the greatest tragedy in the history of literature,” noting that the encyclopedia was “the most colossal literary work ever carried out by man” (8 February 1914).

The Yongle dadian was commissioned at the behest of Emperor Yongle (reigned 1402–1424) shortly after he usurped the throne from his nephew, the Jianwen emperor (reigned 1398–1402). In 1403 the new emperor ordered one of his leading advisors to direct the project. A staff of 147 scholars was drafted, and the project was completed the following year. The emperor, however, was dissatisfied with the result, complaining that it was too limited in scope. He recommissioned the project on a grander scale, insisting that it include material from all philosophical, technical, and literary fields. The staff of compilers, editors, and scribes was expanded to include over two thousand scholars. When the compendium was completed in 1408, Yongle declared his satisfaction and wrote the preface for it himself, boasting of the great aid this work would be to the scholars of the empire. All the information of the world, he explained, was arranged here in topical and phonetic order.

The encyclopedia was but one of many scholarly initiatives of the court at this time. Yongle ordered several other large projects, including elaborately annotated editions of each of the Confucian Five Classics and the Four Books, a large encyclopedia of neo-Confucian terms and teachings, and the full Buddhist scriptural canon, the Tripitaka. Historians generally regard these ambitious projects as an effort by Yongle to shed his image as a violent usurper and to recast his legacy as that of a cultured and benevolent ruler. Moreover, projects such as the Yongle dadian served to enlist officials from among the wary scholar-elite of the empire.

Imperial Precedent

In commissioning the Yongle dadian and other projects, Yongle followed a longstanding imperial precedent that went back at least to the third century CE. His two Ming dynasty (1368–1644) predecessors, Hongwu (reigned 1368–1398) and Jianwen, had each initiated large compilations. However, the Yongle dadian dwarfed all precedents. The term encyclopedia understates the scope of this work because it included large excerpts from a wide range of
texts of the Chinese tradition. Several were transcribed in their entirety. Some pieces, including literary, historical, and dramatic works, have survived only because they were reconstructed or copied from the Yongle dadian.

Yongle originally intended that copies of the Yongle dadian be printed with woodblocks and distributed to various parts of the empire for educational purposes. But this elaborate plan was later abandoned, possibly because the imperial treasuries had been strained by Yongle’s other projects. The compendium was kept at the palace at Nanjing and moved to Beijing along with rest of the imperial library when Yongle relocated his capital to the north. (Some sources say an additional copy was kept in Nanjing.) The Yongle dadian remained on the palace grounds and apparently saw little use in the decades that followed. In 1562 it was nearly destroyed by a fire that engulfed several palace buildings. In response, the Jiajing emperor (reigned 1521–1567) ordered that two copies be made of the original manuscript. (Some scholars say only one copy was made.) This endeavor took five years, supervised by high court officials with a staff of 108 scholars. The original volumes were sent back to the southern Ming capital at Nanjing, while the two copies were kept in Beijing.

The Nanjing copy and one of the Beijing copies are believed to have been destroyed when the Ming dynasty fell in 1644. By the late eighteenth century only one dilapidated copy remained, with some sections missing. Some scholars have speculated that the original edition of the encyclopedia still survives in some hidden location. One theory is that this edition was entombed with the Jiajing emperor when he died in 1567.

Reconstruction

No subsequent Ming emperor attempted to emulate Yongle’s ambitious project, but emperors of the early Qing dynasty (1644–1912) did. The Kangxi emperor (reigned 1662–1722) ordered two ambitious encyclopedic projects, although neither attained the scope of the Yongle dadian. In the late eighteenth century the Qianlong emperor
(reigned 1736–1795) ordered his officials to comb through Yongle’s encyclopedia to reconstruct texts that had been lost in the intervening centuries. Several hundred previously missing works were partially or completely reconstructed.

In 1900 the Yongle dadian was located in the scholarly halls of the Hanlin Academy near the British Legation and other foreign embassies. That summer as Western armies battled against Chinese forces of the Boxer Rebellion, the buildings of the academy caught on fire, destroying most of the library and nearly all of the Yongle dadian. Approximately 400 of the original 11,095 volumes survived. In the ensuing chaotic years individual pages and volumes of the encyclopedia found their way into private hands, and many were eventually acquired by foreigners. Hence, many of the surviving sections of the Yongle dadian are now held outside of China in Europe, the United States, and Japan. (Russia and East Germany returned their volumes in the 1950s.) Two hundred twenty-one of the surviving volumes are currently held in China, sixty of which are in Taiwan.

Various portions of the surviving volumes have been reprinted in modern editions. Several scholars have called for a return of the original volumes of the Yongle dadian to China, arguing that with the reprinted editions now available to researchers, there is no reason not to return the originals to their country of origin. In 2001 the National Central Library in Beijing began to digitize the entire surviving corpus of the encyclopedia, calling for the cooperation of holders of volumes around the globe.

Yongle, Emperor (ZHU Di)

Yǒnglè Huángdì (Zhū Dì) 永乐皇帝 (朱棣)

1360–1424 Ming dynasty emperor

Zhu Di 朱棣, son of the founder of the Ming dynasty, usurped the throne from his nephew in 1402 to become the Yongle emperor. During his reign he extended the power and influence of the dynasty, commissioned naval expeditions to the Indian Ocean, moved the imperial capital to Beijing, and oversaw important scholarly enterprises.

Zhu Di (reigned 1402–1424) was the son of the Hongwu emperor (reigned 1368–1398), who founded the Ming dynasty (1368–1644). Zhu, usurping the throne from his nephew, the Jianwen emperor (reigned 1398–1402), became one of the most powerful and effective emperors of the dynasty. Under his reign the empire became stabilized after the tumultuous early years of the dynasty. As a powerful military leader, Zhu Di oversaw the consolidation and expansion of Ming power.

Zhu Di claimed to be the fourth son of the founder by his primary wife, Empress Ma (1332–1382). Some later sources rumored that Zhu Di was a son by a concubine, perhaps from Korea or Mongolia. As a youth, Zhu Di was known for his military prowess, and his father entrusted him with the strategic northern fiefdom of Yan, the ancient name for the Beijing region. Zhu Di took up his post as the prince of Yan in 1380 when he was twenty years old, participating in successful military campaigns against the Mongols in 1381, 1390, and 1396.

In 1399, suspicious of the Jianwen emperor and covetous of the throne, the prince of Yan launched a civil war against his nephew. He claimed that the court had fallen prey to evil advisors and that his intervention to “quell the difficulties” was in accord with the wishes of the founder. Zhu Di’s superior military leadership and well-trained troops defeated the imperial forces, leading to the capture of the Jianwen emperor.

of Nanjing, where the Jianwen emperor apparently died in the burning palace (although rumors persisted that he had miraculously escaped).

After the bloody civil war Zhu Di ascended the throne, declaring his reign “Yongle” (Everlasting Happiness). Seeking to consolidate his rule and restore order to the realm, he restored the civil service examination system and recruited large numbers of scholars to work on several ambitious literary projects, including the giant encyclopedia, the *Yongle dadian* (Great Compendium of the Yongle Reign), comprehensive editions of the Confucian canon (the Five Classics and the Four Books), a large anthology of neo-Confucian terms and teachings, and the entire Buddhist canon (the Tripitaka).

The Yongle emperor had grand imperial pretensions far beyond those of his predecessors. He launched military campaigns against the Mongols to the north and affirmed the northern power of the dynasty by moving the imperial capital from Nanjing to Beijing, where he built an imposing imperial complex (the Forbidden City). To the south he sought to extend Ming military and political control over Vietnam. His most celebrated initiative was the series of voyages in the Indian Ocean from 1405 to 1433, led by the eunuch Zheng He. These expeditions asserted Ming military and economic power as far as the Persian Gulf and the coast of Africa.

Upon his death in 1424 Zhu Di was canonized with the posthumous title of Taizong (Grand Ancestor), a standard title for the second emperor of a dynasty, once again officially bypassing the Jianwen reign. In 1537 the Jiajing emperor (1521–1567) changed Zhu's posthumous title to Chengzu (Accomplished Progenitor) in recognition of his importance in the consolidation of the dynasty.

Yu Boya and Zhong Ziqi

The Chinese call a close, sympathetic friend *zhiyin* (knowing the sound) or “one who truly appreciates the tune played by another.” This is an allusion to a legend about two friends named Yu Boya and Zhong Ziqi.

Yu Boya refers to the actual famed musician Bo Ya who lived in the State of Chu during the Spring and Autumn Period (770–476 BCE). He demonstrated a great musical talent at an early age and later became a student of a great master *zheng* player named Cheng Lian. *Zheng* is a traditional Chinese stringed instrument of the zither family. Even though he excelled at all the techniques Master Cheng could teach him, Yu Boya was still unsatisfied, because he felt unable to express his feelings when he played. Seeing this, Cheng Lian offered to take him to his own master, who lived on an island in the East China Sea. Once there, Cheng Lian asked Yu Boya to wait for his master; he promised to pick up Yu Boya when he was done. Days passed, however, without a sign of either Cheng Lian or Cheng’s master. Now Yu Boya’s only companions were the birds singing in the forest. Their

This man plays a *zheng*, the instrument Yu Boya played to his friend Zhong Ziqi during the Spring and Autumn period (770–476 BCE). PHOTO BY PAUL AND BERNICE NOLL.
songs, with the backdrop of the pounding waves, sounded as melancholy as he felt. This struck a chord in his heart; with a sigh, Yu Boya began to pluck his zheng, and it produced the soul-stirring music he had been seeking all along. In fact, this was just what Master Cheng Lian had planned. Later, people observed that Yu Boya played so well that "even horses eating at their troughs would raise their heads and listen" (Zhu, 1998). Nevertheless, he still was not satisfied because he felt that no one really understood the beautiful music he could play.

One day, Yu Boya was traveling on a riverboat when it began to rain. He had to seek shelter at the foot of a mountain. Watching the downpour as it beat on the heaving waters of the river, Yu Boya felt the urge to play a tune in response. He was indulging himself with the emotions that his beautiful music had created when a string on his zheng snapped. Yu Boya raised his head and caught sight of a woodchopper sitting on the bank. The man, Zhong Ziqi by name, had been listening to Yu’s music so attentively that he was even oblivious of the rain. Deeply touched, Yu Boya invited Zhong Ziqi to his boat so he could share his music with him. As soon as Yu Boya finished a tune he had named in his own mind “High Mountains,” Zhong Ziqi told him, unaware of Yu Boya’s unstated title for the song, that the melody painted a picture of unbroken mountain ranges in his mind. Then, after Yu Boya performed another tune he intended to call “Flowing Waters,” Zhong Ziqi commented that it seemed as if he had heard the torrent of the Yangzi (Chang) River while listening to the song. Seeing his zhiyin in front of him, Yu Boya’s joy was boundless. Instantly they became avowed friends. Before parting, they agreed to meet again in the near future.

A few years later, Yu Boya decided to pay Zhong Ziqi a visit. Unfortunately, when he arrived at his home, he learned that Zhong Ziqi had already passed away. Yu Boya was filled with sorrow, lamenting that no one in this world would ever appreciate his music like Zhong Ziqi. Rushing to his friend’s tomb, Yu Boya knelt down and started playing his zheng. Then, rising slowly, he crashed it to the ground. After that day, not a single tune ever came out of Yu Boya’s skillful hands again.

Yuan Drama

Growing out of a largely anonymous performance and ritual tradition of the Song and Jin periods, Yuan drama matured into a recognizable artistic form. During this first golden age of Chinese song-drama (1279–1368), individual actresses and actors, playwrights, and critics perfected performance conventions, scripts, and aesthetic criteria.

The Yuan dynasty (1279–1368) is generally regarded as the first golden age of traditional Chinese song-drama, particularly with regard to the theatrical form commonly known as “Northern-style zaju drama.” Drama became significant enough as an aesthetic form for urban communities and their participants—authors, performers, critics, patrons—to acknowledge their contributions to the world of theater. The names of approximately one hundred zaju authors and the titles of more than six hundred plays attributed to them are known to us today. Similarly, the names, and in some rare cases the likenesses of individual zaju actors and actresses, have been transmitted through visual, poetic, and documentary sources produced by patrons, scholar-officials, other playwrights, and drama connoisseurs. In addition, a number of critics developed explicit formal criteria to evaluate the authors, the performers, and the stylistic characteristics of song-drama as well as the musically related form known as sanqu songs. Finally, the libretti of at least thirty zaju song-dramas were considered aesthetically important and linguistically demanding enough to be printed as early as the first half of the fourteenth century, thus providing us with some of the earliest texts in the Asian theatrical repertoire.

History of the Form

All the impressive firsts of Yuan dynasty zaju, notwithstanding, zaju evolved over the course of at least two hundred years before becoming a literary medium for playwrights and a star vehicle for performers. In the mid-twelfth century contemporary observers reminisced about the large commercial theaters operating in the capital of the Northern Song dynasty (960–1126), Kaifeng (modern Kaifeng), where comic duos (fumo and fujing) together with a leading man (moni) and an official (zhuanggu) role type offered humorous fare then known as “variety plays” (zaju). These same diarists also mentioned that various entertainments were enacted on permanent open-air stages attached to temples as well as on temporary stages erected for particular holidays. In the context of a Buddhist-inspired All Souls Festival the title of a particular zaju play, the Buddhist salvation story of Mulian Rescues His Mother [from Hell], first appeared. The tale was subsequently adopted into the Yuan zaju repertoire and remains a staple of certain regional operas to this day.

When in the 1130s the Jurchen Jin dynasty (1115–1234) assumed control over the heartland of early zaju performances (modern-day Henan, Shanxi, and Shaanxi provinces), the development of zaju continued unabated, partly because Jurchens had a strong song-and-dance tradition of their own and partly because the Jin court selectively
adopted Song institutions as well as Chinese literary culture more generally. Not only do later lists of comic skits about everyday life and of stories about historical figures, romance, and religions suggest a rich urban repertoire performed in the new capital of Yanjing (present-day Beijing), but also Jin dynasty stages found in smaller towns around Henan, Shanxi, and Shaanxi provinces suggest that \textit{zaju} performance was a common feature of rural life. Furthermore, judging both from extant stages and from the replicas of stages and performers unearthed from Jin dynasty tombs, conventions of \textit{zaju} performance were moving toward a specialized theatrical stage and the role system of a main female or male lead (\textit{zhengdan} and \textit{zhengmo}), both of which would become hallmarks of mature Yuan drama. Moreover, the popularity of the musically innovative Jin dynasty \textit{chantefable} genre known as “All Keys and Modes” (\textit{zhugongdiao}) coincided with the final stage of the maturation of Yuan drama. Rather than simply repeating identical tunes patterns, “All Keys and Modes” welded together several melodies into song-sets, a feature that would be developed into song-suites set to different musical modes in Yuan \textit{zaju} plays.

The Mongol defeat of the Jin in 1233 and of the Southern Song dynasty (1127–1279) did not disrupt but rather furthered the evolution of song-drama in the old capitals as well as the hinterland. The new Yuan capital, Dadu (modern Beijing), was located in the same city as the Jurchen capital of Yanjing. Not surprisingly perhaps, Dadu was the initial urban epicenter of the synthesis of the theatrical, musical, and authorial developments begun under the Song and the Jin dynasties. Most of the early dramatists hailed from Dadu, including the reputed progenitor
of the genre of Yuan zaju, Guan Hanqing. However, the move of the Song court to Lin’an (modern-day Hangzhou), the capital of the Southern Song dynasty, had helped old-style zaju find a new home in the south in the 1100s, and hence mature Yuan zaju quickly took hold in the former Southern Song capital as well, with many of the later Yuan dramatists such as Zheng Guangzu being active in Hangzhou.

**Form of Yuan Zaju**

**Song-Drama**

In its mature form Yuan zaju typically consisted of a melodic sequence of songs set to different musical modes, which musically delineated four distinct acts. Occasionally the four-act format was expanded with short melodic prologues or interludes known as “wedges.” In rare cases such as the cross-culturally famous *The Orphan of the House of Zhao* (*Zhaoshi gu’er*), Yuan zaju were comprised of five rather than the standard four acts. With five books consisting of four acts each, the famous love comedy *The Story of the Western Wing* (*Xixiang ji*) adhered to the conventions of both the short zaju and the much longer chuanqi form. In general, each song-suite accommodated different sets of melodies, which were said to have connoted different emotive timbres. All songs were sung by a single role type, the main female (*zhengdan*) or male lead (*zhengmo*), the story’s central locus of emotion. In most cases a single character occupied that role type, but in rare instances two characters assumed the role of the singing lead. In the exceptional *The Story of the Western Wing*, a set of four acts was principally sung by the same role, but the lead role varied across the five books of the play.

The arias alternated with dialogue spoken by all parties. The language of the arias blended both classical...
allusions and colloquial elements, which earned the genre the characterization of “being neither excessively formal nor vulgar” (buwen busu). In Yuan-printed texts the dialogue was sketchy rather than fully elaborated, implying that performers may have improvised those segments or that audiences needed no reading aids to follow the spoken parts. By contrast, extant Ming dynasty (1368–1644) versions of Yuan drama greatly expanded the dialogue and added set poetic recitation pieces. In Selections of Yuan Plays (Yuanqu xuan, also known as One Hundred Yuan Plays, Yuanren baizhong qu, 1615/16), Zang Maoxun (1550–1620) fleshed out the dialogue and edited the arias to create the definitive reading text for “Yuan drama.” Cleverly claiming that the Yuan court selected the highest echelon of examination candidates through the writing of arias, Zang provided a new sheen of literary respectability for song-drama in general.

Authors and Themes

The bulk of individually attributable Chinese literature written prior to the Yuan dynasty originated with scholar-officials or aristocrats. By contrast, Yuan zaju was the first major body of Chinese texts to have been primarily written by relatively well-educated professional authors. Zhou Deqing (flourished 1330), the most influential contemporaneous critic, singled out Guan Hanqing, Zheng Guangzu, Bai Pu, and Ma Zhiyuan as particularly accomplished, a judgment that, with the addition of Wang Shifu, has largely withstood the vagaries of time.

Within a corpus of more than sixty known titles, Guan Hanqing was, despite the uncorroborated claim to a minor post, the professional author par excellence. The subject matter of his plays ranged widely, covering all social registers and moving from uproarious comedy to deeply felt grief. Guan’s plays reworked both well-known and untapped tales about lovorn emperors and heartbroken consorts; turned biographical bits about generals, scholar-officials, and young girls into alternately heart-rending and didactic stories such as The Jade Mirror Stand (Yujing tai); adapted episodes from the well-known The Records of the Three Kingdoms to turn them into heroic or melancholy pieces; fashioned innovative romantic plots with few or no known precedents into vehicles for clever courtesans, maids, and widows such as Rescuing a Coquette (Jiufengchen). In the Yuan dynasty other playwrights adopted the nicknames “Little Hanqing” and “Southern Hanqing,” attesting to Guan Hanqing’s standing as Yuan zaju’s foundational author. In the twentieth century The Injustice to Dou E (Dou E yuan) was singled out and came to exemplify Guan’s excellence as a writer of the then newly sinicized genre of tragedy.

Pai Pu (1226–c. 1280) ranked among the few known literati authors of Yuan drama. Hailing from Shanxi Province, Pai Pu’s father, Bai Hua, had passed the highest examinations during the Jin dynasty, an honor that earned him a biography in the official History of the Jin. After the fall of the dynasty the family fell on hard times but eventually settled in Nanjing. Bai’s song lyrics alluded to his longing for the old dynasty; given the extant attributions, his plays for the most part dealt with romance. Most famous among these was Rain on the Pawlownia Tree (Wutongyu), one of the few extant song-dramas that survived the Ming dynasty prohibition on the imperial figures in zaju texts and performance. Rain empathetically told the well-known story of Tang emperor Xuanzong’s loss of his favorite consort, Yang Guifei, to political necessity from the point of view of the heartbroken emperor.

A native of Dadu, Ma Zhiyuan, may have served as a minor functionary, according to one source, but according to another, he was a member of a professional writing association. The rather bleak outlook of his songs and of his plays certainly seemed in tune with the often resentfully satirical tone associated with the Southern xiwen plays produced by writing guilds. Ma adapted famous episodes from the dynastic histories and from the annals of poetry to conjure melancholy meditations on loss, most notably in Autumn in the Han Palace (Hangongqiu) and Tears on the Official’s Gown (Qingshan leiq). Ma is equally well known for his Dao-inspired deliverance plays that tout the rewards of renunciation in the face of an intracable and futile quest for success. Ma adopted the official patriarch of a newly popular school of Quanzhen Daoism, Lü Dongbin, as the hero of two of his deliverance plays, The Yueyang Tower (Yueyanglou) and The Yellow Millet Dream (Huangliangmeng).

Another native of Dadu, Wang Shifu, made his name largely as the author of The Story of the Western Wing (Xixiang ji), the most widely reproduced love comedy in the Chinese corpus. When literary critic Jin Shengtan (1608–1661) created an alternative, quasi-modern
canon of six literary works called “books of genius,” he included a highly idiosyncratic version of Wang’s *Story* as the “Sixth Book of Genius.” The many successive reprints and versions of Jin’s version of *The Story of the Western Wing*, together with Zang Maoxun’s *One Hundred Yuan Plays*, ensured that Yuan *zaju* continued to be widely disseminated as reading material long after the end of the Yuan dynasty.

**Modern Impact**

Although the musical form of Yuan *zaju* drama gradually died out in the sixteenth century, Ming dynasty playwrights such as Tang Xianzu (1550–1616) drew ideas from Yuan drama, and many of the stories from the Yuan corpus, such as *The Butterfly Lovers*, found their way into the regional operas of the Qing dynasty (1644–1912). Among the earliest Chinese dramatic forms to be introduced to Japan, *Xixiang ji* was translated into Japanese in the early 1800s. European translations of Yuan *zaju* plays inspired famous plays by the French writer Voltaire (1694–1778) and the German dramatist Bertolt Brecht (1898–1956). Because of the modern academic study of Yuan drama by influential scholars such as Wang Guowei (1877–1927) and Wu Mei (1883–1939), many important modern Chinese playwrights such as Guo Moruo (1892–1978) and Tian Han (1898–1968) seized upon plays in Zang Maoxun’s anthology and other Yuan dramas to address modern cultural concerns such as marriage reform. More recently other Chinese playwrights have staged Chinese and Western versions of Yuan drama side-by-side to offer political commentary. Thus, the legacy of Yuan drama continues to evolve at the crossroads of Chinese and world theater.

**Dui niú tán qín**
In the late thirteenth century the Mongols, nomadic invaders from Central Asia, conquered China. During their rule as the Yuan dynasty the Mongols borrowed extensively from other traditions, creating a uniquely multicultural political and cultural environment. While many aspects of Mongolian rule over China vanished with the dynasty in 1368, some political, military and social features survived and influenced succeeding dynasties.

The Yuan dynasty (1279–1368) marked the first era in Chinese history in which Central Asian invaders succeeded in conquering all of China territorially. Mongolian tribes, reorganized into military units by the famed conqueror Chinggis Khan (also known as Genghis Khan, 1162–1227), descended upon China in repeated campaigns from the early years of the thirteenth century until the conquest process ended with the collapse of the Southern Song dynasty (1127–1279) under Chinggis’s grandson, Khubilai Khan (1215–1294). North China had been ruled by other invaders from the north (first the Khitans, then the Jurchens) from 916 to 1234, but the Mongols were the first outsiders to conquer and reunify all of China.

After Chinggis Khan’s death, his heirs carved out separate imperial domains (khanates) that, while connected by trade and diplomacy, evolved into independent geopolitical units. In addition to the Yuan dynasty in China, these units consisted of the Il-Khan dynasty in Persia, the Golden Horde in Russia, and the Chagatai khanate in Central Asia. The Yuan dynasty in China was directly ruled by a branch of Chinggis Khan’s descendants who were based in the Yuan capital city of Daidu (modern Beijing). As such, the Yuan dynasty was an independent polity that was governed quite differently from the other Mongolian-ruled polities in Eurasia.

The Mongols as Rulers of China

After the fall of the Yuan dynasty the new Ming rulers of China castigated the Mongols for their inattention to the welfare of the people and for their abuses of privilege. The Mongols, in fact, did rule China differently than previous dynasties had. As a pastoral nomadic people, they relied on their traditional emphasis on military values and hereditary transmission of office. Yet the Mongols also adapted many preexisting Chinese institutions to facilitate their rule. The structure of the Yuan civilian bureaucracy fit the traditional Chinese mold to a high degree, but the fact that Mongols and Western and Central Asians (Turks, Uygurs, Persians, and others) held the higher-level positions meant that many Chinese scholars, accustomed to the status derived from government service, felt disenfranchised.

The Yuan rulers did not allow the traditional Chinese civil examination system, which had determined who entered into the civilian bureaucracy in previous centuries, to function until 1315; even then it was a minor source of recruitment. The Mongolian emphasis on heredity and the primacy given to the military sphere over the civilian
sphere made government service less accessible and even unpalatable for many Chinese.

However, the Chinese viewed the Yuan dynasty as a legitimate dynasty that had won the Mandate of Heaven and had reunified the empire. Khubilai Khan was largely responsible for winning Chinese acceptance of Mongolian rule. In 1272, Khubilai gave the dynasty its Chinese name, Yuan, and employed several prominent Chinese scholars as advisers at his court in Daidu (Dadu). Khubilai also selected this site (modern-day Beijing) in 1260 as the dynasty’s capital, thereby moving the symbolic center of Mongolian rule from Mongolia into China proper.

Khubilai also employed Tibetan Buddhist monks and Central Asian Muslim financiers as his court advisers. A multiethnic, multilingual entourage gave the Yuan court a cosmopolitan aura. Yet, from the point of view of contemporary Chinese observers, the Tibetans at the Yuan court were seen as arrogantly interfering with the administration of justice and claiming privileged status for themselves; Muslim financial advisers were criticized for imposing too severe a tax burden on the Chinese people and were accused of usury and embezzlement. While such criticisms may have been exacerbated by the factions at the Yuan court, it is true that the Tibetans and Central Asians rarely displayed any philosophical interest in Confucianism and its values of frugality and loyal, selfless service to one’s ruler. Tensions ran high among the different ethnic groups that served the Yuan court during Khubilai’s reign and in later Yuan times.
Culture and Society

Blocked from government service and alienated from their Mongolian rulers, some Chinese literati turned to the arts as an outlet for their untapped energies and talents. Popular drama, a genre that had existed in China for at least two centuries prior to the Mongolian invasion, benefited from the elite’s participation in the writing of new plays. Displaced from their usual roles as scholar-officials, the Chinese elite developed Yuan drama, known as zaju, which exposed social problems of the era, thus allowing modern readers precious insights into everyday life. At least 160 Yuan plays are extant. The Yuan era also produced many great Chinese painters, some of whom, like Zhao Mengfu (1254–1322), served the Yuan court in official capacities. Since the Yuan rulers for the most part did not scrutinize or censor artistic themes, Chinese painting of this era flourished both stylistically and thematically, one example being the new focus on horse painting.

While Confucianism as a philosophy and way of life was never directly threatened with suppression by the Mongolian rulers of China, competing philosophies were encouraged in the Yuan period. Uygurs reintroduced Islam, Tibetans promoted Buddhism, and Central Asian monks revived Nestorian Christianity. The Mongol rulers practiced religious toleration in China and elsewhere throughout Eurasia; they exempted the clergy of all religions from taxation and from military conscription. As long as clerics did not foment or support anti-Mongolian sentiments, their churches, temples, and mosques were left untouched. In spite of the coexistence of a variety of religions in China in the thirteenth and fourteenth centuries, however, the Chinese elite remained strongly bonded to their own Confucian tradition. Overall during the Yuan, Confucianism, Daoism, Buddhism, Islam, and the Mongols’ own shamanistic beliefs managed to weather the inevitable strains and mutual antagonisms of a multiethnic empire, giving the Yuan a rather unique cultural profile in Chinese history.

Trade, Transport, and the Economy

The Mongols, like other pastoral nomadic peoples of Eurasia, saw trade with neighboring sedentary peoples as an acceptable method to obtain needed goods to supplement the products of their own economy. Trade and raids co-existed in the frontier history of China and Central Asia. Chinggis Khan had employed Muslim merchants in long-distance trading ventures as early as 1218 in western Central Asia. By the generation of his grandson, Kubilai, the Yuan imperial family was experienced in world trade. Investing silver in Central Asian Muslim merchant companies that financed trade caravans to distant lands and loaned funds within China at usurious rates, Kubilai and his successors reaped enormous profits. Maritime trade also flourished in Yuan times, and the government treasury was enriched by trade taxes.

Within China itself, trade and communications were facilitated by the more than 1,400 government postal stations which allowed authorized officials and merchants to cover great distances in a short span of time, with fresh mounts supplied at each station. Using some 3 million conscripted laborers and an enormous expenditure of government funds, Kubilai Khan extended the Grand Canal so that grain from the Yangzi (Chang) River region could be shipped north to the Yuan capital at Daidu. Both land and inland waterway transport routes were improved in the Yuan era.

Paper currency had been in circulation to varying degrees in China before the Yuan dynasty, but during Kubilai Khan’s reign it became more widespread than ever. Taxes were paid in paper money, and merchants saw the advantages of the new currency. The Yuan court, however, never completely resisted the temptation to print more money when revenue demands generated by military campaigns of expansion and by fiscal mismanagement arose. Ultimately, inflation was one of the economic factors that contributed to the collapse of the dynasty in 1368.

Decline

During Kubilai’s reign, the Mongols continued their campaigns outward from China, successfully subjugating Korea. Their naval attacks upon Japan in 1274 and 1281, however, were defeated. Mongolian military expeditions into Southeast Asia in the 1270s and 1280s also met stiff resistance. After Kubilai’s reign, the Yuan rulers abandoned further expansionist campaigns. The
dynasty fell into decline during the course of the fourteenth century because the once-powerful military could not suppress widespread popular revolts after 1350. The last decades of the Yuan dynasty were marred by major floods, droughts, and epidemics, creating a confluence of natural disasters that would have undermined any dynasty, whether foreign or Chinese in origin. The Mongols fled their capital city of Daidu and returned to Mongolia in 1368, escaping before the arrival of the armies of Zhu Yuanzhang, a rebel leader who founded the Ming dynasty (1368–1644). Although a short-lived dynasty, the Yuan left a strong imprint upon Chinese society, military practices, and politics as evidenced by the post-Yuan continuation of hereditary household occupational registration, the continuation of aspects of military organization, and ultimately an expanded notion of what constituted “China” territorially.

Ruthlessness is key to a man's accomplishment.

无毒不丈夫

Wú dú bú zhàng fu
Yuan Shikai became the first president of the Chinese Republic in 1913 at the behest of both the Qing court and the provisional government. By 1915 he had become the supreme dictator, dissolving parliament and outlawing the Nationalist Party. But for rebellion in the southern provinces, Yuan would have had himself declared emperor before his death in 1916.

Yuan Shikai 袁世凯 was born in 1859 in Xiangcheng, Henan Province, and was adopted. He joined the Qing army in 1880, and from 1885 to 1894 he was the Chinese commissioner of commerce in Korea. He was appointed governor of Shandong Province in 1899, where he suppressed the Boxer Rebellion. In 1901 Yuan Shikai was made governor-general of Zhili Province and the high commissioner for the Northern Ocean (Beiyang Dachen), a position which put him in charge of foreign and military affairs in North China. He directed various reform programs from 1901 to 1908, including the establishment of a modern army, the creation of military schools, the organization of the police system, and the inauguration of modern industry.

With the outbreak of the revolution in 1911, Yuan was placed in charge of the Imperial troops and of negotiations with the revolutionaries, a position of immense military power. He used his position to promote his own interests by clever manipulation of the negotiations, and, as a result, both the Qing court and the provisional government of the Chinese Republic appointed Yuan the president of the first Chinese Republic in February 1912. He assumed the formal presidency in 1913, and in the next two years he outlawed the Nationalist Party, dissolved the parliament, and attained dictatorial control. Yuan prepared to assume the title of emperor in late 1915, announcing that his imperial title, Hong Xian, would be used beginning 1 January 1916.
1916. But southern provinces rebelled, and the ceremony was cancelled. He died of natural causes on 6 June 1916. Yuan Shikai’s military might and political prowess during the formative transition between the Qing dynasty and the Republic of China have established his sometimes controversial position in Chinese history.

CHEN Shiwei

**Yuan Shikai’s Work**

Of the many reform programs led by Yuan Shikai, the reorganization of the indigenous banking industry in Tianjin proved to be particularly difficult, though successful in the end.

When Yuan Shikai took over administration of Tianjin from the foreigners in 1902, he immediately moved to prohibit the discounting of paper currency issued by indigenous banks. This resulted in a second round of failures. Between 1900 and 1902, 90 percent of Tianjin’s three hundred indigenous banks closed. With the indigenous bank industry in ruins, Yuan was left with the task of creating his own financial institutions. Together with Zhou Xuexi and Sun Duoxin, Yuan founded the Tianjin Mint (Yinyuan Ju), which turned out a new eight of copper coin based on the yuan, not the tael. Machine-minted, the new copper coins were difficult to forge or debase, and thus found wide acceptance, making a substantial profit.

Yuanming Yuan, Ruins of
Yuánmíngyuán fèixū 圆明园废墟

A famous imperial park outside of Beijing, Yuanming Yuan is known for its expansive compound of gardens, lakes, and temples. While once a truly beautiful Summer Palace for the Qing court, damages incurred during the Boxer Rebellion and the Cultural Revolution have left much of Yuanming Yuan in ruins.

Thanks to its well-documented and tragic history, the Summer Palace Yuanming Yuan (Garden of Perfect Brightness) is one of the most famous imperial parks worldwide. This vast complex of gardens, lakes, pavilions, temples, and hills is located only 10 kilometers from the walls of Beijing in Haidian, in the vicinity of the prestigious Peking and Qinghua universities. Since this was the preferred residence of five Qing emperors, Chinese historians have viewed the founding, enlargement, and destruction of the palatial complex as an illustration of the growth, extravagance, and decline of the Qing dynasty (1644–1912).

The name “Summer Palace” is misleading because until 1820 the Qing court spent most of the summer away from Beijing, in the cooler hills of Chengde. Yuanming Yuan became known in Europe in 1743 when a Jesuit
missionary employed at Qianlong’s court, the painter Jean-Denis Attiret, mailed an account of his visit in a letter to his correspondent in Paris. His description of the beauty of Chinese items and themes in the gardens helped change the history of landscape design and the design of contemporary European gardens. Parks in the Yuanming Yuan complex include the parks of the Kangxi emperor (1654–1722) and the Qianlong emperor (1711–1799), and Yihe Yuan (Garden of Concord and Peace), renamed by the Cixi dowager empress (1835–1908) in 1888. Xiyang Lou is a European baroque-style section that Qianlong commissioned in the northeast corner of his residence. Cixi decided to restore the western park of the Summer Palace after a French-British military expedition plundered and burnt to the ground the entire complex during the Second Opium War (1856–1960). Within its present limits, Cixi’s Yihe Yuan consists of Kunming Lake and Wanshou Hill, whose massive Buddhist temple dominates the site.

The Summer Palace was further damaged during the Boxer Rebellion (1899–1901) and the Cultural Revolution (1966–1976). Kangxi and Qianlong’s gardens in Yuanming Yuan have not been rebuilt because the Chinese government wants to preserve the site as a symbol of the depredations of foreign imperialism and as a reminder of the humiliations the Qing monarchs brought to China. The Summer Palace is on the United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage List, and the melancholic ruins and ponds of Yuanming Yuan and the placid waters of Kunming Lake in Yihe Yuan attract today nearly as many domestic and foreign tourists as the Forbidden City does.

YUNG Wing ▶
Yung Wing was the first Chinese person to graduate from an American university (Yale, class of 1854). Enthusiastic about his education, he persuaded the Qing government to send the Chinese Educational Mission to preparatory schools and colleges in the United States (1872–1881). He also championed the cause of better treatment of Chinese overseas laborers.

Yung Wing 容闳，(also known as Rong Hong) the first Chinese to graduate from a North American college (Yale, 1854), was born into a farming family in the village of Namping, Guangdong Province, now part of the south Chinese city of Zhuhai. The village was only a few miles from the Portuguese colony of Macao, and at the age of seven Yung Wing became the youngest pupil in its foreign-run school. After the First Opium War (1839–1842) the school, now the Morrison Education Society School, moved to Britain’s newly acquired colony, Hong Kong. This early start gave Yung a remarkable fluency in English, part of the explanation for the achievements of his later life.

In Hong Kong, when a missionary teacher sought student volunteers to take back to the United States, Yung’s autobiography recalled, “I was the first one on my feet!” (Yung 1909, 18) He sailed for the United States in January 1847, his destination being Monson Academy in Massachusetts, where he spent three years on English-language skills and the Latin, Greek, and mathematics required for college entrance. He began his freshman year at Yale in 1850. Finances were a problem. Funding was available provided that after graduation he would return to China as a missionary, but although he had become an enthusiastic Christian, he declined, deciding: “I wanted the utmost freedom of action to avail myself of every opportunity to do the greatest good in China …. (Yung 1909, 35–36). He found others willing to help him and took paid jobs waiting tables, singing in the choir, and working in the library.

Yung Wing was so delighted with his Yale experience that he appealed to the Chinese government to replicate it for other Chinese boys. In 1871 the government organized the Chinese Educational Mission to the United States, with a preparatory school in Shanghai and competitive examinations. The plan was for students to remain in the United States for fifteen years, first studying English in southern New England homes, where they were lodged, then attending local grammar and high schools, and finally entering U.S. colleges, preferably to gain an education in technical subjects that would be useful in public service. Over the course of four years the program sent 120 boys in four groups of thirty. Although China recalled the students after only nine years, some had already received a good education. Mission members later became well known in China: One was foreign minister, another served as prime minister in the new republic, and one became the first Chinese to direct a railroad-building project in China; such projects had before than been directed by Westerners.

Midway in supervising the mission students, Yung Wing was appointed deputy at the newly opened Chinese legation in Washington, D.C. The duties of this post soon involved an investigation of the treatment of Chinese laborers in Peru and Cuba. In Peru Yung surreptitiously
photographed the whiplash marks on the backs of Chinese workers. The eventual report provoked China into ending the infamous coolie trade.

In 1876 Yung Wing married a U.S. citizen, Mary Louise Kellogg. They had two sons. His final years were devoted to writing his autobiography. He died in Hartford, Connecticut.

Yungang Caves

Yúngāng Shíkù 云岗石窟

The cave temples at Yungang date to the fifth and sixth centuries and are considered the earliest surviving Buddhist monuments in China. The forty-five extant caves that stretch nearly a kilometer were built between 460 and 524 CE. Work was sponsored by the Northern Wei rulers and by local elites and officials. The largest Buddha at the site is nearly 56 feet in height. 

The fifth and sixth century cave temples at Yungang are considered to be the earliest surviving Buddhist monuments in China. Located ten miles west of the present-day city of Datong (formerly the Northern Wei capital of Pingcheng), the cave temples were cut into a sandstone ridge that stretches nearly a kilometer along the Wuzhou River. The forty-five extant caves were built in three phases from 460 to 524 CE, and include both imperially-sponsored caves and those financed by local elites and court officials. The site contains thousands of carvings of Buddhist figures ranging in height from less than one inch to nearly fifty-six feet (2.5 centimeters to 17 meters).

Buddhism was adopted as the state religion by the non-Chinese Tuoba from Central Asia who ruled in north China as the Northern Wei dynasty (386–534). However, not all of the Northern Wei rulers were ardent followers of Buddhism. Taiwu Di (r. 424–452), the third emperor of the period, at first supported Buddhism, but on advice

The big statue of Buddha on the exterior of the Yungang caves. PHOTO BY JOAN LEBOLD COHEN.
from Confucian and Daoist court bureaucrats who saw the religion as a threat, instituted a severe anti-Buddhist persecution that lasted from 446 until 452.

In 460, Tanyao, a monk and the head of the Buddhist church, petitioned the emperor. Wencheng Di, to cut five large caves from the stone cliff at Yungang as an act of expiation. These caves, known today as the Tanyao Caves and numbered 16 through 20, each contain a colossal Buddha said to honor—and perhaps represent—the first five Northern Wei emperors, with the Buddha in Cave 16 representing Wencheng Di himself. These caves were made between 460 and 465 or 467. The technique of carving cave temples into cliffs has earlier precedents in India and Central Asia. Indeed, these Buddha figures are an amalgam of foreign and native styles. The colossal Buddha of Cave 20, at 46 feet (14 meters) high, is considered to be the epitome of Northern Wei stone sculpture. These caves are simple and austere in their program of design.

A second phase of construction began around 470 and ended when emperor Xiaowu Di (reigned 471–499) moved the capital south to Luoyang. These imperially-sponsored caves are more Chinese in style. They are more elaborate, show more variation, and contain more inscriptions than the caves of phase I. The colossal Buddhas were replaced by numerous smaller figures. These included the paired caves 1 and 2, 5 and 6, 7 and 8, and 9 and 10, along with caves 11, 12, and 13. The paired caves may relate to the pairings of ruler and consort. Often the Buddha is dressed in the robes of a Chinese scholar. Xiaowen Di decreed in 486 that official court dress would be the traditional dress of the Chinese scholar class, and these Buddhas likely reflect court practice.

After the capital was moved, work continued at the site until 524. During this third phase, Caves 21 to 45 were constructed, along with a number of smaller caves and niches that stretched westward from the Tanyao Caves. With imperial patronage over, support came from local officials, and the work was done on a much smaller scale.

Over time, wind, rain, pollution, and the activities of looters have taken their toll. In 1988, researchers from the Getty Institute joined the Chinese in working to preserve the site. The cultural importance of the Buddhist Yungang caves has been recognized by UNESCO, which named Yungang a World Heritage Site in 2001.

Yunnan Province

Yúnnán Shěng 云南省

45.14 million est. 2007 pop. 394,000 square km

Covering an area about the size of the state of California, Yunnan Province in the south of China is a mountainous region whose climate ranges from temperate to subtropical to tropical. About a third of its over 45 million people belong to one of China's fifty-five officially recognized minority groups; twenty-two minority groups are represented, with the Yi being the largest.

The southern province of Yunnan (Yun nan, the cloudy south) borders in the west on Myanmar (Burma) and the Tibet (Xizang) Autonomous Region, in the north on Sichuan Province, in the east on Guizhou Province and the Guangxi Zhuang Autonomous Region, and in the south on Vietnam and Laos. The province covers 394,000 square kilometers (152,124 square miles) of mountains and plateaus. The northwestern section features the Hengduan mountain range, traversed by several big rivers and with peaks reaching over 4,000

Historical illustration from an edition of The Travels of Marco Polo. The original caption reads: “Ho-nhi and other Tribes in the Department of Lin-ngan in S. Yun-nan (supposed to be the Anin country of Marco Polo).”
meters (13,123 feet). The eastern and southeastern sections form a lower plateau. The diversity of Yunnan’s topography means there are three climate zones: temperate in the mountains and subtropic and tropic to the south. The rainy season between May and October accounts for about 80 percent of the annual precipitation, which averages above 1,000 millimeters (39 inches).

Yunnan has a population of over 45 million, of which about a third belong to twenty-two officially recognized minority peoples, the Yi being the largest. The Han Chinese, who constitute about 70 percent of the population, are mainly concentrated on the eastern plateau, where the capital, Kunming (2007 est. pop. 6.19 million), is located.

Yunnan was loosely incorporated into the Chinese Empire during the Han dynasty (206 BCE–220 CE). It was the center of the independent Nanzhao and Dali kingdoms from the eighth to the thirteenth centuries and was reincorporated as a Chinese frontier area under the Yuan
Yunnan Province

During the Ming dynasty (1368–1644), the Chinese government encouraged Chinese immigration into Yunnan, and during the Qing dynasty (1644–1912) the province was repeatedly the seat of rebellion against the Manchu government. In the nineteenth century British and French colonial powers in Southeast Asia extended their activities into Yunnan, and the French built a railway connecting Kunming with Vietnam. During the Japanese occupation of eastern China, the Chinese Nationalist Party (Guomindang) moved the government and various industries to the western provinces of Sichuan and Yunnan, and Yunnan became a stronghold against further Japanese advance.

Kunming developed into an important industrial center in the southwest, a position it still retains. Yunnan has one of the largest reserves of tin in the world, and the principal industries are tin and copper mining. Heavy industry, such as iron and steel works, is concentrated in the area around Kunming. The province is an important manufacturer of textiles, chemicals, processed foods, and various light industrial products, and a major producer of tea, cigarettes, and sugar.

ZENG Guofan

Zēng Guójīng 曾国藩

1811–1872  Qing government official

Zeng Guofan was a leading government official during the mid-nineteenth century who initiated the decentralization of power and the rise in influence of regional officials that took place during the final decades of the Qing dynasty (1644–1912). He is best known for his role in suppressing the Taiping Rebellion (1850–1864) and for his efforts to modernize China’s military and improve its industrial capabilities.

Zeng Guofan (Tseng Kuo-fan) was born in Xiangxiang, Hunan Province. He received the jinshi (advanced scholar) degree at the age of twenty-seven (1838) and was appointed to the prestigious Hanlin Academy in Beijing. He served on various boards in the capital during the next fourteen years and was promoted to the position of junior vice president of the Board of Ceremonies. In 1852 Zeng returned to his home province as commissioner for local defense, charged with the task of suppressing the Taiping rebels. He raised a province-wide militia, the Hunan Braves (later known as the “Hunan Army” or “Xiang Army”), personally selecting the officers and insisting on Confucian discipline among the troops. In August 1860 the emperor appointed Zeng governor-general of Jiangsu and Jiangxi provinces (liang Jiang) and granted him the political authority and fiscal independence he needed to coordinate the military campaign against the Taiping rebels. Together with the armies of Li Hongzhang and Zuo Zongtang, Zeng captured the city on 19 July 1864, bringing to an end the devastating rebellion. For his role in suppressing the Taiping rebels, Zeng Guofan was awarded the title of “marquis of the first class.” He was the first civil official to receive this honor.

After the Taiping Rebellion Zeng returned to Nanjing to take up his post as governor-general. He initiated a number of policies aimed at inspiring obedience to local and central authorities. He opened printing offices to republish classical Confucian texts and reinstated the provincial examinations at Nanjing. In 1865 he established the Jiangnan Arsenal in Shanghai to produce modern weapons and gunboats. In addition to manufacturing rifles, ammunition, cannons, and steamships, it housed a school for training technicians and translators. In 1867 Zeng was appointed grand secretary and the next year was made governor-general of Zhili Province. In 1870 he was ordered to negotiate a settlement with the French over the Tianjin Massacre (21 June 1870). His conciliatory approach to foreign demands during these negotiations conflicted with the hard-line position of many officials in Beijing. He was replaced by Li Hongzhang and reassigned to Nanjing, where he died.

Zeng Guofan’s importance in late Qing history is undeniable. He was instrumental in preserving the dynasty during the Taiping Rebellion. The reforms he enacted after the rebellion helped to stabilize and strengthen the country. His arsenals provided modern weapons...
to protect the nation’s sovereignty. Perhaps most significantly, however, Zeng’s career symbolized a turning point in late Qing political affairs. His ability to independently raise, train, finance, and command the Hunan Army indicated a shift in power from Beijing to the provinces. From this time onward provincial officials would most often take the lead in introducing new technologies, modern industries, and advanced educational systems.

当断不断
Dāng duàn bù duàn
ZHANG Daqian
Zhāng Dàqiān 张大千
1899–1983  Modernist painter, collector, and forger

Zhang Daqian was one of the great modernist painters of the twentieth century. Along with a mastery of styles, techniques, and innovative methods, he is also known for his convincing copies and forgeries, many of which found their way into museum and private collections. In his sixty-year career, Zhang Daqian produced around thirty thousand paintings, five thousand of which are extant.

Although he considered himself a traditionalist painter, Zhang Daqian was one of the great modernists of the twentieth century. He combined a mastery of a broad range of styles and techniques with innovative methods of using ink splashes and color splashes to produce bold, semiabstract compositions that also evoked works of the past. Zhang’s command of the styles of the great masters also allowed him to make convincing copies and forgeries, many of which found their way into both museum and private collections. A well-traveled artist, Zhang was also a prolific one: Estimates put his total output during a sixty-year career at around thirty thousand paintings, five thousand of which are extant.

Drinking and Singing at the Foot of a Precipitous Mountain was supposedly a tenth century work attributed to the painter Guan Tong, now believed to be a master forgery by Zhang Daqian. The forgery includes seals of supposed past owners to create a false history.
personal secretary. In 1917 Shang traveled to Kyoto with his brother, Shanzi, where he studied textile weaving and dyeing for two years. This time in Japan was influential for Zhang: He was introduced to Western styles of art, Japanese-style painting, Japanese woodblock prints, and Chinese works by the Southern Song dynasty (1127–1279) Zen Buddhist artists.

Upon his return to China in 1919 Zhang briefly entered a Buddhist monastery. He then studied calligraphy in Shanghai under the celebrated masters Zeng Xi and Li Ruqing. Soon Zhang showed an impressive ability to copy the works of others. He gained a reputation for his imitations, and from 1941 to 1943 he used this talent to copy the wall paintings in the Mogao Caves at Dunhuang. With the Communist takeover of China in 1949 Zhang left for India, Hong Kong, Argentina, Brazil, the United States, and eventually Taiwan, where he retired. He never returned to China.

Zhang’s best-known works are his abstract ink-splashed paintings that utilized rich, dark tones and brilliant mineral-based colors, a technique he started in the late 1950s. He poured ink and colors onto the paper or silk so that they produced random, ambiguous forms to which he added small details—a figure or a tree—to give concreteness to the painting. This combination of traditional Chinese brushwork and abstract expressionism created powerful and dramatic works unlike anything seen before. Although the splashing technique itself is quick, some paintings were years in the making because Zhang had to wait for one application of ink to dry before he could pour on another.

Zhang was also an art collector and connoisseur. He felt that in order to paint well an artist needs to copy the works of the best artists. He traveled widely, viewing paintings in private collections and acquiring works for his own. Three aspects of his career—as an innovative artist, as a connoisseur and collector of all genres of Chinese art, and as a masterful forger—were the focus of a 2008 exhibition at the Boston Museum of Fine Arts, to which Zhang, upon visiting there in 1953 and finding not a single one of his works in the museum’s collection, bequeathed a painting of a mountain scene in Sichuan. One of the highlights of the exhibit was a Zhang forgery the museum acquired in 1957, believing it to be an authentic tenth-century landscape by the Five Dynasties master Guan Tong.

Upon his death in 1983 Zhang left his collection to the National Palace Museum in Taipei, Taiwan. With his innovative use of color and his firm rooting in ancient styles, Zhang Daqian is remembered as both China’s last great literati artist and also as its first great abstractionist.

ZHANG Yimou

© 2009 by Berkshire Publishing Group LLC
ZHANG Yimou
Zhāng Yīmóu 张艺谋

b. 1951  Film, stage, and 2008 Olympics opening ceremonies director

Zhang Yimou is one of China’s most celebrated and commercially successful film directors. His martial arts blockbusters since 2002 contrast with films from the early part of his career that focused on China’s tumultuous history. An acclaimed stage director, Zhang has directed operas, ballets, folk musicals, and the spectacular opening ceremonies to the 2008 Summer Olympics in Beijing.

Born in Xi’an on November 14, 1951, Zhang Yimou has been one of China’s most celebrated and commercially successful filmmakers since the 1980s. Zhang graduated from the Beijing Film Academy in 1978 and was assigned to work as a cinematographer in the Guangxi Film Studio in 1982. Founded in 1958 and located in the southwestern city of Nanning, this studio is one of the major state-owned film and television studios in China. Zhang served as the cinematographer for Yellow Earth (1984), which was directed by classmate Chen Kaige. The film’s stark shots, sparse dialogue, and politically ambiguous message marked a radical change from the revolutionary themes and socialist realist style of films made during the Maoist era (1949–1976).

His directorial debut Red Sorghum (1987) received notable international acclaim for its rich imagery and powerful narrative about a rural winery’s opposition to the Japanese occupation of northeast China. Ju Dou (1990) and Raise the Red Lantern (1991) provide an oblique critique on contemporary society by adopting the theme of traditional society’s oppression of women.

To Live (1994) reminds audiences of the tumult of China’s twentieth history while affirming the universal theme of the struggle to survive and maintain dignity despite hardship and tragedy. Zhang’s new cinematic language combined with social and historical critique launched his international stardom and established Zhang as one of the key representatives of the fifth generation of filmmakers in China.

Between 1992 and 2000 Zhang experimented with a range of cinematic styles, especially neo-realism. whereas

Gong Li, in a scene from the film Red Sorghum, Zhang Yimou’s first film to become a major hit. Zhang Yimou filmed it at Xi’an Studio. PHOTO COURTESY OF JOAN LEBOLD COHEN.
his earlier films featured stories from China’s past, The Story of Qiu Ju (1992), The Road Home (1999), and Not One Less (2000) are set in recent China and address contemporary social issues such as legal rights, universal education, and family values. The latter two films represent a shift away from a critique of China to a call for audiences to assist in China’s social development. These films moved Zhang closer to the government and shaped the trajectory of his future career.

The spectacle of Zhang’s films are also presented on stage as ballets, operas, theatre, and pageantry. Zhang directed Puccini’s opera Turandot in Italy (1997) and in an historically unprecedented performance in Beijing’s Forbidden City (1998), he adapted Raise the Red Lantern into a ballet (2001), and directed The First Emperor at the Metropolitan Opera in New York (premiered in 2007). He has also directed the outdoor folk music spectaculars Third Sister Liu (since 2003) in southwestern China and Impression Lijiang in scenic Yunnan Province (since 2006).

After having directed the 2001 short film to promote Beijing’s Olympic bid and China’s eight-minute performance at the closing ceremonies of the 2004 summer Olympics in Athens, Zhang was selected to direct the opening ceremonies of the 2008 Summer Olympics in Beijing. The nearly four-hour show, described by many as dazzling, was held in the Bird’s Nest, China’s newly built and iconic national stadium. It was attended by an unprecedented eighty world leaders and viewed by 1 billion people on television. The spectacular show included a display of 35,000 fireworks, designed by acclaimed artist Cai Guo-qiang, and 15,000 performers of acrobatics, martial arts, and a variety of musical performances, including the countdown performed by 2,008 drummers. The magnificent performance represented China’s global prominence and symbolically displayed the Chinese government’s emphasis upon solidarity, harmony, and technological progress.

ZHANG Zhidong
Zhāng Zhīdòng 张之洞
1837–1909 Confucian scholar-official

Zhang Zhidong was a Confucian scholar-official of the late nineteenth century who was closely associated with China’s Self-Strengthening Movement. Appointed by the Qing government as viceroy of Liangjiang, Zhang Zhidong promoted Western-style industrialization through the establishment of a modern coal and steel complexes in the lower Yangzi River region.

Zhang Zhidong, born in Nanpi in Zhili (modern-day Hebei) Province, was a Confucian scholar-official who was closely associated with China’s Self-Strengthening Movement. His service in the Qing dynasty (1644–1912) government began in 1863 when he passed the highest-level civil service exam and earned the jinsshi (presented scholar) degree. He then held several supervisory posts related to the Confucian examination system and education in Sichuan, Zhejiang, and Hubei provinces from 1867 to 1877. Zhang was known for his promotion of scholarship and exemplary rectitude in administrative affairs during this time. In 1879 he was admitted to the Imperial Academy. There he earned a reputation as a commentator on Chinese political reform and foreign relations.

Zhang became governor of Shanxi Province in 1882. This was the first of several administrative posts that culminated in his tenure as governor-general of Hubei and Hunan provinces. During his eighteen years as governor-

Zhang Zhidong, a Confucian scholar-official of the late Qing dynasty, advocated a philosophy of modernizing reform: “Chinese learning as the essence, Western learning for practical development.”
Zhang Zhidong’s View of the Examination System

Wendy Larson, a scholar of Chinese literature, film, and theory, writing on Zhang Zhidong:

One of the most forceful attacks on the examination system was engineered by Qing reformer Zhang Zhidong, who felt the exam was too literary and did not test candidates in a sufficient scope of affairs. His suggestion, similar to that of Ouyang Xiu in 1044, was to emphasize the dissertation and discussion in essays on the shi and fu poetry and to abandon the bagu writing style. He also petitioned to have the test of small formal calligraphy eliminated. Symbolic of an interpretation of writing as form equal to or more important than content, calligraphy is often mentioned by critics of the examination as one type of uselessly applied textual effort. . . . When the abolition of the examination system was announced and took place in 1905, however, Zhang Zhidong began to develop plans to establish a School for the Preservation of Antiquity; he petitioned the throne to establish this school on July 9, 1907, and it was opened August 28 of the same year. The school was to concentrate on Chinese subjects, emphasizing national literature, both prose and poetry, as well as the spoken and written language.

Zhang obviously perceived the value of the examination system as a unifying influence in the spiritual and conceptual realm of Chinese thought and realized that while its abolition would allow China to progress in previously undeveloped ways, a chaotic spiritual gap may result from the lack of guiding and unifying ideology.

general Zhang was known as a political reformer and modernizer even as he remained devoted to Confucianism and the Qing dynastic order. Zhang’s philosophy of reform was Zhongxue wei ti, Xixue wei yong (Chinese learning as the essence, Western learning for practical development).

The Qing court in 1901 appointed Zhang viceroy of Liangjiang in Guangxi Zhuang. He promoted development of railways and sponsored the Han-Ye-Ping iron and steelworks in the lower Yangzi River region to strengthen the Chinese state and economy. In addition he founded an institute of higher learning that was the foundation of modern University of Nanjing.

Zhao Mengfu 赵孟頫

ZHANG Zhidong

Comprehensive index starts in volume 5, page 2667.

Zhao Mengfu 赵孟頫 was a poet and musician and a highly distinguished painter and calligrapher of the Yuan dynasty (1279–1368). His painting was marked with a return to archaism and covered a wide range of subjects, while his calligraphic scripts, called the “Zhao style,” were elegantly structured and rigorously controlled.

Zhao Mengfu, born in Huzhou, Zhejiang Province, as a descendant of the founding Northern Song dynasty (960–1126) emperor, was a painter, calligrapher, poet, and musician of the Yuan dynasty (1279–1368). His father, who excelled in poetry, was a high local official during the Southern Song dynasty (1127–1279), and Zhao thus benefited from his family’s rich literary collections. After the collapse of the Song dynasty Zhao Mengfu accepted an offer of an official post from Yuan emperor Khubilai Khan. This acceptance provoked bitter feelings among many ethnic Han Chinese scholars who regarded Zhao’s service in the Mongolian court as a dishonorable collaboration. Zhao later held many other high posts, including the governorship in two provinces and the directorship of the imperial Hanlin Academy.

Zhao Mengfu painted a wide range of subjects, including landscape, human figures, birds and flowers, bamboos and rocks, humans and horses, and goats and sheep. The techniques he used also varied, ranging from finely detailed colored paintings to pictures done with broad, spontaneous brushstrokes that express symbolic messages. One of Zhao’s most famous paintings, *Autumn Colors on the Que and Hua Mountains* (handscroll, ink and color on paper, 1296, National Museum, Taipei, Taiwan), is based on his visit to the two mountains in Shandong Province. Arranged on the two sides of the painting, the two greenish mountains rise abruptly in the background. The middle and front distances of the picture are filled with cottages, trees, boats, reeds, and human figures. Stylistically, this painting is far from naturalistic. The mountains in the back are too small in scale compared with the houses and trees in front of them. Light brushstrokes moving left to right by the lakefront establish the different levels of perspective in the painting but somehow impede the sense of space receding into the picture plane. Such discontinuities and anomalies deliberately refer and pay tribute to the ancient masters such as Gu Kaizhi (active fourth century), who experimented with spatial relations among human figures, trees, rocks, and flowers. Zhao’s return to archaism marked a decisive move from the naturalism of Song painting technique and was followed by many artists in the same spirit.

Another famous painting by Zhao, *Elegant Rocks and Sparse Trees* (handscroll, ink on paper, Palace Museum, Beijing), uses broad and cursive brushstrokes to depict the rocks and tree boughs in a typical calligraphic style. His own inscription on the painting states that “Rocks as in flying white (script), trees as in seal script” and “calligraphy and painting have always been the same” (Cahill 1997, 187). Indeed, Zhao was one of the four great masters of the formal scripts in China with Ouyang Xun (557–641), Yan Zhenqing (709–785), and Liu Gongquan (778–865). His calligraphy, called the “Zhao style,” is elegantly...
structured and rigorously controlled. The official History of the Yuan Dynasty (composed in the fourteenth century) judged Zhao's skills in different kinds of scripts as having no rival.

Yu JIANG

Further Reading
Zhao Ziyang was a leading economic reformer of the People’s Republic of China in the 1970s. He rapidly rose through the ranks of the Chinese Communist Party (CCP), becoming premier and party general secretary in the 1980s. His opposition to the crackdown on the 1989 protests in Tiananmen Square in Beijing resulted in his dismissal from office.

Zhao Ziyang was born as Zhao Xiusheng in Huaxian County, Henan Province in 1919. His father was a local landlord. He attended primary school in his native town and middle schools in Kaifeng and Wuhan. He joined the Communist Youth League in 1932 and the Chinese Communist Party (CCP) in 1938. By 1940 he was the party secretary of the Third Special District in the Hebei-Shandong Border Region. After the end of World War II in Asia, he occupied himself with rural reform work in the Hebei-Shandong-Henan Border Region. He also served as the party secretary of Luoyang District in Henan from 1948 to 1949.

After the establishment of the People’s Republic of China (PRC), Zhao served in numerous positions in Guangdong Province. He was elected a member of the People’s Council of Guangdong in 1955, was appointed secretary of the Guangdong Province Communist Party in 1957, and rose to the position of provincial first party secretary in 1965. He played an instrumental role in consolidating CCP control and implementing land reform policies.

During the Cultural Revolution, Zhao was accused of being a follower of unpopular figures such as Tao Zhu and Liu Shaoqi. During the late 1960s, he was publicly denounced, stripped of office, and paraded through the streets of Guangzhou (Canton) in a dunce cap. In 1971, he was sent to what amounted to internal exile as a party secretary in Inner Mongolia.

In the dying days of the Cultural Revolution, Zhao was rehabilitated by Zhou Enlai (1899–1976) and assigned as provincial first party secretary in Sichuan Province in 1976. He proceeded to address the province’s economic stagnation that resulted from the Cultural Revolution. He allowed up to 15 percent of land in communes to be worked privately. He also permitted both farmers and workers to engage in a wide range of small-scale private economic activities. The results were impressive: grain production grew by 24 percent and industrial production rose by 80 percent in the period from 1976 to 1979.

Due to his success in Sichuan, Zhao was rapidly promoted by China’s paramount leader Deng Xiaoping (1904–1997). Zhao was appointed alternate member of the Politburo in 1977, a full member of the Politburo in 1979, a member of the Politburo’s Standing Committee in 1980, and vice-premier in the same year. Six months later, he replaced Hua Guofeng as premier. He was appointed to the post of CCP general secretary in January of 1987.

In positions of nationwide power and influence, Zhao continued to advocate market-style reforms and a more open policy toward the outside world, particularly the West. He also implemented measures to streamline the bloated bureaucracy and called for the gradual separation of the CCP from both government administration and
industrial management. While many of his reforms were praised, his economic liberalization program was blamed for the rising inflation of the late 1980s.

Zhao’s most important moment and his political downfall came with the student protests in Tiananmen Square in May and June of 1989. Many of the student demonstrators felt that Zhao would be more sympathetic to their demands for reform than many of Zhao’s more hard-line colleagues. This was borne out in secret meetings of China’s top leaders, where Zhao consistently opposed the use of force against the demonstrators. When Deng Xiaoping declared that “I have the army behind me” in a tumultuous 17 May 1989 Politburo meeting, Zhao reportedly retorted, “But I have the people behind me. You have nothing.” But as the students became increasingly strident in their criticism of the government, emboldened by worldwide media coverage and joined by over one million residents in Beijing, averting the ultimate repression of the demonstrations proved impossible for the state. Zhao’s personal visit to Tiananmen Square to urge students to end their hunger strike had no effect; “I came too late; I came too late,” he lamented to student leaders. After the declaration of martial law and the bloody clearing of Tiananmen Square by military troops, Zhao was removed from office and replaced by Jiang Zemin. He was also placed under house arrest. He remained a member of the CCP but was almost completely absent from public life until his death.

Zhao died in January 2005 at the age of eighty-five. The PRC government acknowledged Zhao’s death but kept memorials to a bare minimum, perhaps in fear that widespread mourning of Zhao’s passing might lead to anti-government demonstrations as had previously happened in the cases of Zhou Enlai and Hu Yaobang. Zhao was survived by his second wife, Liang Boqi, five children, and several grandchildren.

Many events have been held in the world’s largest public square, but it is the student protests of June 1989, when Zhao Ziyang supported and then tried to calm those camped in the Square, that continue to resonate. Photo by Joan Lebold Cohen.
Zhaozhou Bridge
Zhàozhōu Qiáo 赵州桥

The Zhaozhou Bridge, built between 595 and 605 CE, is the world’s first large segmental arch bridge, making possible a near-level span of a broad river in North China. The innovation of open spandrels—arch-shaped openings—in the triangular area below the deck on both ends of the bridge did not appear in the West until the nineteenth century.

Among China’s contributions to world architecture and engineering, no bridge has received more acclaim than the Zhaozhou Bridge, in Zhaoxian County, Hebei Province. Constructed between 595 and 605 CE in the middle of the Sui dynasty, the structure is the world’s first large segmental arch bridge, a daringly innovative form that broke with the tradition of using a semicircle for the arched shape of a bridge. By using a segment of a circle, thus flattening the curve of the arch, it was possible to meet the seemingly conflicting demands for both a single long span with gentle approaches and one that was high enough to permit boat traffic beneath. In addition, the incorporation of two pairs of open spandrels—arch-shaped cavities—in the triangular area below the deck on both ends of the bridge was an innovation not used in the West until the nineteenth century. The open spandrels not only lessen the weight of the bridge, thus reducing the outward thrusts on the abutments, but also facilitate the passage of periodic flood waters that might impact the bridge. Unlike most old bridges whose construction can only be attributed to anonymous builders, the design of the Zhaozhou Bridge—also called the Anji [Safe Crossing] Bridge—is credited to Li Chun, a historical figure who also organized the masons who crafted it.

Approximately 65 meters long with an open span of nearly 37 meters, the low-lying bridge rises only some 7 meters above the water below. The full circle, of which the arch is but a segment, has a radius of 27.7 meters along the west side and 27.3 meters along the east side. Viewed from beneath, it’s apparent how the bridge was constructed using twenty-eight parallel sets of stone voussoirs (wedge-shaped stones forming the curved part of an arch) that run the length of each segmental ring. While these parallel voussoirs produce a stone structure of great flexibility, the need to stabilize the bridge led to the use of reinforcing stone rods, stone hooks, and dovetailed iron keys, as well as a slight inward camber. The elegant geometry and sophisticated mathematics of the superstructure were enhanced with profuse stone carvings along the balustrades and posts. These carvings include a variety of dragons and protective amulets in animal form.

With tall sails providing propulsion, boat traffic along the Xiao River continued well into the middle of the twentieth century. In time, because of diminished water flow and increased road traffic, the Zhaozhou Bridge, like numerous other bridges on the North China Plain, fell into disrepair. In the 1980s, major efforts were made to restore the bridge to its original state. The Zhaozhou Bridge
today is preserved within a park-like setting, and an admission ticket is required to cross it. In this in situ outdoor museum, exhibits focus on the technical aspects of the bridge’s structure as well as the historical circumstances that gave rise to its construction. Although graceful open-spandrel, segmental masonry bridges are ubiquitous today throughout the world—and are usually considered to be modern since they are constructed of reinforced cement rather than blocks of stone—it is important to remember that their design had its origins in China more than thirteen centuries ago.

The segmented open spandrels (arches) that support the Zhaozhou Bridge, built during the Sui dynasty, were a Chinese innovation. Such engineering allowed the bridge to span a wide river and accommodate boat traffic.
Zhejiang Province

Zhejiang, on China’s southeastern coast, is one of the nation’s wealthiest and most fertile provinces. Since the tenth century Zhejiang has been a leading producer of silk, porcelain, tea, and paper. It also is the home of many of China’s political and intellectual elite. Its 101,800 square kilometers, which make it comparable in size to Iceland, include 3,061 off-shore islands.

Zhejiang Province historically has been in the forefront of China’s cultural and economic development since the early Han dynasty (206 BCE–220 CE). During the seventh century its emergence as a major grain producer resulted in the extension of the Grand Canal to Hangzhou. Since the tenth century Zhejiang also has been a leading producer of silk, porcelain, tea, and paper and a center of commerce and trade. When the Southern Song dynasty established its capital in Hangzhou in 1127, Zhejiang also became the cultural and political center of China. It continues to be the home of many of China’s political and intellectual elite. Two of the greatest modern Chinese writers—Mao Dun and Lu Xun—were from Zhejiang, as...
are nearly one-fifth of the members of the Chinese Academy of Sciences. Zhejiang also produced two of China’s best-known contemporary leaders: Chiang Kai-shek, president of the Republic of China on Taiwan from 1949 to 1975, and Zhou En-lai, premier of the People’s Republic of China from 1949 to 1976.

Zhejiang Province has been a prime beneficiary of China’s current economic reforms. The province’s economy since 1978 has grown faster than the national average, thanks in part to the rapid growth of collective and private firms. Zhejiang is one of the wealthiest of China’s provinces and ranked among the top four or five on various economic indicators along with economic powerhouses such as Guangdong and Jiangsu. In addition to its traditional industries, Zhejiang has concentrated on developing its machinery, chemical, electronics, and pharmaceutical industries. Foreign tourism, trade, and investment also have flourished, especially in the coastal cities of Ningbo, Hangzhou, and Wenzhou.

ZHENG Chenggong
Zheng Chenggong (1624–1662) built on the structure of commerce and naval power established by his father, Zheng Zhilong, to support a Ming loyalist regime in Fujian, and after the dynasty’s collapse in 1644 he continued to oppose the Qing. He expelled the Dutch from Taiwan in 1661–1662 and died shortly thereafter.

Zheng Chenggong 鄭成功 was known to Europeans as “Coxinga,” from the Chinese word Guoxingye (Lord of the Imperial Surname), reflecting his high favor under the Ming dynasty (1368–1644) loyalist court at Fuzhou, his continued championing of the Ming loyalist cause after the fall of that court, and perhaps his tacit move toward claiming the Ming succession for himself in the last months of his short life. He was the heir to a maritime power structure built by his father, Zheng Zhilong 鄭芝龍, who drew on a web of connections among the Fujian ports, Macao, Manila, Taiwan (then not yet heavily settled by Chinese or under Chinese administration), and Japan. Zhilong’s most important base was at Hirado, Japan, where he was a leading subordinate.
of the “captain” of all Chinese in Japan, Li Dan. Zheng Chenggong was born in Hirado; his mother was a Japanese woman from a respected family.

In 1624 Li Dan and Zheng Zhilong brokered the withdrawal of Dutch invaders from the Penghu Islands in the Taiwan Strait, which were Ming territory, to the south coast of Taiwan, which was not. This withdrawal gave the Zheng family some kind of claim to control of Taiwan, which Zheng Chenggong would assert when he expelled the Dutch thirty-eight years later. From 1624 to 1635 Zheng Zhilong fought off rival maritime leaders, made himself indispensable to the tottering Ming dynasty, and maintained his network of fleets and lines of trade as a naval officer of the Ming dynasty. Merchants under his control or paying taxes to him dominated Chinese trade with Japan and with the Dutch on Taiwan and sailed as far as the Malay Peninsula.

When the Manchu Qing took Beijing in 1644, Zheng forces gave at best ambivalent support to the Ming loyalist court at Nanjing, then dominated another loyalist regime at Fuzhou on the Fujian coast. Zheng Chenggong, who had studied with some of the great literati of the late Ming dynasty in Nanjing, attracted the notice of the loyalist emperor at Fuzhou, who bestowed on Zheng the Ming imperial surname Zhu. However, Zheng Zhilong saw no future in resistance, negotiated with the Qing dynasty (1644–1912), and was taken away to end his life in house arrest in Beijing. Several Zheng relatives sought to preserve the maritime power structure; Chenggong won the struggle among them and in the 1650s built a powerful fleet and tightly controlled trade operations centered on his capital at Xiamen on the Fujian coast.

Under increasing pressure from Qing armies and trade embargoes, Zheng Chenggong launched a desperate and unsuccessful attack on Nanjing in 1659, then turned to invade Taiwan and expel the Dutch, only to die in 1662 a few months after their final withdrawal. His son and grandson and their generals maintained power on Taiwan until 1683, when Qing forces commanded by Shi Lang, who had defected from Zheng thirty years before, took control of Taiwan.

ZHENG He ▶
Zheng He was a diplomat, explorer, and fleet admiral who, between 1405 and 1433, made seven voyages to the Indian Ocean. His expeditions and four naval and land battles brought more than thirty kingdoms into the Chinese economic sphere.

Zheng He was born Ma He in Yunnan Province (southwest China bordering Burma, Laos, and Vietnam.) He was a sixth-generation son of the Ma family, descended from devout Turko-Persian Muslims originally from Bukhara in Central Asia (present-day Uzbekistan).

In 1381 a Ming dynasty army came to Yunnan to quell a revolt. Ma He was taken captive, castrated, and trained as a servant for the imperial court where he became a confidant of the Prince of Yan (1360–1424), fourth son of Hongwu (1328–1398), the first Ming emperor. Yan became Yongle, the third Ming emperor. Ma He, renamed Zheng He on 11 February 1404, was director of palace servants and held the highest rank among eunuchs.

Yongle began major shipbuilding in 1403, shortly after he assumed the throne, and ordered Zheng to command a naval expedition combining exploration and the extension of the tribute system to the Western (Indian) Ocean. Zheng ultimately made seven voyages:

- First voyage (1405–1407) to Champa (a kingdom in South Vietnam), Java, Malacca, Sumatra, Ceylon, Cochin, and Calicut (southwest coast of India)
- Second voyage (1407–1409) to Champa, Java, Siam, Sumatra, and Calicut
- Third voyage (1409–1411) to Champa, Calicut, Coimbatore (southern India), and Puttanpur (western India)
- Fourth voyage (1412–1415) to Champa and Calicut, Hormuz (Persian Gulf), the Maldives, and Sumatra
- Fifth voyage (1416–1419) to Champa and Calicut, the Maldives, Hormuz, Aden, Mogadishu and Malindi (both coastal East Africa)
- Sixth voyage (1421–1422) separate squadrons sailed to Champa and Calicut, Ceylon and the Maldives, Hormuz, the Arabian peninsula, East Africa, and Sumatran states (Lambri, Aru, and Semudera)
- Seventh voyage (1431–1433) followed the route to Hormuz

From 1424 to 1430, Zheng commanded the garrison at Nanking, and the fleet remained there until the new emperor, Xuande (1398–1435) sent him on his seventh and last exploration. Zheng He died during this voyage and was buried at sea.

For all but the fifth voyage, contemporary records (Mingshi, Ming History) document the numbers of ships and personnel. For instance, on the first voyage, Zheng commanded 62 treasure ships, 255 other vessels, and 27,800 armed troops and mariners; other voyages were comparable. Later historians listed the treasure ships as nine-masted junks about 127 meters (416 feet) long.
and 52 meters (170 feet) wide) and capable of carrying up to 1,500 tons. By comparison, Columbus’s were about 17 meters (55 feet) long and carried 700–1,000 tons; a modern ship of 60 meters (200 feet) long carries 1,200 tons. Zheng’s treasure ships would have been the largest wooden ships ever built, a claim many historians now dispute.

Zheng He’s fleet consisted of treasure ships, horse ships, troop transports, and supply ships as well as auxiliary craft such as patrol boats and water tankers; overall, 1,476 wooden ships were constructed during his administration; the first voyage alone consisted of 252 vessels. The improbable sizes of the largest ships are questioned because of varying measurements given in zhang (141 inches) and chi (14.1 inches) which varied through time. Keel-less, bark-rigged treasure vessels had up to nine masts and twelve sails, and archaeological specimens suggest lengths of 164.5–183 meters (538–600 feet), while Chinese documentary accounts indicate lengths of up to 117–136 meters (385–440) feet and beams of 48–55 meters (157.5–180 feet).

Zheng’s seven expeditions and four naval and land battles brought more than thirty kingdoms into the Chinese economic sphere. During Zheng He’s tenure, China expanded its maritime exploration and seagoing trade, established and enhanced tribute systems, and embarked on territorial conquests in the north, especially present-day Mongolia, and the south into Vietnam. His seven voyages served to establish the wealth and political power and technical sophistication of China. Subsequently, China withdrew from the sea and focused on land conquests, and Ming dynasty naval efforts diminished dramatically primarily due to the costs of maintaining the fleet and financial pressures to maintain armies fighting in Mongolia.

Zhong Yong
(Doctrine of the Mean)

One of Confucianism’s sacred texts, the Zhong Yong serves as a guide to achieving harmony—personal, social, and political—through a mind and self in a state of perfect equilibrium. Translated as The Doctrine of the Mean, it embodies many of the central themes of Confucianism.

The Doctrine of the Mean (the Zhong Yong) comprises two chapters in the Classic of Rites (Li Ji), one of the sets of books that form the canon of Confucian thought. During the early period of the Song dynasty (960–1279), it came to be regarded as a single text worthy of investigation and study on its own. Tradition maintains that it was written by Zisi (Kong Ji), who was the grandson of Confucius (551–479 BCE). The date of its composition is likely around 450 BCE.

The intellectual concerns of the Song period included, for the most part, an engagement with Buddhism, which advocated the understanding of the relationship that existed not between human beings but between human beings and the cosmos. This idea profoundly changed Song China, and more importantly, it forced the thinkers of the day to go back and reexamine traditional Chinese works of philosophy to see if they could find in them native traditions that also addressed the relationship vaunted by Buddhism. Thus, the Zhong Yong was read as a spiritual text first and foremost and only afterwards as a guide for bringing about a better and just society.

The work is written in an aphoristic style, with a student posing questions and a sage providing the answers. At first glance, these aphorisms seem to be unrelated, but a closer examination reveals that they address specific spiritual and philosophical themes, all of which seek to elucidate the spiritual content of Chinese culture, and not only its pragmatic concerns.

The larger aspect of externality is the cosmos, or heaven, and this too is linked with spiritual internality. Both heaven and the individual share the same reality; that is, perfection. But, whereas heaven does not deviate from its true reality, an individual does. This causes disharmony and strife, which devastate not only the individual but also society. A corrupt ruler corrupts those whom he rules, and a corrupt individual corrupts those that live with him in the community. It is only after intense struggle to attain moral rectitude (the state of perfection) that the harmony between heaven and the individual can once more be reestablished, and thus strife and disharmony are destroyed. Self-perfection, therefore, reaches outwards; first it perfects society, and then it joins with the eternal perfection that is contained in heaven. In effect, perfection is a virtue of heaven, which is also placed inside the individual; the task of the individual is to find and highlight this virtue in his or her own life.

The Zhong Yong thus offers a far more profound evaluation of perfectibility than that found in Buddhism. The goal is not solipsistic; it does not stay focused on the self; it is not, and never should be, an isolated event. Rather, the demand is for a person to become sincere so that she or he might know that his or her own perfectibility is an immense force for change, and for the better. And this
From The Doctrine of the Mean

What Heaven has endowed is called the nature. Following the nature is called the Way. Cultivating the Way is called instruction. The Way cannot be departed from for so much as an instant. If it were possible to depart from, it would not be the Way.

perfectibility is made manifest in moral rectitude, which creates and then sustains a perfected self living within a perfected community, all governed by the laws of a perfect cosmos. And this state of harmony is also the place where truth and justice easily endure.

In the Zhong Yong, Chinese intellectual culture found a thorough and complete system of personal and social life, which went farther than Buddhist tenets. For this reason, it became a central text for later Confucian thinkers who, throughout the breadth of Chinese history, turned to it again and again as a guide and methodology to attain and retain the Way of Confucianism.

Further Reading:

The Zhou dynasty covered two time periods: the Western Zhou and the Eastern Zhou. The former was characterized by the hegemonic rule of Zhou lineage over a number of tribute states. The Eastern Zhou period, when the Zhou family was forced eastward out of their western homeland, was characterized by the rise of former Zhou and non-Zhou states who competed for control and moral authority.

Western Zhou period: 1045–771 BCE; Eastern Zhou period 770–221 BCE

Origins

The original Zhou nation developed in the Wei River valley in Shaanxi. Shang dynasty (1766–1045 BCE) oracle-bone records dating from 1200–1000 BCE suggest that the Shang considered the Zhou alternately as an enemy and as a tribute-paying subject. By the middle of the eleventh century BCE the Zhou had built a coalition of partners, including former Shang subjects in northern Henan, and destroyed Shang hegemony (influence). In texts compiled centuries later this power shift was attributed to the will of heaven and called the “Mandate of Heaven” (tianming). In Zhou bronze texts the term referred to the will of ancestral spirits, perhaps manifested as astral phenomena (in religious philosophy, occurrences held to be next in refinement above those in the tangible world). But by the Eastern Zhou period the power shift was mythologized as a heroic military conquest commanded by heaven and executed by King Wu (representing “martial” reckoning against immoral leaders), who was the son of King Wen, the founder of the Zhou nation (who represented “humane” treatment of inferiors and a system of utopian agrarian government). By the Han dynasty (206 BCE–220 CE) the Mandate of Heaven clearly signified shifts in a system of natural forces, much closer to the five phases system (wuxing) that was popular by the third century BCE. The Mandate of Heaven theory became a permanent part of political thought and was used by later Chinese reformers to frighten defiant rulers, as well as by those who took up arms against the government to justify their rebellion.

After the shift of influence from the Shang in the east to the Zhou in the west, Zhou rulers spent the next two centuries consolidating their power by military coercion and trade. They concentrated on control over resources that were essential to their economic system of gift giving and award—a system inherited from the Shang and
intimately tied to the spread of the worship of Zhou ancestral spirits. Cowries (a kind of seashell), jade, and bronze—all being valued in Shang religion and all requiring trade ties with distant regions—continued to be important to the Zhou. Although the Zhou initially worshiped Shang spirits, by the middle of the tenth century BCE their own Zhou ancestors had clearly become national icons. Nation building became a form of ancestor worship as the Zhou rewarded subjects with sacrificial vessels, wines, ritual clothing, and agricultural land (for food production) to advance the Zhou ritual system. Recipients used these gifts to present mortuary feasts to ancestral spirits, often including the names of their Zhou benefactors and their ancestors in the inscribed prayers.

The sophistication of Zhou carved jades, bronze vessels, and musical instruments points to control over resources and production in regions beyond the Zhou homeland. At the height of Zhou influence, during the late tenth to the late ninth centuries BCE, the Zhou controlled a network that reached west into Gansu Province, northeast to Beijing, southwest into Sichuan Province, east into Shandong Province, and south into Hubei Province and beyond the Yangzi (Chang) River.

**Eastern Zhou**

Scholars subdivide the Eastern Zhou period into the Spring and Autumn period (770–476 BCE) and the Warring States period (475–221 BCE), the names for both periods deriving from chronicles collected that detail alliances and conflicts between former subject states of the Zhou. The entire Eastern Zhou era was characterized by larger states annexing smaller states such that by the third century BCE only a few large states remained. During the Spring and Autumn period the Zhou ruler was alternately a puppet of the states of Jin to the north, Zheng to the south, and Qi to the east, each of which took a turn as “hegemon protector” (ba). States on the fringes of the Zhou earlier realm rose to power and challenged the exclusionary protector system.

Powerful new players by the Warring States period included the states of Qin, located to the west in the old Zhou homeland; Yue, spreading north into the lower Huai River valley from the southeastern coastal region; Chu, spreading south and east out of the Han River valley in modern Hubei Province; and Yan, in the northeast near modern-day Beijing. In the meantime Jin (a powerful state that developed in southern Shanxi Province not far from the Zhou administrative city of Chengzhou) divided into territories run by the large lineage groups Wei, Zhao, and Han. The Han took over Zheng, but other states survived simply by allying strategically with larger groups. Examples include Lu, the birthplace of the philosopher Confucius (551–479 BCE), and nearby Song, the birthplace of the anti-Confucian thinker Mozi (470?–391? BCE).

The art of strategic alliances, known as the “Theory of Horizontal or Vertical Alliances,” was advanced by itinerant “guests” (ke), who were members of disenfranchised...
artisan and elite families who had studied under masters of military, technical, and ritual arts. By the Warring States period literacy and text production, as well as occult or technical expertise, spread with the guest masters and their disciples from one site of patronage to another. The many new text types and ritual items discovered in Warring States tombs, especially those associated with the southern state of Chu, attest to a cross-fertilization of practices and ideas over great geographical distances. This cross-fertilization no doubt was perpetuated not only by the roving guests but also by the migrations of peoples, states, and armies. The guests took the cultural fabric once identified as Zhou and rewove it, introducing ideologies that better fit the economic and cultural realities of their far-flung patron rulers. They used tales about former Zhou-period rulers to cajole and warn cajole regional leaders. Founding kings Wen and Wu were cast as paragons of honesty and humility, and—most important to enhancing the uncertain position of these guest advisers—the wise minister Zhou Gong (regent for Wu’s son and cult founder of the state of Lu) was cast as vital to the foundation of a strong Zhou state. Zhou Gong assumed rule while the king was weak, gave speeches about morality, repressed remnant Shang rebels, established an administration, and politely retired when the king came of age.

Drastic Social Changes

A comparison of the Warring States and early Western Zhou economies shows drastic social changes. The economic network that was expanded by the Zhou from the eleventh through the ninth centuries BCE collapsed under its own ideological weight (a collapse that continued through the Spring and Autumn period). The rigid link to Zhou kinship through mortuary ritual and a gift-giving system was not sustainable. In contrast, the major states during the Warring States period established their own monetary systems and individualized religious systems that incorporated both local practices and elements of the archaic but prestigious Zhou rhetoric. Lesser states participated in the expanded networks of the larger states. Markets were common in every city. The export of mass-produced trade goods and the import of exotic goods thrived. The network of interstate relationships was often multilateral, involving trade, warfare, marriage, and political agreements. Until the Qin dynasty (221–206 BCE) conquered the entire region and attempted unification, early China was a complex social web of mingled social classes, competing philosophies, and people from different cultural backgrounds. Amid this cultural fluidity individual states promoted their own calendar systems, musical styles, artistic styles, script styles, and occult practices.
The Warring States period was the end of the Bronze Age period (when human culture was characterized by the use of bronze, beginning between 4000 and 3000 CE and ending with the advent of the Iron Age) in Zhou culture. Philosophers and writers of this and later periods would use an increasingly idealized vision of Zhou ritual and government as a rhetorical foil against which to criticize the political chaos of their own periods.

**ZHOU Enlai**

Zhōu Ėnlái 周恩来

1898–1976  **First premier of the People’s Republic of China**

Considered one of the most important politicians in the Communist revolution, Zhou Enlai was the first premier of the People’s Republic of China and chief diplomat for Chinese Communist Party leader Mao Zedong. Zhou’s less ideological approach was pivotal in determining the future of Communism in China.

One of the towering figures of China’s Communist revolution, Zhou Enlai was premier of the People’s Republic of China (PRC) from 1949 until his death in 1976, chief diplomat for Chinese Communist Party (CCP) leader Mao Zedong, and mentor to CCP general secretary Deng Xiaoping, among others. Zhou Enlai is typically remembered as the revolution’s second-most important politician. He was the functionary who made Chairman Mao’s policies operational. Serving the Communist Party for a half-century in both international and domestic affairs, Zhou played a critical role in China’s rise to power in the twentieth century.

True to the meaning of his given name “Enlai” (“Coming of Grace”), Zhou excelled at resolving logistical problems and mediating between opposing groups. He is known for his negotiations with U.S. secretary of state Henry Kissinger that culminated in the signing of the Shanghai Communiqué in 1972, the agreement that struck a compromise on the thorny issue of Taiwan and culminated in the reestablishment of normal relations between the People’s Republic of China and the United States. In 1964 and again in 1975 Zhou urged the adoption of the Four Modernizations, a new policy direction emphasizing investment in advanced technology and economic construction that set the stage for Deng Xiaoping’s Second Revolution in the post–Cultural Revolution (1966–1976) period.

Zhou Enlai rose quickly to a leadership position during the so-called United Front phase of Chinese politics (1924–1927), when his interpersonal skills were particularly useful for mediating between the Chinese Nationalist Party (Guomindang), China’s Communist Party, and the Soviet Union’s Communist International. Zhou first entered politics as a student activist and journalist in Tianjin during the May Fourth Movement of 1919. Exposed to Marxist ideas for the first time while studying in Japan, Zhou grew increasingly committed to Communist ideology after he was jailed for six months in Tianjin for participating in street protests. In 1920 he joined the wave of Chinese youth traveling to Europe to participate in work-study opportunities. He became known among the overseas Chinese community in France as an energetic and resourceful revolutionary organizer and publicist. Returning to China in 1924, Zhou was appointed secretary of the Communist Party of the Guangdong-Guangxi region and political director of the Whampoa Military Academy in Guangzhou (Canton), a position that allowed him to earn the trust of revolutionary military officers.

Zhou would continue to be admired by a variety of constituencies both inside and outside the Communist Party because he was perceived to be a force for moderation and openness. Zhou personally handled all of Chairman Mao’s foreign policy initiatives throughout the half-century of their political partnership. Mao himself
rarely traveled abroad and typically left the details of his policies to others. Even in the rare instances when Mao met personally with a head of state, such as his historic meeting with Soviet leader Joseph Stalin in Moscow to cement the Sino-Soviet Agreement of 1950 or with U.S. president Richard Nixon in Beijing to open up relations with the United States in 1972, the chairman relied on Zhou to initiate and finalize all arrangements. Thus, it is hard to distinguish the degree to which Zhou should be credited with the substance, as opposed to the mere execution, of these momentous shifts in policies.

Some analysts portray Zhou as a mere appendage of Mao, a skilled implementer of another man’s strategic vision, whereas others portray Zhou as an independent force in his own right, a self-effacing figure who discretely shaped and expanded the broad field of action that Mao afforded him. The specifics of each case must be sorted out before an informed evaluation of Zhou’s significance can be determined. Regarding the 1972 opening of relations with the United States, for example, not Zhou but rather his foreign minister, Marshall Chen Yi, first advocated the conceptual shift toward détente with the United States in a strategic report submitted to Mao in 1969. Zhou could never have acted on Chen Yi’s recommendation to improve relations with the United States without Mao’s explicit endorsement. Yet, after Mao gave approval for this broad policy shift and granted the request of the U.S. Ping Pong team to visit Beijing, Zhou orchestrated the complex preparations leading up to Nixon’s visit with intelligence and finesse.

A Symbiotic Pair

Retrospectively, Zhou has won praise from those who see him as representing a more benign and cosmopolitan alternative to the Chinese Communism championed by Mao. Considering the calamitous result of Mao’s Great Leap Forward and Cultural Revolution, Zhou does seem to stack up favorably by comparison. However, comparing the first and second most important Chinese revolutionaries like this presumes that their careers can be disentangled from one another. This is only partially true. Although they began as rivals, the two men became an indissoluble symbiotic pair after Zhou subordinated himself to Mao’s leadership over the course of the Long March (1934–1935). Actually their personal relationship was always strained, but they managed to forge a potent political partnership despite their contrasting personalities. Zhou was by nature a prudent and tolerant team player, whereas Mao was an uncompromising rebel, polarizing and overbearing. Mao was the brains of the dyad, and Zhou, its arms and legs. Their careers became so intertwined that Zhou must be considered accountable, at least to some degree, for all of Mao’s destructive policies. He was the technocrat who enabled them to be implemented. If Zhou had sided with the leaders trying to restrain Mao rather than constantly aligning himself with Mao, the immense human suffering caused by the Great Leap Forward and the Cultural Revolution might have been limited considerably. Zhou Enlai may be credited with having mitigated some of the destructiveness of the Red Guard movement by stationing guards, for example, to defend valuable cultural properties like the Forbidden City, but he also prolonged the Cultural Revolution in that his willingness to modify the excesses of the movement kept it operational and seemingly palatable.

Although his real opinions were often shrouded in secrecy, Zhou disagreed with Mao on the critical issue of how to pace and structure China’s economic development. Zhou expressed disagreement with Mao’s so-called Little Leap in 1956, the precursor to the more extreme Great Leap Forward campaign that Mao devised in 1958. Zhou thought the targets for growth that Mao was advocating were overambitious and recommended scaling them back. Mao became angry at Zhou for suggesting a slower timetable and forced Zhou to recant his views before a large meeting of party delegates. A few years later, when Minister of Defense Peng Dehuai urgently sought to convince Mao to halt the Great Leap Forward, Zhou did not support Peng’s petition but rather remained cowed and neutral. This was also the case in February 1967 when several military officers challenged Mao’s Cultural Revolution policies. Zhou agreed with the officers’ complaint that the Cultural Revolution should be curtailed and order restored, but again he remained neutral, unwilling to risk detaching himself from Mao. Thus, Zhou failed to defend the public interest when it really counted, that is, when his support for constraining Mao might have decisively blunted Mao’s power.

According to the memoirs of Mao’s personal physician, Zhou behaved surprisingly obsequiously in Mao’s
presence, tasting his food to make sure that it was not poisoned and crawling at his feet to show him maps as if Zhou were a eunuch serving the emperor. In private Mao referred to Zhou dismissively as “his housekeeper.” Apparently, the servile way in which Zhou related to Mao was partially a strategy for assuaging Mao’s ego and easing his paranoia and partially a relic of feudal habits and arrangements. An important watershed in cementing Zhou’s partnership with Mao in the early years was Zhou’s convincing apology during the Yan’an Rectification Movement of 1943. Zhou had been singled out for special criticism at Yan’an for his role in pushing Mao out of power at the Ningdu Conference of 1932. Zhou outranked Mao prior to the Long March and had sided with the Soviet-backed majority against Mao’s guerilla warfare strategy.

“Self-Rectification”

Over the course of the Long March, Zhou had switched his allegiance to Mao. To persuade Mao that he could be trusted, Zhou put on a consummate performance at Yan’an, chastising himself bitterly for ever having doubts about Mao and declaring his complete loyalty going forward. In subsequent years Zhou would be called upon repeatedly to demean himself like this, most notably near the end of his life when Mao’s wife Jiang Qing and her allies accused the ailing Zhou of being a closet Confucian and arranged for Zhou to endure a “self-rectification” before hundreds of officials within the Great Hall of the People in 1974.

In the aftermath of heir-apparent Lin Biao’s seeming betrayal of Mao in 1971 and his subsequent death in a plane crash, the need to establish a credible successor to Mao loomed heavily in the minds of both Zhou and Mao. By 1972 the Cultural Revolution’s ideological extremism was sputtering, and in this new circumstance the contrasting approaches of Zhou and Mao seemed more contradictory than complementary. By 1972 Zhou had sprung into action, restoring normal governmental functions, rehabilitating party veterans, and putting the economy back on solid footing. Mao and his radical allies, on the other hand, seemed anxious to keep these “rightist” tendencies in check and to salvage some positive legacy for the Cultural Revolution. Because both Zhou and Mao were chronically ill, Zhou with cancer and Mao with Lou Gehrig’s disease, a sense of urgency infused their decision making. The subtle rivalry between Mao and Zhou, long suppressed by the self-effacing Zhou, flared up as they both sought to leave their personal stamp on the future.
direction of the revolution to which they had dedicated their lives. What was at stake was whether the party machinery would be left in capable hands. Zhou was determined to pass on his position as premier to Deng Xiaoping and to secure Mao’s endorsement for it. Mao respected Deng’s abilities as an administrator, and he gave Zhou the approval he sought to return Deng to power and make him acting premier despite the objections of the radicals. But Mao remained ambivalent about Deng as a successor because he wanted the ultimate decision maker to be someone whose ideology he trusted would remain purely revolutionary, such as Wang Hongwen or Hua Guofeng, his choices for successors. Mao did not want to see ideological objectives diminished or buried. Mao suspected that Deng was ultimately “a capitulationist,” that is, one who would eventually forgo revolutionary aspirations and “go down the capitalist road” were he not properly kept in check by a genuine revolutionary like himself.

By January 1976, when Zhou succumbed to cancer, Mao’s credibility was on the wane because of his lingering support for ideological extremists such as his wife, Jiang Qing. On the other hand, Zhou’s reputation had been enhanced. His conspicuous role in restoring governmental functions and rehabilitating persecuted intellectuals and party veterans since 1971 was widely appreciated. Deng was seen as the one few cadres capable of continuing Zhou’s work in his absence. The intense outpouring of grief accompanying news of Zhou’s death unsettled Mao and his allies and spurred them to make a decisive move to curtail public mourning for Zhou and to remove Deng Xiaoping from power for a second time.

Demonstration Suppressed

On 4 April 1976, coinciding with the Qingming Festival to honor the dead, thousands gathered at Tiananmen Square in Beijing in defiance of strictures, laying wreaths, poems, and flowers in tribute to Zhou at the Monument to the People’s Heroes. The gathering threatened to escalate into a demonstration against Mao himself as some wall posters denounced him as a cruel Qin Shi Huang Di, the despotic first emperor famous in history for “burning the books and burying the scholars.” The CCP sent public security forces during the night of 4–5 April to remove the offerings from the monument and cordoned off the area in an effort to keep the throngs of mourners at bay. The radicals responded by accusing Deng Xiaoping of orchestrating a conspiracy, and troops were sent in to suppress the demonstration on the night of 5 April. After Mao’s died in September and the Gang of Four was arrested, mourning for Zhou was again permitted. Deng Xiaoping was exonerated of conspiracy charges, and the verdict on the so-called Tiananmen Incident of 1976 was reversed after Deng replaced Mao’s appointed successor, Hua Guofeng, as paramount leader in a peaceful transfer of power that began in 1979 and was formally consolidated in 1981.

The dramatic events after Zhou’s death suggest that Zhou ultimately won the footrace with Mao over the succession issue in the manner of the tortoise overtaking the hare. Some might even go so far as to say that Zhou finally stepped out from under the shadow of Mao to contend with him, albeit in his self-effacing way, during the final years of his life. Decades later we see that Zhou’s more moderate, less ideological approach proved pivotal in determining the future of communism in China. Mao’s choice of successor, the ideologue Hua Guofeng, could not compete with Zhou’s candidate, the seasoned pragmatist and team player, Deng Xiaoping.

Zhou’s rigorous work schedule, interrupted by only a few hours of sleep a night, epitomized the self-sacrifice and industriousness implied by Mao’s slogan, “Serve the People,” a motto that Zhou wore pinned to his lapel every day.

Dance and Politics

The political beliefs of Zhou Enlai can be explained by observing his behavior and performance on the dance floor.

Zhou’s handling of his political life can be understood by analogy to his behavior on the dance floor. Both Mao and Zhou enjoyed ballroom dancing. For Mao, dance parties were occasions for reveling in the adulation of a harem of young ladies. Ever anxious not to upstage the chairman, Zhou Enlai always left the dance floor the moment Mao arrived, although dancing, along with table tennis, was one of the few pastimes he permitted himself. But Zhou abstained himself from the limelight in deference to Mao because Zhou wished to preserve harmonious relations with Mao. Within that ruler-minister relationship, Zhou had to display his junior status conspicuously.

This was the secret of Zhou’s ability to survive so many purges; Mao could rely on him because he trusted that Zhou would never plot against him.

A radical Maoist once quipped that Zhou Enlai always swung his dance partner to the right. Apparently this was true—but not because Zhou consciously swung the ladies in the direction of his politics, as his critic was suggesting, but because an arm injury limited his range of motion. Nevertheless, the joke is in fact suggestive of who Zhou really was and how he was understood during his final years. By the early 1970s, Zhou was clearly a pragmatist, or a moderate, surviving in a sea of radicals. He was their tool, but he was not one of them, and they knew it.

ZHOU Xuexi

Zhōu Xuéxī 周学熙

1866–1947 Qing and Republican official

Zhou Xuexi was an official in the late Qing dynasty (1644–1912) and early Republic of China (1912–1949). After retiring from public service he championed north China’s industrial development, rivaling the reputation of Zhang Jian, another magnate who operated his industrial conglomerate at Nantong near Shanghai.

Zhou Xuexi was born in Nanjing, although his father, Zhou Fu, a noted provincial governor in the Self-Strengthening Movement (a period of institutional reforms during the Qing dynasty), kept an ancestral home at Zhide (now Dongzhi) in Anhui Province. In 1886 the younger Zhou began his bureaucratic career as an attaché at the Bureau of Irrigation and Transportation in the Ministry of Works and became a juren (provincial graduate; the official designation granted a passer of a provincial examination) in 1893 under somewhat controversial circumstances. After futile attempts at the coveted jinshi degree (presented scholar; a degree conferred on successful candidates in the highest-level Civil service examination), he purchased official titles qualifying him to serve at various provincial posts until he found a patron in Yuan Shikai (who later succeeded Sun Yat-sen as president of the Republic of China). Rising quickly through the ranks, Zhou was instrumental in the establishment of state-supervised enterprises such as the Chee-Hsin Cement Co. (1900), Beiyang Mint (1902), the Lan-chou Official Mining Co. (1907, merged with the Kaiping Colliery to form the Kailian Mining Administration in 1912), and the Beijing Waterworks (1908). Into the republican period he served as Yuan’s chief aide in economic affairs and as minister of finance (1912–1913, 1915–1916). He joined the Nationalist Party (Guomindang) briefly to push through the controversial Reorganization Loan, a £25,000,000 political loan granted in 1913–1914 from England, France, Germany, Russia and Japan in support of Yuan Shikai.

However, Zhou’s resistance to Yuan Shikai’s monarchial bid and Beijing’s factional politics soon forced his resignation. Although subsequently he received appointments such as national director of the Cotton Development Administration (1919), he increasingly pursued private industrial development and investment, beginning with the Guangqin Spinning and Weaving Mill in Wuxi in 1917. Amid charges of misappropriating state property, he privatized the Huaxin Cotton Spinning Mill (Tianjin), which soon branched out to Qingdao in 1918. To ensure a steady supply of raw material and financing, he organized the Xinghua Capital Corp. and Xingji cotton brokerage. Successes led to the launching in 1919 of branch mills at Tangshan and Weihui in Henan Province and formation of the Huaxin Corporation. Capitalized at 10 million yuan, the corporation was to coordinate the activities of the mills, although each retained its own board of directors and accounting independence. Profits from the Kailian mines provided the initial capital for the Yaohua Mechanical Glass Co., Ltd. (1921), a joint venture with Banque d’Outremer Consortium Industriel Belge,
Vanishing Owners and Melting Spindles

*The rise and ultimate demise of the cotton mills in Tianjin are indicative of the unpredictable growth and development of industry in China. Zhou Xuexi worked toward repairing such unsteady conditions, which were often exacerbated by lax government policies.*

The absence of a stable group of industrialists, a problem both caused and compounded by the political instability of North China, meant that local industry grew in erratic fits and starts. Nowhere is this more clear than in the case of Tianjin’s largest mechanized industry, cotton spinning. In its bid to become a cotton center of national stature, Tianjin had several advantages: a local class of moneyed investors, access to raw materials, and a large market. Changes in the political scene brought in new entrepreneurs and gave the mills at least three opportunities to flourish—during World War I, in the late 1930s, and immediately after the Allied victory in World War II. But in each case chronic warfare, as well as government policies that sometimes verged on the cannibalistic, ultimately made it impossible for industry to prosper.

In the year after World War I, most of the Tianjin cotton mills were founded with the sponsorship of specific official or warlord cliques. Four of the mills were built at the southeastern edge of the concessions; two were north of the old city. Cao Kun, of the Fengtian warlord clique, was a major investor in the Heng Yuan Mill. The Yu Yuan Mill was dominated by the Anfu warlord clique. Its largest single stockholder was Ni Sichong (1.1 million yuan), and its original Board of Directors included Ni, Duan Qirui, and various high officials. Zhou Xuexi’s Hua Xin Mill and the Yu Da Mill were other attractive targets for warlord investment.

which held the patent on the Fourcault process of making flat glass. To maintain control of these far-flung industries, Zhou established the Huaxin central office in 1922 (dissolved 1931) to oversee the four cotton mills, supported by the Huaxin Bank (flourished 1923, dissolved 1931). Declining reappointments to various companies, he attempted to retain control through his Industrial Office in 1924 but soon retired from active management of the group. At the height of his industrial career he controlled assets estimated at over 40 million yuan.

In retirement Zhou dedicated himself to philanthropic work, establishing lineage halls to commemorate the Zhou family lineage and schools and charitable estates at Wuhu, Zhide, and Tianjin. He also compiled and financed the publication of works on neo-Confucianism, although he became a practicing Buddhist and vegetarian in 1929. He was buried in Beijing.

ZHOU Zuoren
Zhōu Zuōrén 周作人
1884–1967 Essayist

Zhou Zuoren, a leading essayist and social-cultural critic, influenced the development of modern Chinese literature by advocating “Human Literature” (its focus on humanistic as opposed to imperialist values), and by experimenting with styles that blend the unpretentious of the vernacular with the elegance of the classical.

Zhou Zuoren, a leading essayist of the twentieth century, was one of the major leaders in the New Culture Movement, a cultural critic, and a controversial writer. Born into a scholar-official family whose fortune was in sharp decline after centuries of social prestige, Zhou Zuoren grew up in Shaoxing County, Zhejiang Province, and received a traditional education in Chinese classics. After failing entry-level civil service examinations between 1898 and 1900, Zhou was ready for change and decided in 1901 to enroll in Nanjing’s Jiangnan Naval Academy; there he studied English, mathematics, natural sciences, and military and naval history. In 1906 Zhou went to Japan on a government scholarship intended to support his study of architecture. Zhou instead turned his energy to studying language. In 1910 he returned to China without earning a degree but with language skills in Japanese, English, Russian, and Greek.

Zhou’s return to China coincided with the 1911 Revolution, an event that marked not only the beginning of Republican China (1912–1949) but also decade-long chaos that would stimulate the New Culture Movement. In 1917 he accepted a professorship in the College of Arts at Beijing University, a tenure that Zhou retained until 1945. In 1925 Zhou was instrumental in expanding the curriculum in literature to establish the Department of Eastern Literature in Beijing University. From the 1920s to the 1940s he also taught at Yenching University and Beijing Normal University as a guest professor.

Already an experienced and published translator of Western literature, Zhou entered his most productive and innovative years as a writer in Beijing. He contributed regularly to the magazine New Youth with translations of literature from Russia, Japan, Poland, Hungary, and the United States. He was co-translator and co-compiler of Yuwai xiaoshuo ji (Short Stories from Abroad), China’s first such publication. Most important to his growing influence was his article, “Ren de wenxue” (Human Literature), published in New Youth in 1918 and viewed by his contemporaries as the article that conceptualized a goal of the rising literary revolution, as the literary experiments in the May Fourth era began to be called then. Between 1919 and 1920 he was active in promoting the “New Village” in China, a utopian experiment that was initiated by the Japanese Shirahaba School and influenced Chinese youth with anarchist idealism. He was one of the founding members of the Literary Research Association when it was established in Beijing in 1921. He also was one of the founders of an influential literary weekly, Yusi (Threads of Talk), when it was launched in 1924 and remained, in practice, its editor-in-chief. Throughout the 1920s Zhou contributed regularly to the literary
supplement of Jing Bao, one of the major newspapers in north China.

**Experiments with the Essay**

Beyond his “Human Literature,” Zhou’s enduring contribution to modern Chinese literature lies in his experiments with the essay. His knowledge of traditional as well as foreign literature and languages evidently influenced his choice of style and genre. Yet his attention to style was also a direct reaction to the politicization of the May Fourth Movement, which turned some literary pursuits into propaganda. Zhou, an outspoken advocate for vernacular reform, took the view that the best style should be presented in the vernacular yet be inclusive of the elegance of the classical. He praised the style of the natural and the unpretentious and valued “taste,” “simplicity,” and even “austerity” in essay composition. His own essays, which were published and compiled into thirty volumes during his life, reflected such values. At Beijing University, Xie Bingxin, Xu Dishan, and Yu Pingbo were among those the best-known writers whose style was influenced by Zhou.

Although he held the position of a radical iconoclast against Confucian tradition in his national debut in *New Youth*, Zhou took a more inclusive attitude toward Chinese literature by the mid-1920s when he turned to writing *biji*, essays based on informal notes and musings he made while reading. His writing subjects during the 1920s ranged from literature to folklore, religion, sexology, women, and current affairs, and his sympathy always went to the weak and the oppressed. In the late 1930s and early 1940s he even made use of writings in Confucian tradition to expound his ideas. Seemingly a dramatic change, Zhou’s approach to China’s cultural legacies initially resulted from his disillusionment over the government controlled by the Guomindang (Chinese Nationalist Party) in 1928, which used violence to suppress radical youth and the Communists. During the War of Resistance against Japan (1937–1945, known primarily outside China as the Second Sino-Japanese War, which was fought in the larger context of World War II beginning in 1939), Zhou again used his comments on the humanism in the Confucian tradition as a masked criticism of Japan’s invasion.

A proponent of cosmopolitanism toward foreign cultures, Zhou had been known as a Japanophile because of his writings and public activities in promoting Chinese understanding of Japan and Japanese culture since the 1920s. Yet through these writings he made a clear distinction between Japanese politics of his time, which angered him, and Japanese culture, which he admired. Many of his friends were disappointed that he chose to remain in Beijing when Japan invaded, and many more denounced him when he served as the minister of education of the North China Political Council in occupied Beijing. Testimony by underground resisters later revealed that he had been persuaded by them to take the job in order to prevent an energetic collaborator from stepping into this influential position. Zhou’s own writings that criticized in masked language the Japanese brutality during the war also provided corroborative evidence. Regardless of the solid evidence against the accusation of his collaboration,
Zhou was sentenced to a ten-year jail term in the charged political climate after the war. He was released in early 1949 when the Nationalist government collapsed. Zhou chose to return to Beijing; he was able to publish essays, memoirs, and translated works from Japanese and Greek literature only under pseudonyms. He died in 1967 after being beaten and abused for months by the Red Guards.

Revival of Interest

In the 1980s the Chinese people renewed their interest in Zhou’s writings and life in what was termed “Zhou Zuoren Fever.” Not only were his works reprinted, but also hundreds of scholarly articles and several biographies were published. Although his literary accomplishments and his contributions to the literature revolution were appreciated, his service to a collaboration regime under Japanese occupation remained controversial as critics under the influence of nationalism refused to accept his failed “national character.” The revived interest in Zhou attests to both his importance as a writer in the modern Chinese literary movement and to the enduring difficulty of separating politics and culture in modern Chinese history.

Zhu De (Chu Teh), the man who would found the Chinese Communist army, was the son of a poor tenant farmer. After Zhu graduated from Yunnan Military Academy in 1911, he participated in anti-Manchu activities in Yunnan and Sichuan provinces between 1912 and 1916. In 1922 he went to Europe on a work-study program and participated in Communist Party activities. Zhu returned to China in 1926 and became involved in the army of the Chinese Nationalist Party (Guomindang). After the Nanchang Uprising failed in 1927 Zhu led his troops to Hunan Province, where he joined with Chinese Communist Party (CCP) leader Mao Zedong (1893–1976). In Hunan Province they developed an effective military force that would become the Red Army. The Red Army, under Zhu’s command, defended the Jiangxi soviet (the headquarters of the CCP) undertook the 9,656-kilometer Long March to Shaanxi Province.

During the War of Resistance against Japan (1937–1945, known outside China as the Second Sino-Japanese War) Zhu commanded the Red Army’s northern forces. After Japan surrendered Zhu was commander of the People’s Liberation Army (PLA) until 1955, when he became a PLA marshal. He later became chairman of the National People’s Congress Standing Committee and continually was listed in many high positions, although he was not actively involved in politics after 1954.

ZHU Xī
Zhū Xī 朱熹
1130–1200 Synthesizer of neo-Confucianism

Zhu Xi was perhaps the greatest neo-Confucian philosopher. His Collected Commentaries on the Four Books became the basis of the civil service examinations in 1315 until they were abolished in 1905; twenty-first-century Confucian scholars remain deeply influenced by Zhu’s interpretations.

Zhu Xi, born in Youzi in Fukien Province, was perhaps the greatest neo-Confucian philosopher. He developed and clarified the metaphysics of two earlier philosophers, Cheng Yi (1033–1107) and brother Cheng Hao (1032–1085). According to their view, everything in the universe has two aspects, li (principle) and qi. Li is a structuring principle that accounts for both the way a thing is and the way it ought to be. Although the li is completely present in each and every thing, things are distinguished by having different endowments of qi. Qi is a sort of self-moving ethereal substance, which has varying degrees of turbidity or clarity. Inanimate objects have the most turbid qi, with plants, animals, and humans having increasingly clearer qi.

Because the li is one, everything is part of a potentially harmonious whole. Consequently, a good person has

Zhu Xi’s writings on neo-Confucianism became the foundation of China’s civil service exams for nearly six hundred years, and thus were the focus of study for generations of hopeful scholar-officials.
Philosophy of Zhu Xi

While Zhu Xi, also known as Chu Hsi, is best known for his work Collected Commentaries on the Four Books and its contributions to Neo-Confucianism; he wrote on many topics, as seen below in his work on Heaven and Earth.

In the beginning of the universe there was only material force [ch'i] consisting of yin and yang. This force moved and circulated, turning this way and that. As this movement gained speed, a mass of sediment was pushed together and, since there was no outlet for this, it consolidated to form the earth in the center of the universe. The clear part of material force formed the sky, the sun and moon, the starts and zodiacal spaces. It is only on the outside that the encircling movement perpetually goes on. The earth exists motionless in the center of the system, not at the bottom.

In the beginning of the universe, when it was still in a state of undifferentiated chaos, I imagine there were only water and fire. The sediment from water formed the earth. If today we climb the high mountains and look around, we will see ranges of mountains in the shape of waves. This is because the water formed them like this, though we do not know at what period they solidified. This solidification was at first very soft, but in time it became hard.

Question: I imagine it is like the tide rushing upon and making waves in the save. [Is that right?]
Answer: Yes. The most turbid water formed the earth and the purest fire became wind, thunder, lightning, starts, and the like.

Further Question: Can the universe be destroyed?
Answer: It is indestructible. But in time man will lose all moral principles and everything will be thrown together in a chaos. Man and things will all die out, and then there will be a new beginning.

ZHU Yuanzhang

Zhu Yuánzhāng 朱元璋
1328–1398  Founder of the Ming Dynasty

Zhu Yuanzhang 朱元璋 was the founding emperor of the Ming 明 dynasty (1368–1644). He rose from a life of suffering and adversity to become one of the most powerful and autocratic emperors in Chinese history.

Little is known of Zhu Yuanzhang’s childhood except that he suffered many hardships. When most of his family died during an epidemic in 1344, he sought refuge at a Buddhist temple, where he spent several years as a novice monk, begging for food and basic supplies for the temple and learning to read and write from some of the monks. In 1352, after the temple was attacked and burned by the Yuan 元 military, he joined the Red Turban movement, part of the secret Buddhist-inspired White Lotus Society, which interpreted the floods, starvation, and chaos of the time as signs that the Buddha of the future, Maitreya, was about to appear and that the Mongols had lost the Mandate of Heaven and should be overthrown. The Mandate of Heaven, cited by every dynasty since the Zhou in 1045 BCE, refers to the belief that a benevolent Heaven bestowed the right to rule on every virtuous ruler.

Zhu was tall, physically imposing, intelligent, and fearless in battle. He quickly rose through the ranks and soon had troops under his command. He married his commander’s adopted daughter, and when his commander was killed in battle in 1355, Zhu seemed the natural choice to take his place. In 1356 his troops occupied the important regional city of Nanjing, which had been the seat of several southern kingdoms. He had gained the allegiance of several learned and experienced men, and rather than simply loot and plunder, he and his forces began to administer the territory surrounding Nanjing and to impose peace and order in areas that had been in chaos for over a decade.

He formally broke with the Red Turbans in 1366, and within two years he had eliminated his rivals among the Red Turban commanders. He then declared the founding of a new dynasty, the Ming (meaning “bright” or “light”) and sent his largest army in 1368 to invade and take over the former Yuan capital, which he renamed Beiping, “the north pacified.” The name was changed to Beijing, “the Northern Capital,” in the early fifteenth century.

The new emperor took the reign title Hongwu 明洪武 (Abundantly Martial), and he is also known in history as Ming Taizu 名太祖 (the Grand Progenitor of the Ming). He was energetic, smart, dedicated, and determined to ensure that the people of China would never have to suffer as he and his family had suffered. He ordered an empire-wide land and population survey, kept central government expenses low, and placed the dynasty on a firm financial footing. He put out many pleas, from 1368 on, for men of talent and dedication to come forward and aid him in the great enterprise of governing the empire. But after the empire was fully in his hands, he found it increasingly difficult to trust his officials and subordinates as implicitly as he had during his rise to power.

Whether from some deep character flaws, the insecurities of his youth, or the corruptions of power itself,
he became a paranoid emperor who ultimately tried to control his officials through the blunt use of force and terror. In 1376 he ordered the execution of up to a thousand officials for having “prestamped” tax documents, which he took as a sign of corruption. In 1380 he turned on his prime minister, abolished his position, and had him killed along with another fifteen thousand officials. He ordered that his own Confucian admonitions and teachings be read aloud monthly at every village in the empire, so that the entire population could be taught the virtues of Confucian filial piety and loyalty to the emperor.

After his wife, Empress Ma, died in 1382 the emperor became even more paranoid and continued to order purge after purge, leaving the Confucian bureaucracy terrified and demoralized. Some have estimated that one hundred thousand people were executed by order of the “Abundantly Martial” emperor during his thirty years on the throne. Seldom has so much success and so much failure been combined in one life.

The Zhuang (or Bouxcueng) tribal people of the southeast have contributed greatly to the history of southern China. They now are the largest of China's fifty-five officially recognized ethnic minority groups.

The Zhuang is the largest officially recognized minority ethnic group in China. (The Chinese government recognizes one majority group, the Han, and fifty-five minority groups.) They are very tribal and locality-oriented and traditionally have not considered themselves as one nationality. According to the 2000 census of the People's Republic of China, the Zhuang population was about 18 million.

Home
More than 90 percent of the Zhuang people live in the Guangxi Zhuang Autonomous Region in the southeast, bordering Vietnam and the Gulf of Tonkin. The remainder live in Yunnan, Guangdong, Guizhou, and Hunan provinces and often reside in areas populated with other southern Chinese minority groups. A small population of Zhuang also lives in Vietnam. The tourist city of Guilin, with its famous nearby karst limestone landscape, is in a Zhuang-inhabited area. The Zhuang live in hamlets of twenty to thirty households, in brick and wood houses, often on stilts, in rain-forested mountainous regions known for straight high peaks, grottoes, and subterranean rivers.

The climate of Guangxi is mild in winter and tropical in summer. The mountains of Guangxi are heavily forested and rich in tea plantations. Minerals such as iron, coal, gold, copper, aluminum, zinc, and petroleum are abundant. Abundant rainfall flows through traditional bamboo pipes to nurture Zhuang rice paddies that can rise 1,000 meters (3,280 feet). The Zhuang also raise yams, corn, sugar cane, mangos, bananas, mushrooms, special medicinal plants, and fennel.

History
The Zhuang have a long recorded history, although the name “Zhuang” appeared only about 1,000 years ago. Their community sites came under Han Chinese control in 221 BCE under the first emperor of the Qin dynasty (221–206 BCE). Frescoes dating back more than 2,000 years have been discovered on numerous cliffs over the Zuojiang River in southwest Guangxi, which portray scenes in the life of the early Zhuang people. Powerful land-owning clans emerged in Zhuang areas of Guangxi and established Chinese-influenced kingdoms called Nan Yue (south) and Nan Han.

During the Tang dynasty (618–907 CE) and Song dynasty (960–1279), irrigated rice paddies, animal raising, and cloth manufacturing spread to the Zhuang people. Zhuang social classes included heredity landowners, tenant farmers, and servants, all ruled by headmen. Known for their martial spirit, they repulsed the Annamese (Vietnamese) invasions of south China in the 1070s and also defeated Japanese pirates in the sixteenth century.
Throughout the last thousand years, the Zhuang and Yao minorities often fought each other. When the Taiping Rebellion (1851–1864) peasant uprising broke out in southwest China, many Zhuang became important leaders in its army. Zhuang and Han Chinese forces in Guangxi combined to stop invading French armies near Hanoi, Vietnam, in 1873 and in 1882.

Ethnic Zhuang played key roles in Dr. Sun Yat-sen’s revolutionary organization in the early twentieth century, but Zhuang efforts to become autonomous were crushed under Chiang Kai-shek in 1929. Zhuang guerrillas fought alongside the communists against the Japanese in World War II, but after the foundation of the People’s Republic of China in 1949, Zhuang land was confiscated from traditional property owners and redistributed.

Under the communists, handicraft cooperatives were established and timber output increased greatly. More than twenty universities and colleges were established in Zhuang regions; the most famous is Guangxi Ethnic Institute. Infectious diseases that used to be rampant among the Zhuang—such as malaria, cholera, smallpox, and snail fever—have been wiped out.

Culture and Customs

The Zhuang language belongs to the Thai group of the Sino-Tibetan language family and has two main dialects. (Mandarin, the best known Chinese language, belongs to the Sinitic branch of Sino-Tibetan family. Zhuang and Mandarin are only distantly related, and speakers of one language do not understand speakers from the other.) The Zhuang developed their own written characters during the Song Dynasty (960–1279), but later Han Chinese characters were used for writing until in 1957, when the
The Zhuang are polytheists, worshipping and making sacrifices to giant rocks, old trees, mountains, animals, and their human ancestors. Since the Tang dynasty, Daoism has strongly influenced their religious rites.

The Zhuang have a rich folk literature of legends, fairy tales, stories, and songs. Songfests are a common feature of social life and a means of choosing marriage partners. Common Zhuang musical instruments include the double-reed oboe (suona) bronze drum, cymbal, gong, Chinese windpipe (sheng), vertical bamboo flute, and horse-bone fiddle. Typical bronze drums of unclear purpose but reflecting skill in relief decorations have been unearthed and date back over 2,000 years. Zhuang dances are full of forceful and quick steps with humorous gestures. Their dance forms include dancing on wooden stilts, masked dances, and dancing with horse images. Zhuang opera, which combines folk literature, music, and dance, originated from Tang dynasty religious rituals. The Zhuang people also have their own form of puppet dramas.

Zhuang brocade originated in the Tang dynasty and is noted for its beautiful, colorful velour designs and tie-dyeing. There are regional clothing customs but, in general, men wear clothing similar to Han Chinese. However, the women in northwest Guangxi wear collarless, blue or black embroidered jackets buttoned to the left, with loose, wide trousers or pleated skirts with embroidered belts. Zhuang women in southwest Guangxi wear black collarless jackets buttoned to the left, with black square scarf headbands and loose black trousers. Women wear several large silver loop necklaces and other silver ornaments.

Tattooing on the face is still in practice among the Zhuang. Chewing betel nuts and drinking homemade wines remain common. Zhuang also make lacquerware similar to that found in Burma.

The Zhuang have three special festivals. On the Devil Festival, usually in August, every family prepares chicken, duck, wine, candy, and five-colored glutinous rice to offer as sacrifices to ancestors and ghosts. During the Cattle Soul Festival, after spring plowing, families carry a basket of steamed five-colored glutinous rice and a fresh grass bundle to the previously bathed cattle. They feed this mixture to the cattle to restore the souls they lost when whipped during the plowing. The Feasting Festival is celebrated by Zhuang near the Vietnamese border. It pays tribute to the Zhuang soldiers who gave up their traditional Spring Festival to repel the French invaders in the nineteenth century.

Many of the Zhuang people are surnamed Wei and trace their descent from a Han dynasty general, Han Xing. After the general’s execution, a close friend took his son to south China and revised the writing of his surname Han to create the new name of Wei. Zhuang descendants of this Wei ancestor include Wei Baqun, who in 1894 led peasant uprisings in western Guangxi Province against the Manchus. These guerrilla activities developed into the Communist-inspired Baise uprising in the 1920s, which later was praised by Mao Zedong as an attempt to establish Soviet-style control in Zhuang territory. The most powerful leader in Guangxi after the communist revolution was the Zhuang tribal boss, Wei Guoqing, who was attacked and removed in the Cultural Revolution. Another famous Zhuang historical figure was Nong Zhigao, who is remembered for his declaration of independence from the Song Dynasty (960–1279) for his Zhuang clan in 1041.

Zodiac

Shǔxiàng 属相

In China the zodiac is based on a calendrical system rather than on the stars. In a repeating sixty-year cycle twelve earthly “branches” operate in conjunction with ten heavenly “stems.” Each earthly branch has an animal associated with it; each stem is associated with one of the two primordial, complementary forces of Chinese cosmology.

Whereas the Western zodiac is determined by the constellations that travel through the plane of the Earth’s orbit against the celestial sphere, the Chinese zodiac is connected more closely with the Chinese calendrical system than with the stars. An ancient Chinese system of measuring time made use of a repeating sixty-year cycle whose component years combined ten heavenly “stems” and twelve earthly “branches.” Each of the earthly branches has an animal associated with it—hence, the twelve animals of the Chinese zodiac.

The first earthly branch is symbolized by the rat (or mouse). The second is symbolized variously by the ox, the cow, or the water buffalo. The third is symbolized by the tiger. The fourth is symbolized by the rabbit (or the cat). The fifth earthly branch is usually symbolized by the dragon. The sixth earthly branch is symbolized by the snake; the seventh by the horse; the eighth by the goat or sheep; the ninth by the monkey; the tenth by the chicken (cock); the eleventh by the dog; and the twelfth by the pig.

Stories explain how the various animals became zodiac animals and why they appear in the order they do. One story explains how the cat came to be left out of the zodiac (it was because of trickery on the part of the rat) and explains the mortal enmity between the two. Interestingly enough, in Vietnam the cat takes the rabbit’s place in the zodiac.
These twelve earthly branches operate in conjunction with the ten heavenly stems. The stems are divided into the two basic, primordial, complementary forces of Chinese cosmology (a branch of metaphysics that deals with the nature of the universe): yin (hot, dry, masculine, etc.) and yang (cold, wet, feminine, etc.), which are further modified by each of the five Chinese elements. (The ancient Greeks thought of four fundamental elements—earth, air, fire, and water—but the ancient Chinese thought in terms of five: fire, water, wood, metal, and earth.) The stems combine with the branches in six cycles of stems and five cycles of branches, for a total of sixty years in the overarching cycle.

The way the stems and branches combine is such that each animal in the Chinese zodiac is either always yin or always yang: The rat, tiger, dragon, horse, monkey, and dog are yang; the ox, rabbit, snake, sheep (or goat), chicken (cock), and pig are yin. The animals are also divided into four groups of three: the rat, dragon, and monkey; the ox, snake, and chicken (cock); the tiger, horse, and dog; and the rabbit, sheep (goat), and pig. Each group shares similar strengths, weaknesses, and other characteristics, although the characteristics of a zodiac animal

in any given year will also be modified by the element for the year—so that, for instance, the fire horse is said to be a particularly potent horse.

Thus, a year has a yin or yang designation, an elemental designation, and an animal designation. Most of 2000, for example, was a yang metal dragon year. This style of designation can also be used for days or months—and, indeed, can be related to (or used to represent) stars, directions, seasons of the year, landscape features, foods, flavors, parts of the body, and many other things. The zodiac is thus linked to astrology, geomancy (divination by means of figures or lines or geographic features), health, diet, selection of a marriage partner, and the best (or worst) time to travel, begin building a house, or perform certain religious rituals.

Further Reading

Zuglakang Monastery in Lhasa is the most sacred Buddhist site in Tibet. It houses a statue of the Buddha said to date from his lifetime (c. 566–486 BCE).

Regarded as the most sacred Buddhist site in Tibet, Zuglakang Monastery has been closely linked with the historical development of Lhasa as a city and of Tibet as a nation. Zuglakang is one of the primary places of pilgrimage for Tibetan Buddhists because it contains a revered statue—that of Jowo (the Buddha at the age of twelve)—said to date from the lifetime of the Buddha (c. 566–486 BCE). Also, the name of the city, “Lhasa” (place of the gods) is an appellative for “Zuglakang.”

Legends relate that the Yarlung king, Songsten Gampo (605–649 CE), began construction of the monastery in the year 639 in accordance with the wishes of his wife Bhrikuti, a princess of Nepal who had brought, as part of her dowry, statues of the Buddha that she wished to house in a suitable temple; she had noted that Tibet possessed no Buddhist temple. Songsten Gampo himself is said to have worked alongside the laborers in erecting Zuglakang.

The king had a second, Chinese wife, Wencheng Kongjo, of the Tang dynasty (618–907 CE) royal house. She, too, was a Buddhist and had brought with her the Jowo statue; she also required a temple for it. Wencheng is said to have practiced geomancy (divination by means of figures or lines or geographic features), and thereby she located the site where a temple would not be harmed by malignant forces. Zuglakang was built at that site.

Much of Zuglakang’s design is based on Indian Buddhist architecture, with a strong, but later, admixture of Nepalese and Tang elements. Indeed, the structure itself may well be the oldest extant example of Indian religious structural design because similar buildings in India have long vanished, given the fact that Buddhism did not endure in the subcontinent. The monastery also contains many carved pillars, ornamented shrines, and adorned ceilings; it once had many paintings on stucco, but many of these have been destroyed, most during the Cultural Revolution (1966–1976).

When the Yarlung dynasty was overthrown in the middle of the ninth century, Zuglakang fell into disrepair, given the anti-Buddhist fervor of Repachen, the new ruler. However, subsequent kings began to demonstrate their piety and to show their legitimacy by undertaking elaborate restorations of the monastery. Thus, by the eighteenth century Zuglakang had become an expansive complex with chapels, residential apartments for the Dalai and Panchen Lamas, dormitories for monks, kitchens, storage facilities, government offices, service buildings, and large courtyards.

However, Zuglakang’s symbolic significance as the first Buddhist temple in Tibet has allowed it to become intimately interwoven with Tibetan history. Thus, it has become the emblem of Tibetan identity. The sacred quality of the monastery depends on the legends that surround it, which ultimately speak of the
process through which the message of the Buddha was brought to Tibet and then firmly rooted there. Zuglakang, then, is much more than a monastic complex: It is the soul of Tibet because through it Tibetans have constructed their identity, and within its walls they have historically placed their cultural, political, and religious aspirations.

Jiè huā xiàn fó
Zuo Zongtang was a renowned military leader of nineteenth-century China; he led the Chinese military in the suppression of the Muslim and Nian rebellions (1868–1880), negotiated with the Russians, and led the war against the French in 1884–1885.

Zuo Zongtang (1812–1885) was born to a scholarly family in Hunan Province; in his early years he studied works in the fields of history, classics, geography, and agriculture. In 1852 he joined the military in the campaign against the Taiping Rebellion and soon displayed his military ability and wisdom. He was promoted to governor-general of Fujian and Zhejiang provinces in 1863 and remained in this position until 1866. Zuo founded China’s first modern dockyard and naval school in Fuzhou during this period. In 1866 Zuo was appointed governor-general of Shaanxi and Gansu provinces to suppress the Muslim rebels there. Between 1868 and 1880, Zuo suppressed Nian rebels in Shandong Province and the Muslim rebels in the northwestern China and consolidated China’s northwestern frontier. He militarily sustained China’s negotiation with Russia in recovering Yili, a Chinese territory occupied by Russia during the Muslim rebellion. He also carried out several important economic reforms, including the encouragement of the cotton industry in Xinjiang and the mobilization of soldiers to farm unused land. In 1881 Zuo was appointed to serve in the Grand Council of the central government. Later, in 1884, he was once again put in
charge of all military affairs of China during the Sino-French War (1884–1885). After a settlement between China and France was reached, Zuo Zongtang died on 5 September 1885. Zuo Zongtang’s success in putting down rebellions shaped the military prowess and unity of China in the nineteenth century.
